testosterone decline in men is also called *androgen decline in the ageing male* (**ADAM**) or *ageing male syndrome* (**AMS**). See also **ANDROPAUSE**, **CLIMACTERIC**, **TESTOSTERONE REPLACEMENT THERAPY (TRT)**. [First used in an article by the English reproductive biologist Gerald A. Lincoln in the *Journal of Reproduction, Fertility and Development* in 2001, echoing the term *irritable bowel syndrome*]

irritable mood *n.* An irascible ***mood** (1) of angry impatience and hasty temper in which a person is easily annoyed or roused to anger or aggression.

Isakower phenomenon *n.* A type of ***hypnagogic image** in which a soft, doughy mass appears to be moving towards one's face. It was first reported in 1938 by the Austrian psychoanalyst Otto Isakower (1899–1972), who attributed it to a revival of the infantile experience of feeding at the mother's breast.

ischaemia *n.* Obstruction of the flow of blood to an organ or tissue of the body. Also spelt *ischemia*. **ischaemic** or **ischemic** *adj.* [From Greek *ischein* to restrain + *haima* blood + *-ia* indicating a condition or quality]

ischaemic pain *n.* Pain induced by applying a tourniquet to the arm just above the elbow to obstruct the flow of blood, then squeezing a hand-exercising device for a minute or two. When the exercising stops, pain begins to mount and typically becomes unbearable after about eight minutes. It is used in experimental studies of pain because it causes no permanent tissue damage. US *ischemic pain*. See also **ALGESIMETER**, **COLD PRESSOR PAIN**, **DOLORIMETER**.

I-self *n.* According to the pioneering the US psychologist William James (1842–1910) in his *Principles of Psychology* (1890), the self as it is experienced and as it acts in the world (the ***phenomenal self**), or the self as subject, in contradistinction to the ***Me-self**.

Ishihara test *n.* A popular test for the detection and characterization of ***colour-blindness** or ***colour deficiency**, consisting of a series of coloured plates each composed of small blobs of different colours closely packed together, each plate having a large numeral clearly visible to viewers with
*****ebook converter DEMO Watermarks*****

normal colour vision but invisible to those with a form of colour deficiency associated with that plate, the pattern of responses across the complete set of plates enabling the form of colour deficiency to be specified reasonably precisely. *See also* **PSEUDO-ISOCHROMATIC**. *Compare* **HOLMGREN TEST**, **STILLING TEST**. [Named after the Japanese ophthalmologist Shinobu Ishihara (1897–1963) who devised it]

island of Reil *n.* Another name for the ***insula**. [Named after the Dutch-born German physician Johann Christian Reil (1759–1813) who drew attention to it]

islets of Langerhans *n.* Groups of endocrine glands in the ***pancreas** that secrete ***insulin** and ***glucagon** into the bloodstream, and whose failure leads to ***diabetes** mellitus. Also called *islands of Langerhans*. [Named after the German pathologist Paul Langerhans (1847–88) who discovered them]

isocarboxazid *n.* A ***monoamine oxidase inhibitor** (MAOI), derived from ***hydrazine**, used as an ***antidepressant** drug. Also called *Marplan* (trademark).

isocortex *n.* Another name for the ***neocortex**. [From Greek *isos* equal or the same + Latin *cortex* bark or outer layer]

isogenic *adj.* Derived from the same source, as are organs derived from the same embryonic tissue. Also written *isogenous*. [From Greek *isos* equal or the same + *genein* to produce + *-ikos* of, relating to, or resembling]

isogloss *n.* A line on a map enclosing an area within which a particular linguistic ***feature** (1) is found. Various types of isogloss are distinguished: an *isophone* is a feature of pronunciation, an *isolex* an item of vocabulary, an *isomorph* a feature of word formation, and an *isoseme* a particular word meaning. [From Greek *isos* equal + *glossa* a tongue]

isolate *n.* 1. An individual cut off from other members of a group or community. In a ***sociogram**, an individual who is not chosen by any other group member. 2. An organism or group of organisms separated from a

specimen. [From Latin *insulatus* made into an island, from *insula* an island]

isolating language *n.* A language such as Chinese, Vietnamese, and Samoan in which words are invariable, there are no inflections or changeable endings, and grammatical relations are indicated by word order. English has some features of an isolating language, as shown by the two sentences *The burglar killed the woman* and *The woman killed the burglar*. Also called an *analytic language* or a *root language*. Compare [AGGLUTINATIVE LANGUAGE](#), [INFLECTING LANGUAGE](#).

isolating mechanism *n.* A topographic, ecological, physical, or psychological barrier that prevents breeding between two populations and thereby allows differentiation into distinct [*taxonomic](#) groups and that sometimes causes [*speciation](#) to occur.

isolation *n.* The act or process of separating or placing apart; in reproductive biology, the prevention of interbreeding between populations resulting from one or more [*isolating mechanisms](#).

isolation effect *n.* Another name for the [*von Restorff effect](#).

isolation of affect *n.* In [*psychoanalysis](#), a [*defence mechanism](#) in which [*emotion](#) is detached from an idea and rendered unconscious, leaving the idea bland and emotionally flat. It is especially important in [*obsessive–compulsive disorder](#), and in non-disordered people it most often occurs following a traumatic experience. The mechanisms by which the detachment is effected include repetitive intrusive thoughts and ritualistic behaviour. Sigmund Freud (1856–1939) expressed his ideas about isolation most clearly in his book *Inhibitions, Symptoms and Anxiety* (1926, *Standard Edition*, XX, pp. 77–175, at pp. 120–2). Also called *isolation*. See also [DECATHEXIS](#).

isoluminant *adj.* Having uniform light intensity, pertaining to visual stimuli in which shapes or forms are defined by variations in colour without any contrasts in [*lightness](#). If red and green stripes in motion on a television screen are adjusted so that they are isoluminant, then although the viewer can see that they have changed position from one moment to the next, the sensation of movement is either greatly reduced or entirely eliminated,
*****ebook converter DEMO Watermarks*****

because information about movement is processed by the colour-blind ***magnocellular system**; and for the same reason, binocular ***stereopsis** and the other binocular and monocular cues used for ***depth perception** do not function with isoluminant stimuli, which invariably appear flat and two-dimensional. Also called *equiluminant*. See also **DARK FOCUS**. **isoluminance** *n.* [From Greek *isos* equal or the same + Latin *lumen* light]

isomorphism *n.* **1.** A one-to-one correspondence between the elements of two or more sets or classes and between the sums or products of the elements of one set and the sums or products of the equivalent elements of the other set. A typical isomorphism exists between the Arabic numerals 1, 2, 3, 4, ... and the Roman numerals I, II, III, IV, ... **2.** A similarity in form or structure between two or more substances or entities, including abstract structures or problems that look superficially different but turn out, on analysis, to be different versions of the same problem. See also **BOOLEAN**. **3.** The doctrine of ***Gestalt psychology** according to which a mental experience such as a perception is invariably accompanied by a neurophysiological ***representation (1)** that is similar to it in structure. The idea can be traced to an article by the Austrian physicist, philosopher, and psychologist Ernst Mach (1838–1916) in the *Kaiserlichen Akademie der Wissenschaften* (1865): ‘Every psychical event corresponds to a physical event and vice versa. *Equal* psychical processes correspond to *equal* physical processes, *unequal* to *unequal* ones’ (p. 269 of the English translation published in 1965, italics in original). This notion was developed and imported into Gestalt psychology by the German psychologist Wolfgang Köhler (1887–1967), who asserted in his book *Gestalt Psychology* (1947) that ‘the principle of isomorphism demands that in a given case the organization of experience and the underlying physiological facts have the same structure’ (p. 301). See also **PRÄGNANZ**. **isomorph** *n.* Anything that exhibits isomorphism with something else. See also **ISOGLOSS**. **isomorphic** *adj.* Manifesting isomorphism. Also called *isophorphous*. [From Greek *isos* equal or the same + *morphe* a shape or form + *-ismos* indicating a state or condition]

isophonic contour *n.* Another name for an ***equal-loudness contour**. [From Greek *isos* equal or the same + *phonikos* of or relating to sound, from *phone* a voice or sound + *-ikos* of, relating to, or resembling]

isoquinoline *n.* Any of a number of nitrogenous bases that can be formed from catecholamines and indoleamines and that, when treated with formaldehyde gas, fluoresce under ultraviolet light, the wavelength of the emitted light depending on the specific catecholamine or indoleamine involved, providing a method of tracking these neurotransmitters in the nervous system. [From Greek *isos* equal or the same + *quinoline*, from Spanish *quina* kinchoma bark, from Quechua *kina* bark]

isotonia *n.* The state or condition of equal tone or tension in two or more muscles. See [ISOTONIC \(1\)](#). Compare [HYPERTONIA](#), [HYPOTONIA](#).

isotonic *adj.* **1.** Of, relating to, or comprising two or more muscles that are equally tense. Compare [HYPERTONIC \(1\)](#), [HYPOTONIC \(1\)](#). **2.** Of or relating to two or more solutions having equal concentration and hence exerting the same **osmotic pressure* as each other, such as a 0.9 per cent sodium chloride (salt) solution and the **intracellular fluid* of the body. See also [OSMOSIS](#). Compare [HYPERTONIC \(2\)](#), [HYPOTONIC \(2\)](#). [From Greek *isos* equal or the same + *tonos* tension + *-ikos* of, relating to, or resembling]

isotropic *adj.* Having the same properties in all directions or with respect to all axes. Compare [ANISOTROPIC](#). **isotropism** or **isotropy** *n.* [From Greek *isos* equal or the same + *tropos* a turn, from *trepein* to turn]

is-ought question See [NATURALISTIC FALLACY](#).

Issawi's law of social motion *n.* The following proposition: 'In any dispute, the intensity of feeling is inversely proportional to the value of the stakes at issue. That is why academic politics are so bitter.' It was first published by the Egyptian-born US economist Charles Philip Issawi (1916–2000) in his book *Issawi's Laws of Social Motion* (1973), although it had been formulated earlier by the US political scientist Wallace Stanley Sayre (1905–72), without written publication, and is also called *Sayre's law*.

item analysis *n.* In psychometrics, a set of techniques for determining the psychometric properties of test items, including the **discriminating power* of attitude scale items or the correlation of item scores with an external

criterion.

item bias *n.* In psychometrics, a form of **test bias* restricted to specific test items.

item characteristic curve *n.* Another name for an item response function. See *ITEM RESPONSE THEORY*.

item discrimination index *n.* In psychometrics, a measure of the extent to which test respondents who are known to be high on the attribute being measured exhibit different responses to a test item than people who are known to be low on the attribute. It is a measure of the **discriminating power* of the item.

Item Group Checklist *n.* A list of **signs (1)* and **symptoms* used in evaluating patients with mental disorders as part of the **SCAN* system. **IGC** *abbrev.*

item response curve *n.* Another name for an item response function. See *ITEM RESPONSE THEORY*.

item response theory *n.* An approach to the theory of psychological testing based on the assumption that the probability of a particular response to a test item is a joint function of one or more characteristics of the individual respondent and one or more characteristics of the test item. The relationship of these parameters to the probability of a particular response is defined by an *item response function*, and their values are estimated from the observable responses of respondents to the test item. It is the principal alternative to **classical test theory*. Also called *latent trait theory*. See also *RASCH SCALE*. **IRT** *abbrev.*

I-thou relation *n.* A term coined in 1923 by the Austrian theologian and philosopher Martin Buber (1878–1965) in his book *Ich und du* (I and Thou) to denote a relationship based on mutuality and reciprocity rather than utilitarian objectives.

Jacksonian epilepsy *n.* A form of **epilepsy* that is associated with abnormal neuronal activity in a localized area of the brain and that typically begins with spasmodic contractions in a finger, toe, or corner of the mouth and then spreads throughout the body, usually with loss of **consciousness*. Also called *focal epilepsy* or *focal seizure*. [Named after the English neurologist J(ohn) Hughlings Jackson (1835–1911) who studied it]

Jackson's principle *n.* The notion that deterioration of psychological functions through mental disorders or neurological impairments retraces in reverse the order of evolutionary development, so that the most recently evolved are the first to be lost. Also called *Jackson's law*. Compare *RIBOT'S LAW*. [Formulated by the English neurologist J(ohn) Hughlings Jackson (1835–1911)]

Jacobson's organ *n.* Another name for the **vomeronasal organ*. [Named after the Danish anatomist Ludvig Levin Jacobson (1783–1843) who discovered it]

Jacobson's progressive relaxation *n.* Another name for **progressive relaxation*. [Named after the US physician Edmund Jacobson (1888–1983) who introduced it in 1938]

jactation *n.* Jerky, convulsive bodily movements characteristic of severe fevers, some mental disorders, and neurological damage to the **subthalamic nucleus*. See also *BALLISM*. [From Latin *iactare* to throw + *-ation* indicating a process or condition]

jamais vu *n.* A form of [*paramnesia \(1\)](#) characterized by an erroneous belief of having never before seen or experienced something that one has in reality encountered before. *Compare* [DÉJÀ VU](#). [From French *jamais* never + *vu* seen]

James–Lange theory *n.* The proposition that [*emotions](#) are caused by bodily sensations. It was first propounded by the US psychologist William James (1842–1910) in the journal *Mind* in 1884 and most famously expounded in his *Principles of Psychology* (1890): ‘Our natural way of thinking...is that the mental perception of some fact excites the mental affection called the emotion, and that this latter state of mind gives rise to the bodily expression. My thesis, on the contrary, is that *the bodily changes follow directly the perception of the exciting fact, and that our feeling of the same changes as they occur IS the emotion*....We feel sorry because we cry, angry because we strike, afraid because we tremble’ (volume 2, p. 449, italics in original). The Danish physician Carl (Georg) Lange (1834–1900) independently put forward a somewhat similar theory in his book *Om Sindsbevægelser* in 1885, although Lange's theory places no emphasis on emotion as a mental state, equating emotion with the bodily (especially visceral) events themselves. The main problem with the theory, first pointed out in 1927 by the US physiologist Walter Bradford Cannon (1871–1945), is that the physiological changes accompanying qualitatively different emotions are often very similar. *See also* [COGNITIVE-APPRAISAL THEORY](#), [FACIAL FEEDBACK HYPOTHESIS](#). *Compare* [CANNON–BARD THEORY](#).

Japanese writing *See* [KANA](#), [KANJI](#).

jargon *n.* **1.** The specialized language associated with a particular profession or field of activity. *See also* [PSYCHOBABBLE](#), [REGISTER \(2\)](#). **2.** In developmental psychology, an unintelligible but well-articulated utterance of a child learning to speak. **3.** Meaningless gibberish. *See also* [JARGON APHASIA](#). [French *jargon*, origin obscure]

jargon aphasia *n.* A form of *fluent aphasia* characterized by a copious flow of unintelligible speech. Jargon-aphasic speech may be subdivided into semantic jargon, in which ordinary words are strung together to form unintelligible utterances, such as *automatic winding voice and the very very*
*****ebook converter DEMO Watermarks*****

recording, and phonemic jargon involving neologisms, such as *I've not norter with the verker*. See also [APHASIA](#).

Jastrow illusion *n.* A visual illusion in which two identical tapering annular or ring segments placed one above the other appear unequal in size (see [illustration](#)). [Named after the Polish-born US psychologist Joseph Jastrow (1863–1944) who first published it in 1891]

Jastrow illusion. The two figures are identical.

jealous delusional disorder *n.* A type of [*delusional disorder](#) in which the central theme of the [*delusion](#) is that the sexual partner is being unfaithful.

jealousy, morbid *n.* Another name for [*jealous delusional disorder](#).

Jerusalem syndrome *n.* A non-technical name for a condition occasionally affecting Jewish, Christian, and other pilgrim-tourists visiting Jerusalem who develop [*delusions](#) (usually transient) of being biblical personalities such as Jesus Christ, John the Baptist, or Mary Magdalene. The Argentine–Israeli psychiatrist Yair Carlos Bar-El (1937–2009) first identified and named the syndrome in 1982 and discussed it in articles in the journal *Comprehensive Psychiatry* in 1991 and the *British Journal of Psychiatry* in

*****ebook converter DEMO Watermarks*****

2000. Compare [STENDHAL SYNDROME](#).

jet lag *n.* A condition of fatigue and disorientation brought about by travelling across several time zones in a short period, especially in an eastward direction, resulting in a mismatch between exogenous temporal cues and endogenous [*circadian rhythms](#). See also [MELATONIN](#). **jet-lagged** *adj.*

jigsaw classroom *n.* A cooperative technique designed to reduce [*prejudice](#) and conflict in racially mixed groups of children. In the original research, children were arranged in six-member groups, and the day's lessons were divided into six sections, each section being assigned to a different child, with every child having essential information that, like a piece of a jigsaw puzzle, was necessary for completing the task and had to be learned and taught to other group members to achieve the common goal of receiving good marks. Evidence suggests that, compared to traditional classes, jigsaw groups tend to manifest less prejudice and stereotyping, increased liking among group members both within and across ethnic boundaries, increased self-esteem, better scholastic performance, and greater enjoyment of school. The US social psychologist Elliot Aronson (born 1932), working with several graduate students, introduced the technique to deal with racial conflict following the desegregation of schools in Austin, Texas in 1971 and published it initially in a book entitled *The Jigsaw Classroom* (1978) and an article in *Personality and Social Psychology Bulletin* (1979). Compare [ROBBERS CAVE EXPERIMENT](#).

Jimmy *n.* A nickname used by psychologists to refer to the best-selling textbook *Psychology: Briefer Course* (1892) by the US psychologist William James (1842–1910). His monumental two-volume *Principles of Psychology* appeared in 1890, after a gestation period of 12 years, and comments such as *You'll find it in James* were so common that the book gradually came to be known as *James*. When the abridged version appeared in 1892, it was immediately nicknamed *Jimmy*.

jinjinia bemar See [KORO](#).

jiryan See [DHAT](#).

job analysis *n.* In **personnel psychology*, the process of determining the characteristics of a job and the **attributes* required to perform it for purposes of selection and placement of employees, evaluation of employee productivity for purposes of promotion, and design of training programmes for employees. It usually begins with a *job description*—a detailed description, often agreed between management and workforce, of the work normally done by a person carrying out the job, including all relevant duties and responsibilities. The next step is the construction of a *job specification*—a record of the work that a person in the job ought ideally to do. The final step is the specification of a set of *job requirements*—skills, competencies, and qualifications needed by a person to perform the job satisfactorily. The list of job requirements may be viewed as a distillation of the personal factors that are important in carrying out the work.

Job Descriptive Index *n.* A scale used widely in **personnel psychology* to measure five major factors associated with **job satisfaction*: the nature of the work itself, wages and salaries, attitudes towards supervisors, relations with co-workers, and opportunities for promotion. **JDI** *abbrev.*

job satisfaction *n.* In **personnel psychology* and **industrial/organizational psychology* or **occupational psychology*, the degree to which employees are contented with their jobs. It tends to be low when experience in a job fails to live up to expectations, although the same work might produce higher levels of job satisfaction among employees with more realistic expectations. Low job satisfaction leads to high absenteeism and labour turnover, but the relationship between job satisfaction and productivity is not straightforward. *See also* **JOB DESCRIPTIVE INDEX**.

Jocasta complex *n.* In **psychoanalysis*, sexual desire of a mother for her son. *Compare* **OEDIPUS COMPLEX**. [Named after Jocasta, Queen of Thebes in Greek mythology, who married Oedipus without realizing that he was her son]

John Henry effect *n.* A tendency for members of the **control group* in certain experiments to adopt a competitive attitude towards the **experimental group*, thereby negating their status as controls. In an industrial setting, for
*****ebook converter DEMO Watermarks*****

example, if members of the experimental group are provided with a powerful new tool, members of the control group may treat this as a challenge and, using the old tool, may try to beat the experimental group members in productivity. [Named after John Henry, an enormously strong and hard-working African American railroad worker and folk tale hero of the late 19th century, possibly based on a real person]

joint *n.* A place where two things, especially bones, meet, allowing a hingelike movement. Also, a common street name for a hand-rolled cigarette containing **cannabis*. [Perhaps from *joint* American slang for penis, alluding to its appearance]

joint sense *n.* A form of **proprioception* and **kinaesthesia* mediated by receptors in the joints and stimulated by flexion. *See also* *GOLGI TENDON ORGAN*, *PACINIAN CORPUSCLE*.

Jost's law *n.* **1.** The proposition that if two learnt associations are of equal strength but of different durations, then repetition will increase the strength of the older one more than that of the more recent one. **2.** The proposition that if two learnt associations are of equal strength but of different durations, then the older one will decay more slowly than the more recent one. [Named after the German psychologist Adolph Jost (1874–1920) who propounded both laws in an article in the journal *Zeitschrift für Psychologie* in 1897]

Julesz stereogram *n.* Another name for a **random-dot stereogram*. [Named after the Hungarian-born US radar engineer and psychologist Bela Julesz (1928–2003) who invented it in 1960]

jumping gene *n.* A plasmid, transposon, or other fragment of DNA that can migrate to a gene locus from somewhere else, sometimes causing a mutation and disrupting normal gene function.

Jungian *adj.* Of or relating to the school of **psychoanalysis* founded in 1913 by the Swiss psychologist Carl Gustav Jung (1875–1961). *See* *ANALYTICAL PSYCHOLOGY*.

Jungian analysis *n.* A form of **psychoanalysis* based on **Jungian* theories or **analytical psychology*.

junk *n.* Rubbish. Also, a common street name for **heroin*. [From the obsolete word *jonke* useless old rope]

junk DNA *n.* Long sections of **DNA* that consist of highly repetitive non-coding **introns* and other DNA having no apparent effect on the **phenotype* but having important uses in **genetic fingerprinting*. See also REPETITIVE DNA.

junkie *n.* An informal name for a drug user, especially an injecting heroin user.

just noticeable difference *n.* Another name for a **difference threshold*. **jnd** *abbrev.*

just world hypothesis *n.* The widespread but false belief that the world is essentially fair, so that the good are rewarded and the bad punished. One consequence of this belief is that people who suffer misfortunes are assumed to deserve their fates: a person involved in a traffic accident must have been driving carelessly, a victim of burglary could not have taken adequate precautions, a woman who was raped must have acted provocatively and led her attacker on, and so on, and even the victims often blame themselves. This phenomenon, which is usually interpreted as a consequence of the **illusion of control*, was first identified and named by the Canadian psychologist Melvin J. Lerner (born 1929) in an article in the *Journal of Personality and Social Psychology* in 1965. See also BLAMING THE VICTIM, JUST WORLD SCALE.

Just World Scale *n.* A questionnaire designed to measure the extent to which the respondent believes in a just world. It contains statements such as *Basically, the world is a just place; When parents punish their children, it is almost always for good reasons; and By and large, people get what they deserve*. It was designed by the US psychologist Zick Rubin (born 1944) and the English-born US psychologist (Letitia) Anne Peplau (born 1945) and was

published by them in two articles in the *Journal of Social Issues* in 1973 and 1975. See also [JUST WORLD HYPOTHESIS](#).

kainic acid *n.* A neurotoxic amino acid that is found in the Japanese red alga or seaweed *Digenia simplex* and that acts as a powerful central nervous system **stimulant* by potentiating the neurotransmitter **glutamate*, causing destruction to postsynaptic cells with glutamate receptors. [From Japanese *kainin*-so red alga]

kairomone *n.* A **pheromone* or **allomone* that has a detrimental affect on the animal that emits it, for example, a chemical that attracts not only mates but also predators. [From Greek *kairos* opportunity + *horman* to stir up or urge on]

kakosmia See CACOSMIA.

Kamin blocking *n.* A phenomenon of **selective attention* that occurs in **classical conditioning*, in both human and animal learning of compound cues. The standard demonstration of the effect involves a learning phase in which an experimental group is exposed to a **conditioned stimulus* A (such as a tone), repeatedly paired with an **unconditioned stimulus* X (such as shock), and a **control group* is not exposed to this pairing; then both groups are exposed to a compound stimulus AB composed of A (tone) plus a second conditioned stimulus B (light), repeatedly paired with the same unconditioned stimulus X (shock). The outcome is that when both groups are tested for the strength of the learned association between B (light) and X (shock), which have been paired the same number of times in both groups, a weaker association is found in the experimental group than in the control group. [Named after the US psychologist Leon J. Kamin (born 1927) who first reported it in a book chapter published in 1968]

Kamin effect *n.* The finding that, after [*avoidance conditioning](#), an animal tested repeatedly shows a U-shaped performance curve, performing well at first, then performing much worse after about an hour, then finally performing well again after about two hours. [Named after the US psychologist Leon J. Kamin (born 1927) who discovered it]

kana *n.* A syllabic writing system, used in conjunction with [*kanji](#) in Japanese writing. It consists of two written forms: *hiragana*, used to express particles and grammatical distinctions, is based on Chinese cursive script and is widely used in newspapers and general literature, and *katakana*, an angular script based mainly on Chinese [*logographs](#), is used mainly for loan words and foreign words. See also [KANJI](#). [Japanese: literally borrowed or provisional characters, distinguishing them from kanji, regarded as real characters]

Kanizsa triangle *n.* A visual illusion of a triangle without a corresponding retinal image, induced by three dark [*Pac-Man](#) icons at the corners of an imaginary triangle, oriented to give the impression that they are discs with segments occluded by the vertices of the triangle (see [illustration](#)). The [*illusory contour](#) arises from processing that occurs in Area V2 of the [*visual cortex](#) of information sent there from the primary visual cortex. The other major example of form perception without a retinal image is [*anorthoscopic](#) vision. Compare [EHRENSTEIN'S BRIGHTNESS ILLUSION](#), [RANDOM-DOT STEREOGRAM](#). [Named after the Italian psychologist Gaetano Kanizsa (1913–93), born in Trieste when it was part of the Austro-Hungarian Empire, who discovered it in 1971]

Kanizsa triangle. A figure with illusory contours and no corresponding retinal image.

kanji *n.* The Japanese **logographic* writing system based mainly on Chinese logographs. A character in this system is also called a *kanji*. *See also* *KANA*. [From Chinese *han* Chinese + *zi* a character]

Kanner's syndrome *n.* An alternative name for **autism spectrum disorder*. [Named after the Austrian-born US child psychiatrist Leo Kanner (1894–1981) who first described it in 1943]

kappa effect *n.* A relation between perceived space and time, demonstrated most simply by placing three light sources *A*, *B*, and *C* at different positions, with *A* and *B* closer together than *B* and *C*, and then

flashing the lights successively in the dark, with equal time intervals between the three flashes, creating the **space–time illusion* that the time interval between *A* and *B* is shorter than that between *B* and *C*. Compare *TAU EFFECT*.

kappa statistic *n.* In statistics, an index of the degree of agreement between two raters classifying the same set of items, ranging from zero when agreement is no better than chance to 1 (except in certain special cases) when agreement is perfect. It is calculated by dividing the difference between the observed proportion of cases in which the raters agree and the proportion expected by chance by the maximum difference possible between the observed and expected proportions, assuming fixed row and column totals (marginals). The statistic was introduced by the US psychologist Jacob (Jack) Cohen (1923–98) in an article in the journal *Educational and Psychological Measurement* in 1960. Also called *Cohen’s kappa coefficient*. Symbol: *K*. See also *KENDALL COEFFICIENT OF CONCORDANCE*. [From *kappa* (*K*), the tenth letter of the Greek alphabet]

Kardos effect *n.* The appearance of a white surface as black when it is precisely covered by a small region of shadow and is viewed among a collection of brightly illuminated objects. If the screen that casts the shadow is adjusted so that its edge is visible on the white surface, then the whole of the white surface is immediately perceived as white and partly in shadow, but as soon as the shadow is returned to its original position to cover the whole of the white surface, the surface instantly reverts to its previous black appearance. This phenomenon, like its counterpart the **Gelb effect*, demonstrates that the lightness dimension of colour is not determined straightforwardly by physical light intensity but is subject to **context effects*, as are other dimensions of colour. See also *LIGHTNESS*, *LUMINANCE*. Compare *CHEQUER–SHADOW ILLUSION*, *LAND EFFECT*. [Named after the Hungarian psychologist Lajos (Ludwig) Kardos (1899–1985) who published his experiment in 1934]

karyotype *n.* 1. The number, size, shape, and general appearance of the **chromosomes* in a **somatic* cell of an organism; or a diagram or photograph of the complete set of chromosomes. *vb.* 2. To determine the karyotype of a cell. [From Greek *karyon* a kernel or nut + Greek *typos* a mark]

Kaspar Hauser experiment *n.* An experiment in which an animal is reared in isolation from members of its own species (conspecifics), for example, the experiments carried out in the 1950s by the British ethologist William H(oman) Thorpe (1902–86) in which birds were reared in isolation to determine which aspects of their songs are **innate*. See also [FERAL CHILD](#), [PSAMMETICHUS EXPERIMENT](#). [Named after Kaspar Hauser (?1812–33), a teenage boy who appeared mysteriously in Nuremberg in 1828 and was believed at first to be a feral child, having grown up virtually without human contact]

kat See [KHAT](#).

katakana See [KANA](#).

katasexualism *n.* A generic name for the **paraphilias* **necrophilia* and **zoophilia*. [From Greek *kata* down + English *sexualism*]

kava *n.* The aromatic pepper plant *Piper methysticum*, indigenous to the south Pacific islands of Fiji, Tonga, Vanuatu, and Samoa, or a drink prepared by grinding its roots and stems, mixing them with water, and sieving the resulting liquid. It induces euphoria, sedation, incoordination, and other effects, some of them possibly harmful. It is a traditional ceremonial drug in Fiji and elsewhere, and in the late 1990s a demand for it began to emerge in Western cultures. See also [SUBSTANCE ABUSE](#), [SUBSTANCE-RELATED AND ADDICTIVE DISORDERS](#). [From Polynesian (Tongan) *kava* bitter]

K complex *n.* A brief high-amplitude **EEG* wave occurring at approximately one-minute intervals during Stage II **NREM sleep*.

Keeler polygraph *n.* An instrument for recording changes in respiration rate, pulse rate, and blood pressure, used as a **lie detector* during interrogations. See also [POLYGRAPH](#). [Named after the US criminologist Leonarde Keeler (1903–49) who invented it]

Kelley's cube *n.* An influential contribution to **attribution theory*, formulated by the US psychologist Harold H(arding) Kelley (1921–2003) and

first published in the *Nebraska Symposium on Motivation* in 1967, according to which people integrate three types of information in explaining an observed item of behaviour: *consensus*, the proportion of other people who have performed the same behaviour, providing an estimate of how unusual the behaviour in question is; *consistency*, the extent to which the behaviour is typical of the past behaviour of the person in similar situations; and *distinctiveness*, the extent to which the behaviour is peculiar to the particular situation in which it occurred. For example, a person may observe a friend losing her temper in response to her mother criticizing her in public, and the observer may judge this behaviour to be low on consensus (unusual for people in general), high in consistency (typical of that woman in that type of situation), and low in distinctiveness (something that she does in many other situations as well). Each of the three variables can be judged to be high or low, leading to eight possible combinations, often depicted as a $2 \times 2 \times 2$ cube (see [illustration](#)). According to Kelley, observers tend to attribute behaviour to internal, dispositional causes within the actor when consensus is low, consistency is high, and distinctiveness is low, as in the example; conversely, observers tend to attribute behaviour to external, situational causes when consensus is high, consistency low, and distinctiveness high. Also called *Kelley's ANOVA model*. See also [ATTRIBUTION](#), [CAUSAL SCHEMA](#), [COVARIATION PRINCIPLE](#), [FUNDAMENTAL ATTRIBUTION ERROR](#), [SELF-SERVING BIAS](#).

Kelley's cube. The shaded cell indicates low consensus, high consistency, and low distinctiveness (see text).

Kendall coefficient of concordance *n.* In statistics, an index of the degree of agreement between several variables measured on an **ordinal scale* or transformed to **ranks*, ranging from 0 (no agreement) to 1 (complete agreement). It may be thought of as similar to **Kendall's tau* but suitable for measuring the association between more than two variables at a time. Symbol: *W*. See also *KAPPA STATISTIC*. [Named after the English statistician Maurice George Kendall (1907–83) who introduced it in 1948]

Kendall correlation coefficient *n.* Another name for **Kendall's tau*.

Kendall's tau *n.* In statistics, an index of the degree of association between two variables measured on an **ordinal scale* or transformed to **ranks*. Its computation involves examining every pair of items and counting the number of pairs that are similarly ranked (concordant) and the number differently ranked (discordant) relative to each other on the two variables, and the difference between the number of concordant and discordant pairs is then divided by the total number of pairs. See also *KENDALL COEFFICIENT OF CONCORDANCE*. [Named after the English statistician Maurice George Kendall (1907–83) who introduced it in 1938]

Kent–Rosanoff Free Association Test *n.* A popular **word-association test* consisting of 100 nouns, adjectives, and verbs selected by the US psychologist Grace H. Kent (1875–1973) and the Russian-born US psychologist Aaron J. Rosanoff (1878–1943) and published in the *American Journal of Insanity* in 1910. The words are all emotionally neutral, unlike some other word-association tests, and norms obtained by counting and classifying the associations given by 1,000 normal respondents are supplied.

kernel *n.* A basic form of sentence structure (simple, active, declarative) used as a starting point in some forms of **generative grammar*. [Old English *cyrnel* a little seed, from *corn* seed]

ketamine *n.* A drug closely related to **phencyclidine*, developed originally as an **anaesthetic* (1) and adopted as a street drug in the 1960s, often called *Special K*. See also *PHENCYCLIDINE-RELATED DISORDERS*. [From

ket(one) + amine]

ketone *n.* A chemical compound consisting of a carbonyl group joined to two like or unlike alkyl radicals and containing volatile substances that are **psychotropic* when inhaled. *See also* *INHALANT-RELATED DISORDERS*, *SOLVENT ABUSE*. [German *Keton*, from *Aketon* acetone]

keyword mnemonic *n.* Another name for the **peg-word mnemonic*.

khat *n.* An evergreen shrub *Catha edulis* native to Africa and Arabia that has **stimulant* effects when its leaves are chewed or used to make tea. [From Arabic *qat*]

khyâl cap *n.* A **culture-bound syndrome* included in **DSM-5*, found among Cambodians in Cambodia and the US, involving **panic attacks*, with dizziness, palpitations, shortness of breath, and cold hands and feet, accompanied by catastrophic thoughts and images that a wind-like substance (*khyâl*) will rise in the body causing serious bodily effects. [From Cambodian *khyâl cap* wind attacks]

Kiddie Mach *n.* A version of the **Mach scale* designed for children.

killer T cell *See* *T LYMPHOCYTE*.

kilocalorie *n.* Another name for a **Calorie*.

kinaesthesia *n.* The sensation that is stimulated by movements of the body or parts of the body and is mediated by **proprioceptors* in the **vestibular system* and in the muscles, tendons, and joints. The term is sometimes used as a synonym for **proprioception*, thus including sensations of position and orientation rather than just movement, but this ignores the etymology of the word and sacrifices a useful distinction, and the over-extended sense is therefore avoided in careful usage. US *kinesthesia*. Also called *kinaesthesia* or *kinesthesia*. *See* *JOINT SENSE*, *MUSCLE SENSE*, *STATIC SENSE*, *TENDON SENSE*. **kinaesthetic** or **kinesthetic** *adj.* [From Greek *kinein* to move + *aisthesis* sensation, from *aisthanesthai* to feel]

*****ebook converter DEMO Watermarks*****

kinaesthetic method *n.* **1.** A method of correcting faulty speech by teaching the learner to sense the differences between the sensations of movement of the vocal apparatus in correct and faulty speech. **2.** A technique for treating **reading disorder* by encouraging the reader to trace the outlines of letters and words. US *kinesthetic method*.

kindling *n.* A progressively increasing response of a group of neurons when exposed to a repetitive electrical stimulation of unchanging strength, sometimes leading to a **psychomotor* seizure or **convulsion*, a phenomenon mediated by neurons in the **hippocampus* and **amygdala*. [From Old Norse *kyndill* to set fire to or inflame, from Latin *candela* a candle]

kineme *n.* The most basic component of **kinesic* behaviour, distinguishing one kinesic signal or gesture from another. Compare *PHONEME*. [A blend of *kin(esic)* and *(phon)eme*]

kinemorph *n.* The smallest unit of **kinesic* behaviour having a distinctive function. Compare *MORPHEME*. [A blend of *kine(sic)* and *morph(eme)*]

kinephantom *n.* A misperception of visual movement such as occurs when viewing the **trapezoidal window* or **Pulfrich effect*. [From Greek *kinesis* movement, from *kineein* to move + *phantasma* an illusion, from *phantazein* to make visible, from *phainein* to show, from *phaein* to shine]

kinesics *n.* The study of the role of **gestures (1)* and other body movements in **non-verbal communication*. Gestures are often classified into **emblems* (gestures that substitute for words, such as waving the hand for ‘goodbye’ or putting a forefinger to the lips for ‘silence’); **illustrators* (gestures that accompany speech and depict what is being said, such as moving the hands apart to illustrate a description of a big fish); **adaptors* (gestures, usually involving self-touching, that help one to cope with emotional reactions, such as covering the eyes with shock or putting a hand over the mouth with surprise); and **regulators* (gestures that accompany speech and help to coordinate turn-taking, including raising a hand in the air to indicate that one has not finished speaking). In addition to these, **affect displays* are **facial expressions* that convey emotional states. Also called

body language. See also [AMIMIA](#), [APRAXIA](#), [ASEMIA](#), [COPROPAXIA](#), [ECHOPRAXIA](#), [KINEME](#), [KINEMORPH](#), [PARAMIMIA](#), [RETT'S DISORDER](#), [SEMIOTICS](#). **kinesic** *adj.* Of or relating to kinesics. [From Greek *kinesis* movement, from *kineein* to move]

kinetic depth effect *n.* A phenomenon, discovered by the German-born US psychologist Hans Wallach (1904–98) and co-workers in 1953, in which a moving two-dimensional shadow cast by a three-dimensional object such as a rod appears three-dimensional when the object is held obliquely and rotated about its centre, causing complex transformations that make the shadow appear to move in front and behind the surface on which it is cast. The three-dimensional effect disappears if the rod stops moving, or if it rotates in a plane perpendicular to the surface on which the shadow is cast, causing the shadow merely to lengthen and shorten as the rod rotates. It is closely related to the [*windmill illusion](#). *See also* [STRUCTURE FROM MOTION](#). **KDE** *abbrev.*

kingdom *n.* 1. A state or nation ruled by a king or queen. 2. Any of the highest [*taxonomic](#) groups into which nature is divided, traditionally the animal, vegetable, and mineral kingdoms, but now comprising animals, plants, fungi (which resemble plants but lack chlorophyll and do not grow by photosynthesis), protists (single-celled eukaryotic organisms such as protozoans), monera (single-celled prokaryotes such as bacteria), and viruses (subcellular organisms). Animal and plant kingdoms are further subdivided into phyla.

kinin *n.* Any of a group of [*polypeptides](#) functioning as local hormones, manufactured in the blood or tissues as and when needed, causing [*smooth muscles](#) to contract and blood vessels to dilate. Two important kinins found in human and animal tissue are [*cholecystokinin](#) and [*bradykinin](#). [From Greek *kineein* to move + *-in(e)* indicating an organic compound]

kinocilium *n.* A long hair with a bulbous tip that projects from every [*hair cell](#). In the [*vestibular system](#), in the [*macula](#) within the [*sacculle](#) in the [*membranous labyrinth](#) of the [*inner ear](#), it is embedded in a gelatinous matrix containing crystals of calcium carbonate that exert gravitation drag on it and on the shorter [*stereocilia](#). **kinocilia** *pl.* [From Greek *kineein* to move + Latin *cilium* an eyelash]

*****ebook converter DEMO Watermarks*****

kin selection *n.* A form of *[natural selection](#) involving *[altruism](#) shown by animals towards their siblings or other close relatives, thereby increasing their own *[inclusive fitness](#) indirectly by helping their relatives to propagate genes that they share. The concept was introduced by the British biologist William D(onald) Hamilton (1936–2000) in two articles in the *Journal of Theoretical Biology* in 1964. Compare [GROUP SELECTION](#). [From Old English *cynn* people belonging to the same family]

kinship, coefficient of See [COEFFICIENT OF CONSANGUINITY](#).

kinship study *n.* In behaviour genetics, a comparison of the correlations between relatives of different known degrees of genetic relatedness on a measurable *[trait](#) in order to estimate the *[heritability](#) of that trait, the assumption being that the higher the heritability of the trait the more closely will the correlations correspond to degrees of relatedness. For example, because children share on average half their genes with each parent and with each sibling, the highest correlation between such relatives that could be expected for a trait with very high heritability is .5, and a substantially lower correlation would suggest low heritability, but see [EMERGENESIS](#). Also called a *consanguinity study* or a *family study*. Compare [ADOPTION STUDY](#), [TWIN STUDY](#).

Kleine–Levin syndrome *n.* A rare disorder, restricted largely to adolescent boys, characterized by recurrent episodes of *[hypersomnia](#), *[asthenia](#), *[bulimia](#) (1), abnormally increased sexual drive, and sometimes *[psychotic](#) (1) symptoms such as *[hallucinations](#). Episodes last for days, weeks, or occasionally months, and they become less frequent and usually disappear after the age of 25. Also called *sleeping beauty syndrome*. **KLS** *abbrev.* [Named after the German psychiatrist Willi Kleine (1879–1961), who first described it in an article in the *Monatsschrift für Psychiatrie und Neurologie* in 1925 and the Russian-born US neurologist Max Levin (1901–74), who discussed it in an article in the *Archives of Neurology and Psychiatry* in 1929 and in the journal *Brain* in 1936, where he identified it as ‘a new syndrome’]

Kleinian *adj.* Of or relating to the school of *[psychoanalysis](#) founded by the British-based Austrian psychoanalyst Melanie Klein (1882–1960). See [COMBINED PARENT-FIGURE](#), [DEPRESSIVE POSITION](#), [GOOD BREAST](#), [GOOD OBJECT](#),
*****ebook converter DEMO Watermarks*****

IDEALIZATION, IMAGO (1), INTERNALIZATION, OBJECT RELATIONS, ORAL SADISTIC PHASE, PARANOID–SCHIZOID POSITION, PART OBJECT, PROJECTIVE IDENTIFICATION, REPARATION, SPLITTING OF THE OBJECT, WHOLE OBJECT. *See also* EARLY ORAL PHASE, OEDIPUS COMPLEX, ORAL SADISTIC PHASE, PENIS ENVY, PRIMARY NARCISSISM, SUPEREGO, THANATOS, URETHRAL EROTISM.

kleptolagnia *n.* A **paraphilia* characterized by recurrent sexually arousing fantasies, sexual urges, or behaviour involving stealing. *See also* KLEPTOMANIA. [From Greek *kleptein* to steal + *lagneia* lust]

kleptomania *n.* A **disruptive, impulse-control, and conduct disorder* in **DSM-5* characterized by repeated stealing of objects not needed for personal use or for their intrinsic value, with emotional tension before the commission of a theft, followed by pleasure, gratification, or relief after its completion, the behaviour being generally experienced as **ego-dystonic*. *See also* KLEPTOLAGNIA. [From Greek *kleptein* to steal + *mania* madness]

K-line *n.* In an associative **network model*, a connection that reactivates a memory. The term was introduced by the US cognitive scientist Marvin (Lee) Minsky (born 1927). [Abbreviation of *knowledge-line*]

Klinefelter's syndrome *n.* A disorder of males resulting from the presence of two or more **X chromosomes*, causing small testicles, female physical characteristics, long legs, and **intellectual disability*. Also called *XXY syndrome*. Compare TURNER'S SYNDROME, XXX SYNDROME, XYY SYNDROME. [Named after the US physician Harry Fitch Klinefelter (1912–90) who first described it in 1942]

klinokinesis *n.* Movement in which an organism travels in a straight line except when it encounters an unfavourable environment or an aversive stimulus, when it turns at random to remain in the favourable environment, the frequency of turning depending on the environmental variability and the direction or angular velocity of turning, which depends in turn on the intensity of the environmental stimulus. [From Greek *kleinein* to incline + *kinesis* movement]

Klüver–Bucy syndrome *n.* A syndrome resulting from bilateral
*****ebook converter DEMO Watermarks*****

damage to the ***temporal lobes** of the brain, characterized by increased and indiscriminate sexual activity, excessive oral behaviour, visual agnosia (see **AGNOSIA**), and ***hypermetamorphosis**. See also **HERPES SIMPLEX ENCEPHALITIS**. [Named after the US-based German psychologist Heinrich Klüver (1898–1979) and the US neurosurgeon Paul Clancy Bucy (1904–92) who first described the condition in monkeys following surgical removal of the temporal lobes]

klysmaphilia *n.* A ***paraphilia** characterized by recurrent sexually arousing fantasies, sexual urges, or behaviour involving enemas. [From Greek *klyσμα* an enema + *philos* loving, from *phileein* to love + *-ia* indicating a condition or quality]

knee-jerk reflex *n.* A non-technical name for the ***patellar reflex**.

Knobe effect *n.* An asymmetry in people's moral intuitions about the side-effects of an action intended to achieve a different goal, depending on whether the side-effects are good or bad. It was discovered by the US experimental philosopher Joshua (Michael) Knobe (born 1974) during his PhD research and first reported in the journal *Analysis* in 2003, using the following imaginary scenario. The vice-president of a company went to the chairman of the board and said, 'We are thinking of starting a new program. It will help us increase profits, but it will also harm the environment.' The chairman of the board answered, 'I don't care at all about harming the environment. I just want to make as much profit as I can. Let's start the new program.' They started the new programme. Sure enough, the environment was harmed. When Knobe presented this scenario to members of the public and asked them whether the CEO had intentionally harmed the environment, 82 per cent replied 'Yes'. But when the scenario was changed by substituting the phrase 'help the environment' for 'harm the environment' and 'the environment was helped' for 'the environment was harmed', and people were asked whether the CEO had intentionally helped the environment, only 23 per cent replied 'Yes'. The effect has been replicated many times, even with children, but its interpretation is controversial. Compare **TROLLEY PROBLEM**.

knobs-and-dials psychology *n.* An aspect of ***ergonomics** or human factors psychology concerned with the optimal design of human-machine

*****ebook converter DEMO Watermarks*****

interfaces, including the design and placement of instrument panels and controls, taking into account **population stereotypes* and findings from research into perception and other relevant areas of psychology. *See also* POPULATION STEREOTYPE.

knowing how *n.* Another name for **procedural knowledge*.

knowing that *n.* Another name for **declarative knowledge*.

knowledge *n.* Anything that is known. The three major classes of knowledge are **declarative knowledge* (knowing that), **procedural knowledge* (knowing how), and **acquaintanceship knowledge* (knowing people, places, and things). *See also* INFORMATION (1). *Compare* BELIEF, OPINION. [From Latin *noscere* to come to know]

knowledge representation *n.* The encoding and storage of **knowledge* in computational models of cognition. It is a major branch of **artificial intelligence* and is also studied in cognitive psychology, logic, computer science, and linguistics. The representation of informal and intuitive human knowledge is one of its major unsolved problems. *See also* ACT*, ANALOGUE (2), BINDING PROBLEM, CONCEPTUAL DEPENDENCY THEORY, CONNECTIONISM (1), FRAME (2), FRAME PROBLEM, FUZZY LOGIC, INTUITIVE PHYSICS, K-LINE, NEURAL NETWORK, NON-MONOTONIC REASONING, SYMBOLIC REPRESENTATION. **KR** *abbrev.*

Koffka–Korte laws *n.* Another name for **Korte's laws*. [Named after the German **Gestalt psychologist* Kurt Koffka (1886–1941) and his doctoral student Adolf Korte, who published them in the journal *Zeitschrift für Psychologie* in 1915 shortly before Korte died in World War I]

Kohlberg stage *n.* Any of the three stages of moral development, each divided into two levels, proposed by the US psychologist Lawrence Kohlberg (1927–87) on the basis of research in which he confronted children with stories that posed moral dilemmas. Kohlberg developed his theory in a series of investigations, beginning with his doctoral dissertation in 1958 and culminating in his book *Stages in the Development of Moral Thought and Action* (1969). *See* CONVENTIONAL MORALITY, POSTCONVENTIONAL MORALITY, *****ebook converter DEMO Watermarks*****

PRECONVENTIONAL MORALITY.

Kohnstamm effect *n.* A dramatic phenomenon of involuntary movement. Stand with one shoulder about a foot from a wall and, with your arm rigidly extended downwards, press the back of your hand hard against the wall for about two minutes. If you then stand away from the wall with your arm hanging loosely by your side, it will rise up into the air, spontaneously and involuntarily. A double-arm version of the effect can be produced by standing in an open doorway and pressing the backs of both hands against the door frame. The phenomenon has been exploited in preparing people for **hypnosis*, by deluding them into believing that they are responding involuntarily to a suggestion from the hypnotist for their arms to rise. The phenomenon has been interpreted as a **postural aftereffect*. Also called the *Kohnstamm phenomenon* or *Kohnstamm manoeuvre*. [Named after the German physician Oskar Kohnstamm (1871–1917) who drew attention to it]

Kohs Block Design Test *n.* A **psychometric* test in which the respondent has to arrange groups of 4, 9, or 16 multi-coloured blocks to copy patterns presented on test cards, designed originally to differentiate brain-damaged from psychiatric patients, later adapted as an **intelligence* subtest and incorporated into the **Wechsler scales*, the **Goldstein–Scheerer tests*, and other **IQ tests*. [Named after the US psychologist Samuel Calmin Kohs (1890–1984) who introduced it]

Kohutian *adj.* Of or relating to **self-psychology* and the theories of the Austrian-born US psychoanalyst Heinz Kohut (1913–81) and his followers. See *GRANDIOSE SELF*, *NARCISSISM*, *NARCISSISTIC PERSONALITY DISORDER*, *SELF-OBJECT*.

Kolmogorov's axioms *n.* Four propositions about **probabilities* from which all major theorems can be derived: (1) the probability of any event is equal to or greater than zero; (2) the probability of a certain event is 1; (3) if *E* and *F* are two mutually exclusive events (events that cannot both occur), then the probability of the disjunction (the probability of either *E* or *F* occurring) is equal to the sum of their individual probabilities: $P(E \text{ or } F) = P(E) + P(F)$; and (4) the probability of a conjunction of two events *E* and *F*

*****ebook converter DEMO Watermarks*****

(the probability that both *E* and *F* occur) is equal to the probability of *E* assuming that *F* occurs multiplied by the probability of *F*: $P(E \text{ and } F) = P(E|F)P(F)$. [Named after the Russian mathematician Andrei Nikolaevich Kolmogorov (1903–87) who formulated them in 1933]

Kolmogorov–Smirnov test *n.* In statistics, a **goodness of fit (1)* test to determine whether a single sample fits some theoretical distribution or whether two independent samples have been drawn from the same population (or populations with the same distribution). *See also* [CHI-SQUARE TEST](#), [INDEPENDENT SAMPLES T TEST](#). [Named after the Russian mathematicians Andrei Nikolaevich Kolmogorov (1903–87), who proposed the test in 1933, and Nikolai Vasilevich Smirnov (1900–66) who developed it further in 1939]

König bars *n.* A diagram depicting a set of bars subtending **visual angles* of 3 minutes (sixtieths of a degree), separated by distances of 1 minute, used for measuring **visual acuity*. *See also* [ACUITY GRATING](#). [Named after the German physiologist and psychologist Arthur König (1856–1901) who devised them]

koro *n.* A **culture-bound syndrome* included in CCMD-2 (the *Chinese Classification of Mental Disorders*, 2nd ed.), restricted mainly to male members of ethnic Chinese communities in southern and eastern Asia and elsewhere, sometimes occurring in localized **epidemics (1)*, characterized by sudden and intense anxiety that the penis is shrinking and is liable to retract into the abdomen, resulting in death. In an effort to prevent this from happening, afflicted men often hold on to their penises during the day and wear commercially available bamboo clamps while sleeping. A less common female variant of the syndrome, focused on fear of the nipples or vulva retracting, is also recognized. Also called *shook yong*, *shuk yang*, *suk yeong*, or *suo yang* in Chinese-speaking areas, *rok-joo* in Thailand, and *jinjinia bemar* or *jinjin* in north-eastern India. [From Malay *koro* to shrink]

Korsakoff's psychosis *n.* A **mental disorder* characterized by **amnesia*, especially an impairment in ability to retain newly acquired information, typically accompanied by confabulation—a tendency to invent explanations to cover areas of memory loss—but with other **cognitive* functions usually well preserved, in contrast to **dementia*. It is caused by a

*****ebook converter DEMO Watermarks*****

deficiency of thiamine (vitamin B₁) usually resulting from **alcohol dependence*. Also called *alcohol amnestic disorder* or *Korsakoff's syndrome*. See also *DORSOMEDIAL THALAMUS*. [Named after the Russian neuropsychiatrist Sergei Sergeievich Korsakoff (1854–1900) who first described it in 1887]

Korte's laws *n.* Laws governing the illusion of **apparent movement* when two stimuli are exposed in alternation. If *s* is the spatial distance between the stimuli, *t* is their exposure time (assumed to be the same for both stimuli), *i* is their intensity (assumed equal), and *p* the interstimulus interval or pause between exposures, then for critical values of *s*, *i*, and *t* yielding **optimal movement*, the four basic laws are as follows. (a) *s* increases as *i* increases, *p* and *t* remaining constant; (b) *i* decreases as *p* increases, *s* and *t* remaining constant; (c) *s* increases as *p* increases, *i* and *t* remaining constant; (d) *t* increases as *p* increases, *i* and *s* remaining constant. The laws apply approximately to **partial movement* and **phi movement* also. Also called *Koffka–Korte laws* on account of the supervision of Korte's (doctoral) work by the German **Gestalt psychologist* Kurt Koffka (1886–1941). See also *ALPHA MOVEMENT*, *BETA MOVEMENT*, *GAMMA MOVEMENT*, *DELTA MOVEMENT*, *PHI MOVEMENT*. [Named after the German Gestalt psychologist Adolf Korte who formulated the earliest version of them in the journal *Zeitschrift für Psychologie* in 1915, shortly before he died in World War I]

Krebs cycle *n.* A complex sequence of biochemical reactions in the **mitochondria* of living cells whereby acetyl coenzyme A, derived by **glycolysis* from **glucose*, which in turn is derived from the **metabolism* of amino acids, fatty acids, and carbohydrates in foodstuffs, is oxidized into carbon dioxide and water, with the release of minute quantities of stored energy in the form of **ATP*. Any interference with the Krebs cycle, as by swallowing a poison such as potassium cyanide, is fatal within minutes. See also *OXIDATIVE PHOSPHORYLATION*. Also called the *citric acid cycle* or the *tricarboxylic acid cycle*. [Named after the German-born British biochemist Hans Adolf Krebs (1900–81) who discovered it in 1934 and shared a Nobel prize for so doing in 1953]

Kretschmer constitutional type *n.* Any of the four basic body types, each associated with its own distinctive pattern of personality characteristics, in the theory propounded by the German psychiatrist Ernst
*****ebook converter DEMO Watermarks*****

Kretschmer (1888–1964) in his book *Körperbau und Charakter* (1948, Body Build and Character). See [ASTHENIC BODY TYPE](#), [ATHLETIC BODY TYPE](#), [DYSPLASTIC BODY TYPE](#), [PYKNIC BODY TYPE](#). Compare [SHELDON'S CONSTITUTIONAL PSYCHOLOGY](#).

Kruskal–Wallis 1-way analysis of variance *n.* In statistics, a test used with scores measured on an [*ordinal scale](#), or with data converted to [*ranks](#), to determine whether several independent samples are from populations with the same [*median](#). It is a non-parametric equivalent of one-way [*analysis of variance](#) (ANOVA). Also called *Kruskal–Wallis 1-way ANOVA*. [Named after the US statisticians William Henry Kruskal (1919–2005) and Wilson Allen Wallis (1912–98) who developed it in 1952]

K-selection *n.* A form of [*natural selection](#) that is typical of organisms in relatively stable, constant, and predictable ecological conditions in which rapid population growth is unimportant, and that is characterized by slow development, long life, large size, late reproduction, intensive parental care, and high learning capacity. See also [R–K CONTINUUM](#). Compare [R-SELECTION](#). **K-selected** *adj.* Selected for superiority in such environments.

Kuder Preference Record *n.* An [*occupational interest inventory](#) designed to measure the respondent's relative levels of interest in ten occupational areas: clerical, computational, art, music, social service, outdoor, science, persuasive, literary, mechanical. Each item of the scale consists of three activities from which the respondent selects the least liked and the most liked. **KPR** or **KPR-V** *abbrev.* [Named after the US psychologist George Frederic (Fritz) Kuder (1903–2000) who published it as a commercial test in 1960]

Kuder–Richardson coefficient *n.* In psychometrics, [*Cronbach's alpha](#) coefficient of reliability in the special case of a scale with pass/fail, yes/no, or other dichotomous test items. There are two slightly different versions based on different statistical assumptions: the Kuder–Richardson 20 formula and the Kuder–Richardson 21 formula, named after equation numbers in Kuder and Richardson's 1937 article. **K–R 20** or **K–R 21** *abbrev.* [Named after the US psychologists George Frederic (Fritz) Kuder (1903–2000) and Marion Webster Richardson (1891–1965) who introduced it in an

*****ebook converter DEMO Watermarks*****

article in the journal *Psychometrika* in 1937]

kufungisisa *n.* A [*culture-bound syndrome](#) found among the Shona people of Zimbabwe, included in [*DSM-5](#), supposedly caused by mulling over worries and upsetting memories and believed to cause [*anxiety](#), [*depression](#), and various bodily symptoms. [From Shona *kufungisisa* thinking too much]

Kuhnian *adj.* Of or relating to the ideas and writings of the US historian and philosopher of science Thomas S(amuel) Kuhn (1922–96), especially his distinction between [*normal science](#) and [*scientific revolution](#) and his doctrine of the [*paradigm](#) shift presented in his influential book *The Structure of Scientific Revolutions* (1962).

kula ring *n.* A ceremonial gift exchange among tribes in the western Pacific, practised alongside normal trading, functioning to establish and maintain friendly relations between islands. [From Melanesian *kula*]

Kuleshov experiment *See* [DIALECTICAL MONTAGE](#).

Kundt's rules *n.* The propositions that (a) a distance or space divided into parts looks greater than the same distance or space undivided; and (b) an attempt to bisect a line with one eye closed usually results in a division too close to the nasal side of the open eye. *See also* [FILLED-SPACE ILLUSION](#). [Named after the German physicist August Adolph Eduard Eberhardt Kundt (1838–94) who formulated them in the early 1860s]

kurtosis *n.* In statistics, a measure of the peakedness of a distribution indicating the degree to which a set of scores is concentrated around its mean. A distribution that is more concentrated about its mean than the [*normal distribution](#) is *leptokurtic*, one that is concentrated like the normal distribution is *mesokurtic*, and a distribution that is flatter than the normal distribution is *platykurtic*. *Compare* [SKEWNESS](#). [From Greek *kurtos* arched + *-osis* indicating a process or state]

kuru *n.* A human [*prion disease](#) affecting the nervous system, restricted to

the Fore highlanders of Papua New Guinea who used to practise a form of ritual cannibalism involving the eating of the brains of deceased relatives as an act of homage. It is characterized by *tremor, *ataxia, *dementia, and death usually within months of the onset of symptoms. [Native Fore word: literally, the trembles]

kymograph *n.* An early device consisting of a rotating drum covered with paper on which a tracking stylus records continuous measurements of blood pressure, heart rate, respiration, variations in the muscular action of the organs of speech, or other physiological data. [From Greek *kyma* a wave + *graphein* to write]

la belle indifférence *n.* An abnormal lack of concern about one's afflictions or disabilities, characteristic of some ***conversion disorders**. [French: literally beautiful indifference]

labelling theory *n.* An influential theory of ***deviance** (1), according to which a label attached to a person can function as a ***self-fulfilling prophecy**, profoundly influencing that person's behaviour. Classical labelling theory was first proposed by the US sociologist Edwin (McCarty) Lemert (1912–96) in a book entitled *Social Pathology: A Systematic Approach to the Theory of Psychopathic Behavior* (1951) and developed further by the US sociologist Thomas J(oel) Scheff (born 1929) in his book *Being Mentally Ill* (1966). The theory distinguishes between primary deviance, such as the ***hallucinations** and ***thought disorder** that are usually taken as symptoms of ***schizophrenia**, and those same experiences in a person who is aware of having been labelled as mentally ill. According to the theory, primary deviance is usually relatively brief and insignificant, but a person who becomes aware of the label begins to play the role of a mentally ill person, at first inadvertently and later often involuntarily, and this can have a profound influence. This theory arose from a rejection of the classic interpretation of deviance as behaviour violating an objective social norm. In labelling theory, deviance is not an attribute of a person or of behaviour but of the categorization or naming of behaviour by psychiatrists, courts, police, family members, and others. This is clear in the case of criminal deviance, because what is defined as criminal, and therefore who is labelled as a criminal, varies from one society to another and, even within a society, from one time to another. US *labeling theory*. See also **PYGMALION EFFECT**. [From Old French *label* a tag, cognate with German *Lappen* a flap]

labia majora *n.* The two outer folds surrounding the vaginal orifice of the female **vulva*. Compare LABIA MINORA. [From Latin *labia* lips + *majora* larger]

labia minora *n.* The two inner folds surrounding the vaginal orifice of the female **vulva*. Compare LABIA MAJORA. [From Latin *labia* lips + *minora* smaller or lesser]

labile affect (mood) See AFFECT.

labiodental *adj.* Of, relating to, or denoting a speech sound articulated with the lower lip touching the upper teeth, as in the initial **phonemes* in *fine* and *vine*. See also PLACE OF ARTICULATION. [From Latin *labium* a lip + *dens, dentis* a tooth + *-alis* of or relating to]

labiovelar *adj.* Of, relating to, or denoting a speech sound articulated with the back of the tongue against the soft palate and the lips rounded, as in the initial **phoneme* in the words *win*. See also PLACE OF ARTICULATION. [From Latin *labium* a lip + *velum* a veil]

labyrinth *n.* Any mazelike structure or network of interconnecting chambers, especially the system of cavities of the **inner ear*. See BONY LABYRINTH, DYNAMIC LABYRINTH, MEMBRANOUS LABYRINTH, STATIC LABYRINTH. See also VESTIBULAR SYSTEM. [From Greek *labyrinthos* a maze, especially in Greek mythology the huge maze in Crete that Daedalus built for King Minos to contain the Minotaur]

labyrinthine nystagmus *n.* A form of **nystagmus* resulting from damage to the **labyrinth*.

Lacanian *adj.* Of or relating to the approach to **psychoanalysis* adopted by the French psychoanalyst Jacques Lacan (1901–81). See FORECLOSURE, MIRROR PHASE. See also CONDENSATION, DEFERRED ACTION, DISPLACEMENT, PHALLUS.

lacrimator *n.* Another name for a **tear gas*. [From Latin *lacrima* a tear]

lacunar amnesia *n.* Another name for ***episodic amnesia**. [From Latin *lacuna* a hole or cavity]

Ladd-Franklin theory *n.* A speculative theory of colour vision according to which the first photoreceptors to evolve yielded only ***achromatic (1)** vision, receptors for blue and yellow evolved next, and receptors for red and green evolved most recently, the central area of the retina, where all colours are perceived, being the most evolutionarily advanced. [Named after the US psychologist and logician Christine Ladd-Franklin (1847–1930) who first published it in her book *Colour and Colour Theories* in 1929]

Lake Wobegon effect *n.* A tendency for most people to believe that they are above average in intelligence, sense of humour, diving ability, and similar traits. Although the effect arises from a ***self-serving bias**, the widespread belief that it is mathematically impossible for a majority to be above average is itself a fallacy. If four people score 8/10 on a test and one scores 3/10, then the average or ***mean** score in that five-person group is 7/10, and a majority are above average. The term was introduced by the US physician John Jacob Cannell (born 1948) in privately published reports in 1987 and 1988, commenting on the fact that all 50 US states reported elementary school results above the national average. Also called the *Lake Wobegon fallacy*. Also (mis)spelt *Lake Woebegon* and *Lake Woebegone*. Compare **UNREALISTIC OPTIMISM**. [Alluding to Lake Wobegon, ‘a place where all the women are strong, all the men are good-looking, and all the children are above average’ in a radio show entitled *A Prairie Home Companion*, created and hosted by the US writer Garrison Keillor (born 1942) and described in his novel *Lake Wobegon Days* (1985)]

lallation *n.* 1. A speech defect in which the ***phoneme** /l/ is substituted for /r/, as in *velly solly*. 2. Another name for ***pseudolalia**. [From Latin *lallare* to sing a lullaby + *-ation* indicating a process or condition]

laloplegia *n.* A form of ***aphasia** resulting from ***paralysis** of the muscles of the vocal tract and not those of the tongue. [From Greek *lalia* speech + *plege* stroke, from *plessein* to strike + *-ia* indicating a condition or quality]

lalorrhoea *n.* Another name for ***logorrhoea**. US *lalorrhea*. [From Greek *lalia* speech + *rhoia* a flow]

Lamarckism *n.* The theory of evolution, largely obsolete in biology but still relevant to social or cultural evolution (see **MEME**), according to which acquired characteristics resulting from adaptations to new environments may be inherited. See also **LYSENKOISM**, **NEO-LAMARCKISM**. Compare **DARWINIAN EVOLUTION**, **NEO-DARWINISM**. **Lamarckian** *adj.* [Named after the French naturalist Jean Baptiste Pierre Antoine de Monet Lamarck (1744–1829) who propounded it in his book *Philosophie Zoologique* (1809)]

lambda statistic *n.* Another name for the ***Goodman–Kruskal lambda**.

lambert *n.* A unit of light intensity or illumination, equal to one ***lumen** per square centimetre. **millilambert** *n.* 1/1,000 of a lambert. [Named after the German mathematician and physicist Johann H. Lambert (1728–77)]

Land effect *n.* A vivid impression of a full range of colours created from monochromatic light. The effect is produced by taking two black-and-white photographs of a coloured display such as a bowl of fruit, the first with a green filter over the camera lens and the second from the identical position with a red filter, and then superimposing images of the two resulting black-and-white transparencies on a screen with slide projectors, the first without any filter over its lens and the second with a red filter. Although in terms of absolute wavelength all the light falling on the screen and being reflected from it is red, pink, or white, apples look green, plums blue, bananas yellow, and so on, disproving the common misconception that the colour of an object in the visual field is fully explained by the wavelength of the light reflected from it. In reality, the visual system assigns colours according to the relative balance of short, medium, and long wavelengths across the whole visual field, so that light of a particular wavelength has no inherent colour in itself but may be perceived as any colour depending on the range of wavelengths in the surrounding visual field, and this is why the effect disappears if the screen is viewed in ***void mode**. See also **COLOUR CONSTANCY**, **CONE**, **RETINEX THEORY**. Compare **GELB EFFECT**, **KARDOS EFFECT**. [Named after the US physicist Edwin H(erbert) Land (1909–91), inventor of the Polaroid Land camera and president of the Polaroid Corporation, who discovered the effect and
*****ebook converter DEMO Watermarks*****]

published it in the *Proceedings of the National Academy of Sciences* in 1959 and in *Scientific American* magazine later in the same year]

Landmark Forum *n.* The official name, since 1984, for *est.

Landolt circle *n.* A circle with a tiny part of its circumference missing, easily perceived as a circle in spite of the fact that it is not a closed curve, illustrating the *closure grouping law and the phenomenon of *Prägnanz. It is used mainly to test *visual acuity, the respondent being shown a series of small differently oriented Landolt circles and asked to say where the gaps appear, choosing from alternatives such as twelve o'clock, three o'clock, six o'clock, and nine o'clock. Also called a *Landolt C*. [Named after the Swiss-born German physical chemist Hans Heinrich Landolt (1831–1910) who devised it]

langage *n.* A term introduced in 1915 by the Swiss linguist Ferdinand de Saussure (1857–1913) to denote the faculty of speech present in all human beings and acquired through heredity, which is divided into two major aspects, namely **langue* and **parole*, often said to correspond roughly to the *competence (2) and *performance (2) of the US linguist and philosopher (Avram) Noam Chomsky (born 1928), but there are important differences between *langue* and competence. [Old French *langage* language, from Latin *lingua* the tongue]

language *n.* 1. A conventional system of communicative sounds and sometimes (though not necessarily) written symbols capable of fulfilling the following hierarchy of functions suggested by the German-born Austrian psychologist Karl Bühler (1879–1963) and the Austrian-born British philosopher Karl Raimund Popper (1902–94): expressing a communicator's physical, emotional, or cognitive state; issuing signals that can elicit responses from other individuals; describing a concept, idea, or external state of affairs; and commenting on a previous communication. The concept of language is often interpreted loosely to embrace codes devised for specific purposes, as in expressions such as *programming languages*, and forms of communication that fulfil some but not all of the four listed functions, including *body language* and the *language of the bees* (see [WAGGLE DANCE](#)), neither of which can fulfil the fourth and highest function. 2. The particular

*****ebook converter DEMO Watermarks*****

system of verbal communication, such as the English language, that is used by a specific nation or people. [From Old French *langage*, from Latin *lingua* the tongue]

language acquisition device *n.* A hypothetical mechanism, based on **generative grammar*, introduced in 1964 by the US linguist and philosopher (Avram) Noam Chomsky (born 1928) to explain how children acquire internalized knowledge of grammar with remarkable speed on the basis of fragmentary and degenerate input data. The language acquisition device is assumed to be a biologically based innate capacity for language, independent of any specific **natural language*, that enables a child exposed to adult speech to implement certain general principles for discovering the grammatical rules of the specific language in question. Also called a *language acquisition system (LAS)*. See also *INNATE IDEA*. **LAD** abbrev.

language disorder *n.* In **DSM-5*, a **communication disorder* affecting the expression or understanding of **language*, requiring the following four criteria for diagnosis: persistent difficulty in using language, including reduced vocabulary, limited ability to structure sentences, and impairments in the ability to hold a conversation; language ability substantially below age norms, affecting social, academic, or occupational functioning; onset in early development; and the language difficulties not being attributable to **auditory* or **visual impairments*, motor dysfunction, **neurological* impairment, or general delay in development. See also *APHASIA*, *AUTISM SPECTRUM DISORDER*, *DYSARTHRIA*, *SELECTIVE MUTISM*.

Language Personality Sphere *n.* The set of 4,505 trait names with distinct meanings, located by an exhaustive dictionary search in 1936. The dictionary search located 17,953 **trait* names, but the number was reduced to 4,505 by eliminating synonyms. This study was carried out by the US psychologists Gordon W(illard) Allport (1897–1967) and Henry S(ebastian) Odbert (1909–95) and published in the journal *Psychological Monographs* in 1936. See also *HEXACO*, *16PF*.

langue *n.* A term introduced in 1915 by the Swiss linguist Ferdinand de Saussure (1857–1913) to denote language as an abstract communicative system or social institution that is the common possession of a particular

*****ebook converter DEMO Watermarks*****

speech community and is one of the two major aspects of **langage*, the other being **parole*. [French *langue* language]

lanugo *n.* Fine hair or down, especially the woolly covering of a human foetus at birth and the fluffy hair that often appears on the faces of people with **anorexia nervosa*. [From Latin *lanugo* down, from *lana* wool]

lapsus calami *n.* Another name for a **slip of the pen*. [From Latin *lapsus* an error + *calamus* a reedpen]

lapsus linguae *n.* Another name for a **slip of the tongue*. [From Latin *lapsus* an error + *lingua* a tongue]

lapsus memoriae *n.* Another name for a **slip of memory*. [From Latin *lapsus* an error + *memoria* a memory]

Largactil *n.* A proprietary name for the neuroleptic drug **chlorpromazine*, used in the treatment of schizophrenia. [Trademark, from *larg(e)* + *act(ion)* + Latin *-il(is)* indicating capability or relationship]

large intestine *n.* The section of the **alimentary canal* between the small intestine and the anus.

Laroxyl *n.* A proprietary name for the tricyclic antidepressant drug **amitriptyline*. [Trademark]

larynx *n.* The upper part of the windpipe, behind the Adam's apple, containing and protecting the **vocal folds*. Its non-technical name is the *voice box*. [From Greek *larynx* the throat]

Lashley jumping stand *n.* A device used to study visual discrimination in rats. It comprises a platform on which the rat is placed and two vertical cards, each containing a visual stimulus, towards which the rat jumps. If the rat chooses the right card, then a door swings open and the rat lands in a chamber and receives a food reward; if it chooses wrongly, it bumps against a fixed door and falls into a net below. [Named after the US

physiological psychologist Karl Spencer Lashley (1890–1958) who invented it]

latah *n.* A ***culture-bound syndrome** found mainly in Malaysian and Indonesian cultures, most often among middle-aged women, but reported occasionally in Thailand (where it is called *bah tschi* or *baah-ji*), the Philippines (*mali-mali* or *silok*), among the native Ainu people of Japan (*imu*), in Siberia (*amurakh*, *irkunii*, *ikota*, *olan*, *myriachit*, or *menkeiti*), and in southern Africa (*latah*), in which a person after experiencing a sudden fright or shock displays abnormal ***suggestibility**, accompanied by ***echolalia**, ***echopraxia**, and a state resembling a ***trance**. Also spelt *lattah*. [From Malay]

late luteal phase dysphoric disorder *n.* Another name for ***premenstrual dysphoric disorder**. **LLPDD** *abbrev.* [Referring to the ***luteal phase** of the menstrual cycle]

latency *n.* The interval between a ***stimulus** (1) and a ***response**. Also called *latent time*, *reaction time*, or *response latency*. [From Latin *latere* to lie hidden or to escape attention]

latency period *n.* In ***psychoanalysis**, a period of development from the dissolution of the ***Oedipus complex** at the end of the ***phallic stage** around 5 or 6 years of age until the ***genital stage** at puberty. It is characterized by a decrease in sexual activity, a decline in sexual investment in ***object relations**, and the emergence of emotions such as shame and disgust. Sigmund Freud (1856–1939) presented the concept in its fully developed form in 1924 in an article entitled ‘The Dissolution of the Oedipus Complex’ (*Standard Edition*, XIX, pp. 173–9). He attributed the term *latency period* to his friend, the German physician Wilhelm Fliess (1858–1928), and he used the term *period* rather than *stage* because no new organization of sexuality takes place at this time—it is not a turning point. *See also* **CASTRATION COMPLEX**.

latent content *n.* In ***psychoanalysis**, the underlying hidden meaning of a ***dream** (1) or other psychological phenomenon exposed by ***interpretation** (2) of the ***dreamwork**.

*****ebook converter DEMO Watermarks*****

latent homosexuality *n.* A form of *homosexuality that is not recognized as such by the person concerned but is *repressed and manifested indirectly through various *defence mechanisms, generally including *projection (1). *See also* SCHREBER CASE.

latent inhibition *n.* In *classical conditioning, the retardation of learning caused by repeated presentation of the *conditioned stimulus before the beginning of the conditioning process. **LI** *abbrev.*

latent learning *n.* Animal *learning (1) that occurs without any apparent *reinforcement (1, 2) or reward, as when a rat explores a maze and is later shown to have learned to find its way around it. In human learning, the phenomenon is called *incidental learning. Also called *passive learning*.

latent time *n.* Another name for *reaction time.

latent trait theory *n.* Another name for *item response theory.

latent variable *n.* Another name for a *construct.

lateral *adj. n.* Situated at the side or oriented towards the side; the opposite of *medial. In phonetics, (pertaining to) a consonant articulated with the tip of the tongue touching the *alveolar ridge, allowing the airstream to pass on one or both sides of this central obstruction. The initial phoneme in the English word *low* is a voiced lateral consonant, whereas the phoneme represented twice by *ll* in the name of the Welsh town *Llanelli* is a voiceless lateral consonant. [From Latin *lateralis* situated on the side, from *latus* the side]

lateral dominance *n.* Another name for *handedness (1) or *cerebral dominance.

lateral eye movement *n.* A deflection of gaze to the left or right, sometimes claimed to indicate an increase of activity in the contralateral *cerebral hemisphere, so that a person will tend to show a rightward deflection of gaze when preparing to answer a question requiring verbal

processing and a leftward deflection when thinking about a spatial problem.
LEM *abbrev.*

lateral fissure *n.* Another name for the ***lateral sulcus**.

lateral frontal cortex *n.* The left or right side of the ***prefrontal cortex**, specifically ***Brodmann areas** 4, 6, 44, 45, and 47, devoted to higher mental process including ***working memory**, problem solving, decision making, and planning. *See also* DORSOLATERAL PREFRONTAL CORTEX, FRONTAL LOBE, FRONTAL LOBE SYNDROME, PREFRONTAL CORTEX. **LFC** *abbrev.*

lateral funiculus *See* FUNICULUS.

lateral geniculate nucleus *n.* A peanut-sized structure at the side of each lobe of the ***thalamus**, receiving most of its input via the ***optic tract** from the opposite half of the visual field as represented on the ***retinas** of both eyes, these inputs preserving the ***centre-surround receptive fields** of the retinal ***ganglion cells** and being arranged in a ***topographic map** so that points close together on the retina are close together in the lateral geniculate nucleus, and relaying most of them to the ***primary visual cortex** (Area V1), where the topographic order is preserved. It contains six layers of cells, three receiving inputs from the left (L) eye alternating with three from the right (R) eye, in the order from top to bottom LRLRRL in the left geniculate or RLRLRL in the right geniculate, with the six maps of the visual field superimposed exactly. It also receives inputs from the primary visual cortex to which it projects and from the brainstem ***reticular formation**, affecting visual attention. Also called the *lateral geniculate body*. *See also* MAGNOCELLULAR SYSTEM, PARVOCELLULAR SYSTEM, PRETECTAL PATHWAY, RETINOTOPIC MAP. **lateral geniculate nuclei** *pl.* **LGN** *abbrev.* [From Latin *lateralis* situated on the side, from *latus* the side + *geniculatus* knee-shaped, from *geniculum* a little knee, diminutive of *genus* a knee]

lateral hypothalamic feeding centre *n.* One of the two parts of the ***appestat** on each side of the hypothalamus, stimulation of which increases eating and destruction of which inhibits eating. US *lateral hypothalamic feeding center*. Compare VENTROMEDIAL HYPOTHALAMUS.

lateral hypothalamic syndrome *n.* A constellation of signs and symptoms including **anorexia*, **aphagia*, and **adipsia* associated with lesions in the **lateral* hypothalamic feeding centres on both sides of the thalamus. *Compare* VENTROMEDIAL HYPOTHALAMIC SYNDROME.

lateral inhibition *n.* Suppression by a neuron of the response of a neighbouring neuron at the same level in a sensory system, such as the suppression by neurons receiving information from the OFF region of a **centre-surround receptive field* of neurons in the ON region if both regions are stimulated simultaneously. This phenomenon occurs in certain neural structures in which receptor cells are arranged to represent points along a **continuum*, as in the **retina* and the **organ of Corti*, and in which excitation at one point produces inhibition at adjacent points, leading to enhancement or sharpening of differences between neighbouring regions.

laterality *n.* The asymmetry in functions between the two **cerebral hemispheres*, including **handedness* (1) and language functions, the left hemisphere being dominant for language in approximately 90 per cent of people—over 95 per cent of right-handers and about 70 per cent of left-handers. Laterality of functions has been studied via cognitive deficits in people with unilateral brain damage and electrical brain stimulation, and through other specialized research techniques: **dichotic* listening studies, **dichaptic* techniques, **divided visual field* studies, **split-brain* preparations, **EEG* studies, examinations of **evoked potentials*, and **brain imaging* techniques. *See also* BROCA'S AREA, HEMISITY, SPINNING DANCER ILLUSION, WADA TEST, WERNICKE'S AREA.

lateral lemniscus *n.* Either of the two bands of nerve fibres in the **lemniscus* connecting the **cochlear nuclei* to the **inferior* colliculi and the **thalamus* on each side of the brain, involved in the processing of auditory signals. *Compare* MEDIAL LEMNISCUS, TRIGEMINAL LEMNISCUS.

lateral sulcus *n.* The deep horizontal cleft in the outside wall of each **cerebral hemisphere*, separating the frontal lobe and part of the parietal lobe from the temporal lobe. Also called the *fissure of Sylvius*, the *lateral fissure*, or the *Sylvian fissure*. *See also* INSULA, OPERCULUM.

lateral surface *n.* The surface of an organ or structure situated or oriented towards the side of the body, such as the outer surface of each cerebral hemisphere.

lateral thinking *n.* Creative [*problem solving](#), usually by reformulating the problem or viewing it from a fresh angle. It is contrasted with *vertical thinking*, which involves finding methods for overcoming obstacles in the chosen line of approach. The distinction was first made explicit by the Maltese-born British psychologist and author Edward (Francis Charles Publius) de Bono (born 1933) in his book *Lateral Thinking* (1970). It is well illustrated by the [*nine-dot problem](#).

lateral ventricle *See* [VENTRICLE](#).

late selection *n.* In the study of [*attention](#), the filtering out of unwanted information at a late stage in the process of information processing.

Latin square *n.* In statistics and experimental design, a square array of letters (or occasionally numbers or other symbols) such that no symbol occurs more than once in any row or column. The following is a 4×4 Latin square:

A B C D
B C D A
C D A B
D A B C

A *Latin square design* is a type of [*within-subjects design](#) in which research participants or subjects are allocated to treatment conditions according to a Latin square with as many rows or columns as there are treatment conditions in order to control for [*order effects](#). Usually equal numbers are assigned to each of the rows of a Latin square and are exposed to the treatments in the order of the letters in the row. *See also* [RANDOMIZED BLOCKS DESIGN](#). [So called because letters from the Roman alphabet are conventionally used to represent it]

lattah *See* [LATAH](#).

*****ebook converter DEMO Watermarks*****

laudanum *n.* Tincture (solution in alcohol) of [*opium](#), containing [*morphine](#) and [*codeine](#) as active ingredients, first prepared by the Swiss physician and alchemist Philippus Aureolus Paracelsus (1493–1541) and used as a [*narcotic analgesic](#). Formerly and more loosely, any medication containing opium as its main component. [Coined by Paracelsus, probably from *labdanum* or *ladanum* a juice obtained from rockroses, from Greek *ledon* a rockrose]

laughing gas *n.* A non-technical name for [*nitrous oxide](#). [So called because it sometimes induces giggling or laughter]

lavatory wall illusion *n.* A variant of the [*hollow squares illusion](#) and the [*Münsterberg illusion](#), created by an alternating arrangement of square two-tone tiles, each changing smoothly from light to dark along one axis, the effect being that the tiles appear misaligned and non-parallel. It was first reported in 1987 by the English optometrists J(oy) Margaret Woodhouse (born 1948) and Stephen P(hilip) Taylor (born 1951), who reproduced a photograph of a bathroom decorated with such tiles. *See also* [CAFE WALL ILLUSION](#).

law of comparative judgement *n.* The proposition that in any [*comparative judgement](#), the magnitude of the psychological or subjective difference corresponds to the relative frequency with which the stimuli are discriminated.

law of effect *n.* A proposition formulated by the US psychologist Edward Lee Thorndike (1874–1949) in his book *Animal Intelligence: Experimental Studies* (1911) as follows: ‘Of several responses made to the same situation, those which are accompanied or closely followed by satisfaction [are] more firmly connected with the situation...; those which are accompanied or closely followed by discomfort...have their connections with the situation weakened’ (p. 244). According to this law, responses that lead to reward tend to increase in strength, whereas those that lead to punishment tend to decrease in strength. The first part of the law has been amply corroborated by empirical studies and is one of the foundation stones of modern behaviourism. *See also* [ASSOCIATIONISM](#), [CONNECTIONISM \(2\)](#), [REINFORCEMENT \(1\)](#). *Compare* [LAW OF EXERCISE](#).

*****ebook converter DEMO Watermarks*****

law of exercise *n.* A proposition formulated in 1911 by the US psychologist Edward Lee Thorndike (1874–1949) according to which repetition tends to strengthen the association between a ***stimulus (1)** and a ***response**, making the response more likely to occur on the next presentation of the stimulus. *Compare* LAW OF EFFECT.

law of forgetting *See* FORGETTING LAW.

law of independent assortment *See* INDEPENDENT ASSORTMENT.

law of segregation *See* SEGREGATION OF ALLELES.

law of social impact *n.* A proposition introduced by the US psychologist Bibb Latané (born 1937) in an article in the journal *American Psychologist* in 1981, designed to explain ***social influence** effects, including ***persuasion**, ***conformity**, ***compliance**, and ***obedience**. It is usually expressed by the equation $T = f(SIN)$, where T is the magnitude of the impact, f indicates a function, S is the strength of the influence sources (for example, their ***credibility** in the case of attitude change), I is the immediacy of the influence sources (face-to-face communication being the most immediate and the print media the least immediate), and N is the number of influence sources. The analogy of electric lamps shining on a sheet of paper helps to explain the law: the amount of light reaching the paper is a function of the strength (wattage) of the lamps, the immediacy of the lamps (how close they are to the paper), and the number of lamps. The law embodies a ***multiplicative model**, because if S , I , or N is zero, the magnitude of the impact is zero.

law of the excluded middle *See* EXCLUDED MIDDLE LAW.

lay personality theory *n.* Another name for an ***implicit personality theory**.

L-dopa *abbrev.* Laevo-dihydroxyphenylalanine, a substance that is synthesized in the body from tyrosine and is an immediate precursor of

***dopamine.** Dopamine cannot cross the ***blood–brain barrier**, but L-dopa can, therefore a synthetic form of L-dopa is used in the treatment of ***Parkinson’s disease**, which arises from a failure of dopamine production in the brain. Also called *levodopa*. See also **ANTIPARKINSONIAN**, **APHRODISIAC**, **DOPA**. [From *laevo-* indicating a left-handed form, from Latin *laevus* left + *d(ihydr)o(xy)p(henyl)a(lanine)*]

leaning tower illusion *n.* A visual illusion—specifically, a ***perspective illusion**—originally demonstrated with an image of the Leaning Tower of Pisa, photographed from below. When two identical copies of the image are placed side by side, the towers appear to lean away from each other (see **illustration**, top, overleaf.). This is caused by the fact that the visual system interprets the two images as parts of a single image. A single image of a pair of towers aligned with each other and photographed from below would converge towards the top, owing to ***linear perspective**, and the visual system would correct for this convergence so that the towers would be perceived as rising in parallel. In the illusion, the towers are in separate images and do not converge, but the visual system interprets them as parts of a single image, and automatic perspective correction therefore causes them to appear to diverge. In spite of its name, the same illusion is seen when identical images of any scene with strong perspective cues, such as two identical images of a road receding towards the horizon, are placed side by side (see **illustration**, bottom, overleaf). The illusion was discovered by the Canadian-based British neuroscientist Frederick A. A. Kingdom (born 1953) and two research associates at McGill University, and it was first published in the journal *Perception* in 2007. [So called because it causes one tower to appear to lean away from the other, and also because the Leaning Tower of Pisa was used to illustrate it.]

Leaning tower illusion. The two images of the Leaning Tower of Pisa (top), are identical and, amazingly, so are the two images of the road (bottom).

learned food/flavour/taste aversion See [FOOD AVERSION LEARNING](#).

learned helplessness *n.* An apathetic condition in an animal or a human being resulting from exposure to insoluble problems or inescapable physical or emotional stress, believed by some psychologists to underlie [*depression](#). The term was introduced in 1967 by the US psychologists J(ames) Bruce Overmier (born 1938) and Martin E. P. Seligman (born 1942) in an article in the *Journal of Comparative and Physiological Psychology*. Early experiments involved strapping experimental dogs into harnesses to prevent them escaping, and then exposing them to inescapable electric

shocks. When the dogs were later placed in a situation in which they had to respond to a warning signal by jumping over a low barrier in order to avoid further shocks, most became apathetic and listless and failed to learn this simple avoidance response, whereas a control group of dogs that had not been exposed to the inescapable shocks learned the avoidance response quickly and easily. Learned helplessness has been demonstrated in humans as well as animals, and Seligman and his followers believe that it reduces the motivation to solve problems, interferes with the ability to learn from experience, and produces depression. It is very occasionally spelt *learnt helplessness*, which is arguably preferable inasmuch as it avoids the implication that the helplessness is knowledgeable and well read. [So called because it is acquired by [*learning \(1\)](#)]

learning *n.* 1. Any lasting change in behaviour resulting from experience, especially [*conditioning \(1\)](#). 2. The act or process of acquiring knowledge or skill, or knowledge gained by study (*He had several university degrees and was a man of learning*).

learning curve *n.* A mathematical expression of the change in behaviour occurring as a function of practice, usually represented by a graph showing a measure of performance on the vertical axis and amount of learning, represented by trials or time, on the horizontal axis. The best example is a [*cumulative record](#). The concept was introduced by the US psychologist Louis Leon Thurstone (1887–1955) in an article entitled ‘The Learning Curve Equation’ in the journal *Psychological Monographs* in 1919. Also called a *practice curve*.

learning difficulties *n.* A term used by [*educational psychologists](#) in the UK since the 1980s to refer to [*intellectual disability](#); thus *moderate learning difficulties* corresponds approximately to moderate [*intellectual disability](#), *severe learning difficulties* to severe [*intellectual disability](#), and *profound learning difficulties* to [*profound mental retardation](#). Compare [LEARNING DISABILITY](#), [SPECIFIC LEARNING DISORDER](#).

learning disability *n.* A generic name for disorders characterized by substantial deficits in scholastic or academic skills, including [*reading disorder](#), [*mathematics disorder](#), and [*disorder of written expression](#). The

*****ebook converter DEMO Watermarks*****

term was introduced by the US special educator and psychologist Samuel A(lexander) Kirk (1904–96) in his book, *Educating Exceptional Children* (1962). The preferred term in *DSM-5 is *specific learning disorder. Also called *academic skills disorders* or *learning disorders*. See also SPECIFIC LEARNING DISABILITY. Compare LEARNING DIFFICULTIES. **LD** abbrev.

Learning Potential Assessment Device *n.* A device intended for *dynamic testing of children, adolescents, and adults for potential cognitive growth. It comprises a battery of 15 instruments designed to challenge the respondent's ability to use different cognitive operations (serialization, classification) in different *content domains (numerical, verbal, logico-deductive, and figural), while the examiner detects errors and helps the respondent to find ways to remedy them. **LPAD** abbrev.

least-effort principle See PRINCIPLE OF LEAST EFFORT.

least-significant difference test *n.* In statistics, a method of *multiple comparisons in which all possible *t tests between group means are performed without adjustment of the significance levels for the fact that multiple, non-independent comparisons are being made, and therefore without adequate protection against a *Type I error. Compare BONFERRONI CORRECTION, DUNCAN'S MULTIPLE RANGE TEST, NEWMAN–KEULS TEST, SCHEFFÉ TEST, TUKEY-HSD TEST.

least-squares method *n.* In statistics, a technique for estimating the value of an unknown quantity from a number of observations or scores, especially for finding the line or curve that best fits a set of data points, by finding the values that minimize the sum of the squared deviations of the observed scores from their expected values. The method was introduced in 1805 by the French mathematician Adrien-Marie Legendre (1752–1833).

lect *n.* A general term for any variety of a language that can be identified in a speech community. Compare ACROLECT, BASILECT, DIALECT, IDIOLECT, MESOLECT. [From Greek *legein* to speak]

Lee-Boot effect *n.* The suspension of *oestrous cycles in a group of females housed together in the absence of males of the same species or their
*****ebook converter DEMO Watermarks*****

***pheromones.** Compare **WHITTEN EFFECT**. [Named after the Dutch biologists S. van der Lee and L. M. Boot who first reported it in 1955]

left-sided apraxia *n.* An impairment of ability to carry out verbal requests with the left hand, resulting from damage to the ***corpus callosum**, preventing impulses from the left hemisphere, where language is processed, from reaching the right ***motor cortex**, where control of the left side of the body is located. Also called *callosal apraxia*, *sympathetic apraxia*, *unilateral limb apraxia*. See also **APRAXIA**, **DISCONNECTION SYNDROME**.

legasthenia *n.* A term introduced in 1916 (in the German form *Legasthenie*) by the Hungarian psychiatrist Paul Ranschburg (1870–1945) to denote specific ***reading disorder**. [From Latin *legere* to read + Greek *astheneia* weakness, from *a-* without + *sthenos* strength + *-ia* indicating a condition or quality]

legend, urban See **URBAN LEGEND**.

lek *n.* A small area of ground where certain species of birds such as grouse gather for ***courtship (1)** and ***display (1)**, or the behaviour that occurs at such a location, or the season during which such behaviour takes place. [From Old English *lacan* to frolic, perhaps from Swedish *leka* to play]

lemma *n.* **1.** In logic and mathematics, a preliminary ***proposition (1)** on which the proof of a subsequent proposition depends. **2.** In linguistics, a word in its ***citation form**, together with all its inflected forms, such as *do* together with *doing*, *does*, *did*, and *done*. **lemmatize** *vb.* [From Greek *lambanein* to take for granted]

lemniscus *n.* A band of ascending sensory nerve fibres connected to the thalamus, including the ***lateral lemniscus**, ***medial lemniscus** and ***trigeminal lemniscus**, the whole lemniscus being referred to non-technically as the *fillet*. Also called the *lemniscal system*. [From Greek *lemniskos* a ribbon]

lenis *adj.* Of or relating to a ***consonant** speech sound articulated with

relatively weak muscular tension of the organs of speech and breath pressure, such as the initial phonemes in *bee*, *die*, *go*, *vow*, *though*, and *zoo*. *See also* [CLIPPING](#). *Compare* [FORTIS](#). [From Latin *lenis* gentle]

lens *n.* A transparent structure, with one or more convex or concave surfaces, that [*refracts](#) light passing through it, causing either convergence or divergence of rays. The [*crystalline lens](#) of the [*eye](#) converges light rays on to the retina. *See also* [DIOPTRE](#), [REFRACTION](#). [From Latin *lens*, *lentis* a lentil, alluding to the shape of a biconvex lens]

lens illusion *See* [CURVATURE ILLUSION](#).

lens model *n.* A metaphor proposed by the Hungarian-born US psychologist Egon Brunswik (1903–55) to highlight the probabilistic relationships between, on the one hand, an [*ecological criterion](#), and on the other, the sensory [*cues](#) (2) of imperfect [*ecological validity](#) (2) that an organism uses to judge the ecological criterion, the cues being focused by cognitive processes like rays of light on to the ecological criterion. *See also* [BRUNSWIKIAN](#).

lenticular nucleus *n.* One of the [*basal ganglia](#) comprising the [*putamen](#) and the [*globus pallidus](#) in each cerebral hemisphere, implicated in the control of movement. Also called the *lentiform nucleus*. *See also* [CORPUS STRIATUM](#). [From Latin *lens*, *lentis* a lentil, alluding to its double-convex shape]

lento speech *n.* Slow, deliberate, careful speech lacking the features typical of rapid, casual, connected [*allegro speech](#). [Italian *lento* slow, from Latin *lentus* slow]

leptin *n.* A [*hormone](#) found in the bloodstream of humans and other mammals, encoded by the *ob* (obesity) gene, regulating the amount of food intake and fat deposited in the body. In strains of massively obese mice, it is not synthesized normally, but injections of leptin lead to reduced food intake and weight reduction in both normal and obese mice. It was discovered in mice and humans in 1994 by the US molecular geneticist Jeffrey Friedman (born 1954) and first reported and named in print by Friedman and several
*****ebook converter DEMO Watermarks*****

collaborators in the journal *Science* in 1995. Compare **GHRELIN**. [From Greek *leptos* thin, from *lepein* to peel]

leptokurtic See **KURTOSIS**.

Lerntest *n.* A collection of ***dynamic testing** procedures developed in Germany in the early 1990s, administered with repetitions, prompts, and systematic feedback. [From German *Lerntest* learning test, from *lern* learn + *Test* a test]

lesbian *n.* A ***homosexual** woman. **lesbianism** *n.* The practice of being a lesbian, also called *sapphism*. [From the name of the Greek island of Lesbos, home of the lyric poet Sappho, believed to have been a lesbian]

Lesch–Nyhan syndrome *n.* A hereditary disorder of purine metabolism, affecting young boys, transmitted by a ***sex-linked *recessive gene**, characterized by ***intellectual disability**, self-mutilation of lips and fingers by biting, and abnormal physical development, often leading to death. [Named after the US paediatricians Michael Lesch (1939–2008) and William L. Nyhan, Jr (born 1926), who first studied it]

lesion *n.* Any structural alteration of an organ or tissue of the body brought about by injury or disease. [From Latin *laesio* an injury, from *laedere* to hurt + *-ion* indicating an action, process, or state]

lesion experiment *n.* Another name for an ***ablation experiment**.

less-is-more effect *n.* A phenomenon in judgement and decision making when less knowledge in a particular domain enables one to make more accurate judgements than more knowledge. The effect was first reported and named by the US psychologist Daniel G(ray) Goldstein (born 1969) and the German psychologist Gerd Gigerenzer (born 1947) in a chapter on the ***recognition heuristic** in a book by Gigerenzer and several co-authors entitled *Simple Heuristics That Make Us Smart* in 1999 and in an article in the journal *Psychological Review* in 2002. They reported a study of German and US respondents who were asked, ‘Which city has the larger population:

San Diego or San Antonio?’ The German respondents had comparatively little relevant knowledge, but all of them had heard of San Diego, and about half of them had heard of San Antonio. Nevertheless, all German respondents arrived at the correct answer that San Diego has the larger population by using the recognition heuristic; whereas only two-thirds of the US respondents, who had far more relevant knowledge, answered correctly.

lethal dosage *n.* The minimum dosage of a drug required to kill an organism. **LD** *abbrev.* **lethal dosage 50** *n.* Another name for the **median lethal dosage*. See also THERAPEUTIC INDEX, THERAPEUTIC RATIO. Compare EFFECTIVE DOSAGE, TOXIC DOSAGE. **LD-50** or **LD₅₀** *abbrev.*

lethargy *n.* Lack of energy. See also ENCEPHALITIS LETHARGICA, HEBETUDE, IRRITABLE MALE SYNDROME, STUPOR, WATER INTOXICATION. [From Latin *lethargia* sluggishness, from Greek *lethargos* drowsy, from *lethe* oblivion]

letter-by-letter reading *n.* An alternative name for **spelling dyslexia*.

leucocyte *n.* Any of the various types of large white corpuscles of the blood and lymph in humans and other vertebrates, including **phagocytes* with granular cytoplasm and other immunologically active cells with clear cytoplasm. US *leukocyte*. Also called a *white blood cell* or *white blood corpuscle*. See also GRANULOCYTE, LYMPHOCYTE, MONOCYTE, STEM CELL. Compare ERYTHROCYTE. [From Greek *leucos* white + *kytos* a vessel]

leucotomy *n.* A shortened name for **frontal leucotomy*. Also spelt *leukotomy*.

leu-enkephalin See ENKEPHALIN.

leukocyte See LEUCOCYTE.

levelling *n.* 1. The tendency to perceive or to remember material in a form closer to a **good Gestalt* than is objectively the case, unimportant and incongruous details gradually disappearing over time, such alteration also occurring in **serial reproduction* and **rumour* transmission. Compare

[ASSIMILATION \(5\)](#), [SHARPENING](#). **2.** In the terminology of some forms of therapy and counselling, speaking frankly and openly (being level in the sense of straightforward). **3.** In linguistics, the gradual loss of linguistic distinctions, such as the loss of the distinction between the nominative and accusative forms of nouns in Old English, which have generally been levelled to a single form, although the distinction has been preserved in some pronouns (*I/me, he/him, she/her, they/them*) though not in *you*. US *leveling*.

level of aspiration See [ASPIRATION \(1\)](#). **LOA** abbrev.

level of measurement See [MEASUREMENT LEVEL](#).

levels of processing *n.* The depth with which incoming information is analysed and [*encoded](#), ranging from superficial processing of sensory [*features \(1\)](#) to semantic and conceptual processing, with deeper levels of processing leading to longer-lasting memories. According to this interpretation, incoming verbal information may be analysed in terms of its sensory and surface features but may also be processed at progressively deeper levels in terms of its [*phonemic](#), [*semantic](#), and [*conceptual](#) properties, the early sensory analyses being relatively automatic and effortless and the later deeper analyses requiring attention and effort. The concept was introduced in 1972 by the Canadian-based Scottish psychologist Fergus I(an) M(uirden) Craik (born 1935) and the Canadian-based Australian psychologist Robert S. Lockhart (born 1939). In 1975 Craik and the Estonian-born Canadian psychologist Endel Tulving (born 1927) published a classic experiment in which people first answered yes–no questions about a list of words and then tried to recall as many of them as possible. Some of the words were accompanied by questions asked about their visual appearance (*Is the word in lower case?* or *Is the word in upper case?*), others their sound (*Does the word rhyme with dog?* and so on), and still others their meaning (*Is it the name of an animal?* and so on). Recall was very poor for words that had been processed according to visual appearance, slightly better for words processed according to sound, and best by far for words processed according to meaning. This approach is sometimes seen as an alternative to the conventional model of three separate memory stores, namely [*sensory memory](#), [*short-term memory](#), and [*long-term memory](#). See also [ATTENUATION THEORY](#), [BOTTLENECK THEORY](#), [DEPTH OF PROCESSING](#), [DOMAINS OF PROCESSING](#)

*****ebook converter DEMO Watermarks*****

THEORY, ELABORATION, FLANKER COMPATIBILITY EFFECT, PROOF-READER'S ILLUSION (1, 2). **LOP** abbrev.

levodopa *n.* Another name for *L-dopa.

Lewinian *adj.* Of, relating to, or resembling the psychological approach of Kurt Lewin (1890–1947), a US psychologist born in a part of Germany that is now in Poland. See ACTION RESEARCH, APPROACH–APPROACH CONFLICT, FIELD THEORY, HODOLOGICAL SPACE, LIFE SPACE, T-GROUP, TOPOLOGICAL PSYCHOLOGY.

Lewy body *n.* A microscopic particle with a characteristic dark core and pale halo found abundantly in cortical neurons of people with *Lewy body dementia. [Named after the German-born US neurologist Frederick H. Lewy (1885–1950) who discovered the particle]

Lewy body dementia *n.* A form of *dementia, distinct from Alzheimer's disease, associated with *Lewy bodies in cortical neurons, especially in the *frontal lobes, characterized by rapid and unpredictable fluctuations in levels of cognitive functioning and extremely poor reactions to *neuroleptic (1) drugs.

lexeme *n.* The basic unit of semantic analysis, roughly equivalent to a word in the everyday sense but referring more precisely to the abstract unit postulated to underlie a set of grammatical variants such as *write*, *writes*, *writing*, *wrote* or *loud*, *louder*, *loudest*; the smallest unit of language with a distinctive meaning that cannot be inferred from the meanings of its component *morphemes. Many lexemes consist of single words (such as *game*, *castle*, or *sing*), but multi-word lexemes also exist (as in *kick the bucket*, meaning die). Also called a *lexical item*. [From Greek *lexis* a word, from *legein* to speak + a suffix on the model of *phoneme*]

lexical access *n.* The process by which a person retrieves items from a *lexicon (2). [From Greek *lexis* a word, from *legein* to speak]

lexical access time *n.* The time taken to retrieve information from a *lexicon (2).

lexical ambiguity *n.* The property of a word that has more than one meaning. In written language it arises from **homographs*, and in spoken language from **homonyms*. See also *POLYSEMY*.

lexical decision task *n.* An experimental task in which participants or subjects are required to decide as quickly as possible whether strings of letters are or are not words. **LDT** *abbrev.*

lexical word *n.* Another name for a **content word*.

lexicographic *adj.* Of, relating to or consisting of a method of arranging a set of items in the manner of a dictionary, by ordering them first according to one **attribute*, then according to a second, and so on. Thus the words *cab*, *dab*, *den*, and *fag* are lexicographically ordered, and so are the vectors (3, 1, 2), (4, 1, 2), (4, 5, 14), and (6, 1, 7), and the relation between the two systems of ordering can be seen by setting $a = 1$, $b = 2, \dots, z = 26$. Also called *lexical*, though this is liable to cause confusion and is avoided in careful usage, because this adjective usually refers to **lexemes* or words. See also *LEXICOGRAPHIC CHOICE*, *LEXICOGRAPHIC SEMIORDER*. [From Greek *lexikon* a dictionary, from *lexis* a word, from *legein* to speak + *graphein* to write + *-ikos* of, relating to, or resembling]

lexicographic choice *n.* Any method of **multi-attribute decision making* that is **lexicographic* inasmuch as the decision maker proceeds by first comparing the alternatives on the most important **attribute*, and if more than one alternative is best on the first attribute, the decision maker then compares them on the next most important attribute, and so on until just one alternative emerges as best or the list of attributes is exhausted without a definite first preference emerging. Suppose a decision maker has to choose between two travel agencies, namely A_1 offering a tour only to destination D_1 (Africa), and A_2 offering tours to both D_1 (Africa) and D_2 (the Far East). The decision maker is equally attracted by Africa and the Far East and is indifferent between the travel agencies. According to the conventional linear value-maximization model of decision making, the three alternatives A_1D_1 , A_2D_1 , A_2D_2 are equally valued and are therefore equally likely to be chosen; but it is intuitively obvious that most human decision makers would choose

*****ebook converter DEMO Watermarks*****

first between destinations D_1 and D_2 , because this attribute is most important, and only then between travel agencies A_1 and A_2 , and consequently the probability of choosing A_2D_2 would be greater than that of the other two alternatives. Also called *lexicographic decision making* or *lexical choice*, although the latter is avoided in careful usage, because it causes confusion with *lexical decision task*. See also [ELIMINATION BY ASPECTS](#), [LEXICOGRAPHIC SEMIORDER](#).

lexicographic semiorder *n.* A [*lexicographic](#) preference ordering applied to a set of elements differing on two or more [*attributes](#), at least one of which yields a [*semiorder](#). It is noteworthy because it can generate an [*intransitive preference](#) ordering from intuitively reasonable transitive preferences within each separate attribute. For example, suppose three job applicants x , y , and z are ranked according to aptitude test scores and interview performance, and interview performance is taken into account only if the difference in aptitude test score between two candidates is less than five points and is therefore considered to be negligible. Suppose that the data are as follows:

<i>Candidate Aptitude Interview</i>		
x	70	good
y	73	moderate
z	76	weak

Then x is preferred to y , y is preferred to z , and z is preferred to x . Also called a *lexical semiorder*, though this is apt to cause confusion.

lexicology *n.* The study of the development and present state of the [*lexicon \(1\)](#) of a language. [From Greek *lexis* a word, from *legein* to speak + *logos* word, discourse, or reason]

lexicon *n.* **1.** The entire vocabulary of a language, especially one that is listed alphabetically like a dictionary. English is believed to have the largest lexicon of any language: the *Oxford English Dictionary* (2nd ed.) defines more than 500,000 words. **2.** The entire vocabulary of an individual. The US psychologist George A(rmitage) Miller (1920–2012) estimated in 1991 that the average high-school graduate has a passive lexicon of about 60,000 words that are understood but not necessarily used. Also called a *mental lexicon*. **3.**

*****ebook converter DEMO Watermarks*****

A list of words relating to a particular subject. **lexical** *adj.* [From Greek *lexikon* a dictionary, from *lexis* a word, from *legein* to speak]

lexicostatistics *n.* A technique devised by the US linguists Morris Swadesh (1909–67) and Robert Benjamin Lees (1922–96) in the late 1940s for studying the vocabularies of languages, especially to trace historical links with other languages through ***glottochronology**. Using a list of 100 basic words (such as *I, you, not, tree, father, two*), the number of words in the two languages that are recognizably similar or cognate can be counted, and the fewer the cognate words, the longer they are assumed to have been separated: on average, two languages have 86 per cent in common after 1,000 years of separation. *See also* **INDO-EUROPEAN**. [From Greek *lexis* a word, from *legein* to speak + *statistics*]

liar paradox *n.* A profound and intractable though simple ***paradox** discovered by ancient Greek thinkers. Epimenides, the Cretan, says that all Cretans are liars; if he is telling the truth, then he must be a liar, and if he is lying, then he must be telling the truth. The simplest version of the paradox is the statement *This statement is false*; if it is true, then it must be false, and if it is false, then it must be true. The paradox was mentioned by St Paul in his epistle to Titus (1 : 12), although Paul evidently failed to grasp its point. *See also* **METALANGUAGE**.

liberation psychology *n.* An approach to ***social psychology** that attempts to reconstruct the discipline from a radical ideological perspective and place it at the service of the poor and oppressed by focusing on problems such as urban overcrowding, land reform, and violence. It was developed largely by the Salvadorean social psychologist and Jesuit priest Ignacio Martín Baró (1942–89) and was inspired by Marxism, psychoanalysis, some approaches to social psychology, and above all by liberation theology, the doctrine influential chiefly in Latin America that Christianity demands the overthrow of exploitative and oppressive social and political institutions. Its moral flavour and commitment to liberation distinguish it from other radical approaches to psychology, such as ***critical theory**. It has been influential mainly in Latin America and South Africa, but it also has followers among social psychologists in Europe, North America, and Australasia. **PSL** *abbrev.* (see etymology). [From Spanish *psicología social de la liberación*]

*****ebook converter DEMO Watermarks*****

liberty cap *n.* The slightly poisonous mushroom *Psilocybe semilanceata*, sometimes eaten as a ***hallucinogenic** drug. Also called *magic mushroom*. Its common street name is *mush*. See also **FLY AGARIC**. [So called because of its resemblance to the soft felt cap worn during the French Revolution as a symbol of liberty]

Libet's delay *n.* A period of approximately half a second between a person's skin being touched and the resulting conscious experience of being touched, although the brain receives the signal and responds to the stimulus with an ***evoked potential** after a little more than a hundredth of a second (15 milliseconds), and a ***reflex** response can occur within about a tenth of a second (100 milliseconds). In research with fully conscious patients during brain surgery under local anaesthetic, Libet found a half-second delay between the beginning of continuous electrical stimulation of the exposed ***somatosensory cortex** and the patient's report of a conscious sensation, such as a tingle in the right hand during electrical stimulation of a point in the left somatosensory cortex. In contrast, even a brief stimulus applied directly to the skin is consciously experienced, but not immediately—if it is followed within less than half a second by stimulation of the somatosensory cortex, then ***backward masking** stops the skin stimulus from being felt, confirming that the conscious experience of a skin stimulus is delayed by about half a second. According to Libet, the reason why we do not notice the half-second delay is that our conscious experiences of sensations are antedated to the time of the evoked potentials, creating the illusion that the sensations are almost immediate. Also called the *antedating of consciousness*, *backward referral of sensation*, *half-second delay in consciousness*, or *time delay in consciousness*. See also **READINESS POTENTIAL**. [Named after the US physiologist Benjamin Libet (1916–2007) who reported the delay first in an article in the journal *Perspectives in Biology and Medicine* in 1965 and subsequently in numerous publications, notably an article in the journal *Brain* in 1979 (co-authored with three colleagues) and in *Behavioral and Brain Sciences* in 1985]

libidinal regression See **REGRESSION (2)**.

libidinal stage *n.* In ***psychoanalysis**, any stage or phase of ***psychosexual development** when ***libido** is focused specifically on one
*****ebook converter DEMO Watermarks*****

***erotogenic zone** and in which one mode of ***object-relationship** predominates. Also called a *libidinal phase* or a *psychosexual stage*. See **ANAL STAGE**, **GENITAL STAGE**, **LATENCY PERIOD**, **ORAL STAGE**, **PHALLIC STAGE**, **POLYMORPHOUS PERVERSITY**. See also **FIXATION (2)**, **REGRESSION (2)**.

libido *n.* Sexual desire. In ***psychoanalysis**, the energy of the ***sexual instinct** as a component of the ***Eros**. Sigmund Freud (1856–1939) introduced the concept in his book *Three Essays on the Theory of Sexuality* (1905), in a passage added to the 1915 edition (*Standard Edition*, VII, pp. 130–243, at p. 217), and he expanded his explanation in his book *Group Psychology and the Analysis of the Ego* (1921), where he gave the following definition: ‘Libido is an expression taken from the theory of the emotions. We call by that name the energy, regarded as a quantitative magnitude, (though not at present actually measurable), of those instincts which have to do with all that may be comprised under the word “love”’ (*Standard Edition*, XVIII, pp. 69–143, at p. 90). Freud attributed the term to the book *Untersuchungen über die Libido sexualis* (1898, *Researches into the Sexual Libido*) by the German psychiatrist Albert Moll (1862–1939), but Freud had already used the word several times in letters (*Standard Edition*, I, pp. 173ff.) to his friend, the German physician Wilhelm Fliess (1858–1928), the earliest occurrence being in June 1894, several years before the publication of Moll’s book. See also **EGO LIBIDO**, **OBJECT LIBIDO**. Compare **DESTRUDO**, **MORTIDO**, **SELF-PRESERVATION INSTINCT**. **libidinal** *adj.* Of or relating to the libido. **libidinous** *adj.* Lustful, lascivious, or lewd. [From Latin *libido* desire or lust]

Librium *n.* A proprietary name for the benzodiazepine drug ***chlordiazepoxide**. [Trademark]

lie detector *n.* A type of ***polygraph** sometimes used in police interrogations to detect untrue or deceptive answers by recording involuntary stress-induced physiological responses, typically including changes in galvanic skin response (**GSR**), respiration rate, blood pressure, and heart rate. Responses to test questions relevant to the crime or matter at issue are compared with responses to unrelated control questions, and the most advanced polygraph lie detectors incorporate computer software, based on data from confirmed polygraph test results, designed to analyse the waveforms and eliminate subjectivity from their interpretation. The original

*****ebook converter DEMO Watermarks*****

polygraph lie detector was called the *Keeler polygraph*. Also called simply a *polygraph*. See also [BOGUS PIPELINE](#), [CHEVREUL PENDULUM](#), [WORD-ASSOCIATION TEST](#).

lie scale *n.* In psychometrics, a set of items included in a test to provide an indication of the extent to which the respondent has answered truthfully in other parts of the test. Some lie scales consist of repetitions of the same or closely similar items, to check for consistency of responses; others are made up of items to which certain responses may be assumed to be evidence of [*social desirability response set](#), or some other [*response bias](#), for example *I always smile at strangers in the street* (True) or *I never regret things that I have said* (True); and there are other more devious and subtle types of lie scales.

life instincts *n.* Another name for [*Eros](#).

life lie *n.* In [*individual psychology](#), a term introduced by the Austrian psychiatrist Alfred Adler (1870–1937) to denote the false belief, functioning as a means of evading responsibility, that one cannot achieve any of one's goals.

life space *n.* A term introduced in 1936 by the German–US psychologist Kurt Lewin (1890–1947) to refer to the psychological [*field](#), comprising the person *P* and the person's environment *E*, jointly determining the person's behaviour *B* at a given moment, this relation being expressed by the equation $B = f(P, E)$, certain regions of the life space having *valence* and thus being either attractive or repulsive to the person and determining *locomotion* from one region to another. See also [APPROACH–APPROACH CONFLICT](#), [APPROACH–AVOIDANCE CONFLICT](#), [AVOIDANCE–AVOIDANCE CONFLICT](#), [FIELD THEORY](#), [HODOLOGICAL SPACE](#), [LEWINIAN](#), [TOPOLOGICAL PSYCHOLOGY](#).

life table *n.* Another name for a [*mortality table](#).

ligand *n.* An atom, molecule, ion, or radical that binds with a central atom; more specifically, any such element that binds with a specific [*neuroreceptor](#). [From Latin *ligandum* binding, from *ligare* to bind]

light adaptation *n.* A form of **adaptation* (2) in which the visual system is adjusted for efficient response to light under conditions of strong illumination, including the constriction of the **pupil*, a rapid increase in the **absolute threshold* for vision, and the switch from the **scotopic* system to the **photopic* system. *See also* PURKINJE SHIFT. *Compare* DARK ADAPTATION. **light-adapted** *adj.* Of or relating to the eye or the visual system after it has undergone light adaptation.

lightness *n.* The **achromatic* (1) dimension of **colour*, ranging from black (0) to white (10) in the **Munsell* value scale of lightness, being one of the three major dimensions of colour together with **hue* and **saturation* (1). It is the psychological counterpart of physical **luminance*, but the fact that it does not correspond in a simple way to physical light intensity can be demonstrated by first noting the lightness of a television screen when the power is turned off—it is usually not very dark—and then switching on the power and observing that parts of the picture appear much darker and even pitch black, despite the fact that the transmitted images can only increase and never reduce the intensity of the light coming from any part of the screen. Also called *Munsell value* or *brightness*, although brightness is specifically related to luminance, which as explained above is a different though closely related physical property. *See also* GELB EFFECT, HERING GREY, KARDOS EFFECT.

lightness constancy *n.* The apparent stability of an object's **lightness* despite changes in illumination. Also called *brightness constancy* or *whiteness constancy*. *See also* PERCEPTUAL CONSTANCY.

lightness contrast *n.* The apparent darkening of an object or image when viewed against, alongside, or immediately after a lighter one, or an apparent lightening of an object or image juxtaposed with a darker one. Also called *brightness contrast*. *See also* CONTRAST (2), SIMULTANEOUS CONTRAST, SUCCESSIVE CONTRAST, VISUAL INDUCTION.

light reflex *n.* Another name for the **pupillary light reflex*.

likelihood function *n.* In statistics, the probability of obtaining a given set of observed scores in a random sample as a function of the **parameter(s)*

of the population from which the scores are drawn. *See also* [LIKELIHOOD RATIO \(1\)](#).

likelihood principle *n.* A hypothesis first proposed in 1866 by the German physiologist, physicist, and mathematician Hermann Ludwig Ferdinand von Helmholtz (1821–94) that a perception is inferred unconsciously to correspond to the most likely physical events or circumstances that could have produced the pattern of sensations that generated it. *Compare* [PRÄGNANZ](#).

likelihood ratio *n.* **1.** In statistics, the ratio of two [*likelihood functions](#) at a given value, especially the ratio of a likelihood function to the [*maximum likelihood](#), or in [*Bayesian inference](#), the ratio between (a) the probability of an observation or datum conditional on a hypothesis and (b) the probability of the same observation or datum conditional on an alternative hypothesis: $P(D | H_1)/P(D | H_2)$. **2.** In [*signal detection theory](#), the ratio (at a particular cutoff or criterion level of sensory activation) given by the probability of a response being due to signal plus noise divided by the probability of its being due to noise alone. Symbol: β .

likelihood ratio chi-square test *n.* A statistical test of association or [*goodness of fit \(1\)](#) that is based on the [*likelihood ratio \(1\)](#) and is thought by many statisticians to be preferable to the conventional Pearson [*chi-square test](#) for the simultaneous analysis of several overlapping associations in a multiple-classification table, because under certain conditions it has the property of [*additivity](#) of effects. The statistic, which is distributed like chi-square, is computed from the natural logarithms of observed and (in goodness of fit tests) expected frequencies. *Compare* [PEARSON CHI-SQUARE TEST](#).

Likert scale *n.* One of the most popular types of attitude scale, constructed by the method of [*summated ratings](#) in which a sample of respondents are given a large number of candidate statements about an attitude object (such as *Homosexuality is acceptable in today's society*, *Homosexuality should be outlawed*) to which they respond with their own attitudes by choosing one of the response categories attached to each item, for example, *strongly disagree*, *disagree*, *neutral*, *agree*, *strongly agree*. Items that are worded positively towards the attitude object, such as the first of the
*****ebook converter DEMO Watermarks*****

examples above, are assigned positively increasing scores to their response categories such as 0, 1, 2, 3, and 4, respectively, and for negatively worded items such as the second example the scoring is reversed (4, 3, 2, 1, 0). Each respondent's scores on all the candidate items are summed to yield a total score, the candidate items are then subjected to [*item analysis](#), and those with the highest discriminating power are retained for the final scale. [Named after the US sociologist and economist Rensis Likert (1903–81) who introduced it in an article in the *Archives of Psychology* in 1932]

liking scale *n.* A questionnaire designed to measure interpersonal liking, defined in terms of fondness and respect for the liked person and a feeling that the liked person is similar to oneself, the scale being specifically intended to distinguish liking from loving, which is measured by a [*romantic love scale](#). Both scales were constructed by the US psychologist Zick Rubin (born 1944) and published in the *Journal of Personality and Social Psychology* in 1970.

l'illusion de sosies *n.* Another name for [*Capgras syndrome](#). [From French *l'illusion* the illusion + *de* of + *sosies* doubles, from *Socias* in Greek mythology, the identity that Zeus persuaded Mercury to adopt to help him seduce Alcmene by impersonating her husband]

limbic system *n.* A ring of cortical and subcortical structures folded into the inner surface of the [*temporal lobe](#) surrounding the brainstem and bordering on the corpus callosum, including the [*amygdala](#), [*cingulate gyrus](#), [*fornix](#), [*hippocampus](#), [*parahippocampal gyrus](#), and [*septum pellucidum](#), implicated in basic emotions, hunger, sex, and memory. *See also* [PAPEZ CIRCUIT](#), [PLEASURE CENTRE](#). [From Latin *limbicus* bordering, from *limbus* a border]

limen *n.* Another name for a [*threshold](#). [From Latin *limen* a threshold]

limits, method of *See* [METHOD OF LIMITS](#).

Linda problem *n.* A classic problem of judgement. *See* [CONJUNCTION FALLACY](#). [Named after a fictitious bank teller called Linda]

linear model *n.* A mathematical model represented by a linear equation of the form $Y = b_1X_1 + b_2X_2 + \dots + b_nX_n$, or by a system of such linear equations. The relationship between the variables in a linear equation is a straight line when plotted on a graph. In ***multiple regression**, Y represents the estimated value of the ***dependent variable**, each of the X_i represents a ***predictor variable**, and the b_i are regression coefficients or weights. If they are expressed as ***standardized regression coefficients**, then they are represented by the Greek letter beta (β) instead of b and are called beta coefficients. *See also* **BOOTSTRAPPING**.

linear perspective *n.* One of the monocular cues of visual ***depth perception**, a form of ***perspective** closely related to ***aerial perspective** and ***texture gradient**, arising from the fact that an object of a fixed size subtends a smaller ***visual angle** when it is far away than when it is relatively close, so that parallel lines such as rail tracks appear to converge towards a ***vanishing point** at the horizon. *See also* **CARPENTERED WORLD**, **LEANING TOWER ILLUSION**.

linear regression *See* **REGRESSION ANALYSIS**.

line bisection test *n.* A simple test in which a person is asked to mark the approximate midpoint of a straight line. People with ***spatial neglect** perform badly on this test, tending to ignore part of the line and consequently to divide it too far towards the other side.

line graph *n.* A depiction of the relation between two ***variables** (in a *simple line graph*) with the horizontal and vertical axes representing the two variables, and points, connected with line segments representing values on these variables. A line graph showing the relationships between more than one pair of variables is called a *multiple line graph*. *See also* **ERROR BAR**. [From Latin *linea* a line or string + Greek *graphein* to write]

lingam *n.* The Hindu phallic symbol representing the god Shiva, associated with the powers of reproduction and dissolution. *See* **PHALLUS**. [From Sanskrit *linga* a mark or sexual characteristic]

linguistic competence *n.* Another name for ***competence (2)**.

*****ebook converter DEMO Watermarks*****

linguistic determinism *n.* The theory propounded originally by the US fire prevention officer and linguist Benjamin Lee Whorf (1897–1943) that language determines the way people perceive the world and think, rather than vice versa. Whorf argued that because the North American Hopi Indians have only one word (*masa'yataka*) for everything that flies, apart from birds, they do not perceive and conceptualize the distinctions between insects, aircraft, bats, and aviators that English-speakers do; and analogously, English-speakers do not perceive and conceptualize the distinctions between different kinds of snow that are distinguished in the language of the Inuit Eskimos, who have twelve separate words for specific kinds of snow (although only one word meaning snow in general), the popular myth that the Eskimos have hundreds of words for snow having originated in 1911 in the introduction by the German-born American anthropologist Franz Boas (1858–1942) to his *Handbook of North American Indian Languages*. The theory of linguistic determinism has been undermined by evidence such as that of the Dani tribesmen in Papua New Guinea, who have only two words for colours (usually translated as *light* and *dark*), but can distinguish between colours as well as people from Western cultures. *See also* [LINGUISTIC RELATIVITY](#), [POLYONYMY](#), [SAPIR–WHORF HYPOTHESIS](#).

linguistic performance *n.* Another name for [*performance \(2\)](#).

linguistic relativity *n.* The hypothesis first suggested by the German ethnologist Wilhelm von Humboldt (1767–1835) and reformulated in the 20th century by the US fire prevention officer and linguist Benjamin Lee Whorf (1897–1943) that people who speak different languages perceive reality and think differently, because categories and distinctions encoded in one language are not necessarily available in another. For example, the language of the North American Hopi Indians has no forms corresponding to English tenses and no words for conceptualizing time as a dimension; therefore, Whorf argued, it would be difficult for a Hopi and an English-speaking physicist to understand each other's thinking about time. *See also* [LINGUISTIC DETERMINISM](#), [SAPIR–WHORF HYPOTHESIS](#).

linguistics *n.* The scientific study of language, the major branches of which include [*phonetics](#), [*phonology](#), [*semantics](#), [*syntax](#), and [*pragmatics](#). *Compare* [PSYCHOLINGUISTICS](#).

*****ebook converter DEMO Watermarks*****

linguistic universals *n.* Linguistic features that are believed to be common to all **natural languages*. They are usually divided into three classes: **substantive universals*; **formal universals*; and **implicational universals*. *See also* CREOLE.

linkage *n.* In genetics, the occurrence of two **genes* close together on the same **chromosome*, so that they are unlikely to become separated during **crossing over* and tend to be inherited together. *See also* GENE MAPPING, INDEPENDENT ASSORTMENT.

linking r *n.* A type of **intrusion* in fluent speech, especially **allegro speech*, in which the phoneme /r/ is pronounced in such phrases as *the car in the photo* or *the floor of the House*, even by a non-**rhotic* speaker (such as one who uses **Received Pronunciation*) who does not normally pronounce the /r/ in *car* or *floor*. *Compare* INTRUSION.

lipid *n.* Any of a group of organic compounds, including especially fats and waxes that are esters of fatty acids, that together with carbohydrates and proteins are the principal constituents of living cells and are soluble in alcohol and other solvents but not in water. [From French *lipide*, from Greek *lipos* fat]

lipid bilayer *n.* A double layer of **amphipathic* lipid molecules that forms a **cell membrane* (see *illustration*).

Lipid bilayer

lipogram *n.* A written text from which a specific letter is absent

throughout. The most ambitious example is the 50,000-word novel *Gadsby* (1939) by Ernest Vincent Wright (1872–1939) in which the letter *e*, normally the most frequent in English, does not appear; this is a serious novel intended to present a different picture of the US from *The Great Gatsby* (1925) by (Francis) Scott (Key) Fitzgerald (1896–1940). A more recent novel entitled *A Void* (1995), a translation by the Scottish writer Gilbert Adair (1944–2011) of *La Disparation* (1969) by the French novelist Georges Perec (1936–82), also omits the letter *e* throughout. The accidental omission of letters or words from writing is called *lipography* or **haplography*. [From Greek *leipein* to omit + *gramma* a letter]

lipostatic theory *n.* A **homeostatic* theory of hunger according to which the brain monitors the level in the blood of free fatty acids that result from the metabolism of fat. A low level indicates that fat has not recently been metabolized, and this leads to a lessening of hunger, whereas a high level indicates recent fat metabolism and increases hunger. *Compare* *GLUCOSTATIC THEORY*. [From Greek *lipos* fat + *statikos* bringing to a standstill, from *histanai* to cause to stand or to weigh in a balance + *-itikos* resembling or marked by]

liquid *n.* A speech sound articulated by narrowing the mouth passage but allowing the airstream to escape without turbulence. In English, there are two liquids /l/ and /r/ as in the initial **phonemes* in the words *lung* and *rung*, and both are **approximants*. *See also* *MANNER OF ARTICULATION*.

Lissajous figure *n.* A curve traced out by a point moving in simple harmonic motion in two directions perpendicular to each other, the shape of the curve being determined by the relative frequencies and phases of the motion. If the motion is observed for some time on an oscilloscope screen, the direction of apparent rotation appears to reverse spontaneously. [Named after the French physicist Jules Antoine Lissajous (1822–80) who first constructed it]

lithium *n.* A soft, silvery, **alkaline* metal, lighter than any other yet discovered. *See also* *LITHIUM CARBONATE*. [From Greek *lithos* stone + Latin *-ium* indicating a metallic element]

lithium carbonate *n.* A salt of ***lithium**, used as a mood stabilizer in the treatment of acute ***manic episodes** and ***bipolar disorders** in general, by replacing sodium in body tissues, thereby affecting the permeability of their membranes. It curbs both manic and depressive episodes by stabilizing levels of the neurotransmitter ***glutamate** in the brain. It, or its close relative lithium citrate, is also used in the treatment of ***hypomanic episodes** and (more controversially and at best indirectly) ***depressive disorders**. Also called simply *lithium*. See also **ANTIMANIC**, **MOOD STABILIZER**, **ORPHAN DRUG**.

Little Hans *n.* In ***psychoanalysis**, the pseudonym of a 5-year-old boy with an irrational fear of horses (hippophobia) who was analysed by his father in 1906–8 with the advice of Sigmund Freud (1856–1939) and discussed in an article by Freud in a famous case study in 1909 entitled ‘Analysis of a Phobia in a Five-Year-Old Boy’ (*Standard Edition*, X, pp. 5–149), in which the phobia was traced to a ***castration complex**.

little thirty *n.* Specific personality ***traits** associated with the ***Big Five** personality factors. Each of the Big Five is described by six traits on which it loads most heavily, for example, ***extraversion** is associated with warmth, sociability, positive emotions, excitement-seeking, activity, and assertiveness. The little thirty is a finer-grained way of describing personality than the Big Five, which tend to obscure anomalies such as that of the ***passive–aggressive personality disorder**, which is characterized by high assertiveness but low warmth.

Lloyd Morgan's canon *n.* A frequently paraphrased doctrine propounded in 1894 by the British zoologist and geologist C(onwy) Lloyd Morgan (1852–1936) in his *Introduction to Comparative Psychology*: ‘In no case may we interpret an action as the outcome of the exercise of a higher psychical faculty, if it can be interpreted as the exercise of one which stands lower in the psychological scale’ (p. 53). It is an application of ***Ockham's razor**, implying as it does that psychology must seek the simplest explanations. Morgan was anticipated by the German psychologist Wilhelm (Max) Wundt (1832–1920) who wrote in 1863 in his *Vorlesungen über die Menschen- und Tierseele* (translated into English as *Lectures on Human and Animal Psychology*) that in psychological matters recourse should be had to ‘complex principles of explanation [only] when the simplest ones have

*****ebook converter DEMO Watermarks*****

proved inadequate' (p. 350 of the English translation).

loan translation *n.* A word or phrase borrowed from another language by translating its component parts separately and literally, as in the English word *superman* taken from the German *Übermensch*. Also called a *calque*.

lobe *n.* A structurally distinct and usually rounded part of any larger organ or body part. The four lobes of each **cerebral hemisphere* are the **frontal lobe*, the **parietal lobe*, the **temporal lobe*, and the **occipital lobe* (see *illustration*). [From Latin *lobus* a lobe, from Greek *lobos* an earlobe]

Lobes of the brain. F, frontal lobe; P, parietal lobe; O, occipital lobe; T, temporal lobe.

lobectomy *n.* Surgical excision of a lobe of an organ, especially excision of the prefrontal areas of the **frontal lobe* of the brain. *Compare* PREFRONTAL LEUCOTOMY. [From Greek *lobos* a lobe + *ectome* an excision, from *tome* a cut]

lobotomy *n.* 1. Surgical severing of one or more nerve fibres in the **frontal lobe* of the brain as a method of treating intractable **mental disorders*. More correctly called **frontal lobotomy* or **frontal leucotomy*. 2. Surgical removal or disconnection of a lobe of any organ. [From Greek *lobos* a lobe + *tome* a cut]

local feature *n.* A stimulus **feature* (1), such as an indentation in the outline of a visual image or a click in an auditory tone, that is characteristic of part of the stimulus rather than of the stimulus as a whole. *See also* NAVON FIGURE. *Compare* GLOBAL FEATURE.

localization *n.* 1. Determining the position of something. *See also* ECCENTRIC PROJECTION, EGOCENTRIC LOCALIZATION, SOUND LOCALIZATION. 2. Becoming characteristic of a particular region in attitudes or behaviour. 3. Restricting something to a particular region.

localization of function *n.* The specialization of different areas of the brain for different operations, activities, or processes. *Compare* EQUIPOTENTIALITY, MASS ACTION.

local processing *n.* *See* LOCAL FEATURE, NAVON FIGURE.

local sign *n.* Information from a **photoreceptor* in the eye indicating direction in space, or from a **touch receptor* indicating a specific point on the body.

loci, method of *See* METHOD OF LOCI.

lock-and-key theory *n.* Another name for the **stereochemical theory* of odour, so called because molecules with particular shapes are assumed to fit specific olfactory receptors as keys fit locks.

locked-in syndrome *n.* A condition resulting from bilateral destruction of the **medulla oblongata* or base of the **pons*, resulting in **paralysis* of all voluntary muscles except those of the eyes, with intact consciousness but loss of speech, and communication only through blinking or eye movements. Also called *pseudocoma*. *Compare* PERSISTENT VEGETATIVE STATE.

locomotor ataxia *n.* A form of **ataxia* resulting from syphilis, with slow degeneration of nerve fibres, muscular **atrophy*, and gradual loss of deep tendon reflexes. Also called *tabes dorsalis*. *Compare* GAIT ATAXIA.

locura *n.* A ***culture-bound syndrome** resembling a chronic ***psychosis** (1) found in several parts of Latin America and among Latino communities in the United States and elsewhere, with signs and symptoms such as ***incoherence**, ***psychomotor agitation**, auditory and visual ***hallucinations**, and sometimes outbursts of violent or aggressive behaviour. It is often interpreted as a form of ***schizophrenia**. [Spanish *locura* madness]

locus *n.* **1.** A specific place or region, especially the position occupied by a particular ***gene** or ***allele** on a ***chromosome**, as in a locus for eye colour. Also called a *gene locus*. **2.** In mathematics, a set of points satisfying a specified condition, such as all points whose distance from a fixed point P is a constant, or all points satisfying the equation $r^2 = x^2 + y^2$, where r is a constant, both of which conditions define a circle. **loci** *pl.* [From Latin *locus* a place]

locus coeruleus *n.* A small region on either side of the ***pons** containing neurons that secrete ***noradrenalin** (norepinephrine) and ***serotonin**, prominently implicated in anxiety and fear, and responsible for initiating ***REM sleep** after a period of slow-wave sleep. Also spelt *locus ceruleus*. See also **SUBCOERULEAR NUCLEUS**. [From Latin *locus* a place + *caelum* sky, referring to its deeply pigmented appearance]

locus of control *n.* A ***cognitive style** or personality ***trait** characterized by a generalized expectancy about the relationship between behaviour and the subsequent occurrence of ***reinforcement** (1) in the form of reward and punishment. People with *internal* locus of control tend to expect ***reinforcements** (1) to be the consequences of their own efforts or behaviour, whereas people with *external* locus of control expect them to be the consequences of chance, luck, fate, or the actions of powerful others. Between these two extremes lies a ***continuum** of intermediate cognitive styles. The concept was introduced by the US psychologist E. Jerry Phares (1928–2007) and first published in the *Journal of Abnormal and Social Psychology* in 1957. In an article in the journal *Psychological Monographs* in 1966, the US psychologist Julian B(ernard) Rotter (1916–2014) introduced the ***internal–external scale** to measure it. Also called *internal–external control of reinforcement*. See also **CORE SELF-EVALUATION**, **SOCIAL LEARNING**.

locutionary act *n.* The **speech act* of uttering a meaningful sentence. Compare *ILLOCUTIONARY ACT*, *PERLOCUTIONARY ACT*. [From Latin *locutio* an utterance, from *loqui* to speak]

logagnosia *n.* Another name for **Wernicke's aphasia*. Also called *logamnesia*. See *APHASIA*.

logic *n.* The branch of philosophy devoted to the study of valid arguments, or (equivalently) of consistent sets of beliefs, involving the application of rules of **inference* to draw valid conclusions from sets of **premises*. An argument is a set of statements purporting to provide a reason for believing a certain statement, and it is valid if its **counterexample set* is inconsistent. More specifically, a logic is any particular formal system of axioms and rules of inference, or the arrangement of elements in a computer designed to perform a specified computation; and more generally logic is any sound or valid method of argument or reasoning, or **rational* thinking as distinct from irrationality. See also *ANALYTIC STATEMENT*, *BICONDITIONAL*, *BOOLEAN*, *CONDITIONAL REASONING*, *DEONTIC LOGIC*, *FUZZY LOGIC*, *INTERPRETATION (3)*, *LEMMA (1)*, *LOGICAL ANALYSIS*, *LOGICAL POSITIVISM*, *MODAL LOGIC*, *MONOTONICITY*, *MOOD (3)*, *NEGATION (3)*, *PROPOSITIONAL CALCULUS*, *QUANTIFIER (1)*, *SENTENCE FUNCTOR*, *SYLLOGISM*, *SYNTHETIC STATEMENT*, *TRUTH FUNCTOR*, *TRUTH TABLE*. **logical** *adj.* [From Greek *logike* (*techne*) (art) of reason, from *logikos* of or relating to speech or reasoning, from *logos* word, discourse, or reason]

logical analysis *n.* In **logic*, the process of combining short sentences into longer sentences and then finding other sentences that mean the same as the sentences built up in this way. It is an activity somewhere between translating and paraphrasing, and it can be performed quite mechanically, according to strict rules. Some logicians believe that it uncovers the true underlying forms of the sentences that they analyse, whereas others believe that it is part of an enterprise to replace natural languages such as English with a new and more rational language. See also *PROPOSITIONAL CALCULUS*, *TRUTH TABLE*.

logical empiricism *n.* An influential approach to the philosophy of science, less radical than **logical positivism*, associated especially with the writings of three US philosophers of science, namely the German-born
*****ebook converter DEMO Watermarks*****

Rudolph Carnap (1891–1970), the Czechoslovakian-born Ernest Nagel (1901–85), and the German-born Hans Reichenbach (1891–1953), according to which the aim of research in both the natural and social sciences is the discovery and justification (testing) of general laws, a sharp distinction being drawn between the context of discovery and the context of justification. *See also* [EMPIRICISM](#), [FALSIFIABILITY](#).

logical positivism *n.* A largely obsolete philosophical doctrine that rejected metaphysics, theology, and ethics as meaningless and held that the only meaningful [*propositions](#) (1) are those consisting of elementary propositions that are either tautological or empirically verifiable. *See also* [CONFIRMATION BIAS](#), [EMPIRICISM](#), [FALSIFIABILITY](#), [HUME’S FORK](#), [OPERATIONALISM](#). *Compare* [LOGICAL EMPIRICISM](#), [POSITIVISM](#) (1).

log-interval scale *n.* A scale of measurement in which numbers are assigned so that ratios between values reflect ratios in the [*attribute](#) being measured, familiar examples being density (mass divided by volume) and fuel efficiency in miles per gallon or kilometres per litre. *See also* [MEASUREMENT LEVEL](#), [SCALE](#) (1). *Compare* [ABSOLUTE SCALE](#), [INTERVAL SCALE](#), [NOMINAL SCALE](#), [ORDINAL SCALE](#), [RATIO SCALE](#). [So called because the logarithms of the scale scores form an interval scale, the reason being that the ratio $\log(a/b) = \log a - \log b$]

log-linear analysis *n.* In statistics, a technique for analysing [*frequency](#) (2) data to investigate the relationships among the variables in a cross-tabulation by modelling the logarithm of the frequency in a cell as a function of [*main effect](#) and [*interaction effects](#). Unlike the [*chi-square test](#), log-linear analysis is capable of analysing the effects of more than one independent variable on a dependent variable and of estimating not only [*main effects](#) but also [*interaction effects](#). *See also* [MULTIWAY FREQUENCY ANALYSIS](#), [SATURATION](#) (2).

logogen *n.* A representation of a word or other verbal unit in long-term memory, activated by speech sounds, writing, or an object or event to which it refers. In [*tachistoscopic](#) word recognition, for which the concept was originally devised, each logogen has a resting activation level, and if it receives evidence that it corresponds to the stimulus presented, its activation

*****ebook converter DEMO Watermarks*****

level increases: for example, if the observer recognizes the first letter of the display as a *p*, then in the observer's long-term memory all the logogens beginning with *p* are slightly activated, and as further evidence accumulates, if the activation level of a logogen exceeds a certain threshold level (threshold levels being lower for more common verbal expressions), then the logogen 'fires' and the corresponding verbal unit is recognized. The term was introduced by the English cognitive psychologist John Morton (born 1933) in an article in the journal *Psychological Review* in 1969, and the theory has been modified several times since then by Morton and others. *Compare IMAGEN*. [From Greek *logos* a word + *genes* born]

logograph *n.* A representation of a complete **morpheme*, word, or phrase in a single character or symbol, as in the writing systems of China and Japan or internationally recognized symbols such as % for *per cent*, ÷ for *divided by*, @ for *at*, © for *copyright*, and so on. The great Chinese dictionary of K'ang Hsi (1662–1722) contains almost 50,000 logographs, but basic literacy in modern Chinese is usually assumed to require knowledge of some 2,000 basic logographs, and the Japanese Ministry of Education prescribes 1,850 characters as essential for everyday use, of which 881 are taught to elementary schoolchildren. Also called a *logogram*. *See also KANJI*. *Compare IDEOGRAPH, PICTOGRAPH*. **logographic** *adj.* [From Greek *logos* a word + *graphein* to write]

logography *n.* A system of writing based on **logographs*. *Compare PHONOGRAPHY*. **logographic** *adj.*

logorrhoea *n.* Excessive, uncontrollable talking or verbal diarrhoea. US *logorrhea*. Also called *lalorrhoea*. [From Greek *logos* a word + *rhoia* a flow]

logotherapy *n.* A form of **psychotherapy* developed by the Austrian psychiatrist Viktor E. Frankl (1905–97) that capitalizes on people's will to meaning (rather than their will to power or the will to pleasure), attempts to restore a sense of meaning by encouraging meaningful and creative activities and experiences of art, nature, and culture, and encourages self-acceptance and an appreciation of one's place in the world by a close study of one's attitudes to work, love, and life in general, using techniques such as **paradoxical intention* and **de-reflection*. [From Greek *logos* word,

*****ebook converter DEMO Watermarks*****

discourse, or reason + English *therapy*, intended to denote meaning-centred therapy]

Lomotil *n.* A proprietary name for a **narcotic* drug containing an antiperistaltic agent (diphenoxylate hydrochloride) and an anticholinergic agent (atropine sulphate), used in the treatment of diarrhoea and sometimes taken as a street drug for its psychotropic effects. [Trademark]

longitudinal fissure *n.* The long deep groove separating the two **cerebral hemispheres* of the brain. Also called the *interhemispheric fissure*, *principal sulcus*, *longitudinal sulcus*, or *sulcus principalis*. [From Latin *longitudo*, *longitudinis* length, from *longus* long]

longitudinal study *n.* A research design in which the same sample of research participants or subjects is examined repeatedly over an extended span of time, typically to investigate problems of developmental psychology. *See also* *PANEL STUDY*. *Compare* *CROSS-SECTIONAL STUDY*.

long-sightedness *n.* A non-technical name for **hyperopia*.

long-term memory *n.* A type of **memory* containing information that is stored for periods ranging from about 30 seconds to many decades, often differentiated into **episodic memory* for events and experiences and **semantic memory* for information about the world, although **perceptual memory* may not fall into either category. Also called *secondary memory*. *See also* *ACT**, *DECLARATIVE MEMORY*, *EPISODIC MEMORY*, *LEVELS OF PROCESSING*, *PROCEDURAL MEMORY*, *SEMANTIC MEMORY*, *WORKING MEMORY*. *Compare* *SENSORY MEMORY*, *SHORT-TERM MEMORY*. **LTM** *abbrev.*

long-term potentiation *n.* A process necessary for **consolidation* of certain types of memory traces, occurring prominently in the **hippocampus* but also in other brain regions, involving cells showing increased sensitivity to new stimulation as a result of prior excitation, believed to be based on **Hebb synapses*. It is promoted by **opiates*, **noradrenalin* (norepinephrine), and **dopamine*. **LTP** *abbrev.* [From Latin *potentia* power or force + *-ation* indicating a process or condition]

long-term store *n.* Another name for **long-term memory*. **LTS** *abbrev.*

look-and-say method *n.* Another name for the **whole-word method*.

looming *n.* Accelerating increase in the **angular size* of a visual image, usually indicating that an object is approaching the face and that a collision is imminent, eliciting reflex avoidance reactions in most animals, including humans even in early infancy, but triggering landing behaviour in flies and other insects. Also called *retinal expansion*.

loosening of associations *n.* A form of **thought disorder*, closely related to **cognitive derailment*, characterized by speech that shifts between topics only minimally related to one another, usually without the speaker being aware of the disconnectedness of the stream of ideas. *See also* **HOMONYM SYMPTOM**. *Compare* **DISORGANIZED SPEECH**, **DISORGANIZED THINKING**, **INCOHERENCE**.

lorazepam *n.* A **benzodiazepine* drug used as an **anxiolytic* and **sedative*. Also called *Ativan* (trademark).

lordosis *n.* Arching of the spine with a concave back and raised pelvis, a posture adopted by females of many animal species when sexually aroused. It is contrasted with kyphosis (hunchback curvature), or scoliosis (lateral curvature). [From Greek *lordos* bent back + *-osis* indicating a process or state]

lordosis quotient *n.* A standard index of the relative sexual receptivity of a female animal in the presence of males, given by the number of times the female adopts a posture of **lordosis* in a specified time period divided by the number of times a male mounts her.

loss aversion *n.* The observation that a loss generally has a greater subjective effect than an equivalent gain. *See* **PROSPECT THEORY**. *See also* **ENDOWMENT EFFECT**. *Compare* **RISK AVERSION**. **loss-averse** *adj.*

lost-letter technique *n.* An **unobtrusive measure* of attitudes in which

stamped addressed envelopes are scattered in public places, as if left by accident, the proportion being posted by members of the public and turning up at the addresses on the envelopes providing a crude index of attitudes in the community. For example, if half the envelopes are addressed to a pro-abortion organization and half to an anti-abortion organization, and if equal numbers of pro-abortion and anti-abortion envelopes are distributed but significantly more of the anti-abortion envelopes are returned, then it may be concluded that members of the community are more favourably disposed towards the anti-abortion than the pro-abortion cause. The technique was introduced by the US psychologist Stanley Milgram (1933–84) and colleagues in an article in the journal *Public Opinion Quarterly* in 1965.

loudness *n.* The experienced or subjective intensity of sound, corresponding to its **decibel* sound pressure level, its standard unit of measurement being the **phon*. Also called *volume*, though that word carries further connotations. *See also* *AMPLITUDE*, *DECIBEL*, *EQUAL-LOUDNESS CONTOUR*, *LOUDNESS LEVEL*, *RECRUITMENT (2)*, *VOLUME (2)*. **loud** *adj.*

loudness level *n.* In relation to any specified sound, the intensity level in **decibel* sound pressure level of a **pure tone* with a frequency of 1,000 hertz (about two octaves above Middle C) that is judged by the listener to be equivalent to it in loudness. *See also* *EQUAL-LOUDNESS CONTOUR*, *PHON*.

loudness matching *n.* In **psychophysics*, a procedure in which a listener adjusts the intensity of a tone until it seems equal in loudness to a comparison tone, used to map **equal-loudness contours*.

loudness recruitment *n.* Another name for **recruitment (2)*.

Lou Gehrig's disease *n.* Another name for **amyotrophic lateral sclerosis*. [Named after an American baseball player Henry Louis Gehrig (1903–41), known as the Iron Horse, who died of it]

love *n.* An intense feeling of fondness or attraction, deeper and stronger than liking, especially when associated with a romantic or sexual attachment to someone. According to a popular taxonomy proposed by the Canadian sociologist John Alan Lee (1933–2013) in *The Colors of Love: An*
*****ebook converter DEMO Watermarks*****

Exploration of the Ways of Loving (1973), there are three primary and three secondary types of love that blend into different shades like colours, the three primary types being *eros* (erotic or passionate love), *ludus* (ludic or playful love), and *storge* (storgic or friendly/affectionate love), and the three secondary types *pragma* (pragmatic or utilitarian love, a combination of ludus and storge), *mania* (manic or obsessive/possessive love, a combination of eros and ludus), and *agape* (agapic or brotherly love, an altruistic or selfless combination of eros and storge). According to the *triangular theory* of love proposed in 1986 by the US psychologist Robert J(effrey) Sternberg (born 1949), there are three basic components of love, namely *passion* (sexual desire), *intimacy* (confiding and sharing feelings), and *commitment* (intention to maintain the relationship), different combinations of the three components yielding eight basic types: *non-love* (none of the three components present), *infatuated love* (passion only), *liking/friendship* (intimacy only), *empty love* (commitment only), *romantic love* (passion and intimacy), *companionate love* (intimacy and commitment), *fatuous love* (passion and commitment), and *consummate love* (passion, intimacy, and commitment). See also [ATTACHMENT THEORY](#), [EROS](#), [GENITAL LOVE](#), [LIBIDO](#). Compare [ROMANTIC LOVE SCALE](#).

love, genital See [GENITAL LOVE](#).

love scale See [ROMANTIC LOVE SCALE](#).

lowball technique *n.* A technique for eliciting [*compliance](#) that is most often used in commercial transactions. A customer is first induced to agree to purchase an item by being quoted an unrealistically low price. Before the deal is completed, the salesperson claims to have discovered a mistake and tells the customer that the sale can go ahead only at a much higher price. Having made a commitment, the customer is more likely to agree than if the true price were revealed at the outset. The technique was named and first studied experimentally in 1978 by the US social psychologist Robert B(eno) Cialdini (born 1945), who discovered it while being trained as a car salesman. Cialdini and several colleagues performed a field experiment in which they first tried to persuade students to agree to volunteer to serve as experimental participants, and 56 per cent agreed. They then told the volunteers that the study was scheduled for 7 a.m., and the volunteers were given the

*****ebook converter DEMO Watermarks*****

opportunity to withdraw, but none did so, and 95 per cent of them actually turned up at the appointed time. However, when a control group were asked to participate and were told the unsocial timing of the experiment up front, only 24 per cent agreed to participate. *See also* [DOOR-IN-THE-FACE TECHNIQUE](#), [FOOT-IN-THE-DOOR TECHNIQUE](#). **lowballing** *vb.* Using the lowball technique. [From *lowball* in baseball, a ball pitched to pass over the plate below the level of the batter's knees, alluding to a quoted price or estimate that is deceptively or misleadingly low]

lower threshold *n.* The lesser of the two thresholds determined by the **method of limits*.

low-pass filter *See* [BAND-PASS FILTER](#).

low vowel *n.* Another name for an **open vowel*.

LSD *abbrev.* Lysergic acid diethylamide, a crystalline compound first synthesized from lysergic acid in 1943 and since the 1960s widely used as a street drug. It acts as a **serotonin *agonist* (3) and has powerful **hallucinogenic* and **psychedelic* effects that can mimic **psychotic* (1) states. Its most common street name is *acid*. *See also* [HALLUCINOGEN-RELATED DISORDERS](#), [PHANTASTICANT](#).

lucid dream *n.* A **dream* (1) in which the dreamer is aware of being asleep and dreaming and is sometimes able to control the course of events in the dream. [From Latin *lucidus* clear, from *lucere* to shine, from *lux* light]

luciferase *n.* An enzyme that is present in all **bioluminescent* organisms and that reacts with **luciferin*, producing light as the luciferin returns to its ground state after enzymatic oxidation. [From Latin *lucifer* light-bearer + Greek *-ase* denoting an enzyme, from *diastasis* separation]

luciferin *n.* A chemical compound involved in **bioluminescence*, present in certain organisms such as deep-sea fishes, fireflies, and glow-worms. It is oxidized by the enzyme **luciferase* and emits light on decaying to its ground state. [From Latin *lucifer* light-bearer + *-in(a)* indicating an organic

compound]

Luckiesh illusion *n.* A more appropriate name for what is usually called the ***Sander parallelogram**. [First published by the US lighting engineer and psychologist Matthew Luckiesh (1883–1967) in his book *Visual Illusions: Their Causes, Characteristics and Applications* (1922, p. 58)]

ludic love *n.* A primary type of ***love** that is playful and flirtatious. *Compare* AGAPIC LOVE, EROTIC LOVE, MANIC LOVE, PRAGMATIC LOVE, STORGIC LOVE. [From Latin *ludere* to play + *-ikos* of, relating to, or resembling]

lumen *n.* **1.** A unit of ***luminous intensity**, equal to the ***luminous flux** emitted or reflected in a solid angle of one steradian (a stereo radian or solid angle with its vertex at the centre of a sphere cutting off an area of the sphere's surface equal to the square of its radius) by a point source having a uniform intensity of one ***candela**. *See also* BRIL, FOOT-CANDLE. **Im abbrev.** **2.** A cavity within an organ, such as any of the hollows within the ***central nervous system** filled with cerebrospinal fluid, including the cerebral ***ventricles** and the ***central canal** of the spinal cord. [From Latin *lumen* light or aperture]

Luminal *n.* A proprietary name for the barbiturate drug ***phenobarbital** (phenobarbitone). [Trademark]

luminance *n.* The amount of light per unit area emitted or reflected by an object or surface, hence the intensity of the emitted or reflected light, giving rise to the visual sensation of ***brightness** or ***lightness**, its standard measure being in ***candelas** per square metre. *See also* CONTRAST RATIO, GELB EFFECT, KARDOS EFFECT, REFLECTANCE, TROLAND. *Compare* LUMINOSITY, LUMINOUS FLUX, LUMINOUS INTENSITY. **L abbrev.**

luminosity *n.* The perceived ***brightness** or ***lightness** of an object or surface emitting or reflecting light, corresponding to its physical ***luminance**.

luminosity coefficient *n.* Any of the weights attached to a wavelength in the ***luminous efficiency function**.

luminosity curve *n.* A graph depicting the intensity of light that is required at each point in the visible spectrum for the colours to appear equally bright, a **photopic luminosity curve* being required for vision in bright light and a **scotopic luminosity curve* for vision in dim light.

luminous efficiency function *n.* A function that predicts the perceived **brightness* of light as a weighted combination of its component wavelengths, the weights or luminosity coefficients being derived from averaged **luminosity curves* of representative viewers. A *photopic luminous efficiency function* is required for cone-mediated vision in bright light and a *scotopic luminous efficiency function* for rod-mediated vision in dim light.

luminous flux *n.* A measure of the rate of emission or reflection of light from an object or surface, its standard unit of measurement being in **lumens*. Symbol: Φ . Compare LUMINANCE, LUMINOUS INTENSITY.

luminous intensity *n.* The amount of light per unit area emitted or reflected by an object or surface, expressed in terms of **luminous flux* per steradian (a stereo radian or solid angle with its vertex at the centre of a sphere cutting off an area of the sphere's surface equal to the square of its radius), its standard unit of measurement being the **candela*. See also PHOTOMETER. Compare LUMINANCE, LUMINOUS FLUX. **I** abbrev.

lunacy *n.* An obsolete term for any severe **mental disorder*, thought to be associated with phases of the moon. Empirical studies have consistently failed to find any significant correlation between phases of the moon and admissions to mental hospitals, suicides, or any other objective index of mental disorder. **lunatic** *n.* One afflicted with lunacy. [From Latin *luna* the moon]

lunatic asylum *n.* An obsolete term for a mental hospital.

lunatic fringe *n.* An abusive term for people who adopt or support views that others consider extreme or fanatical.

luteal phase *n.* The second phase of the **oestrous cycle* or **menstrual*

cycle, characterized by the formation of the ***corpus luteum** and secretion of ***progesterone** from it. In the absence of pregnancy, it culminates in a rapid fall in progesterone and the onset of ***menstruation**, which in turn is followed by the ***follicular phase**. Also called the *secretory phase*. See also **LATE LUTEAL PHASE DYSPHORIC DISORDER**, **LUTEINIZING HORMONE RELEASING HORMONE**. Compare **FOLLICULAR PHASE**, **MENSTRUAL PHASE**. [Named after the corpus luteum]

luteinizing hormone *n.* A gonadotrophic hormone secreted by the anterior pituitary. In females, it stimulates ***ovulation** and the formation of the ***corpus luteum**; in males it stimulates ***androgen** secretion. Also called *interstitial-cell-stimulating hormone (ICSH)*, especially in males. See also **LUTEINIZING —HORMONE RELEASING HORMONE**, **OESTROUS CYCLE**. Compare **FOLLICLE-STIMULATING HORMONE**. **LH** abbrev. [From Latin *luteum* egg yolk, from *luteus* yellow]

luteinizing hormone releasing hormone *n.* A ***releasing hormone** that is secreted by the hypothalamus in response to a ***biological clock** at the beginning of a woman's ***menstrual cycle** and that in turn stimulates the pituitary gland to secrete ***luteinizing hormone**. Also called *gonadotrophin-releasing hormone* **LH-RH** abbrev.

luteotrophic hormone *n.* Another name for ***prolactin**. Also spelt *luteotropic hormone*. Also called *luteotrophin* (or *luteotropin*). **LTH** abbrev. [From Latin *luteum* egg yolk, from *luteus* yellow + *trophe* nourishment]

Luvox *n.* A proprietary name for the antidepressant drug ***fluvoxamine**. [Trademark]

lux *n.* The standard SI unit of ***illuminance** or illumination, equal to 1 ***lumen** per square metre, equivalent to 0.0929 foot-candle. [From Latin *lux* light]

lycanthropy *n.* 1. The magical transformation of a person into a wolf. 2. A ***delusion** that one is a wolf. Cases have been traced back to Nebuchadnezzar II (605–562 BC), King of Babylon, who was apparently so deluded. [From Greek *lykos* a wolf + *anthropos* a person]

lymph *n.* The pale yellow fluid, consisting chiefly of a liquid similar to blood plasma and white blood cells or leucocytes, that is collected from body tissues and transported through a network of capillary vessels called the lymphatic system before flowing passively into the bloodstream through the thoracic duct. [From Latin *lympa* water, cognate with Greek *nymphē* a nymph]

lymphocyte *n.* Any of a group of **leucocytes*, including **B lymphocytes* and **T lymphocytes*, that are present in the blood and lymph and that play an important part in the **immune system*. *See also* GRANULOCYTE, MONOCYTE. [From Latin *lympa* water + Greek *kytos* a vessel]

Lysenkoism *n.* A form of **neo-Lamarckism*, based on the assumption that acquired characteristics can be passed on by heredity. It seriously handicapped Soviet biology and agricultural production from 1948 until the death of Stalin in 1953. [Named after the Ukrainian geneticist and agronomist Trofim Denisovich Lysenko (1898–1976) who propounded it in his book *Agrobiology* in 1948, which earned him the Stalin Prize in 1949]

lysergic acid diethylamide *See* LSD.

lysosome *n.* Any of the tiny particles containing digestive enzymes that are present in the cytoplasm of most cells, contained within membranes to prevent self-digestion of the cells. *See also* RETROGRADE TRANSPORT. [From Greek *lysis* loosening + *soma* a body]

mace *n.* A spice prepared by grinding the dried, reddish, fleshy outer covering of the nutmeg. Not to be confused with ***Mace**. See **MYRISTIN**. [From Latin *macir* mace]

Mace *n.* A liquid that, when sprayed in a person's face, acts as a type of ***tear gas**, causing temporary blindness, dizziness, immobilization, and sometimes nausea, and that is used as an ***incapacitant** for personal defence and crowd control. Not to be confused with ***mace**. Compare **BZ GAS**, **CN GAS**, **CS GAS**, **PEPPER SPRAY**. [Trademark]

Mach band *n.* An illusory light or dark strip along the edge of a blurred contour between light and dark areas of an image, the strip on the light side being lighter than the light area of the image and the strip on the dark side darker than the dark area, familiar examples being the light and dark strips that can be seen at the outer and inner edges, respectively, of a blurred shadow cast by the sun or by a table lamp. Such bands have been incorporated deliberately into paintings by artists such as the French neo-impressionist and pointillist Georges Seurat (1859–91), and the phenomenon is called *irradiation* in the literature of art criticism. See also **CRAIK–O'BRIEN EFFECT**. [Named after the Austrian physicist, philosopher, and psychologist Ernst Mach (1838–1916) who first drew attention to the phenomenon in 1865]

Machiavellianism *n.* A strategy of social conduct that involves manipulating others for personal advantage, often to the detriment of the people being thus exploited. The concept was introduced by the US psychologists Richard Christie (1918–92) and Florence L. Geis (1933–93) in

a book chapter in 1968 and discussed in their edited book *Studies in Machiavellianism* (1970), and it is sometimes interpreted as a personality trait. In an experiment in which groups of three players had to reach agreements as to how to divide \$10 among themselves, people who had scored high on the ***Mach scale** tended to end up with significantly more money (\$5.57 on average) than low scorers (\$1.29 average), the chance expectation, had Machiavellianism been unrelated to outcomes, being \$3.33, and other evidence has accumulated to show that high scorers have a propensity to manipulate others to their own advantage, often by lying and cheating. [Named after the Florentine statesman and political philosopher Niccolò Machiavelli (1469–1527) who advocated manipulative political behaviour in his posthumous book *Il Principe* (The Prince, 1532)]

Mach illusion *n.* A visual illusion consisting of an ambiguous line drawing of a folded sheet of paper (see [illustration](#)). *See also* [AMBIGUOUS FIGURE](#). [Named after the Austrian physicist, philosopher, and psychologist Ernst Mach (1838–1916) who published it in 1866]

Mach illusion. It can be seen as either the inside or the outside of a fold.

machine intelligence *n.* Another name for **artificial intelligence*.

Machover Draw-a-Person Test See [DRAW-A-PERSON TEST](#).

Mach scale *n.* A questionnaire designed to measure **Machiavellianism* as a personality trait. It contains items such as the following (agreement indicating high Machiavellianism): *The best way to handle people is to tell them what they want to hear*; *Anyone who completely trusts anyone else is asking for trouble*; and *It is safest to assume that all people have a vicious streak that will come out when it is given a chance*. The scale also contains items such as the following, agreement with which indicates low

Machiavellianism: *When you ask someone to do something for you, it is best to give the real reasons, rather than giving reasons that might carry more weight; One should take action only when sure it is morally right; and There is no excuse for lying to someone.* People who score high on the scale are called *high Machs* and people who score low are called *low Machs*. The scale was introduced in a book chapter in 1968 by the US psychologists Richard Christie (1918–92) and Florence L. Geis (1933–93) and discussed in their edited book *Studies in Machiavellianism* (1970). A version of the scale for use with children is called the *Kiddie Mach*. Also called the *Machiavellianism scale*.

macrocephaly *n.* Congenital enlargement of the head without increased intracranial pressure (*compare* **HYDROCEPHALUS**), resulting in some degree of ***intellectual disability**. **macrocephalic** *adj.* [From Greek *makros* large + *kephale* head]

macroevolution *n.* A relatively slow change brought about by ***natural selection**, leading to the emergence of a ***genus**, ***family (2)**, ***order (3)**, or ***class (2)** of organisms. *Compare* **MICROEVOLUTION**. [From Greek *makros* large + English *evolution*]

macroglia *n.* A generic name for three types of ***neuroglia** found in the central nervous system, namely ***astrocytes**, ***ependymal cells**, and ***oligodendrocytes**. *See also* **GLIA**. *Compare* **MICROGLIA**. [From Greek *makros* large + *glia* glue]

macromania *n.* An unusual name for ***megalomania**. [From Greek *makros* large + *mania* madness]

macrophage *n.* A large ***phagocytic** ***leucocyte** that is abundantly present in the blood, lymph, and connective tissues of most body organs and that ingests invading micro-organisms and scavenges damaged cells and cellular debris. *See also* **STEM CELL**. [From Greek *makros* large + *phagein* to eat]

macropsia *n.* Visual perception of objects as larger than they really are, usually resulting from damage to the ***retinas**, ***epilepsy**, or a ***somatic**
*****ebook converter DEMO Watermarks*****

symptom disorder. Also called *macropsy*. Compare **MICROPSIA**. [From Greek *makros* large + *opsis* sight, from *ops* an eye + *-ia* indicating a condition or quality]

macula *n.* A patch or spot, especially the patch of ***hair cells** aligned approximately horizontally in the ***utricle** and approximately vertically in the ***saccul** when the head is upright, projecting into the gelatinous otolith membrane in the ***vestibular system**. Also an abbreviated name for the ***macula lutea** of the retina. **maculae** *pl.* [From Latin *macula* a spot or stain]

macula lutea *n.* A small yellowish oval-shaped area in the centre of the ***retina**, where ***cones** are especially plentiful and vision most distinct, located 2 millimetres from the ***optic nerve**, containing the ***fovea**. Also called the *yellow spot*. See also **ARAGO PHENOMENON**, **COLOUR ZONE**. **maculae luteae** *pl.* **macular** *adj.* [From Latin *macula* spot + *lutea* yellow]

Madame Butterfly fantasy *n.* A recurrent ***daydream** that a departed loved one will return, found most often in 5–8-year-old children of divorced parents who fantasize about the absent parent returning. [Named after the eponymous heroine of Puccini's opera, *Madame Butterfly*]

mad cow disease *n.* A non-technical name for ***BSE**.

magazine training *n.* In experimental research with an animal in a ***Skinner box**, a preparatory process during which food is delivered without the animal having to press a lever, peck a key, or make any other response. Its purpose is to accustom the animal to the sound and sight of the food being delivered from the magazine to the food hopper so that this does not cause disturbance during the subsequent learning process.

Magendie's foramen *n.* The central opening in the roof of the fourth cerebral ***ventricle**, interconnecting with the ***subarachnoid** space. [Named after the French physiologist François Magendie (1783–1855) + Latin *foramen* a hole, from *forare* to bore or pierce]

Maggie illusion *n.* Another name for the ***Margaret Thatcher illusion**.

magical number seven *n.* A general limitation on human information processing capacity, according to a classic article in the journal *Psychological Review* in 1956 entitled ‘The Magical Number Seven Plus or Minus Two: Some Limits on Our Capacity for Processing Information’ by the US psychologist George A(mritage) Miller (1920–2012), who assembled evidence suggesting that the human mind has a span of absolute judgement that can distinguish about seven distinct categories, a span of **short-term memory* for about seven items, and a **span of apprehension* or attention that can encompass about six items at a time. *See also* [CHUNKING](#), [DYNAMIC MEMORY SPAN](#), [ICONIC STORE](#), [SUBITIZE](#).

magical thinking *n.* **Thinking* that one's thoughts on their own can bring about effects in the world or that thinking something amounts to doing it.

magic mushroom *n.* Any of a number of mushrooms containing substances that are taken as **psychedelic* or **hallucinogenic* drugs, notably the **fly agaric* mushroom *Amanita muscaria* and the **liberty cap* mushroom *Psilocybe semilanceata*. *See also* [TEONANACTYL](#).

Magnan sign *n.* A name given to **formication* when it occurs as a **withdrawal* symptom in cocaine users. Also called the *cocaine bug*. [Named after the French physician Valentin Magnan (1835–1916) who first described it in a co-authored article in 1889]

magnetic resonance imaging *See* [MRI](#).

magnetic sense *n.* A capacity possessed by some species of bacteria, bees, snails, birds, and fishes to detect the Earth's magnetic field, which acts as an aid to navigation. The navigation of European robins (*Erithacus rubecula*) can be altered by superimposing an artificial magnetic field, and homing pigeons with magnets attached to their heads become disoriented when the sky is overcast and they cannot use the sun as a compass. This sense modality has been most extensively studied in the rainbow trout, which can be conditioned to press a bar for food whenever it detects one magnetic field rather than another, and nerve impulses in response to magnetic fields

have been detected in its **trigeminal nerve*, which branches over the front of its head. The magnetic sense organ is believed to contain crystals of magnetite or loadstone, the mineral first used by humans to construct compasses. Chains of these crystals have been located in a discrete layer of the rainbow trout's snout, and they move when the fish changes its orientation to the Earth's magnetic field. Also called the *electromagnetic sense*. Compare ELECTRORECEPTOR.

magnetoencephalography *n.* A method of **brain* imaging through the recording of magnetic fields induced by the electrical activity of brain cells. **MEG** *abbrev.* [From Greek *magnetis* (*lithos*) magnesian (stone) + *enkephalos* the brain, from *en* in + *kephale* the head + *graphein* to write]

magnitude estimation *n.* A scaling method used in **psychophysics* in which an observer assigns numbers to a **variable* stimulus according to its apparent intensity, often after being presented with a **standard stimulus* and told what number to assign to it, as when an observer is told that a standard light stimulus should be assigned a brightness rating of 10 and the variable stimulus should be assigned numbers in relation to it. See also CROSS-MODAL MATCHING, DIRECT SCALING. Compare MAGNITUDE PRODUCTION.

magnitude matching *n.* An application of **cross-modal matching* in **psychophysics* designed to take account of different people's sensory sensitivity in a particular modality by comparing it with a sensation in a different modality. For example, groups of normal tasters and **supertasters* typically rate Coca-Cola slightly above the midpoint on a scale from zero to maximum sweetness, inviting the misleading interpretation that their taste sensations are similar. If both groups are then asked to match the taste sensation to the loudness of a tone, normal tasters typically choose a loudness of about 80 **decibels*, whereas supertasters choose about 90–100 decibels (twice to three times as loud), indicating that supertasters experience double to triple the sweetness of normal tasters.

magnitude production *n.* A **psychophysical* technique in which an observer adjusts a **variable stimulus* until it stands in some prescribed relation of magnitude to a **standard stimulus*, as when an observer adjusts a sound stimulus until it appears equal in loudness, twice as loud, or half as

*****ebook converter DEMO Watermarks*****

loud as a comparison sound. Also called the *production method*. See also [CROSS-MODAL MATCHING](#). Compare [MAGNITUDE ESTIMATION](#).

magnocellular nucleus *n.* A nucleus in the [*medulla oblongata](#), connected to the [*subcoerulear nucleus](#), responsible for [*REM atonia](#). [From Latin *magnus* large + *cella* a room, from *celare* to hide, alluding to the fact that it contains large cells]

magnocellular system *n.* The earlier evolved of the two major visual pathways, originating in large [*ganglion cells](#) in the [*retina](#), projecting to the bottom two layers of the [*lateral geniculate nucleus](#) that contain neurons with large cell bodies, and thence to layer 4C α of the [*primary visual cortex](#) (Area V1). It is characterized by colour-blindness, rapidly conducting axons responsible for perception of movement, high contrast-sensitivity responsive to small differences in brightness, and low resolution. Magnocellular neurons carry information about movement and depth but not colour, whereas some [*parvocellular](#) neurons carry high-resolution information about shape and others low-resolution information about colour and shades of grey. Also called the *magno system*. See also [M CELL \(Y CELL\)](#), [MT](#), [PARASOL CELL](#). Compare [PARVOCELLULAR SYSTEM](#). **M system** *abbrev.* [From Latin *magnus* large + *cella* a room, from *celare* to hide]

main effect *n.* In statistics, in data obtained from an [*analysis of variance](#) ([ANOVA](#)) or the transformed scores of a [*log-linear analysis](#), the mean change in scores resulting from a change in the level of a single independent variable or factor, averaged over all combinations of levels of the other factor(s). Compare [INTERACTION EFFECT](#).

mainline *vb.* In drug-culture slang, to inject a drug intravenously (into a vein). Compare [SKIN-POP](#).

maintenance behaviour *n.* Behaviour carried out by an animal for basic subsistence, including searching for food, finding or constructing suitable shelter, and mating. US *maintenance behavior*.

maintenance rehearsal *n.* The simple repetition (without elaboration) of items that need to be remembered in order to prevent them fading from
*****ebook converter DEMO Watermarks*****

***short-term memory**, as when a person repeats a telephone number over and over while searching for a pen and paper to write it down. It develops spontaneously in children at 6–7 years of age. *See also* **PHONOLOGICAL LOOP**, **REHEARSE (2)**. *Compare* **ELABORATIVE REHEARSAL**.

major affective disorders *n.* A generic name sometimes used to cover ***major depressive disorder** and ***bipolar disorders**.

major depressive disorder *n.* A ***depressive disorder** in ***DSM-5** characterized by one or more ***major depressive episodes** without any history of ***manic**, ***mixed**, or ***hypomanic** episodes. Up to 15 per cent of people with severe major depressive disorder commit suicide each year. Also called *major depression*. *See also* **ANTIDEPRESSANT**, **COGNITIVE THERAPY**, **INOSITOL**, **MHPG**. *Compare* **DYSTHYMIC DISORDER**, **PERSISTENT DEPRESSIVE DISORDER**. **MDD** *abbrev.*

major depressive episode *n.* A ***mood** episode, lasting at least two weeks, characterized by five or more of the following symptoms, including at least one of the first two, for at least two weeks: depressed mood or ***depression** most of the day, almost every day (possibly manifested as irritability in children and adolescents); markedly diminished interest or pleasure in almost all activities for most of the day; loss of appetite or a marked increase in appetite almost every day, leading to significant weight loss or gain; ***insomnia** (especially middle or terminal insomnia) or ***hypersomnia**; ***psychomotor agitation** (manifested by such behaviour as hand-wringing) or ***psychomotor retardation** (manifested by slowness of movement or speech); fatigue or loss of energy (***asthenia**); feelings of worthlessness or excessive or inappropriate guilt; indecisiveness or diminished ability to think or concentrate; recurrent thoughts of death or suicide. At some time in their lives, 5–10 per cent of men and 10–20 per cent of women in the US, the UK, and comparable industrialized countries experience a major depressive episode.

major epilepsy *n.* A form of ***epilepsy** in which ***tonic–clonic** convulsions occur. Formerly called *grand mal epilepsy*.

majority preference cycle *See* **CONDORCET'S PARADOX**.

*****ebook converter DEMO Watermarks*****

major solution *n.* In the **neo-Freudian* theory of the German-born US psychoanalyst Karen Horney (1885–1952), the repression of aspects of one's self that are in conflict with one's **idealization* of oneself.

major tranquillizer *n.* An obsolescent name for a **neuroleptic* (1) drug. US *major tranquilizer*. Compare MINOR TRANQUILLIZER.

Makaton *n.* A simplified **sign language*, based on **British Sign Language* but internationally recognized, specifically designed for people with **learning* difficulties of all kinds and their parents and carers, developed in 1972–3 at Botley's Park Hospital in Surrey, England, by the English speech therapist Margaret Walker (born 1938), and revised in 1976, the revised version containing approximately 350 signs and associated words. [Formed from the initial letters of the first names of its inventor, Margaret Walker, and the two psychiatric hospital visitors who assisted in its development, Kathy Johnston and Tony Cornforth]

Make-a-Picture-Story Test *n.* A **projective test* devised by the US psychologist Edwin S. Shneidman (1918–2009) and first published in 1947, often described as a cousin of the **TAT*, consisting of a series of background pictures—a living room, a street, a bridge, and so on—together with 67 human and animal cutout figures, the respondent's task being to place one or more of the figures on a background and then to tell a story about the resulting picture. **MAPS** *abbrev.*

maladi moun *n.* A **culture-bound syndrome* included in **DSM-5*, found among Haitian communities, involving a belief that illnesses such as **depression* or **psychosis*, or that academic failure or problems of daily living, especially when these have followed economic, occupational, or other successes or gains, have been caused by the envy and hatred of enemies. Compare MAL DE OJO. [From Haitian creole *maladi moun* humanly caused illness]

maladjustment *n.* Failure to deal adequately with problems of adaptation to physical, emotional, social, economic, or occupational circumstances, events, or experiences, generally leading to coping difficulties

or symptoms of **stress* (1).

malapropism *n.* The unintentional replacement of a word with another word of similar sound, especially when the effect of the error is humorous, as in the phrase *expletive delighted* instead of *expletive deleted*. Compare *CATACHRESIS* (a more general term). [Named after Mrs Malaprop in Sheridan's play, *The Rivals* (1775), from French *mal à propos* out of place or inappropriate]

mal de ojo *n.* A **culture-bound syndrome*, sometimes referred to in English as the *evil eye*, widespread throughout Mediterranean cultures and Latino communities in other parts of the world, to which children are supposed to be especially vulnerable, believed to be caused by a malignant look or glance from a malevolent person, leading to insomnia, crying without provocation, diarrhoea, vomiting, and fever. Compare *MALADI MOUN*. [From Spanish *mal* illness + *de* of + *ojo* an eye]

mal de pelea *n.* A variant name for **amok* in Puerto Rico. [From Spanish *mal* illness + *de* of + *pelea* tussle or quarrel]

male hypoactive sexual desire disorder *n.* One of the **sexual dysfunctions* in **DSM-5*, characterized by persistent or recurrent absence or deficiency of sexual fantasy and desire in men, for at least six months, causing significant distress or problems of interpersonal interaction. It is not diagnosed if it is attributable to a drug or another medical condition. Compare *PERSISTENT SEXUAL AROUSAL SYNDROME*. [From Greek *hypo* under + Latin *activus* in a state of action, from *actus* a doing + *-ivus* tending]

male menopause See *ANDROPAUSE*, *CLIMACTERIC*, *IRRITABLE MALE SYNDROME*.

male mouse effect *n.* Another name for the **Whitten effect*.

male orgasmic disorder *n.* A term used in **DSM-IV* for what DSM-5 separated into **delayed ejaculation* and **premature (early) ejaculation*.

mali-mali See **LATAH**.

malinger *n.* Intentional feigning or exaggeration of physical or psychological symptoms, motivated by external incentives such as avoidance of work or military service, receipt of financial compensation, evasion of criminal prosecution, or procurement of prescription drugs. See also **STENGER TEST**. Compare **COMPENSATION NEUROSIS**, **FACTITIOUS DISORDER**, **MUNCHAUSEN SYNDROME**, **SOMATIC SYMPTOM DISORDER**. **malinger** *vb.* [From French *malindre* sickly, perhaps from *mal* badly + Old French *haingre* feeble]

malleus *n.* The outermost and largest of the three small bones in the ***middle ear**, connected to the ***tympanic membrane** and capable of transmitting sound vibrations to the incus. Referred to non-technically as the *hammer*. Compare **INCUS**, **STAPES**. [From Latin *malleus* a hammer, alluding to its resemblance to a blacksmith's hammer]

mal puesto *n.* A name for ***rootwork** in Spanish-speaking communities of the Caribbean and the southern United States, where it is also called *brujería*. [Spanish *mal puesto* badly placed, from *mal* badly + *poner* to place]

mamillary body *n.* An alternative spelling of *mammillary body*.

mammary gland *n.* The distinctive milk-producing ***exocrine gland** of mammals, consisting in humans of a network of tubes and cavities feeding the external nipple of the breast. [From Latin *mamma* a breast]

mammillary body *n.* Either of two small rounded protrusions from the back of the ***hypothalamus**, forming the terminal pillars of the ***fornix**, implicated in emotion, sexual arousal, and memory. Also spelt *mamillary body*. [From Latin *mammilla* a nipple, diminutive of *mamma* a breast]

mammillothalamic tract *n.* A bundle of nerve fibres connecting the ***mammillary bodies** to the ***thalamus**.

mana *n.* A Melanesian and Polynesian word (also found in Maori), imported into ***analytical psychology** by Carl Gustav Jung (1875–1961),

*****ebook converter DEMO Watermarks*****

denoting a supernatural life force, normally originating from the head or the spirit world, that can be concentrated in other people or objects and inherited and transmitted between people, and that confers high social status and ritual power.

mand *n.* In the writings of the US psychologist B(urrhus) F(rederic) Skinner (1904–90), a verbal utterance that makes a demand and is reinforced by fulfilment of the demand, a typical example being *Please shut the door*. Compare TACT (2). [From (*de*)mand]

mandala *n.* In Hindu and Sanskrit art, a design, usually circular in form, symbolizing the universe. A version of it, comprising a circle divided into four equal sectors (or a circle inscribed in a square, or a square inscribed in a circle), was imported into *analytical psychology by Carl Gustav Jung (1875–1961) as a symbol of the self as a psychic unity, which can appear in dreams or paintings during *Jungian analysis. See also INDIVIDUATION. [From Sanskrit *mandala* a circle]

mania *n.* 1. A *mood disorder characterized by *manic episodes. See also ANTIMANIC, HYPERMANIA, HYPOMANIC EPISODE, INOSITOL. 2. An obsessional preoccupation with a particular idea or activity. See also DANCING MANIA, DIPSOMANIA, DRAPETOMANIA, EGOMANIA, EROTOMANIA, GRAPHOMANIA, KLEPTOMANIA, MEGALOMANIA, MONOMANIA, MONOPEDE MANIA, NECROMANIA, NYMPHOMANIA, PORNOGRAPHOMANIA, PYROMANIA, RHINOTILLEXOMANIA, THANATOMANIA, TRICHOTILLOMANIA. **maniac** *n.* A person with a mania (1). See also LOVE. **manic** *adj.* Of or pertaining to mania (1). **maniacal** *adj.* Of, pertaining to, or resembling a maniac. [From Greek *mania* madness]

manic–depressive psychosis *n.* Another name for *bipolar disorder. Also called *manic–depressive disorder* or *manic–depressive reaction*. **MDP** abbrev.

manic episode *n.* A *mood episode lasting at least one week, characterized by continuously elevated, expansive, or irritable mood, sufficiently severe to cause marked impairment in social or occupational functioning or to require hospitalization, during which there may be inflated *self-esteem or *grandiose ideas or actions, decreased need for sleep (almost

*****ebook converter DEMO Watermarks*****

invariably), increased talkativeness, **flight of ideas*, distractibility, increased goal-oriented activity, **psychomotor agitation*, and risky pleasure-seeking activities such as spree shopping, sexual indiscretions, or imprudent financial investments. *See also* *ANTIMANIC*, *INOSITOL*. *Compare* *MAJOR DEPRESSIVE EPISODE*, *MIXED EPISODE*. [From Greek *mania* madness]

manic love *n.* A secondary form of **love* that is obsessive and/or possessive, often being associated with jealousy, and is a combination of **erotic love* and **ludic love*. *Compare* *AGAPIC LOVE*, *PRAGMATIC LOVE*, *STORGIC LOVE*.

Manifest Anxiety Scale *n.* A questionnaire designed to measure the personality trait of overt or conscious anxiety, developed by the US psychologist Janet A. Taylor (born 1923, later called Janet Taylor Spence) from the pool of items used in the **MMPI*, and published by her in the *Journal of Abnormal and Social Psychology* in 1953. Also called the *Taylor Manifest Anxiety Scale* or the *Iowa Manifest Anxiety Scale*. **MAS** abbrev.

manifest content *n.* In **psychoanalysis*, the narrative substance of a **dream* (1) as it is recalled by the dreamer, in contradistinction to the **latent content* that may be exposed by **interpretation* (2) of the **dreamwork*.

manner of articulation *n.* The way in which the airstream, usually from the lungs, is interfered with in order to produce a speech sound. In English, there are five or six manners of articulation: **plosive*, **fricative*, **affricate*, **nasal* (2), **liquid*, and **semivowel*, the last two usually being combined as **approximant*. *See also* *ARTICULATION*.

Mann–Whitney U test *n.* In statistics, a widely used **distribution-free test*, more powerful than the **median test*, of the null hypothesis that two independent samples come from the same population. The distribution-dependent alternative is the **independent samples t test*. [Named after the Austrian-born US mathematician Henry Berthold Mann (1905–2000) and the US statistician D(onald) Ransom Whitney (1915–2001) who jointly published the test in 1947]

Mantel–Haenszel chi-square *n.* In statistics, an index of linear
*****ebook converter DEMO Watermarks*****

association between the row and column variables in a cross-tabulation, calculated by multiplying the [*product-moment correlation coefficient](#) by one less than the number of scores. [Named after the US biostatistician Nathan Mantel (1919–2002) and epidemiologist William Haenszel (1910–98) who published it in 1959]

map distance *n.* A measure of the relative distance or separation of two [*gene](#) loci in terms of the percentage of progeny inheriting one but not the other. It ranges from zero to 100, thus 10 map units represents ten per cent [*discordant](#) progeny, 15 map units represents fifteen per cent discordant progeny, and so on.

Marbe's law *n.* The proposition that the higher the population frequency of a particular response to an item in a [*word-association test](#), the shorter the [*response latency](#) when that response is given by an individual respondent. Also called the *Marbe-Thumb law*. [Named after the French-born German psychologist Karl Marbe (1869–1953) who formulated it in 1901]

Margaret Thatcher illusion *n.* The natural appearance of an inverted image of a human face in which the eyes (with their eyebrows) and mouth are inverted relative to the face, although the image appears grotesquely hideous when the face as a whole is viewed the right way up, so that only the eyes and mouth are inverted (see [illustration](#)). The illusion of normality in the inverted image is believed to be due to the [*differential inversion effect](#) and the associated difficulty of recognizing configurational incongruities in an inverted face. Also called the *Maggie illusion* or the *Thatcher illusion*. [So called because the British psychologist Peter G. Thompson (born 1950) who discovered it in 1980 originally used a photograph of the newly installed UK Prime Minister Margaret Thatcher (1925–2013)]

Margaret Thatcher illusion. The inverted face looks almost normal, but it becomes grotesquely hideous when turned the right way up.

marginal consciousness *n.* The portion of consciousness that is not the focus of **attention* and of which one is only dimly aware.

marginals *n.* In statistics, the row and column totals of a cross-tabulation.

margin of attention *n.* Another name for **marginal consciousness*.

margin of consciousness *n.* Another name for **marginal consciousness*.

marijuana *n.* The cut and dried upper leaves, flowering tops, and young stems of the female **cannabis* plant, rolled into cigarettes and smoked as a psychotropic drug. [From Mexican Spanish *marihuana*, from Portuguese *mariguango* intoxicant]

*****ebook converter DEMO Watermarks*****

marital therapy *n.* Any form of **psychotherapy* aimed at treating problems of married couples. *Compare* COUPLES THERAPY.

marketing orientation *n.* In **neo-Freudian* theory, a term used by the German-born US psychoanalyst Erich Fromm (1900–80) to denote a category of people who consider their personalities as commodities to be bought and sold and who mould themselves to fit whatever qualities are demanded by others, with consequent superficiality and lack of individuality. *Compare* EXPLOITATIVE ORIENTATION, HOARDING ORIENTATION, PRODUCTIVE ORIENTATION, RECEPTIVE ORIENTATION.

marketing research *n.* Research designed to estimate the size and location of markets or the cost of products or services, distinguished in careful usage from **market research*.

market research *n.* A form of **survey research* into the attitudes, opinions, and behaviour of consumers towards products and services, distinguished in careful usage from **marketing research*. *See also* MYSTERY CUSTOMER RESEARCH.

Marplan *n.* A proprietary name for the antidepressant drug **isocarboxazid*. [Trademark]

marriage counselling *n.* A form of **counselling* offered to people with marital or relationship problems. US *marriage counseling*. Also called *marital counselling* (US *marital counseling*), *marriage guidance*, or *marriage guidance counselling* (US *marriage guidance counseling*).

Marr's computational theory of vision *See* 2½-D SKETCH, 3-D MODEL DESCRIPTION, PRIMAL SKETCH. *See also* COMPUTATIONAL THEORY, GENERALIZED CONE.

marshmallow test *n.* An experimental test devised by the Austrian-born US psychologist Walter Mischel (born 1930) to examine some features and consequences of **deferred gratification*, first published in an article in the *Journal of Abnormal and Social Psychology* in 1958. Children aged between

7 and 9 years in the original experiment, or generally between 4 and 6 years in later research, are given a choice between a small, immediate reward (such as one marshmallow) and a larger, delayed reward (such as two marshmallows). *[Longitudinal studies](#) have shown that delayed gratification in children, defined as waiting 15 minutes for the larger reward, is highly predictive of academic success in terms of *[Scholastic Assessment Test](#) scores and of cognitive and emotional coping in adolescence. Follow-up studies have shown that waiting for the larger reward in childhood predicts higher educational achievement, higher sense of self-worth, better ability to cope with stress, less cocaine/crack use in adulthood, and lower body mass. Also called the *Stanford marshmallow test*, because key experiments in the 1970s were conducted at Stanford University in California. [From English *marsh mallow*, the plant *Althaea officinalis*, indigenous to Africa, that grows in salt marshes, the roots of which have been used to make marshmallow treats since ancient Egyptian times]

Marsilid *n.* A proprietary name for the antidepressant drug *[iproniazid](#). [Trademark]

Martha Mitchell effect *n.* A misinterpretation of a person's justified belief as a *[delusion](#), often by a psychiatrist, clinical psychologist, or general practitioner. The term was introduced in 1988 by the English-born US psychologist Brendan A(rnold) Maher (1924–2009) in a chapter in a book entitled *Delusional Beliefs* that he co-edited. [Named after Martha Beall Mitchell (1918–75), wife of the US Attorney General John Mitchell at the time of the Watergate scandal in 1972, who accused the White House of using her husband as a scapegoat to protect President Richard Nixon. She was widely believed to be deluded, although her allegations were eventually vindicated]

masculine protest *n.* In *[individual psychology](#), a term introduced by the Austrian psychiatrist Alfred Adler (1870–1937) to denote a cluster of personality traits in either sex arising as overcompensations for feelings of inferiority and rejection of the feminine role. In later writings, Adler and his followers used the term more specifically to denote the rejection by women of the feminine role. Adler used the term for the first time in a paper read to the Viennese Psychoanalytic Society in 1911, and he developed and modified

*****ebook converter DEMO Watermarks*****

the concept further in his book *Individual Psychology* (1924), where he identified it as the main source of **neuroses*. See also [DIANA COMPLEX](#), [GENDER DYSPHORIA](#).

masculinity–femininity scale *n.* Any scale designed to measure this dimension of personality, including the masculinity–femininity scale of the **MMPI*.

masculinizing hormone *n.* A **hormone* that causes masculine **traits* to develop in an embryo. See [MÜLLERIAN INHIBITING SUBSTANCE](#), [TESTOSTERONE](#).

masked depression *n.* A form of **depression* that is disguised or concealed behind **affective flattening*, a different **mood* (1) such as irritability, or some other symptom.

masking *n.* The blocking or suppression of the perception of a stimulus, often called the *test stimulus*, by the presentation of another stimulus, called the *masking stimulus*. Complete masking occurs when the test stimulus is not perceived, and partial masking occurs when its **absolute threshold* is raised or its perceived intensity is reduced by the masking stimulus. The masking effect arises from swamping of the neural activity evoked by the test stimulus and/or suppression of the neural activity that test stimulus would have evoked if presented alone. See also [AUDITORY MASKING](#), [BACKWARD MASKING](#), [BINAURAL UNMASKING](#), [BRIGHTNESS MASKING](#), [CENTRAL MASKING](#), [CRITICAL BAND](#), [DICHOPTIC MASKING](#), [INSPECTION TIME](#), [METACONTRAST](#), [PARACONTRAST](#), [PATTERN MASKING](#), [PERKY PHENOMENON](#), [SUBLIMINAL PERCEPTION](#), [VISUAL MASKING](#).

masochism *n.* Another name for **sexual masochism*. The term is also used loosely to denote extreme self-damaging behaviour not accompanied by sexual gratification. **masochistic** *adj.* [Named after the Austrian historian and novelist Leopold von Sacher-Masoch (1836–95) who wrote about it, notably in his novel *Venus im Pelz* (1870), translated into English as *Venus in Furs* (1902), in which the heroine Wanda subjects the narrator to sexually stimulating suffering]

masochistic personality *n.* Another name for **self-defeating personality disorder*. It is misleading in view of the fact that no **paraphilia*
*****ebook converter DEMO Watermarks*****

resembling [*sexual masochism](#) is involved.

mass action *n.* The doctrine propounded by the US physiological psychologist Karl Spencer Lashley (1890–1958) that the [*cerebral cortex](#) functions as a coordinated unit, with large areas being involved in all complex functions, and that consequently, within limits, the degree of deficit resulting from a localized lesion depends on the amount of cortex rather than the specific region affected. This doctrine is now known to have many exceptions, [*localization of function](#) being common in the cerebral cortex. *See also* [EQUIPOTENTIALITY](#).

massage therapy *n.* Manual manipulation of soft tissue to promote physical and mental health and well-being. Forms of massage therapy can be traced back to ancient Chinese, Egyptian, Greek, Roman, Hindu, and Japanese civilizations. Modern forms are based on techniques popularized in the 19th century by the Swedish medical-gymnastic practitioner Per Henrik Ling (1776–1839). *See also* [ROLFING](#). **MT** *abbrev.* [From French *masser* to rub, from Greek *massein* to knead]

massa intermedia *n.* A [*commissure](#), not present in all human (especially male) brains, connecting the [*thalamus](#) in one cerebral hemisphere with its counterpart in the other. [From Latin *massa* a mass + *inter* between + *media* the middle]

massed practice *n.* Learning that takes place in a single block rather than being divided into sessions separated by rest intervals or gaps, generally leading to inferior recall, after a delay, relative to [*distributed practice](#). *See also* [REMINISCENCE \(2\)](#).

mast cell *n.* A type of cell that is present in connective tissue and that responds to inflammation and allergens by releasing [*histamine](#) and [*serotonin](#). *See also* [AXON REFLEX](#). [Coined in 1879 by the German bacteriologist and immunologist Paul Ehrlich (1854–1915) from German *Mast* a fattening]

masturbation *n.* Sexual stimulation of the genitals, either one's own or another person's. *See also* [AUTO-EROTIC](#). **masturbate** *vb.* [From Latin
*****ebook converter DEMO Watermarks*****]

masturbari to masturbate, of unknown origin, formerly believed to derive from *manus* a hand + *stuprare* to have sexual intercourse]

matched guise *n.* A research technique in which a bilingual or bidialectal person speaks the same words in two or more different languages or speech styles in order to compare listeners' responses while controlling for the effects of other factors.

matching bias *n.* In the **Wason selection task*, a tendency to focus attention on evidence containing the letters and numbers mentioned in the rule. Compare [CONFIRMATION BIAS](#).

Matching Familiar Figures Test *n.* An instrument designed to measure **reflection–impulsivity* by requiring the respondent to select repeatedly from several alternative figures the one that matches a standard. The number of errors and the time required to complete the test are recorded, and people with below-median errors and above-median response times are classified as *reflective*; people with above-median errors and below-median response times *impulsive*; people with below-median errors and below-median response times *quick*; and people with above-median errors and above-median response times *slow*. The test was developed in 1966 by the US psychologist Jerome Kagan (born 1929). **MFFT** *abbrev.*

matching to sample *n.* A task in which a person or animal is presented with a series of trials, on each of which the task is to choose a test stimulus that is the same as a sample stimulus, the sample stimulus being presented simultaneously with the test stimulus in *simultaneous matching to sample*, or some time before the test stimulus in *delayed matching to sample*. In *generalized matching to sample*, the several different matching tasks are presented in sequence, and the increase in speed of learning across the series of tasks is measured.

materialism *n.* An approach to the **mind–body problem* according to which only the physical realm is real and mental phenomena are merely functions or aspects of it. See also [DOUBLE-ASPECT THEORY](#), [IDENTITY THEORY](#), [MONISM](#).

maternal deprivation *n.* Inadequate mothering, whether delivered by the mother or another primary carer, during the first six months of life, leading to a failure of attachment, or more generally inadequate mothering during the first five years of life. The concept was introduced by the English psychiatrist (Edward) John (Mostyn) Bowlby (1907–90) who argued in his book *Child Care and the Growth of Love* (1953) that it could seriously affect the child's development and lead to psychological problems and juvenile delinquency. Early research tended to support the theory, but subsequent research suggested that the adverse effects were often caused by other factors that tend to accompany maternal deprivation, such as physical neglect. *See also* ANACLOTIC DEPRESSION, ATTACHMENT THEORY, HOSPITALISM, SEPARATION ANXIETY, SEPARATION ANXIETY DISORDER.

maternal inheritance *n.* Inheritance of characteristics through genes that are carried by *mitochondrial DNA, or by DNA in *plasmids in the cytoplasm outside the cell nucleus, and that are transmitted exclusively through the female line, because only the mother's ovum contributes cytoplasm to the *zygote.

mathematical induction *n.* Another name for *induction (2).

mathematics disorder *n.* A *specific learning disorder characterized by substantially below-average mathematical ability for the given age, intelligence, and education; the *deficit interfering substantially with scholastic or academic achievement or everyday life and not being due merely to a sensory deficit.

matriarchy *n.* Literally, a community of related families under the authority of a female head called a *matriarch*; applied more generally to any form of social organization in which women have predominant power, there being controversy as to whether a matriarchy has ever existed, although there is no doubt that *matrilineal societies have existed. *Compare* PATRIARCHY.
matriarchal *adj.* [From Latin *mater*, *matris* a mother + Greek *arche* a rule]

matrilineal *adj.* Of or relating to descent, kinship, or inheritance through the female line, as occurs in some non-western societies. *Compare*

PATRILINEAL. [From Latin *mater*, *matris* a mother + *linea* a line]

matrist *n.* A person whose ***personality** is modelled on or strongly influenced by his or her mother. *Compare* **PATRIST**. [From Latin *mater*, *matris* a mother + *-ista*, *-istes* indicating a person who performs an action or function]

matrix *n.* In mathematics, any rectangular array or elements, usually numbers. [From Latin *matrix* womb or female animal used for breeding, from *mater* mother]

maturation *n.* The process of growing or ripening towards a fully developed state. [From Latin *maturus* ripe + *-ation* indicating a process or condition]

Maudsley Personality Inventory *n.* A questionnaire designed to measure two major dimensions of personality, namely ***extraversion** and ***neuroticism**, according to the theory of personality of the German-born British psychologist Hans J(ürgen) Eysenck (1916–97), first propounded in his books *Dimensions of Personality* (1947) and *The Scientific Study of Personality* (1952). Eysenck published the test initially in the journal *Rivista di Psicologia* in 1956. Later versions of it were called the ***Eysenck Personality Inventory** and the ***Eysenck Personality Questionnaire**. **MPI** *abbrev.* [Named after the Maudsley Hospital in Denmark Hill, south London, where Eysenck worked, and which in turn is named after the English psychiatrist Henry Maudsley (1835–1918) who founded it]

maximin *n.* In decision theory and game theory, an alternative or ***strategy** (2) that ensures the best of the worst possible payoffs, thereby *maximizing* the *minimum* possible payoff. Thus if there are three available alternatives, and if the worst that can happen is a small loss if the first alternative is chosen, a medium loss if the second alternative is chosen, and a large loss if the third alternative is chosen, then the first alternative is the maximin alternative irrespective of what other payoffs are possible. *See also* **ELLSBERG PARADOX**, **MINIMAX**, **MODIFIED ELLSBERG PARADOX**.

maximum likelihood *n.* In statistics, the probability of obtaining a
*****ebook converter DEMO Watermarks*****

given set of observed scores in a random sample of a population maximized over the possible values of the **parameter(s)* of the population from which the scores are drawn; also, a method of estimation used in **multiple regression* and elsewhere based on this concept, introduced in 1912 by the English statistician and geneticist Ronald Aylmer Fisher (1890–1962).

Maxwell disc *n.* A rotating disc on to which radially slit and overlapping discs of paper, cardboard, or plastic can be mounted to divide the surface into sectors of different colours for investigating **colour mixing*. US *Maxwell disk*. Also called a *colour wheel*. See also *ASSOCIATIONISM*, *TALBOT'S LAW*. [Named after the Scottish physicist James Clerk Maxwell (1831–79) who invented it and published it in 1855]

maze *n.* A network of passages and blind alleys, either a simple **T-maze* or a more intricate labyrinth, introduced into psychology in an article in the *American Journal of Psychology* in 1901 by the US psychologist Willard Stanton Small (1870–1943) for studying animal learning and behaviour, a reward usually being provided for an organism that solves the maze and finds the goal box. Small constructed his original maze, which he used for studying ‘the mental processes of the rat’, as an exact replica in miniature of the famous garden maze at Hampton Court in Richmond-upon-Thames, England. [From Old English *amasian* to amaze]

McCarthy Scales of Children's Abilities *n.* A set of scales for measuring the development of intellectual abilities of children between 2½ and 8½ years of age, divided into verbal ability, perceptual ability, quantitative ability, memory, and motor ability, also providing a score for general cognitive ability based on pooling the other scores. [Named after the US developmental psychologist Dorothea McCarthy (1906–74) who introduced them]

McCollough effect *n.* A visual illusion that is seen by a viewer who stares for half a minute or more at two differently oriented and differently coloured grating patterns, such as vertical red and black stripes and horizontal green and black stripes, shifting attention back and forth between the two, and then looks at a figure containing a grating of vertical black and white stripes and a grating of horizontal black and white stripes. The white areas of

*****ebook converter DEMO Watermarks*****

the black and white gratings appear tinged with the **complementary colours* of the corresponding (vertical or horizontal) coloured gratings, so that the vertical white stripes appear pale green and the horizontal white stripes pink. The fact that the illusory colours depend on the particular black and white grating patterns shows that they cannot be explained by depletion of pigment or any other gross retinal process. *See also* *CONTINGENT AFTEREFFECT*. [Named after the US psychologist Celeste F(aye) McCollough (born 1926) who first reported the illusion in the journal *Science* in 1965]

M cell *abbrev.* A type of ganglion cell belonging to the **magnocellular system*. Also called a *Y cell*. *Compare* *P CELL*.

McGurk effect *n.* A phenomenon that occurs when a speech sound does not match the shape of the lips producing it, as when a sound corresponding to the usual pronunciation of the word *gay* is dubbed on to a video image of a person uttering the word *bay*, causing the listener to hear a word intermediate between the two (*day*). This effect shows that the visual channel conveys important information not just to deaf people but also to listeners with normal hearing. [Named after the Scottish psychologist Harry McGurk (1936–98) who co-authored the first article on it, entitled ‘Hearing Lips and Seeing Voices’ in the journal *Nature* in 1976]

McNaghten rules *n.* A set of rules, established in English law in *Regina v. McNaghten* (1843) and followed in many jurisdictions throughout the world, according to which legal proof of **insanity*, and thus lack of criminal responsibility, requires evidence that the accused either did not know what he or she was doing or was incapable of understanding that what he or she was doing was wrong. Also spelt *McNaughten rules* or *M’Naghten rules*. *See also* *MENS REA*. [Established by the House of Lords following the case of *R v. McNaghten* (1843) in which the defendant, Daniel McNaghten, shot and killed the private secretary of the British Prime Minister Sir Robert Peel but was found to have been of unsound mind at the time]

McNemar test *n.* In statistics, a **distribution-free test* of the significance of changes, especially applicable to before–after designs of the effects of particular treatments in which scores are dichotomous and measurement is made on a **nominal scale* or an **ordinal scale*. It tests the **null hypothesis*

*****ebook converter DEMO Watermarks*****

that unlike pairs of responses (0, 1) and (1, 0) are equally likely. [Named after the US psychologist and statistician Quinn McNemar (1900–86) who developed it in 1947]

MDA *abbrev.* Methyl-dioxy amphetamine, a synthetic **designer drug* derived from **amphetamine*. *See also* AMPHETAMINE-RELATED DISORDERS, EMPATHOGEN, SUBSTANCE-RELATED AND ADDICTIVE DISORDERS.

MDMA *abbrev.* 3,4-methylene-dioxy-methamphetamine, a central nervous system **stimulant* and **designer drug* commonly called **ecstasy* (2).

mean *n.* Short for **arithmetic mean*: in descriptive statistics, the **average* value, calculated for a finite set of scores by adding the scores together and then dividing the total by the number of scores. *See also* GEOMETRIC MEAN, HARMONIC MEAN, LAKE WOBEGON EFFECT, TRIMMED MEAN. *Compare* MEDIAN, MODE. **M** *abbrev.* **mean** *adj.* [From Old French *moien*, from Latin *medius* middle]

mean error method *n.* Another name for the **method of average error*.

mean length of utterance *n.* The mean or average number of **morphemes* or words in a sample of speech, often used as a crude index of the level of linguistic development of a child. **MLU** *abbrev.*

mean lethal dosage *n.* Another name for the **median lethal dosage* (LD-50).

means-end analysis *n.* A cognitive **heuristic* implemented by the **General Problem Solver* to deal with practical problems when the **problem space* is too large for exhaustive search to be used. The problem space is represented by an initial state (such as the starting position in a game of chess), a goal state (such as checkmating the opponent), and all possible intervening states that are achieved by actions involving the application of operators (such as chess moves) to existing states. If there is an action that immediately solves the problem, then it is implemented immediately; if not, the problem solver establishes the subgoal of maximally reducing the

difference between the current state and the goal state; if an action can be found to achieve this subgoal, then it is implemented immediately; if not, the problem solver establishes the sub-subgoal of removing the constraints on achieving the subgoal; and so on. *See also* [GENERAL PROBLEM SOLVER](#).

mean square *n.* In statistics, the [*arithmetic mean](#) of the squared [*deviation scores](#) in a data set, used as an estimate of variance in [*analysis of variance \(ANOVA\)](#). *See also* [SUM OF SQUARES](#).

measurement *n.* The systematic assignment of numbers to represent quantitative [*attributes](#) of objects or events. The US psychologist S(tanley) S(mith) Stevens (1906–73) defined measurement in an article in the journal *Science* in 1946 and in an influential chapter in his *Handbook of Experimental Psychology* as ‘the assignment of numerals to objects or events according to rules’, and this definition is repeated in many textbooks, but it is avoided by many experts because it ignores a crucial (defining) aspect of measurement, namely its connection with quantity or magnitude, and because it includes rule-governed assignments of numbers that do not represent quantities or magnitudes, such as the assignment of telephone numbers to subscribers or of ISBN numbers to books. *See also* [AXIOMATIC MEASUREMENT THEORY](#), [CONJOINT MEASUREMENT THEORY](#), [MEASUREMENT LEVEL](#), [MEASUREMENT MODEL](#), [SCALE \(1\)](#). [From Latin *mensura* a measure, from *metiri* to measure]

measurement level *n.* The type of measurement scale used for generating scores, which determines the permissible transformations that can be performed on the scores without changing their relationship to the [*attributes](#) being measured. For example, it is meaningless to calculate the mean of a collection of telephone numbers, because the level of measurement involved in the numbers (a nominal scale) renders the operations of addition and division meaningless. Level of measurement is not a property of the data themselves, but of the data and their interpretation considered together: the same scores can represent different levels depending on their interpretation. Among the most important measurement levels, with separate entries, are the following, arranged from lowest to highest level of measurement: [*nominal scale](#), [*ordinal scale](#), [*interval scale](#), [*ratio scale](#), [*absolute scale](#). Another, at the same level as the interval scale, is the [*log-interval scale](#). *See also* [MEASUREMENT](#), [SCALE \(1\)](#).

*****ebook converter DEMO Watermarks*****

measurement model *n.* The relationship that is believed or assumed to exist between numerical scores recorded as data in an empirical investigation and the **attribute* that is being measured. *See also* MEASUREMENT, MEASUREMENT LEVEL, MODEL.

mechanism of defence *See* DEFENCE MECHANISM.

mechanoreceptor *n.* A type of **sensory receptor* that converts kinetic energy from mechanical stimulation including touch, pressure, vibration, acceleration, or gravity into nerve impulses, such receptors being either **touch receptors* in the **skin*, **auditory receptors* in the **organ of Corti*, or receptors that respond to mechanical stimulation in the **vestibular system*. [From Greek *mechane* a machine + Latin *recipere*, *receptum* to receive, from *re-* back + *capere*, *ceptum* to take]

Mecholyl *n.* A proprietary name for the parasympathomimetic drug **methacholine*. [Trademark]

MED-50 *abbrev.* The dosage of a drug that produces a specified effect in 50 per cent of the population. Also called the *median effective dosage* or *ED-50*. *See also* EFFECTIVE DOSAGE, THERAPEUTIC INDEX, THERAPEUTIC RATIO.

medial *adj.* Situated in the middle or oriented towards the midline; the opposite of **lateral*. [From Latin *medialis* of or relating to the middle, from *medius* the middle]

medial forebrain bundle *n.* A tract of nerve fibres on each side of the **hypothalamus* involved in the control of hunger and predatory aggression, and functioning more generally as a major reward centre through the action of the catecholamines **dopamine* and **noradrenalin* (norepinephrine). *See also* PLEASURE CENTRE, QUIET-BITING ATTACK. **MFB** *abbrev.* [From Latin *medialis* situated in the middle, from *medius* the middle + English *forebrain*]

medial geniculate nucleus *n.* A structure at the back of each lobe of the **thalamus*, close to the lateral geniculate nucleus, that receives inputs from the **inferior colliculus* and relays them to the primary **auditory cortex*.

Also called the *medial geniculate body*. **medial geniculate nuclei** *pl.* **MGN** *abbrev.* [From Latin *medialis* situated in the middle, from *medius* the middle + *geniculatus* knee-shaped, from *geniculum* a little knee, diminutive of *genus* a knee]

medial lemniscus *n.* Either of the two bundles of nerve fibres of the ***lemniscus** ascending through the medulla oblongata and pons and continuing to the somatosensory cortex in each cerebral hemisphere. *Compare* **LATERAL LEMNISCUS**, **TRIGEMINAL LEMNISCUS**.

medial rectus *n.* One of the four ***rectus muscles** attached externally to the eyeball.

medial surface *n.* The surface of an organ or structure situated or oriented towards the midline of the body, such as the inner surface of each ***cerebral hemisphere**, exposed only by a ***midsagittal section** dividing the brain through its longitudinal fissure. *See also* **SAGITTAL SECTION**.

medial temporal lobe *n.* The inner surface of the ***temporal lobe**, including the ***hippocampal formation**, the ***parahippocampal gyrus**, and the ***entorhinal cortex**, all of which have important ***memory** functions. Also called the *medial temporal cortex*. *See also* **DEFAULT MODE NETWORK**. **MTL** *abbrev.*

median *n.* In descriptive statistics, a measure of ***central tendency** that is the middle value of the set of scores arranged in order of magnitude, or the mean of the two middle scores if there is an even number of scores and therefore no single middle score. *Compare* **MEAN**, **MODE**. **median** *adj.* [From Latin *medius* middle]

median effective dosage *n.* The dosage that produces a specified effect in 50 per cent of the population. *See also* **EFFECTIVE DOSAGE**, **THERAPEUTIC INDEX**, **THERAPEUTIC RATIO**. *Compare* **MEDIAN LETHAL DOSAGE**, **MEDIAN TOXIC DOSAGE**, **MINIMUM EFFECTIVE DOSAGE**, **MINIMUM LETHAL DOSAGE**, **MINIMUM TOXIC DOSAGE**. **ED-50** or **ED₅₀** *abbrev.*

median eminence *n.* A swelling at the base of the **hypothalamus*, immediately above the infundibulum, secreting hormones into the **hypothalamic–hypophyseal portal system*. [From Latin *medius* the middle + *eminentia* a prominence]

median lethal dosage *n.* The dosage of a drug or other substance that kills 50 per cent of experimental animals in a specified time. Also called the *mean lethal dosage*. *See also* LETHAL DOSAGE, THERAPEUTIC INDEX, THERAPEUTIC RATIO. *Compare* MEDIAN EFFECTIVE DOSAGE, MEDIAN TOXIC DOSAGE, MINIMUM EFFECTIVE DOSAGE, MINIMUM LETHAL DOSAGE, MINIMUM TOXIC DOSAGE. **LD-50** or **LD₅₀** *abbrev.*

median plane *n.* Another name for the **midsagittal plane*.

median section *n.* Another name for the **midsagittal section*.

median temporal gyrus *n.* Another name for the **middle temporal gyrus*.

median test *n.* In statistics, a **distribution-free test* of the null hypothesis that two or more independent samples come from populations with the same **median*. *See also* MANN–WHITNEY *U* TEST.

median toxic dosage *n.* The quantity of a drug or other substance that produces signs or symptoms of toxicity in 50 per cent of human or animal experimental subjects in a specified time. Also called the *mean toxic dosage*. *See also* THERAPEUTIC INDEX, THERAPEUTIC RATIO, TOXIC DOSAGE. *Compare* MEDIAN EFFECTIVE DOSAGE, MEDIAN LETHAL DOSAGE, MINIMUM EFFECTIVE DOSAGE, MINIMUM LETHAL DOSAGE, MINIMUM TOXIC DOSAGE. **TD-50** or **TD₅₀** *abbrev.*

mediating variable *n.* A **variable*, the value of which is determined by one or more **independent variables* and/or other mediating variables and that in turn affects the value of a **dependent variable* not directly affected by the independent variables. For example, the independent variable wealth has a measurable effect on the dependent variable life expectancy inasmuch as wealthy people tend to live longer than poor people, and the effect is indirect,

*****ebook converter DEMO Watermarks*****

one mediating variable that plays a part being medical care: wealthy people tend to receive more and better medical care than poor people, and this in turn increases life expectancy. The chain of causation is thus wealth → medical care → life expectancy, and medical care is a mediating variable. Often confused with **intervening variable*. [From Latin *mediare*, *mediatum*, to be in the middle, from *medius* the middle]

medical psychology *n.* A branch of **applied psychology* devoted to psychological problems arising in the practice of medicine, including psychological aspects of pain, terminal illness, bereavement, disability, and reactions to medical advice. It overlaps to some extent with **health psychology*.

medical student syndrome *n.* A form of **hypochondria* in medical students, occasionally developing into full-blown **somatic* symptom disorder, characterized by anxiety about having one or more (often several) of the disorders that are being studied. It often occurs as students begin studying mental disorders, when they begin to believe that they are suffering from the disorders that they are reading about in textbooks, and in this form it is also found among psychology students. Also called *medical student hypochondria*. **MSS** abbrev.

meditation See *TRANSCENDENTAL MEDITATION*.

medulla *n.* The internal part of any structure or organ, such as the adrenal medulla. Usually short for the **medulla oblongata*, though this abbreviation is avoided in careful usage whenever its meaning is ambiguous. **medullae** or **medullas** *pl.* [From Latin *medulla* marrow or innermost part]

medulla oblongata *n.* The lower, tapering part of the **brainstem*, attached to the spinal cord, involved in the control of vegetative processes such as heartbeat, blood pressure, breathing, and consciousness. Often shortened to *medulla*, though this is avoided in careful usage whenever ambiguity would result (see *MEDULLA*). See also *LOCKED-IN SYNDROME*. **medullae oblongatae** or **medulla oblongatas** *pl.* **medullary**, **medullar**, or **bulbar** *adj.* [From Latin *oblongus* elongated, from *longus* long]

medulloblastoma *n.* A quick-growing malignant brain tumour, usually originating in the ***cerebellum**, most common in children (especially boys) between 5 and 9 years old, responsive to radiotherapy but with poor long-term prognosis. Its name does not refer to the medulla oblongata. [From *medulla* + *blastos* a bud + *-oma* indicating a tumour]

megalomania *n.* A pathological condition of ***grandiose delusions**. Also called *macromania*. [From Greek *megas* great + *mania* madness]

megavitamin therapy *n.* Another name for ***orthomolecular therapy**.

meiosis *n.* **1.** A form of cell division such as that of ***gametes** in sexually reproducing species in which the nucleus divides into four daughter nuclei each containing half the ***chromosomes** of the parent nucleus (see *illustration*). It consists of two successive divisions: during the first, ***homologous chromosomes** pair up, exchange genetic material by ***crossing over**, then during the *anaphase* part of the cycle move apart by ***disjunction (1)** to form separate ***haploid** nuclei; during the second phase these daughter nuclei divide by ***mitosis** (with a further anaphase), producing four haploid cells. Also called *reduction division*. Compare **MITOSIS**. **2.** A figure of speech characterized by understatement or litotes. **meiotic** *adj.* [From Greek *meiosis* diminution, from *meion* less + *-osis* indicating a process or state]

Meiosis. Stages in a cell containing two pairs of homologous chromosomes.

Meissner's corpuscle *n.* An egg-shaped ***sensory receptor** in hairless ***skin**, found most abundantly in the finger pads but also present in the skin of the inner forearm, foot, breast nipple, and lips, containing a single nerve fibre that spirals around the interior of the capsule and ends in a globular mass, sensitive to vibration when moving over textured or embossed surfaces. Also called a *tactile corpuscle* or a *Wagner–Meissner corpuscle*. Compare **FREE NERVE ENDING**, **GOLGI TENDON ORGAN**, **MERKEL CELL**, **PACINIAN CORPUSCLE**, **RUFFINI CORPUSCLE**. [Named after the German anatomist Georg Meissner (1829–1905) who discovered it]

mel *n.* A unit of subjective ***pitch**, arbitrarily anchored so that a 1,000-hertz

tone at 40 decibels has a value of 1,000 mels by definition, other values being determined by **fractionation*, the resulting graph of pitch in mels as a function of frequency in hertz usually being approximately S-shaped. [From Greek *melos* a song]

melancholia *n.* A severe form of **depression*; more specifically, a **major depressive episode*. **involutional melancholia** *n.* Another name for **involutional depression*. [From Greek *melas* black + *chole* bile + *-ia* indicating a condition or quality, referring to the ancient doctrine of the four **temperaments*, according to which depression was attributed to an excess of black bile]

melanocyte-stimulating hormone *n.* A polypeptide **hormone* that is secreted by the **anterior pituitary* and that controls the degree of colouring in pigmented cells. **MSH** *abbrev.* [From Greek *melas*, *melanos* black + *kytos* a vessel or hollow]

melatonin *n.* The **hormone* *N*-acetyl-5-methoxytryptamine secreted by the **pineal gland* only at night (hence sometimes called the Dracula hormone), lightening skin pigment in some organisms such as tadpoles, though apparently not in humans, affecting sexual development by inhibiting development of gonads in males and the oestrous cycle in females, perhaps promoting sleep (thus used for treating **jet lag*), and probably fulfilling other unknown functions. [From Greek *mela(s)* black + English *(sero)tonin*, alluding to its ability to lighten melanocytes]

Mellaril *n.* A proprietary name for the neuroleptic drug **thioridazine*. [Trademark]

melodic constancy *n.* A form of **perceptual constancy* according to which a melody or tune tends to remain recognizably the same when it is played in another key with entirely different notes (see *GESTALTQUALITÄT*), at a different tempo (speed), or on another instrument with entirely different **timbre*. See also *GESTALT*.

melodic paradox *n.* A phenomenon in the perception of musical tones that are clearly defined in terms of pitch class (the twelve notes of the octave
*****ebook converter DEMO Watermarks*****

that are normally labelled C, C#, D,..., B) but are ambiguous as regards the octaves to which they belong, each tone being composed of equal [*sinusoidal](#) waves from octaves spanning the auditory range. Using such ambiguous tones, if a sequence of chords (tones sounded together simultaneously) such as B with D, then A with E, then G with F, are presented to listeners, then the listeners clearly perceive the sequence as either converging or diverging in contrary motion, although the sequence could be either converging or diverging depending on the octaves to which the notes belong, and the stimulus tones lack the cues required to determine octave pitch. It is a surprising phenomenon rather than a true [*paradox](#). It was first reported by the US psychologist Roger N(ewland) Shepard (born 1929) in an article in the *Journal of the Acoustical Society of America* in 1964. See also [AUDITORY ILLUSION](#). Compare [SEMITONE PARADOX](#), [TRITONE PARADOX](#).

member *n.* A constituent part of a whole, especially a limb, an individual who belongs to a group or organization, or a political representative in a parliament. The term is used in [*Gestalt psychology](#) in preference to *part*, which has connotations of separateness denied by Gestalt theory. See also [MEMBERSHIP CHARACTER](#). [From Latin *membrum* a limb, member, or part]

membership character *n.* Any [*attribute](#) by which a [*member](#) (in the [*Gestalt](#) sense) is recognized as belonging to a whole; specifically, any attribute of an element that results directly from its belonging to a Gestalt.

membrana tympani *n.* Another name for the [*tympanic membrane](#). [From Latin *membrana* a membrane + *tympanum* a drum]

membrane *n.* A thin film, skin, or layer of (usually) fibrous tissue that covers, lines, or connects biological organs or cells. See also [CELL MEMBRANE](#), [MEMBRANE POTENTIAL](#), [OSMOSIS](#), [SEMIPERMEABLE MEMBRANE](#), [SKIN](#). **membranous** *adj.* Of or relating to a membrane. [From Latin *membrana* skin covering a body part, from *membrum* a member]

membrane potential *n.* The difference in electrical voltage across the membrane of a living cell, controlled by a [*sodium pump](#) and momentarily reversed in a [*neuron](#) when it transmits a nerve impulse. See also [ACTION POTENTIAL](#), [CELL MEMBRANE](#), [DEPOLARIZATION](#), [RESTING POTENTIAL](#).

*****ebook converter DEMO Watermarks*****

membranous labyrinth *n.* The system of ducts, filled with *endolymph, suspended within the three *semicircular canals of the *bony labyrinth in the inner ear, containing the *vestibular system. See also LABYRINTH.

meme *n.* A self-replicating cultural element or pattern of behaviour, analogous to a gene but passed from one individual to another by imitation rather than genetic transmission. Memes are subject to inheritance and evolution through a form of *natural selection according to their likelihood, relative to the alternatives available in the meme pool, of being reproduced or of multiplying. Typical examples are tunes, ideas, beliefs, catch-phrases, stories, hairstyles, clothing fashions, recipes, inventions, skills, traditions, and theories. Whereas genes propagate themselves in a gene pool by migrating from one body to the next, memes propagate themselves in a meme pool by migrating from one brain to the next; but unlike genes, memes are subject to *Lamarckian inheritance, because acquired characteristics can be incorporated into a meme and passed on. See also RUMOUR, SMALL WORLD PHENOMENON. **memeplex** *n.* (Contraction of *meme complex*), a collection of mutually adapted memes that tend to be transmitted together, such as those constituting a religion or political ideology. **meme pool** *n.* The sum total of all memes in a population at a given time. Compare GENE POOL. **memetic** *adj.* Of, relating to, or consisting of a meme or memes. **memetic engineering** *n.* Deliberate and systematic manipulation of memes or memeplexes, as in education, psychotherapy, advertising, or brainwashing. Compare GENETIC ENGINEERING. **memetics** *n.* The science of memes. [From Greek *mimema* something that is imitated, from *mimēsthai* to imitate, coined in 1976 by the British ethologist Richard Dawkins (born 1941) to sound like *gene* and to be reminiscent of *memory* and French *même* same, because memes are sustained and replicated by memory and imitation]

MEM 1414 *abbrev.* Memory 1414, a *smart drug developed in the 1990s that inhibits *phosphodiesterase type 5 and thereby reduces the metabolism of *cyclic AMP and increases the prevalence of *CREB in neurons in the brain. [Abbreviation of *memory 1414*, an arbitrary name used by pharmacologists during the development and testing of the drug]

memory *n.* The psychological function of preserving information,
*****ebook converter DEMO Watermarks*****

involving the processes of **encoding*, **storage*, and **retrieval*. Human memory consists of a series of interconnected systems serving different functions, one of the most basic divisions being into **declarative memory* for factual information about the world and **procedural memory* for information about how to carry out sequences of operations; another basic division being between **long-term memory* for information stored for more than a few seconds, **short-term memory* for temporary storage of information for briefer periods, and **sensory memory* (including the **iconic store*) for very brief storage of visual and possibly other sensory information; and a third basic division being into **episodic memory* for events and experiences and **semantic memory* for information about the world, although **perceptual memory* may not fall into either category. The power of the chemical senses to reawaken distant memories is discussed under **redintegration*. See also AMNESIA, BLOCKING MEMORY, CONFABULATION, CONSTRUCTIVE MEMORY, CUED RECALL, DEFERRED ACTION, DUAL-CODE THEORY (2), DUAL-PROCESS MODEL, ENCODING SPECIFICITY, FREE RECALL, HÖFFDING STEP, HYPERTHYMESIA, LEVELS OF PROCESSING, MEMORY DRUM, MEMORY OPERATING CHARACTERISTIC, MEMORY ORGANIZATION PACKET, MEMORY TRACE, METHOD OF SAVINGS, MNEMONIC, RECALL, RECOGNITION, REPRESENTATIONAL MOMENTUM, SCREEN MEMORY, STATE-DEPENDENT MEMORY, TIP-OF-THE-TONGUE PHENOMENON, UGLY SISTER EFFECT, WORKING MEMORY. [From Latin *memoria* memory, from *memor* mindful]

memory drum *n.* A rotating cylinder on to which may be attached a list of words, nonsense syllables, or other items that are visible one at a time for a fixed time period through a hole in a screen. Before the advent of desktop computers, it was widely used to study **memory*.

memory operating characteristic *n.* A **receiver operating characteristic* applied to experimental data from **recognition* experiments. **Target items* correctly recognized are counted as **hits*, and non-target items incorrectly identified as target items are counted as **false alarms* (2). Also written *memory-operating characteristic*. See also SIGNAL DETECTION THEORY. **MOC** *abbrev.*

memory organization packet *n.* A collection of **scripts* (3) relating to a particular class of situations, such as shopping or going to the cinema, enabling a person to exhibit appropriate behaviour without having to think

*****ebook converter DEMO Watermarks*****

about it. Each memory organization packet is assembled from existing scripts, and different packets often have scripts in common: shopping and going to the cinema, for example, both include a script for paying for goods and services. The inclusion of an inappropriate script in a packet can cause interaction problems, as when a husband treats his wife like a waiter in a restaurant. **MOP** *abbrev.*

memory span *n.* The number of items, such as words, numbers, or letters, that a person can recall immediately after presentation. It is a measure of the capacity of **short-term memory*. *Compare* DYNAMIC MEMORY SPAN.

memory trace *n.* A physiological alteration or process occurring in the nervous system and underlying the storage of a **memory*. Also called a *trace*, an *engram*, or a *neurogram*. *See also* HÖFFDING STEP.

menarche *n.* A female's first **menstruation* when she reaches puberty. [From Greek *men* month + *arche* beginning]

Mendelian *adj.* Of or relating to a form of genetics or a mechanism of inheritance through pairs of non-blending discrete hereditary factors, now called genes, one member of each pair being inherited from each parent. *See also* MENDEL'S LAWS, NON-MENDELIAN GENE. *Compare* BLENDING INHERITANCE.

Mendel's laws *n.* Three major principles of heredity proposed by Mendel on the basis of his breeding experiments with peas and other plants, the first of which is the law of **segregation of alleles*, the second the law of **independent assortment*, and the third the proposition that some alleles show **dominance* (genetic) over others. *Compare* NON-MENDELIAN GENE. [Named after the Austro-Hungarian Augustinian monk Gregor Johann Mendel (1822–84) who published them in 1865 in an article in the *Proceedings of the Natural Science Society of Brunn* that was neglected by biologists for 35 years]

meninges *n. pl.* The three **membranes* covering the brain and spinal cord. *See* ARACHNOID MEMBRANE, DURA MATER, PIA MATER. **meninx** *sing.* [From Greek *meninx*, *meningos* a membrane]

meningioma *n.* A tumour of the meninges of the brain or, rarely, of the spinal cord. [From Greek *meninx*, *meningos* a membrane + *-oma* indicating a tumour]

meningitis *n.* Inflammation of the meninges. [From Greek *meninx*, *meningos* a membrane + *-itis* inflammation]

meninx *n.* The singular of ***meninges**. [From Greek *meninx* a membrane]

menkeiti See [LATAH](#).

menopause *n.* The natural cessation of a woman's ***menstrual cycle** occurring usually between 45 and 50 years of age. Also called the *change of life* or *climacteric*. Compare [ANDROPAUSE](#). [From Greek *men* a month + *pausis* a halt]

menses *n.* Another name for ***menstruation** or menstrual periods. [From Latin *menses* months, from *mensis* a month]

mens rea *n.* A legal term denoting criminal intent and knowledge of the wrongness of a criminal act, the criminal act itself being called the ***actus reus**. For a defendant to be convicted of a crime, both an actus reus and a mens rea must normally be proved. See also [INSANITY](#), [McNAGHTEN RULES](#). [From Latin *mens* mind + *rea* guilty]

menstrual cycle *n.* The monthly ***oestrous cycle** in a woman or other female primate, consisting of the ***follicular phase**, the ***luteal phase**, and the ***menstrual phase**. See also [PHEROMONE](#). [From Latin *menstruus* monthly, from *mensis* a month + Greek *kyklos* a circle or cycle]

menstrual phase *n.* The third and last of the three phases of the ***menstrual cycle**, characterized by ***menstruation**. Compare [FOLLICULAR PHASE](#), [LUTEAL PHASE](#).

menstrual synchrony See [WHITTEN EFFECT](#).

menstruation *n.* The *vaginal discharge from the uterus of a non-pregnant woman occurring monthly from puberty to the *menopause as the final phase of the *menstrual cycle, containing blood and cellular debris from the shedding of the endometrium (the *mucous membrane lining the uterus).
menstruate *vb.*

mental age *n.* A child's performance on a test of mental ability expressed as the average age of children who achieved the same level of performance in a standardization sample. Thus a 10-year-old child who achieves the same score as the average 12-year-old child in a standardization sample has a mental age of 12. The concept was introduced in 1905 by the French psychologists Alfred Binet (1857–1911) and Théodore Simon (1873–1961). See also BINET–SIMON SCALE, IQ. Compare CHRONOLOGICAL AGE, SOCIAL AGE.
MA *abbrev.*

mental chemistry *n.* In the doctrine of *associationism, an idea introduced by the English philosopher John Stuart Mill (1806–73) to replace the *mental mechanics* of his father, the Scottish philosopher James Mill (1773–1836). The idea was borrowed from chemistry, in which compounds often have properties that are qualitatively different from the elements of which they are composed, a familiar example being water, the properties of which are not found in its constituent elements hydrogen or oxygen, which are both gases. According to John Stuart Mill, simple ideas combine to form complex ideas that are qualitatively different from their constituent elements, as when, according to the *contiguity law, the idea of whiteness arises from the association of several different colours seen in rapid succession on a *Maxwell disc, as the English physicist and mathematician Sir Isaac Newton (1642–1727) had demonstrated in his *Opticks* in 1704.

mental defective *n.* An obsolescent term for a person manifesting *intellectual disability.

mental deficiency *n.* Another name for *intellectual disability.

mental disorder *n.* According to *DSM-5, a *syndrome characterized by clinically significant disturbance in cognition, emotional regulation, or

behaviour that reflects a dysfunction in the psychological, biological, or developmental processes underlying mental functioning. Mental disorders are usually associated with distress or disability in social, occupational, or other areas of functioning. According to [*ICD-10](#), a mental disorder is a clinically recognizable collection of symptoms or behaviour associated in most cases with distress or interference with personal functions. A deviant pattern of behaviour, whether political, religious, or sexual, or a conflict between an individual and society is not a mental disorder unless it is symptomatic of a dysfunction in the individual.

mental handicap *n.* An obsolescent term for [*intellectual disability](#).

mental illness *n.* Another name for [*mental disorder](#), with medical connotations that some consider misleading or tendentious.

mental image *n.* Another name for an [*image \(3\)](#).

mental imagery *See* [IMAGERY](#).

mental lexicon *n.* Another name for a [*lexicon \(2\)](#).

mental map *n.* Another name for a [*cognitive map](#).

mental model *n.* An internal representation having—in some abstract sense—the same structure as the aspect or portion of external reality that it represents, such as the [*3-D model description](#) that the English psychologist David Courtenay Marr (1945–80) posited as the basis of visual perception. According to a theory put forward in 1983 by the British psychologist Philip N(icholas) Johnson-Laird (born 1936), people need to construct mental models in order to carry out deductive and inductive reasoning on the basis of [*propositions \(1\)](#), which are not themselves mental models but generally give rise to mental models. For example, the proposition *Alex is to the left of Bernie, and Bernie is to the left of Charlie* may give rise to a mental model in which three men are standing in a row, with Alex to the left of Charlie; but a different mental model would have them arranged anticlockwise around a table, in which case Alex is to the right of Charlie—and in some mental

models they could even be three women. According to some researchers, mental models are required to comprehend **discourse*, to have a **body image*, and even to experience **consciousness*. The concept was suggested in 1943 by the Scottish experimental psychologist Kenneth J(ames) W(illiams) Craik (1914–45) in his book *The Nature of Explanation*. See also *MENTAL ROTATION*. Compare *FRAME (2)*, *SCHEMA*.

mental operation *n.* In the writings of the Swiss psychologist Jean Piaget (1896–1980) and his followers, a mental procedure that can be carried out in reverse. Also called an *operation*. See *CONCRETE OPERATIONS*, *FORMAL OPERATIONS*, *PRE-OPERATIONAL STAGE*.

mental retardation *n.* A term used in **DSM-IV* but replaced in **DSM-5* by **intellectual disability*. **MR** *abbrev.*

mental rotation *n.* The imagined turning of a form or shape from one orientation in space to another, believed to involve the mental image passing through all intermediate positions. The original study of this process by the US psychologist Roger N(ewland) Shepard (born 1929) and his student Jacqueline Ann Metzler (born 1949), published in the journal *Science* in 1971, used stimuli consisting of pairs of computer-generated perspective drawings of three-dimensional objects, each constructed by joining ten cubical blocks face to face to form an arm-like structure with three right-angle bends (see *illustration*). People were asked to decide as quickly as possible whether each pair depicted identical structures in different orientations or mirror-image **enantiomorphs*, and mean response times in recognizing identical structures to be identical were found to increase linearly in almost exact proportion to their angular difference in orientation, from approximately one second for pairs in the same orientation to approximately 4.4 seconds for the maximum angular rotation of 180 degrees, suggesting that the viewers had to mentally rotate one shape through intermediate positions until its orientation matched that of the other shape in order to check for similarity. Men tend to perform significantly better at this task than women. The novel *Dirk Gently's Holistic Detective Agency* (1987) by the English novelist Douglas (Noel) Adams (1952–2002) is devoted largely to the mental rotation of a sofa that has become stuck on a stairway landing. See also *COGNITIVE PENETRABILITY*, *MENTAL MODEL*, *MIRROR REVERSAL PROBLEM*.

Mental rotation. Are the top and bottom objects the same apart from their orientation?

mental set *n.* Another name for a **set (2)*.

mental status examination *n.* An assessment of a person's mental condition, typically covering appearance (visible signs of disorder, weight, dress, hygiene, grooming, sociability, motor activity); mood (facial expression, emotional responses); speech and thought (content and form, language); neuropsychological signs and symptoms (history of neurological signs and symptoms, sensation and localization, **apraxia* and **dyspraxia*,

*****ebook converter DEMO Watermarks*****

attention and concentration, time and place orientation, memory, general intellectual functioning, judgement and insight); and personality (*[defence mechanisms](#) and recent changes in personality). *See also* [MENTAL STATUS EXAMINATION REPORT](#). *Compare* [MINI-MENTAL STATE EXAMINATION](#). **MSE** *abbrev.*

Mental Status Examination Report *n.* A structured assessment of a person's mental condition, based on a multiple-choice *[mental status examination](#), used in several US states as part of an automated system of clinical records. **MSER** *abbrev.*

mental subnormality *n.* An obsolescent term for *[intellectual disability](#).

mental test *n.* Any instrument designed to measure intelligence or any other mental ability or aptitude.

mental time travel *n.* The act or process of recalling past events or envisioning future events. *See also* [AUTONOETIC](#). **MTT** *abbrev.*

meow meow *n.* A street name for *[mephedrone](#). Also spelt *miaow miaow*. [Coined soon after it began to be marketed online in 2009, based on the abbreviation MM-CAT of its chemical name, alluding to the fact that cats meow]

meperidine *n.* Meperidine hydrochloride, a synthetic white crystalline *[narcotic analgesic](#) drug with a *[morphine](#)-like action, used as an *[analgesic](#) and *[sedative](#). Also called *pethidine* or *Demerol* (trademark). *See also* [OPIOID-RELATED DISORDERS](#). [From *me(thyl)* the alkyl radical CH₃ derived from methane by removal of one hydrogen atom, from Greek *methy* wine + *hyle* wood + (*pi*)*peridine*]

mephedrone *n.* A synthetic *[stimulant drug](#) and *[euphoriant](#) 4-methylmethcathinone (4-MM-CAT) or 4-methylephedrone, closely related to *[amphetamine](#), first manufactured in 2007, supplied as a white powder to be snorted through the nostrils or as pills to be swallowed, and often sold as

plant food. Street name: *meow meow*. Formula $C_{11}H_{15}NO$. Often confused with **methadone*. [A contraction of the chemical name of the variant *m(ethyl)ephedrone*]

meprobamate *n.* A bitter-tasting **carbamate* that acts as a central nervous system **depressant* and is used as a sedative and muscle relaxant, the best known of the class of **propanediols*. See also *SEDATIVE-, HYPNOTIC-, OR ANXIOLYTIC-RELATED DISORDERS*. Also called *Miltown* (trademark). **MPB** *abbrev.* [From *me(thyl)* the alkyl radical CH_3 derived from methane by removal of one hydrogen atom, from Greek *methy* wine + *hyle* wood + *pro(pyl)* + (*dicar*)*bamate*]

mere exposure effect *n.* The tendency for repeated exposure to a stimulus to be sufficient to enhance an observer's liking for it or attitude towards it. The effect was first referred to by the German philosopher, physician, psychologist, and mystic Gustav Theodor Fechner (1801–87) in *Vorschule der Aesthetik* (1876, pp. 240–3), and the US psychologist William James (1842–1910) independently rediscovered it and discussed it in *Principles of Psychology* (1890, volume 2, p. 672), but the first quantitative investigation of it was carried out by the US-based Polish psychologist Robert B(oleslaw) Zajonc (1923–2008) and published in the journal *Psychological Monographs* in 1968. Zajonc examined **antonym* pairs and found that the positively toned words were more frequent in the language according to word counts than negatively toned words: *happiness* occurs more than 15 times as frequently in written English as *unhappiness*, *beauty* 41 times as frequently as *ugliness*, *love* almost 10 times as frequently as *hate*, and so on, and similar relationships between frequency and favourability have been found in French, German, Spanish, Russian, Urdu, and other languages. Zajonc also reported experimental evidence using pseudo-Turkish nonsense words such as *iktitaḡ* and diagrams resembling Chinese **logographs*. Participants were exposed to different stimuli different numbers of times, and they then guessed the degree of favourability of the meanings of these items. The results showed almost linear relationships between (log transformed) exposure frequency and rated favourability. See also *POLLYANNA EFFECT*, *PREFERENCE-FEEDBACK HYPOTHESIS*. Compare *NAME–LETTER EFFECT*.

Merkel cell *n.* A touch receptor deep in the skin, and in the mucous membrane of the mouth, with a flattened or slightly cupped body and a large modified epithelial ending, especially sensitive to the edges of objects held in the hand or mouth. Also called a *Merkel corpuscle*, *Merkel disc*, or *Merkel–Ranvier corpuscle*. Compare [FREE NERVE ENDING](#), [GOLGI TENDON ORGAN](#), [MEISSNER’S CORPUSCLE](#), [PACINIAN CORPUSCLE](#), [RUFFINI CORPUSCLE](#). [Named after the German anatomist Friedrich Sigmund Merkel (1845–1919) who discovered it in 1880]

Merkel’s law *n.* In **psychophysics*, the proposition that equal differences in the magnitude of a sensation correspond to equal differences in the intensity of the stimulus causing it. It was not well corroborated by subsequent experimental tests. The term *Merkel’s law* is also an arguably preferable name for **Hick’s law*, because it was first formulated by Merkel. See also [PSYCHOPHYSICAL FUNCTION](#). Compare [FECHNER’S LAW](#), [POWER LAW](#). [Named after the German psychologist Julius Merkel (1834–1900) who formulated it in 1888]

merocrine *adj.* Of or relating to glands such as sweat glands that produce secretions without undergoing degeneration. Compare [APOCRINE](#), [HOLOCRINE](#). [From Greek *meros* part or share + *krinein* to separate]

Merrill-Palmer scale *n.* A scale for measuring mental abilities in preschool children from 18 months to 6 years of age (in the Merrill-Palmer Scale of Mental Tests), or 3 to 5 years of age (in the revised version, called the Extended Merrill-Palmer Scale), designed to provide a broader assessment than can be gained from a conventional IQ test. The Merrill-Palmer Scale of Mental Tests, introduced originally in 1926, comprises 93 tasks, grouped into clusters labelled Language, All-or-None, Form Board and Picture, and Motor Coordination, and grouped into six-month age ranges. The Extended Merrill-Palmer Scale comprises 16 tasks grouped into Semantic Production, Figural Production, Semantic Evaluation, and Figural Evaluation, based on Guilford’s structure-of-intellect model. See also [GUILFORD’S CUBE](#). [Named after the Merrill-Palmer School in Detroit, Michigan, where the scale was developed in 1931 by the US psychologist Rachel Stutsman (later Rachel Stutsman Ball, 1894–1980). The school was endowed by and named after Lizzie Pitts Merrill-Palmer (1838–1916), wife of the US Senator and
*****ebook converter DEMO Watermarks*****]

Ambassador to Spain Thomas Witherell Palmer (1830–1913)]

mescaline *n.* A ***psychotropic alkaloid**, chemically related to ***adrenalin** (epinephrine), derived from the flowering heads of the mescal or peyote cactus *Lophophora williamsii* native to Mexico and the south-western US, used for religious ceremonies in some Native American cultures, usually eaten or dissolved in a drink, acting as a central nervous system ***stimulant** causing pupil dilation and palpitations, together with ***psychedelic** and ***hallucinogenic** effects and feelings of ***euphoria**. Also called *peyote*. See also **PHANTASTICANT**. [From Spanish *mezcal*, from Nahuatl *mexcalli* mescal liquor, from *metl* the tropical American agave plant + *ixcalli* a stew or concoction]

Me-self *n.* According to the pioneering the US psychologist William James (1842–1910) in his *Principles of Psychology* (1890), all that one knows about oneself, or the self as object, in contradistinction to the ***I-self**.

mesencephalic locomotor region *n.* An area of the ***reticular formation** in the mesencephalon or midbrain that, when stimulated, generates alternating limb movements normally seen in walking or running.

mesencephalon *n.* A technical name for the ***midbrain**, especially in a developing embryo. Compare **PROSENCEPHALON**, **RHOMBENCEPHALON**. [From Greek *mesos* middle + *enkephalos* the brain, from *en* in + *kephale* the head]

mesmerism *n.* An obsolete term for ***animal magnetism** or ***hypnosis**. [Named after the Viennese physician Franz Anton Mesmer (1734–1815) who practised animal magnetism, though not hypnosis, in the 1770s]

mesocortex *n.* The five-layered cortex found mainly in the ***cingulate gyrus**, which evolved in humans earlier than most of the ***cerebral cortex** but not as early as the ***archaecortex**. See also **NEOCORTEX**, **PALAEOCORTEX**. [From Greek *mesos* middle + Latin *cortex* bark or outer layer]

mesocortical system *n.* A system of ***dopamine**-secreting neurons with cell bodies in the ***ventral tegmental area** of the midbrain

(mesencephalon) and terminal boutons in the **cerebral cortex*, involved in experiences of pleasure and reward. *See also* *MESOLIMBIC SYSTEM*, *MESOTELENCEPHALIC PATHWAY*.

mesoderm *n.* The middle germ layer of a human or animal **embryo*, from which the muscles, blood, bone, and connective tissue are formed. *Compare* *ECTODERM*, *ENDODERM*. [From Greek *mesos* middle + *derma* skin]

mesokurtic *See* *KURTOSIS*.

mesolect *n.* A speech style intermediate between the **acrolect* and the **basilect* within a speech community. *See also* *DIALECT*, *IDIOLECT*, *LECT*. [From Greek *mesos* middle + *legein* to speak]

mesolimbic system *n.* A system of **dopamine*-secreting neurons with cell bodies in the **ventral tegmental area* of the midbrain (mesencephalon) and terminal boutons in the **limbic system*, widely believed to be the ultimate common pathway for experiences of pleasure and reward in the brain. *See also* *MESOCORTICAL SYSTEM*, *MESOTELENCEPHALIC PATHWAY*.

mesomorph *n.* A muscular physique or body build, believed by the US psychologist William H(erbert) Sheldon (1899–1977) and followers of his **constitutional psychology* to be associated with such personality characteristics as extraversion and aggressiveness. *Compare* *ECTOMORPH*, *ENDOMORPH*. **mesomorphic** *adj.* **mesomorphy** *n.* The state or condition of being a mesomorph. [From Greek *mesos* middle + *morphe* a form or shape]

mesopic *adj.* Of or relating to vision that is intermediate between **photopic* and **scotopic* vision and is mediated by both **rods* and **cones*. [From Greek *mesos* middle + *ops* an eye + *-ikos* of, relating to, or resembling]

mesotelencephalic pathway *n.* A major **dopamine* pathway in the brain that includes the **nigrostriatal bundle* and parts of the **telencephalon*, portions of which are involved in experiences of pleasure and reward. *See also* *MESOCORTICAL SYSTEM*, *MESOLIMBIC SYSTEM*. [From Greek *mesos* middle +

telos end + *enkephalos* the brain, from *en* in + *kephale* the head]

messenger RNA *n.* A short-lived form of ***RNA** found in all cells, functioning as a template for ***protein** synthesis by transcribing genetic information from ***DNA** and carrying the information to a ***ribosome**, where the specified ***proteins** are then synthesized. *See also* **SNURP**. *Compare* **TRANSFER RNA**. **mRNA** *abbrev.*

meta-analysis *n.* A set of techniques for combining the results of a number of research studies and analysing them statistically as a single data set. The US statistician and psychologist Gene V. Glass (born 1940), who introduced the term in an article in the journal *Educational Researcher* in 1976, defined it as ‘the statistical analysis of a large collection of results from individual studies for purposes of integrating the findings’ (p. 3). Often confused with ***metanalysis**. *See also* **EFFECT SIZE**, **FILE DRAWER PROBLEM**. [From Greek *meta* among, beside, after + English *analysis*]

metabolism *n.* The sum total of biological processes occurring in a living organism that result in growth and energy production, more specifically the processes of ***anabolism** whereby foods are converted into body cells and ***catabolism** whereby substances are broken down to release energy. *See also* **AEROBIC**, **ANAEROBIC**, **BASAL METABOLIC RATE**, **KREBS CYCLE**. **metabolic** *adj.* **metabolite** *n.* A substance produced by metabolism. **metabolize** *vb.* To cause to be changed by metabolism. [From Greek *metabole* change, from *meta* among, with, or beside + *ballein* to throw]

metachrosis *n.* The ability of chameleons and certain other reptiles and fishes to change colour by expanding and contracting specialized pigment cells on the outsides of their bodies. [From Greek *meta* beside + *chrosis* colouring, from *chros* colour + *-osis* indicating a process or state]

metacognition *n.* Knowledge and beliefs about one’s own cognitive processes, an important class of metacognition being ***metamemory**. The term is also sometimes applied to regulation of cognitive functions, including planning, checking, or monitoring, as when one plans one’s cognitive strategy for memorizing something, checks one’s accuracy while performing mental arithmetic, or monitors one’s comprehension while reading, and these

*****ebook converter DEMO Watermarks*****

forms of metacognition are called *metacognitive regulation* in contradistinction to *metacognitive knowledge*. Writings on metacognition can be traced back at least as far as *De Anima* and the *Parva Naturalia* of the Greek philosopher Aristotle (384–322 BC), and the phenomenon was brought to prominence during the 1970s largely by the US psychologist John H(urley) Flavell (born 1928), who focused attention especially on developmental aspects of metacognition. In an influential article in the journal *Psychological Review* in 1977, the US psychologists Richard E. Nisbett (born 1941) and Timothy D. Wilson (born 1951) summarized a range of evidence suggesting that people are often unaware of the factors influencing their own choices, evaluations, and behaviour, and that the verbal reports that they give when questioned are often quite erroneous and misleading. *See also* [REALITY MONITORING](#). [From Greek *meta* beside or beyond + English *cognition*]

metacontrast *n.* A type of [*backward masking](#) in which the test stimulus and masking stimulus do not overlap spatially in the visual field. The term is often applied to visual masking by a non-overlapping figure irrespective of the temporal order of test stimulus and masking stimulus, but in careful usage the term [*paracontrast](#) is used when the test stimulus precedes the masking stimulus. *See also* [MASKING](#), [VISUAL MASKING](#). *Compare* [PARACONTRAST](#). [From Greek *meta* beyond + Latin *contra* against + *stare* to stand]

metalanguage *n.* A language used to refer to statements made in another language, called in this context the [*object language](#). If the statements being referred to are in French and the statements referring to them are in English, for example, then the distinction between object language (French) and the metalanguage (English) is clear, but if object language and metalanguage are both expressed in English, or both in a formal language such as the [*predicate calculus](#), then confusion can arise. Quotation marks can sometimes help, as in the sentence ‘*Snow is white*’ is true if and only if snow is white, in which the statement belonging to the object language is enclosed in quotation marks. Many paradoxes, including debatably the [*liar paradox](#), arise from a failure to distinguish object language from metalanguage: expressions involving *true* and *false*, when applied to a sentence, must always be expressed in a metalanguage and not in the object language of the sentence. The ideas behind the concept of a metalanguage are traceable to an article ‘On Denoting’ by the Welsh philosopher Bertrand (Arthur William)

Russell (1872–1970) in the journal *Mind* in 1905, and the concept was fully developed by the Polish logician and mathematician Alfred Tarski (1902–83) in his monograph *Der Wahrheitsbegriff in den formalisierten Sprachen* (The Concept of Truth in Formalized Languages) in 1933.

metamemory *n.* Knowledge or beliefs about one's own memory, its strengths and weaknesses, whether one has remembered particular items, and so on. The word is also used to denote regulation or control of memory, as described under ***metacognition**. See also **MNEMONIC**, **REALITY MONITORING**. [From Greek *meta* beside or beyond + English *memory*]

metamer *n.* Either of a pair of colours that appear identical but have different spectral compositions and are therefore composed of different wavelengths. A mixture of two non-complementary colours produces a colour that appears identical to a pure colour intermediate on the ***colour circle** between the component colours of the mixture but that has a different spectral composition from the pure colour. [From Greek *meta* beside + English (*iso*)*mer*, from Greek *isos* equal or the same + *meros* a part]

metameric match *n.* A comparison colour that a viewer considers identical to both members of a pair of ***metamers**.

metametric pair *n.* Two colours that are ***metamers** of each other.

metanalysis *n.* The formation of a new word through a mistaken analysis of a boundary between existing words. A typical example is the word *adder*, derived from Middle English *naddre* through people mishearing the phrase *a naddre* as *an adder*. A second example is the word *apron*, derived from a mistaken division into *an apron* of the Middle English *a napron*, from Old French *naperon* a little cloth, from Latin *nappa* a napkin. Often confused with ***meta-analysis**. Compare **BACK FORMATION**, **FOLK ETYMOLOGY (2)**. [From Greek *meta* beside or beyond + English *analysis*]

metaphase *n.* The second phase of ***mitosis**, during which the ***nuclear spindles** are formed and the ***chromosomes** attach themselves to the equator of the spindles by their ***centromeres**. [From Greek *meta* beside + *phasis* an aspect, from *phainein* to show]

*****ebook converter DEMO Watermarks*****

metaphor *n.* A [*figure of speech](#) in which a word or phrase is stated to mean something that it resembles but does not literally denote, as in *Life is just a bowl of cherries* (song title) or *Life is just a bowl of cheerios* (graffito). See also [CONDENSATION](#). Compare [SIMILE](#). [From Greek *meta* beside or beyond + *pherein* to carry]

metapsychology *n.* The study of the underlying conceptual questions or principles of psychology. The term was first used in [*psychoanalysis](#) by Sigmund Freud (1856–1939) to denote his own theory of psychology, especially its more abstract conceptual assumptions, in a letter to his friend, the German physician Wilhelm Fliess (1858–1928) in 1898 (*Standard Edition*, I, p. 274), and later given the following definition in his article on ‘The Unconscious’ (1915): ‘I propose that when we have succeeded in describing a psychical process in its dynamic, topographical and economic aspects, we should speak of it as a *metapsychological* presentation’ (*Standard Edition*, XIV, pp. 166–215, at p. 181). See also [DYNAMIC](#), [ECONOMIC](#), [TOPOGRAPHY](#). [From Greek *meta* among, beside, after + English *psychology*]

metathetic stimulus dimension *n.* Any stimulus dimension that can vary continuously and in so doing produce discrete or qualitative changes in perception, the standard example being the wavelength or frequency of visible light, which produces qualitatively different hues or colours as it varies continuously, whereas sound produces continuous or quantitative perceptual changes. Compare [PROTHETIC STIMULUS DIMENSION](#). See also [CATEGORICAL PERCEPTION](#). [From Greek *metathetikos* able to change, from *meta* beside + *tithenai* to place + *-ikos* of, relating to, or resembling]

metatrait *n.* A measure of the relevance of a [*trait](#) to a person, indicated by the consistency or lack of scatter (measured by the [*standard deviation](#)) of the individual’s responses to a set of personality scale items designed to measure it. Thus, for example, a person may score high on a scale to measure [*conscientiousness](#) but low on the corresponding conscientiousness metatrait, given a high inter-item standard deviation of responses to the component scale items. That would imply that the conscientiousness trait has low relevance to that person, and therefore that the high trait score is less predictive of conscientious behaviour across situations than a similar scale score in a person with a higher metatrait score. Metatrait scores have been

*****ebook converter DEMO Watermarks*****

shown to mediate the relation between total trait scores and behaviour and to be stable over time. The term was introduced by the US psychologists Roy F. Baumeister (born 1953) and Dianne M. Tice (born 1960) in an article in the *Journal of Personality* in 1988. [From Greek *meta* among + Old French *trait* a drawing or a stroke of the pen in a picture, from Latin *trahere*, *tractum* to draw]

metencephalon *n.* A part of the **rhombencephalon* hindbrain or of an embryo that develops later into the **cerebellum* and **pons*. Compare *EPENCEPHALON*. [From Greek *meta* among, with, or beside + *enkephalos* the brain, from *en* in + *kephale* the head]

met-enkephalin See *ENKEPHALIN*.

meth *n.* A common street name for **methamphetamine*.

methacholine *n.* A **parasympathomimetic* drug that mimics **acetylcholine* at **muscarinic receptor* sites. Also called *Mecholyl* (trademark). See also *CHOLINOMIMETIC*. [From *meth(yl)* the alkyl radical CH₃ derived from methane by removal of one hydrogen atom, from Greek *methy* wine + *hyle* wood + *a(cetyl)choline*]

methadone *n.* A synthetic **narcotic analgesic* with similar effects to **morphine* but believed by some to be less harmful, often used as a replacement for **heroin* in the treatment of heroin dependency. Often confused with **mephedrone*. Also called *Dolophine* (trademark). See also *CROSS-DEPENDENCE*, *OPIOID-RELATED DISORDERS*. [From *(di)meth(yl)* + *a(mino)* + *d(iphenyl)* + Greek *-one* indicating a chemical compound that is a ketone, from *-one* a feminine name suffix]

methamphetamine *n.* A drug that is closely related to **amphetamine* and that has a long-lasting action, used as a central nervous system **stimulant* and appetite suppressant. Common street names for it include *crank*, *crystal*, *crystal meth*, *meth*, and *speed* (more properly reserved for **amphetamine*). See also *AMPHETAMINE-RELATED DISORDERS*, *ICE*, *YABA*. [From *meth(yl)* the alkyl radical CH₃ derived from methane by removal of one hydrogen atom, from

Greek *methy* wine + *hyle* wood + English *amphetamine*]

methaqualone *n.* A central nervous system **depressant* that is used as a sedative and a hypnotic drug. Also called *Quaalude* (trademark). [From its chemical name *meth(yl)* the alkyl radical CH₃ derived from methane by removal of one hydrogen atom, from Greek *methy* wine + *hyle* wood + *qu(in)a(zo)l(ine)* + *-one* indicating a ketone, from *-one* a feminine name suffix]

method of absolute judgement *n.* In **psychophysics*, a procedure in which judgements are made without any explicit standards of comparison, as when an observer is asked to rate a sound for loudness on a scale from 0 to 100. Also called the *method of single stimuli*. Compare *METHOD OF COMPARATIVE JUDGEMENT*.

method of adjustment *n.* Another name for the **method of average error*.

method of average error *n.* One of the three classical methods of **psychophysics* introduced in 1860 by the German philosopher, physician, psychologist, and mystic Gustav Theodor Fechner (1801–87) for determining **difference thresholds*. It involves repeatedly adjusting a **variable stimulus* until it appears equal (or stands in some other prescribed relation of magnitude) to a **standard stimulus*, a difference threshold being calculated as the **probable error* of the adjustment—the absolute error exceeded in 50 per cent of such matches. Also called the *method of adjustment*, *method of mean error*, or *method of reproduction*. Compare *METHOD OF CONSTANT STIMULI*, *METHOD OF LIMITS*.

method of bisection *n.* In **psychophysics*, a technique for measuring sensations on an **interval scale* by having the observer repeatedly select or adjust a stimulus until it appears to be exactly half-way between two others. It is a form of the **method of equal-appearing intervals*. See also *INDIRECT SCALING*.

method of comparative judgement *n.* In **psychophysics*, a

procedure in which a **variable stimulus* is judged in relation to a **standard stimulus*. See also COMPARATIVE JUDGEMENT, DIFFERENCE THRESHOLD, LAW OF COMPARATIVE JUDGEMENT. Compare METHOD OF ABSOLUTE JUDGEMENT.

method of constant stimuli *n.* One of the three classical methods of **psychophysics* introduced in 1860 by the German philosopher, physician, psychologist, and mystic Gustav Theodor Fechner (1801–87) for determining **absolute thresholds* and **difference thresholds*. It involves presenting **variable* stimuli in random order and determining the smallest intensity that can be detected in the case of an absolute threshold or the smallest difference from a **standard stimulus* that can be detected in the case of a difference threshold, the criterion used nowadays usually being correct detection or discrimination on 75 per cent of presentations, although other percentages are sometimes used. See also METHOD OF EQUAL AND UNEQUAL CASES. Compare METHOD OF AVERAGE ERROR, METHOD OF LIMITS.

method of equal and unequal cases *n.* In **psychophysics*, a version of the **method of constant stimuli* in which a **difference threshold* is determined by presenting stimuli in pairs and requiring the observer to decide in each case whether they are the same or different.

method of equal-appearing intervals *n.* Any method of **psychophysical scaling* in which an observer adjusts the differences between stimuli, or chooses stimuli from a set, so that the differences between the magnitudes of the stimuli appear equal, thereby producing an **interval scale*. A **Thurstone scale* is a special form of equal-appearing interval scale. See also METHOD OF BISECTION.

method of gradation *n.* Any method of **psychophysics* in which an observer's judgement is determined by a succession of increasingly narrow approximations, a typical example being the **method of limits*.

method of limits *n.* One of the three classical methods of **psychophysics* introduced in 1860 by the German philosopher, physician, psychologist, and mystic Gustav Theodor Fechner (1801–87) for determining **absolute thresholds* and **difference thresholds*. It involves the presentation of an ascending series in which the intensity of a **variable stimulus* is
*****ebook converter DEMO Watermarks*****

increased by predetermined steps until it can be perceived on 50 per cent of presentations (for an absolute threshold determination) or until a difference between it and a **standard stimulus* can be perceived on 50 per cent of presentations (for a difference threshold), and a descending series in which the intensity is reduced by corresponding steps until the stimulus or the difference can be perceived on only 50 per cent of presentations. The threshold from the ascending series is called the *upper threshold* and is usually higher than the threshold from the descending series, called the *lower threshold*, and when a single threshold is required it is usually taken as the midpoint between the upper and lower thresholds. Compare [METHOD OF AVERAGE ERROR](#), [METHOD OF CONSTANT STIMULI](#).

method of loci *n.* A technique for memorizing lists of items, first introduced in about 500 BC by the poet Simonides of Ceos (556–468 BC). See [MNEMONIC](#).

method of mean error *n.* Another name for the **method of average error*.

method of paired comparisons *n.* In **psychophysics*, a method of scaling in which pairs of stimuli are presented, every stimulus in the set being paired with every other stimulus, a judgement being made in each case as to which of the two is greater with regard to the **attribute* being scaled (for example, which is heavier, brighter, or preferable). Provided the judgements satisfy certain assumptions, an **ordinal scale* is established. The technique is practical only if the number of stimuli is relatively small, because the number of pairs in a set of n stimuli is $n!/2(n-2)!$ and hence for $n = 8$ there are 28 pairs, for $n = 10$ there are 45 pairs, for $n = 20$ there are 190 pairs, for $n = 50$ there are 1,225 pairs, and so on. See also [UNFOLDING TECHNIQUE](#).

method of reproduction *n.* Another name for the **method of average error*.

method of savings *n.* A technique for studying **memory* by measuring the amount of time or the number of trials required to learn a certain amount of information or a certain skill and then determining how much less time or how many fewer trials are required to relearn the material or skill to the same

*****ebook converter DEMO Watermarks*****

standard after a period of forgetting, the reduction providing an index of the extent of the original learning.

method of single stimuli *n.* In **psychophysics*, a procedure in which judgements are made without explicit standard of comparison, as when an observer is asked to rate a sound for loudness on a scale from 0 to 100. Also called the *method of absolute judgement*.

methyl atropine *n.* A form of **atropine*, biochemically modified by the addition of a methyl radical, leaving the molecule with a positive charge and rendering it incapable of crossing the **blood-brain barrier*, so that it blocks peripheral acetylcholine neuroreceptors but allows brain acetylcholine systems to function normally. *Compare* METHYL SCOPOLAMINE. [From *methyl* the alkyl radical CH₃ derived from methane by removal of one hydrogen atom, from Greek *methy* wine + *hyle* wood + English *atropine*]

methylphenidate *n.* Methylphenidate hydrochloride, an analogue of **amphetamine*, being a mild central nervous system **stimulant drug* that blocks the reuptake of **noradrenalin* and **dopamine* and is often prescribed in the treatment of attention-deficit/hyperactivity disorder (*ADHD*) in children and narcolepsy in adults. Commonly called *Ritalin* (trademark). *See also* AMPHETAMINE-RELATED DISORDERS, INITIAL VALUES LAW. [From *methyl* + *phen(yl)* + (*piper*)*id(ine)* + (*acet*)*ate*]

methylphenylpyridine *n.* The chemical name of **MPP⁺*.

methylphenyltetrahydropyridine *n.* The chemical name of **MPTP*.

methyl scopolamine *n.* A form of **scopolamine*, biochemically modified by the addition of a methyl radical, leaving the molecule with a positive charge and rendering it incapable of crossing the **blood-brain barrier*, so that it blocks peripheral acetylcholine neuroreceptors but allows brain acetylcholine systems to function normally. *Compare* METHYL ATROPINE. [From *methyl* the alkyl radical CH₃ derived from methane by removal of one hydrogen atom, from Greek *methy* wine + *hyle* wood + English *scopolamine*]

methylxanthine *n.* Another name for a **xanthine*.

metonymy *n.* A **figure of speech* in which a word denoting an **attribute* comes to be substituted for the thing referred to, as in the phrase *the crown*, denoting the king or queen, or *the bench*, denoting a collection of judges or magistrates. *See also* *DISPLACEMENT*. *Compare* *SYNECDOCHE*. [From Greek *meta* beside + *onoma* a name]

Metrazol *n.* A proprietary name for the stimulant drug **pentylene tetrazol*. [Trademark, from (*penta*)*met*(*hylene*) + (*tet*)*razol*(*e*)

MHPG *abbrev.* 3-Methoxy-4-hydroxyphenylethylene glycol, a metabolite of **dopamine* and **noradrenalin* (norepinephrine) that is believed to be a biochemical marker for the diagnosis of depression.

mianserin *n.* A **tetracyclic antidepressant* drug, used to treat **depression*, especially when it is accompanied by a **sleep–wake disorder*, and other disorders of which depression is a feature.

miaow miaow *n.* *See* *MEOW MEOW*.

Michelangelo phenomenon *n.* A pattern of relationship interdependence in which close partners influence each other's dispositions, values, and behavioural patterns in such a manner as to bring both people closer to their **ideal selves*. The concept was introduced by the US psychologist Stephen Michael Drigotas (born 1966) and several collaborators in an article in the *Journal of Personality and Social Psychology* in 1999 reporting the results of four experiments designed to elucidate the phenomenon. [Named after the Italian sculptor Michelangelo Buonarroti (1475–1564) who is said to have conceived of sculpture as a process of bringing out figures already hidden in stone by chipping away the excess]

microcephaly *n.* A congenital condition characterized by an abnormally small head and underdeveloped brain, resulting in some degree of **intellectual disability*. **microcephalic** *adj.* [From Greek *mikros* small + *kephale* head]

microelectrode *n.* A fine insulated wire with an extremely narrow tip, usually between one-half and five microns (micrometres or millionths of a metre) in diameter, that when inserted close enough to a ***neuron** can detect its individual electrical signals or can be used to stimulate the neuron. [From Greek *mikros* small + *elektron* amber (in which electricity was first observed) + *hodos* a way]

microevolution *n.* A relatively rapid change in a species or subspecies brought about by ***natural selection** operating intensively on a characteristic or characteristics. *Compare* **MACROEVOLUTION**. [From Greek *mikros* small + English *evolution*]

microfilament *n.* A slender threadlike structure containing ***actin** that is abundantly present in ***muscle** tissue. [From Greek *mikros* small + Latin *filum* a thread, from *filare* to spin]

microglia *n.* A type of ***neuroglial** cell found in the central nervous system, more abundant in ***grey matter** than in ***white matter**, functioning as a ***phagocyte**, scavenging dead or damaged cells or encircling them, and proliferating when the brain is injured or infected. *See also* **GLIA**. *Compare* **MACROGLIA**. [From Greek *mikros* small + *glia* glue]

micropsia *n.* A condition, caused either by a lesion in the retina or by a neurological disorder, in which everything in the ***visual field** appears smaller than normal. Also called *micropsy*. *See also* **CHARLES BONNET SYNDROME**. *Compare* **MACROPSIA**. [From Greek *mikros* small + *opsis* sight, from *ops* an eye + *-ia* indicating a condition or quality]

microsaccade *n.* One of the forms of ***physiological nystagmus**, consisting of a tiny ***saccade**, usually through a visual angle between 1 and 2 minutes of arc (sixtieths of a degree), occurring in random directions three or four times a second while an observer fixates an object visually, necessary to prevent the visual image from disappearing, as an artificially ***stabilized retinal image** does after about a second. *See also* **OCULAR DRIFT**, **OCULAR TREMOR**. [From Greek *mikros* small + French *saccade* a jerk, from Old French *saquer* to pull]

microsleep *n.* A very brief period of sleep, occurring without awareness in a person who is apparently awake, often associated with fatigue or alcohol intoxication.

microsome *n.* Any of the small fragments that can be isolated from biological cells by centrifugal action. They consist of ***ribosomes** with scraps of ***endoplasmic reticulum** attached to them. [From Greek *mikros* small + *soma* a body]

microspecies *n.* A taxonomic category below the level of a ***species**, hence a race, subspecies, or variety. [From Greek *mikros* small + Latin *species* appearance or kind, from *specere* to look]

microtome *n.* An instrument for cutting thin slices of brain tissue or other material for microscopical examination. **microtomy** *n.* The slicing of sections with a microtome. [From Greek *mikros* small + *tome* a cut]

microtubule *n.* Any of the comparatively rigid, hollow protein tunnels, with an outside diameter of approximately 25 nanometres and an inside diameter of approximately 14 nm, up to several millimetres in length, forming part of the ***cytoskeleton** within the cytoplasm of almost all cells, including ***neurons**, where such tunnels are involved in ***anterograde transport** and ***retrograde transport** within ***axons** and ***dendrites**. The molecules of *tubulin*, the protein of which it is composed, can exist in at least two different geometrical configurations, in one of which it bends about 30 degrees from the direction of the microtubule, enabling movement to occur, for example during ***mitosis**, and possibly encoding and transmitting signals within the cell like a ***cellular automaton**. The ***cilia** of ***paramecia** consist of bundles of microtubules. *See also* **NEUROFIBRIL**, **PARAMECIUM**. [From Greek *mikros* small + Latin *tubulus* a little pipe, diminutive of *tubus* a pipe]

midbrain *n.* The middle part of the brain, connecting the diencephalon to the hindbrain, including the ***tectum**, ***tegmentum**, ***cerebral peduncles** and the ***aqueduct of Sylvius**, also called the *mesencephalon*, especially in a developing embryo. *Compare* **FOREBRAIN**, **HINDBRAIN**.

middle commissure *n.* A band of grey matter connecting the two *thalami across the third *ventricle of the brain. *See also* COMMISSURE.

middle ear *n.* The sound-transmitting intermediate part of the ear, filled with air and containing the *malleus, *incus, and *stapes, separated from the outer ear by the *tympanic membrane and from the inner ear by the *round window (fenestra rotunda) and *oval window (fenestra ovalis). *See also* EUSTACHIAN TUBE.

middle insomnia *See* INSOMNIA.

middle temporal gyrus *n.* The middle of the three gyri on the lateral surface of each *temporal lobe, running horizontally between the superior temporal gyrus (temporal operculum) and the inferior temporal gyrus, occupied at its posterior extremity by Area V5 of the *visual cortex, which is responsible for visual perception of motion. Also called the *median temporal gyrus* or the *middle temple*. **MT** abbrev.

midget cell *n.* A small retinal *ganglion cell in the *parvocellular system, with a *centre-surround receptive field, its centre receiving input from only one of the three types of *cone (blue, green, or red) and the surround from the other two types of retinal cones. *Compare* PARASOL CELL.

midsagittal plane *n.* A *sagittal plane passing through the middle of an organ or organism, dividing it into equal right and left halves.

midsagittal section *n.* A *sagittal section dividing an organ or organism down the middle into left and right halves. In the case of the brain it exposes the *medial surfaces of the cerebral hemispheres. Also called the *median section*. *See* SAGITTAL SECTION.

mid vowel *n.* A *vowel (see the diagram accompanying that entry) produced at a position in the vocal tract that is mid-way between the position of a *close vowel and that of an *open vowel, such as the initial vowel in the word *about* (a *schwa) or the vowel in *get*.

Mignon delusion *n.* The delusion that the parents who brought one up are not one's natural parents and that one really belongs to a more distinguished family. [Named after a character of mysterious origins in Goethe's novel *Wilhelm Meister*, and the eponymous heroine of the opera *Mignon* based on it, who pines away and dies without her longings being fulfilled]

migraine *n.* A recurrent headache originating on one side of the head, characterized by severe throbbing pain and an aversion to bright light, sometimes preceded or accompanied by visual disturbances or prodromal **auras* (2) such as **scotomas* or **phosphenes*, nausea, vomiting, sweating, chills, and exhaustion. *See also* **MÖBIUS SYNDROME**. [From Greek (*he*)*mi* half + *kran*(ion) skull]

migration *n.* The movement from one region, place, or country to another, including the seasonal movement of a population of animals to a different environment, most common in certain species of birds (such as Arctic terns, which migrate annually 17,600 km between their breeding ground in the Arctic circle and the Antarctic), but observed also in mammals (such as porpoises), fish (such as eels, salmon), and some insects. *See also* **POPULATION GENETICS**.

mild cognitive impairment *n.* A condition characterized by slight **amnesia* without **dementia* or other forms of **cognitive impairment*, often a precursor of **Alzheimer's disease*. It may be diagnosed in a patient who complains of memory loss, and has demonstrable memory impairment compared to other people of similar age, but is capable of carrying out normal activities of daily life, has normal general cognitive functioning, and does not meet the criteria for the diagnosis of dementia. Approximately 80 per cent of people with the condition develop Alzheimer's disease within 10 years. Also called *cognitive impairment no dementia* (**CIND**). *See also* **CLOCK DRAWING TEST**, **MINI-MENTAL STATE EXAMINATION**. **MCI** *abbrev.*

mild mental retardation *n.* An obsolescent term for a level of **intellectual disability* associated with an **IQ* approximately between 50 and 69 (in adults, **mental age* from 9 to 12 years), equivalent to the educational category of educable mentally retarded. Sometimes called *feeble-mindedness*
*****ebook converter DEMO Watermarks*****

or *mild mental subnormality*.

Milgram experiment *n.* A famous experimental procedure introduced in 1963 by the US psychologist Stanley Milgram (1933–84) to study obedience to authority. See [OBEDIENCE](#).

milieu therapy *n.* A form of [*psychotherapy](#), usually conducted in a hospital or other facility that can function as a [*therapeutic community](#) and provide a stable environment, in which personal growth and behaviour change may be promoted through interaction of individuals within the total therapeutic environment. See also [GROUP THERAPY](#).

Miller Analogies Test *n.* A [*psychometric](#) test designed to select entrants to graduate schools in the United States. It comprises 120 verbal analogy items of the type *Fish is to water as bird is to?* It is the most widely used test for graduate school entry after the [*Graduate Records Examination](#). **MAT** *abbrev.* [Named after the US psychologist Wilford Stanton Miller (1883–1960) who developed it in 1923]

Mill Hill Vocabulary scale *n.* An [*intelligence test](#) designed to measure verbal intelligence, consisting of a list of 88 words divided into two sets of 44, published by the English psychologist John C(arlyle) Raven (1902–70) in its original form in 1944 as a companion to [*Raven's Progressive Matrices](#). The respondent's task is to explain the meanings of the words or (in an alternative form of presentation) to select the correct synonym for each word from a list of six alternatives provided. Most children with a [*mental age](#) of 5 years can explain the meanings of the first few words (*cap, loaf, unhappy*), and between the ages of 5 and 16 children of average intelligence can usually define about three additional words per year. The most difficult words in the list, which only a small minority of adults can define, include *recondite, exiguous, and minatory*. The [*correlation](#) between scores on the Mill Hill Vocabulary scale and Raven's Progressive Matrices is approximately .75, notwithstanding the utterly different ways in which the two tests measure intelligence. **MHV** *abbrev.* [Named after the Mill Hill Emergency Hospital in London, the wartime location of the Maudsley Hospital, where it was developed]

millimicron *n.* Another (obsolescent) name for a **nanometre*.

Miltown *n.* A proprietary name for the depressant drug **meprobamate*.
[Trademark]

mimesis *n.* Imitation or **mimicry*. **mimetic** *adj.* Imitative; of or relating to mimesis. [From Greek *mimesis* imitation, from *mimeisthai* to imitate]

mimicry *n.* Imitation or **mimesis*; more specifically the deceptive resemblance of one animal species to another to protect it from **predators*, common especially among butterflies and other insects. *See also* **BATESIAN MIMICRY**, **MÜLLERIAN MIMICRY**. [From Greek *mimos* a mime]

mind-blindness *n.* A specific inability to appreciate other people's mental states. The term was first used in its modern sense in 1990 by the British psychologist Simon Baron-Cohen (born 1958), although the German physiologist Hermann Munk (1839–1912) introduced it (in the German form *Seelenblindheit*) in an article in the *Archiv für Anatomie und Physiologie* in 1878 to denote a loss of ability to grasp the meaning of visual stimuli without loss of the ability to see. Munk had observed this condition in a dog with a limited lesion in the **occipital* cortex. *See* **THEORY OF MIND**. **mind-blind** *adj.*

mind-body problem *n.* The philosophical problem, usually attributed to the French philosopher René Descartes (1596–1650) of explaining the apparent interaction of mental and physical events, which appear to belong to two quite separate realms of existence, as when a (mental) wish gives rise to a (physical) bodily movement or a (physical) pinprick to a (mental) sensation of pain. The problem was appreciated by Descartes only after he received a letter in 1643 from Princess Elizabeth of Bohemia (1596–1662), the daughter of King James I of England and VI of Scotland, pointing it out. *See also* **CARTESIAN DUALISM**, **DOUBLE-ASPECT THEORY**, **DUALISM**, **EPIPHENOMENALISM**, **IDENTITY THEORY**, **INTERACTIONISM (1)**, **MATERIALISM**, **MONISM**, **NEUTRAL MONISM**, **PSYCHOPHYSICAL PARALLELISM**.

mindfulness *n.* Heedfulness or awareness. In some forms of **psychotherapy* and **counselling psychology*, lucid awareness of events and

experiences. This usage is borrowed from the Buddhist tradition of ***transcendental meditation**, in which the state of mindfulness is likened to a polished mirror that simply reflects what passes before it, unbiased by conceptual thought. Such heightened mental receptivity, including increased sensitivity to the environment, greater openness to new information, new ways of structuring perception, and enhanced awareness of different problem-solving perspectives, is believed to facilitate insight, revealing reality with increased clarity, and is claimed to produce psychological and health benefits. The concept was brought to prominence in psychology by the US psychologist Ellen J. Langer (born 1947), first in an article co-authored with two colleagues in the *Journal of Experimental Social Psychology* in 1974, and later a book entitled *Mindfulness* published in 1989. *See also* **ACCEPTANCE AND COMMITMENT THERAPY**, **ATTENTION**, **CONTROLLED PROCESSING**, **DIALECTICAL BEHAVIOUR THERAPY**, **MINDFULNESS-BASED COGNITIVE THERAPY**, **MORITA THERAPY**. *Compare* **MINDLESSNESS**. **mindful** *adj.* [From a translation of the word *sati* in the ancient Indian language Pali, meaning to remember or to have presence of mind, from Old English *gemynd* mind + *-ful* full + *-nes* indicating a state, condition, or quality]

mindfulness-based cognitive therapy *n.* A therapeutic method based on ***cognitive behaviour therapy**, incorporating ideas associated with ***mindfulness**, designed to prevent recurrence of episodes of ***major depressive disorder**. The mindfulness element trains clients to notice automatic cognitive processes that have triggered depressive episodes in the past and to alter their reactions to be more reflective. It was developed by the Polish-born Canadian psychologist Zindel V(ictor) Segal (born 1956) and the British clinical psychologists J(ohn) Mark G(ruffydd) Williams (born 1952) and John D(ouglas) Teasdale (born 1944) and published in a book entitled *Mindfulness-Based Cognitive Therapy for Depression* in 2002 and an article in the *Journal of Consulting and Clinical Psychology* in 2004. **MBCT** *abbrev.*

mindlessness *n.* A state of reduced cognitive activity, with ***automatic processing** of environmental cues. *Compare* **MINDFULNESS**. **mindless** *adj.* [From Old English *gemynd* mind + *-leas* lacking + *-nes* indicating a state, condition, or quality]

mind-reading *n.* The act or process of discerning another person's thoughts, as in **telepathy* or in the everyday functioning of a **theory of mind*. Compare *MIND-BLINDNESS*. **mind-reader** *n.* One who engages in mind-reading.

mineralocorticoid *n.* Any **corticosteroid* that maintains the body's electrolyte and fluid balance, especially by promoting the retention of sodium in the kidney tubules, the most significant one in humans being **aldosterone*. See also *ZONA GLOMERULOSA*. Compare *GLUCOCORTICOID*. [From *mineral* + *cortico(steroid)*]

miniature end-plate potential *n.* A small variation in the electrical potential across the membrane of a resting muscle cell, below the threshold required to trigger a contraction of the muscle fibre, caused by the release of a small quantity of **acetylcholine* by a **motor neuron* at the **motor end plate*. Compare *END-PLATE POTENTIAL*. **MEPP** *abbrev.*

minimal audible angle See *MINIMUM AUDIBLE ANGLE*.

minimal audible field See *MINIMUM AUDIBLE FIELD*.

minimal audible pressure See *MINIMUM AUDIBLE PRESSURE*.

minimal brain dysfunction *n.* Another name for **attention-deficit/hyperactivity disorder*. Also called *minimal cerebral dysfunction* (or *damage*). **MBD** *abbrev.*

minimal group situation *n.* An experimental procedure in which mere **social categorization* elicits intergroup discrimination. It was introduced in 1970 and 1971 in articles in *Scientific American* magazine and the *European Journal of Social Psychology* respectively by the British-based Polish psychologist Henri Tajfel (1919–82) and several colleagues, who performed the following experiment with a group of 64 schoolboys who knew one another very well. The boys were divided into two groups on arbitrary and insignificant criteria and were then presented with a series of two-row matrices, on each of which they were asked to choose a column specifying

amounts of money to be assigned to two members of their own group (ingroup choices), two members of the other group (outgroup choices), or one member of their own group and one member of the other group (intergroup choices). The boys did not know the identity of the individuals who were affected by their choices but only which groups they belonged to, and their own interests were not affected by their choices, because no one could know their choices. Nevertheless, when they made intergroup choices, a large majority of the boys gave slightly more money to members of their own group than to members of the other group, even when they could have chosen columns in which members of their own group would have got more in absolute terms but the other group would have done even better. In contrast, when they made ingroup choices or outgroup choices, they tended to select columns that distributed the money with maximum fairness. This effect has been replicated with children and adults of both sexes in many different countries. Also called the *minimal group paradigm*, and often confused with the [*minimal social situation](#). See also [SOCIAL IDENTITY THEORY](#).

minimal pair *n.* A pair of words that differ in only one speech sound but have distinct meanings, thus establishing that the speech sounds in question are different [*phonemes](#). For example, the fact that *cap* and *cab* have different meanings establishes that /p/ and /b/ are different phonemes in English. In English, /r/ and /l/ give distinct meanings to minimal pairs (such as *row* and *low*) and are therefore distinct phonemes, whereas in Japanese they do not and are therefore [*allophones](#), which explains why they are often confused by native Japanese speakers of English. See also [ACOUSTIC CUE \(1\)](#), [ACQUIRED SIMILARITY](#), [DISTINCTIVE FEATURE](#), [NEUTRALIZATION](#).

minimal social situation *n.* An interactive decision in which each decision maker is ignorant of the interactive nature of the decision and even of the existence of another decision maker whose actions affect the outcomes, first investigated by the US psychologist Joseph B(oleslaus) Sidowski (born 1925) and his colleagues and published in the *Journal of Abnormal and Social Psychology* in 1956 and the *Journal of Experimental Psychology* in 1957. In the original experiment, pairs of participants or subjects were seated in separate rooms, unaware of each other's existence, with electrodes attached to their bodies, each individual operating an apparatus with a pair of buttons labelled *L* and *R* and a digital display showing the cumulative number

of points scored. They pressed one button at a time as often as required with the twin goals of obtaining rewards (points) and avoiding punishments (electric shocks). The rewards and punishments were arranged according to a *mutual fate control* payoff structure such that whenever either individual pressed *L*, the other was rewarded with points, and whenever either pressed *R*, the other was punished with electric shock; but a choice had no direct effect on the individual who made it. As Sidowski and his colleagues were the first to demonstrate, in such situations people generally learn to coordinate their choices to their mutual benefit, although they are unaware of their interdependence, and in the long run pairs often settle down to choosing *L* on every occasion. The minimal social situation is often confused with the **minimal group situation*. See also WIN–STAY, LOSE–SHIFT STRATEGY.

minimax *n.* In two-person game theory, a **strategy* (2) that *minimizes* the maximum payoff to the co-player. In a two-person **zero-sum game*, it is equivalent to a **maximin* strategy, because each player's gains are the co-player's losses.

minimax theorem *n.* A fundamental result in **game theory*, establishing that every finite, strictly competitive (two-person **zero-sum*) game has what later came to be called a **Nash equilibrium*, provided that **mixed strategies* may be used, and that the corresponding strategies are **minimax* strategies. The theorem was first proved by the Hungarian-born US mathematician John von Neumann (1903–57) and published in the journal *Mathematische Annalen* in 1928.

Mini-Mental State Examination *n.* A brief, easily administered, and simply scored psychological test designed to screen for mental impairment, especially in the elderly, first published by the US psychiatrists Marshal F(rank) Folstein (born 1941), Susan Folstein (born 1944), and Paul R(odney) McHugh (born 1931) in the *Journal of Psychiatric Research* in 1975. It was based on a test developed by the British psychiatrist John Hinton (born 1926) and the British psychologist Eileen Withers, published in the *British Journal of Psychiatry* in 1971, based on 'most of the commonly used tests' in existence at that time, traceable back to the German neurologist Alois Alzheimer (1864–1915). It consists of the following 11 questions: What is the year, season, month, date, day of the week? (5 points). Where are we

*****ebook converter DEMO Watermarks*****

(state/country, county/province, city, hospital/place, floor/street)? (5 points). Remember these and name them after me: *apple, penny, table* (3 points). Subtract 7 from 100, then subtract 7 from the answer, and so on five times, or spell the word *world* backwards (5 points). What are the three words I asked you to remember earlier? (3 points). Name these (pointing to a watch and a pen) (2 points). Repeat the following exactly: *No ifs, ands, or buts* (1 point). Take this sheet of paper in your right hand, use both hands to fold it in half, and then put it on the floor (3 points). Read and follow the command on this paper: CLOSE YOUR EYES (1 point). Write down any sentence of your choice (1 point). Copy this diagram (two overlapping pentagons) (1 point). The test is sensitive in detecting moderate or severe ***dementia** and predicting the development of ***Alzheimer's disease**, scores below 21 being associated with an increased risk of developing dementia. Out of a maximum possible score of 30, less than 24 is considered abnormal, 18–23 indicates ***mild cognitive impairment**, and less than 18 severe dementia. Also called the *Folstein Mini-Mental State Examination*. Compare **MENTAL STATUS EXAMINATION**. **MMSE** abbrev.

minimum audible angle *n.* A measure of the ***acuity** of binaural ***sound localization** in the horizontal plane, equal to the smallest difference in the direction of two sound sources that can be reliably detected. In humans it is usually in the region of two degrees under ideal conditions, whereas in the barn owl, which relies entirely on its hearing to locate fieldmice and other prey in total darkness, it is close to one degree in both the horizontal and vertical dimensions, more acute than that of any other species whose hearing has been tested. Also called the *minimal audible angle*. **MAA** abbrev.

minimum audible field *n.* The smallest sound intensity that can be detected reliably by a listener facing the sound source under ideal listening conditions. Also called the *minimal audible field*. See also **ACUITY**. **MAF** abbrev.

minimum audible pressure *n.* The sound pressure on the tympanic membrane corresponding to the ***minimum audible field**. Also called the *minimal audible pressure*. See also **ACUITY**. **MAP** abbrev.

minimum effective dosage *n.* The smallest dosage of a particular

*****ebook converter DEMO Watermarks*****

drug that produces a specified effect in an organism. Also called *minimal effective dosage*. See also [EFFECTIVE DOSAGE](#), [THERAPEUTIC INDEX](#), [THERAPEUTIC RATIO](#). Compare [MEDIAN EFFECTIVE DOSAGE](#), [MEDIAN LETHAL DOSAGE](#), [MEDIAN TOXIC DOSAGE](#), [MINIMUM LETHAL DOSAGE](#), [MINIMUM TOXIC DOSAGE](#). **MED** abbrev.

minimum lethal dosage *n.* The smallest dosage of a drug that kills an experimental animal. Also called *minimal fatal dosage*. See also [LETHAL DOSAGE](#), [THERAPEUTIC INDEX](#), [THERAPEUTIC RATIO](#). Compare [MEDIAN EFFECTIVE DOSAGE](#), [MEDIAN LETHAL DOSAGE](#), [MEDIAN TOXIC DOSAGE](#), [MINIMUM EFFECTIVE DOSAGE](#), [MINIMUM TOXIC DOSAGE](#). **MLD** abbrev.

minimum separable *n.* A measure of [*visual acuity](#), usually determined with an [*acuity grating](#), equal to the [*visual angle](#) corresponding to the finest grating in which separate bars can be distinguished. A person with normal 20/20 vision according to the [*Snellen fraction](#) has a minimum separable of approximately 1/60 of a degree or one minute of arc. Compare [MINIMUM VISIBLE](#).

minimum toxic dosage *n.* The smallest dosage of a drug that produces signs or symptoms of toxicity in an organism. Also called *minimal toxic dosage*. See also [THERAPEUTIC INDEX](#), [THERAPEUTIC RATIO](#), [TOXIC DOSAGE](#). Compare [MEDIAN EFFECTIVE DOSAGE](#), [MEDIAN LETHAL DOSAGE](#), [MEDIAN TOXIC DOSAGE](#), [MINIMUM EFFECTIVE DOSAGE](#), [MINIMUM LETHAL DOSAGE](#). **MTD** abbrev.

minimum visible *n.* A measure of [*visual acuity](#) in terms of the [*visual angle](#) subtended by the finest hairline that can be reliably detected. Under ideal viewing conditions it is in the region of one-half of one second of arc or about 1/7,000 of a degree. Compare [MINIMUM SEPARABLE](#).

Minnesota Multiphasic Personality Inventory See [MMPI](#).

minor depressive disorder *n.* A term used to denote subthreshold cases of [*major depressive disorder](#). Also called *dysthymic disorder*.

minor epilepsy *n.* A form of [*epilepsy](#) characterized by [*absences](#), without [*convulsions](#). Formerly called *petit mal epilepsy*.

minority social influence *n.* A form of **social influence* in which the deviant subgroup rejects the established group **norm* (1, 2) and persuades the majority to the minority attitude, opinion, belief, or behaviour pattern, thereby changing the norm. The concept was introduced by the Romanian-born French social psychologist Serge Moscovici (born 1925) in his book *Social Influence and Social Change* (1976), in which he argued that the conflict caused by minorities is a force for innovation. Minorities are most influential when they are consistent, consensual, and in line with the underlying values of the group.

minor tranquillizer *n.* An obsolescent name for an **anxiolytic*. US *minor tranquilizer*. Compare MAJOR TRANQUILLIZER.

miracle berry *n.* The fruit of the tropical African tree *Synsepalum dulcificum* that contains the protein **miraculin*. Also called the *miraculous fruit* or *miraculous berry*.

miraculin *n.* A protein found in the **miracle berry* that alters the taste buds, causing bland or acid foods eaten after it to taste sweet. Compare MONOSODIUM GLUTAMATE. [From *miracul(ous)* + *-in(e)* indicating an organic compound]

mirror drawing *n.* Tracing shapes such as stars and circles with a pencil while the writing hand and the shapes are screened from sight but can be viewed via a reflection in a mirror. The discovery in 1960 that the ability to learn such automatic skilled movements is not impaired by bilateral **temporal lobe* lesions, whereas memories requiring conscious cognitive processes are abolished by such lesions, gave the first hint of the existence of two distinct types of learning systems involving **declarative knowledge* and **non-declarative knowledge*.

mirror focus *n.* A region of abnormal electrical activity in the cerebral cortex, corresponding to a region in the opposite cerebral hemisphere that has been stimulated to produce a focal epileptic **seizure*, or an abnormal region of the cerebral cortex developing in response to a **lesion* in the corresponding region of the opposite cerebral hemisphere.

mirror neuron *n.* A ***neuron** that is activated when a person performs a certain action or has a certain experience and also when the person observes someone else performing the same action or having the same experience. Mirror neurons provide internal representations of other people's actions, intentions, and emotions, and were first discovered in the brains of macaque monkeys in the early 1990s at the University of Parma in Italy by the Ukrainian-born neurologist Giacomo Rizzolatti (born 1937) and several colleagues and the findings published in the journal *Experimental Brain Research* in 1992. In humans, ***brain imaging** studies have suggested that mirror neurons responsive to observed bodily movements are located in the ***superior temporal sulcus** and that others are present in the inferior gyrus of the ***parietal lobe** and of the ***motor cortex**. Mirror neurons that respond to emotions or pain being experienced by others have been found in the ***insula** and ***cingulate gyrus**. Mirror neurons provide direct and immediate understanding of actions and emotions and are believed to be implicated in ***social cognition**, ***social learning**, ***skill learning**, ***language**, ***empathy**, and ***theory of mind**. Dysfunctional mirror neurons may explain the primary symptoms of ***autism**. See also **MU WAVE**. [So called because these neurons reflect in an individual's brain actions performed or emotions experienced by another]

mirror phase *n.* In ***psychoanalysis**, a concept introduced in 1936 by the French psychoanalyst Jacques Lacan (1901–81) to denote the stage of human development between 6 months and 18 months, when the infant, though still helpless, is capable of recognizing its body as a unity and imagining a state of being able to master it. According to Lacan, this phase forms the basis on which the ***ego** develops, and it is called the mirror phase because it is evidenced by the infant's jubilant response to its own mirror reflection, with which it is believed to identify.

mirror reversal problem *n.* The problem of explaining why a mirror appears to reverse left and right but not up and down. This question, often loosely labelled a ***paradox**, has been discussed ever since the Greek philosopher Plato (?427–?347 BC) answered it incorrectly in his dialogue *Timaeus*. According to a widely accepted explanation in *The Ambidextrous Universe* (1964) by the best-selling US science writer Martin Gardner (1914–2010), the fact that the image appears behind the mirror causes the viewer to

*****ebook converter DEMO Watermarks*****

perform a ***mental rotation** of it, using the vertical axis of rotation because the human body is nearly left-right symmetrical and this is therefore the easiest mental rotation to perform; but this explanation fails because mental rotation is too slow to account for the phenomenon and because it relies on an awareness that what is seen is a mirror image, whereas the apparent left-right reversal is experienced as usual by a viewer who lacks this awareness. Others have offered explanations based on the fact that we have a pair of horizontally separated eyes; but the apparent reversal is unaffected by closing one eye. Further fallacious explanations have relied on physics or linguistics (the ambiguity of the words *left* and *right*). The correct solution to the problem, first published by the English psychologist Richard L(angton) Gregory (1923–2010) in his book *Mirrors of the Mind* in 1997, with an added discussion of faces in 1999, is surprisingly simple. A mirror does not reverse left and right or top and bottom, but in order to see the reflection of an object we have to rotate it physically to face the mirror, and we usually perform this rotation about the horizontal axis, therefore the image appears left-right reversed because the object is indeed left-right reversed relative to the orientation of the reflected image. If, instead, we turned an object over about its horizontal axis to face a mirror, then its reflection would appear upside-down but not left-right reversed. Mirror images of our own faces appear left-right reversed for the same reason: to look in a mirror, we turn horizontally through 180 degrees relative to the reflected image we are about to produce; we cannot face the same way as the reflected image, because then we would be facing away from the mirror. *See also* **ENANTIOMORPH**.

mirror writing *n.* Handwriting that runs backwards and looks normal when viewed in a mirror. It is sometimes deliberate, a famous exponent being the Italian artist and polymath Leonardo da Vinci (1452–1519), but unintentional mirror writing is more common in young children and brain-damaged adults, and as a frequent transient symptom following left-hemisphere ***stroke**, about a quarter of patients experiencing it. Contrary to popular belief, it is not more common in left-handed than right-handed people and is not related to intelligence in neurologically undamaged people. Also called *palingraphia*.

misandry *n.* Hatred of men. *See also* **ANDROPHOBIA** in Appendix I.
misandrist *n. adj.* One who hates men; of or relating to hatred of men. [From

Greek *misos* hatred + *andros* of a man, from *aner* a man]

misidentification disorders See [DELUSIONAL MISIDENTIFICATION](#).

misinformation effect *n.* Another name for the [*eyewitness misinformation effect](#).

mismatch *n.* An incorrect pairing of a word and a [*concept](#), usually by a child during the course of language development, as when a child calls a toy drum a car. It is seldom possible to trace the source of such misnomers. See also [CONCEPT FORMATION](#). Compare [OVEREXTENSION](#), [OVERGENERALIZATION](#), [UNDEREXTENSION](#).

miss *n.* A failure to hit a target; hence, especially in [*signal detection theory](#), a failure to detect a signal when it is present. Also called a *false negative*. See also [RECEIVER OPERATING CHARACTERISTIC](#). Compare [CORRECT REJECTION](#), [FALSE ALARM \(2\)](#), [HIT](#).

missing fundamental illusion *n.* An [*auditory illusion](#) of pitch perception that arises if the set of [*overtones](#) or harmonics associated with a certain [*fundamental frequency](#) are presented to a listener without the fundamental frequency: the listener perceives the sound as having the pitch of the fundamental although the fundamental frequency is not present in the sound. See also [COMBINATION TONE](#), [OTOGENIC TONE](#).

mitochondrial DNA *n.* A form of [*DNA](#) found in [*mitochondria](#), having its own genetic code, slightly different from the universal code of nuclear DNA and subject to variation between species, encoding subunits of vital respiratory enzymes. It is inherited only from mothers, because only the mother's ovum contributes cytoplasm to the [*zygote](#), it consists of several loops, each containing 37 genes, and it is present in every mitochondrion. Mutations in mitochondrial DNA caused by [*free radicals](#) have been linked to ageing and to several chronic degenerative diseases of the muscles and brain, including [*dystonia](#), [*Alzheimer's disease](#), and [*diabetes mellitus](#). Comparisons of harmless mutations or changes in [*introns](#) that have accumulated, apparently at a fairly constant rate, in the mitochondrial DNA of people from around the world have been used to trace the prehistoric

*****ebook converter DEMO Watermarks*****

migrations of populations from the emergence of **Homo sapiens* in Africa about 150,000 years ago. Mitochondrial DNA is also used in **genetic fingerprinting* when nuclear DNA cannot be extracted in sufficient quantity, as often occurs when DNA is taken from solid bone, tooth fragments, hair, or faeces, rather than from blood, saliva, or semen. *See also* EVE, EVOLUTIONARY CLOCK, MATERNAL INHERITANCE, NON-MENDELIAN GENE, PARSIMONY PRINCIPLE, PLASMAGENE. *Compare* PLASMID. **mtDNA** *abbrev.*

mitochondrion *n.* Any of the tiny (from two to five micrometres long) bean-shaped bodies that are evolutionarily descended from a free-living bacterium and are present in the cytoplasm of every cell, in large numbers in cells with heavy energy demands, releasing through the **Krebs cycle* most of the energy that cells, tissues, and organs of the body require to function. *See also* CRISTA, MITOCHONDRIAL DNA, PLASMAGENE. **mitochondria** *pl.* **mitochondrial** *adj.* [From Greek *mitos* a thread + *chondros* cartilage, as the German biologist Carl Benda (1857–1933) mistakenly thought it was when he named mitochondria in 1898]

mitosis *n.* A form of **cell division* of **somatic cells* in which each of the daughter nuclei contains the same number of **chromosomes* as the parent nucleus, this being the normal form of cell division except for the formation of **gametes* (see *illustration*). During *prophase* the nuclear membrane disappears and the chromosomes divide lengthwise into **chromatids*, which become the chromosomes of the daughter cells; during *metaphase* **nuclear spindles* are formed, and the chromosomes attach themselves to the equator of the spindles by their **centromeres*; during *anaphase* the newly duplicated chromosomes separate and migrate to opposite ends of the spindles; and during the final *telophase* the cell pinches in the middle and a nuclear membrane forms around the chromosomes at each end. The movements taking place during mitosis are controlled by the cell's **cytoskeleton*, and especially by movements of **microtubules*. *Compare* MEIOSIS (1). **mitotic** *adj.* **mitotic clock** *See* TELOMERE. [From Greek *mitos* a thread + *-osis* indicating a process or state]

Mitosis. The stages of mitosis in a cell containing two pairs of homologous chromosomes.

mitral cell *n.* A type of **pyramidal cell* that is found abundantly in the **olfactory bulbs* and that receives inputs from the olfactory receptors and sends information to other parts of the brain. [*Mitral* mitre-shaped, from Latin *mitra* a turban]

Mitwelt *n.* In **phenomenology* and **existentialism*, the social environment as it is experienced. *See also* EXISTENTIAL ANALYSIS, EXISTENTIAL THERAPY. *Compare* EIGENWELT, UMWELT. [From German *mit* with + *Welt* world]

mixed episode *n.* A **mood episode* lasting at least one week during which the criteria of both **manic episode* and **major depressive episode* are met.

mixed-motive game *n.* In **game theory*, any game in which the players' preferences among the outcomes are partly coincident and partly

opposed, motivating the players both to cooperate and to compete, as in the ***Prisoner's Dilemma game**. A player in a mixed-motive game has to contend with an *intrapersonal*, psychological conflict arising from this clash of motives in addition to the *interpersonal* conflict of the game. At an abstract level, a mixed-motive game can be distinguished from a zero-sum game by the fact that the sum of the payoffs differs from one outcome to another, so that it is not the case that what one player gains the other(s) must necessarily lose. Mixed-motive games are therefore sometimes called *variable-sum* or *non-zero-sum* games. Compare **ZERO-SUM GAME**.

mixed strategy *n.* In ***game theory**, a strategy that is chosen with a randomizing device, by assigning a certain probability to each pure strategy. For example, in the children's game of *handy-dandy*, mentioned by Shakespeare in *King Lear* (I.iv.94), one player conceals a small object in one fist and the second player guesses left or right. The first player wins if the guess is wrong, and the second if it is right. Any player who chooses according to any deliberate procedure risks being outguessed by the opponent, and for both players, the game-theoretic solution is a randomized 50–50 mixed strategy that assigns equal probabilities to left and right. See also **MINIMAX THEOREM**.

mixed transcortical aphasia See **APHASIA**.

mixture suppression *n.* A phenomenon of ***olfaction** in which the strength of an odour is reduced by the simultaneous presence of a different odour.

MMPI *abbrev.* The Minnesota Multiphasic Personality Inventory, one of the most widely used paper-and-pencil tests of personality, especially in the US, consisting of 566 (originally 504, later 550) statements, including 16 that are repeated, to which the respondent answers *True or mostly true* (T), *False or not usually true* (F), or *Cannot say* (?), typical items being similar to the following: *I feel contented most of the time*; *I have never had a fainting spell*, and *I believe I am cursed*. The instrument provides scores on 10 clinical scales: Hypochondriasis (Hs), Depression (D), Hysteria (Hy), Psychopathic deviate (Pd), Masculinity–femininity (Mf), Paranoia (Pa), Psychasthenia (Pt), Schizophrenia (Sc), Hypomania (Ma), and Social introversion (Si). In

*****ebook converter DEMO Watermarks*****

addition there are four validity (test-taking attitude) scales: a score for the number of questions left unanswered (?); a Lie scale (L) containing items describing socially desirable but unlikely behaviour, such as *I always tell the truth* (True); an Infrequency scale (F) of items answered in the keyed direction by ten per cent or less of normal people, such as *I see things, animals, or people around me that others do not see* (True); and a Correction factor (K) reflecting defensiveness in admitting to problems, containing items such as *At times I feel like swearing* (False). Numerous other scales have been derived from the MMPI test items. The MMPI was developed and first published in 1942 by the US clinical psychologist Starke Rosecrans Hathaway (1903–84) and the US neuropsychiatrist John Charnley McKinley (1891–1950); a revised version, called *MMPI-2*, was issued in 1989.

mneme *n.* The capacity to retain the aftereffects of an experience or stimulus. **mnemic** *adj.* Of or relating to mneme. *See also* **MNEMIC SYMBOL**. [From Greek *mnemon* mindful, from *mnasthai* to remember]

mnemic symbol *n.* In **psychoanalysis*, a **hysterical* symptom arising from a memory of a trauma or a conflict that has been repressed. In a key passage in an article on ‘The Neuro-Psychoses of Defence’ (1894), Sigmund Freud (1856–1939) described it as follows: ‘By this means the ego succeeds in freeing itself from the contradiction; but instead, it has burdened itself with a mnemic symbol which finds a lodgement in consciousness, like a sort of parasite, either in the form of an unresolvable motor innervation or as a constantly recurring hallucinatory sensation’ (*Standard Edition*, III, pp. 45–61, at p. 49).

mnemon *n.* A basic unit of memory, or the minimum physical change in the nervous system that encodes a memory. The term was introduced by the US neurobiologist Arthur Cherkin (1913–87) in an article in the *Proceedings of the National Academy of Sciences of the United States of America* in 1966, in which he said: ‘Mnemons are assumed to be relatively stable, with a half life of 10^7 seconds (4 months) or more.’ [From Greek *mneme* memory, from *mnasthai* to remember]

mnemonic *adj. n.* (Of or relating to) a technique used to aid memory, such as the *rhyming method* familiar to most English-speaking people in the

*****ebook converter DEMO Watermarks*****

mnemonic *Thirty days hath September...* for remembering how many days there are in each month, or the *acronym method* known by most musicians in the mnemonic *Every Good Boy Deserves Favour* for remembering the five lines of the treble clef in musical notation (E, G, B, D, F). The English physicist Sir James (Hopwood) Jeans (1877–1946) suggested the following *word-length mnemonic* for remembering the first 15 digits of the transcendental number π , represented by the number of letters in each successive word: *How I want a drink, alcoholic of course, after the heavy chapters involving quantum mechanics*, yielding $\pi = 3.14159265358979$. In the same spirit, a US correspondent to *Scientific American* magazine suggested the following word-length mnemonic for the first 10 digits of the transcendental number e : *To express e, remember to memorize a sentence to simplify this*, yielding $e = 2.7182818284$. The use of mnemonics can be traced to ancient Greece, where, in about 500 BC, the poet Simonides of Ceos (556–468 BC) invented the *method of loci*, a useful and effective technique for memorizing collections of items such as shopping lists: the items are visualized at specific locations in a familiar building, and they are recalled by revisiting the locations in a systematic tour round the building carried out in one's imagination. A similar but more flexible and even more effective technique—the method of choice of serious [*mnemonists](#) and professional memory performers—is the [*peg-word mnemonic](#). **mnemonics** *n.* The practice of using mnemonic techniques. [From Greek *mnemonikos* mnemonic, from *mneme* memory, from *mnasthai* to remember + *-ikos* of, relating to, or resembling]

mnemonist *n.* A person who uses [*mnemonics](#). Research has shown that most if not all professional memory performers use mnemonics. One of the most phenomenal and most thoroughly investigated of mnemonists, the Russian man usually referred to as S (actually called Shereshevskii), studied in depth by the Russian neuropsychologist Alexandr Romanovich Luria (1902–77) and described in his book *The Mind of a Mnemonist* (1968), relied heavily on mnemonics, including the method of loci. See also [HYPERTHYMESIA](#). Compare [HYPERMNESIA](#).

mobbing *n.* The coordinated activity of a large number of birds or other small animals in harassing or driving away a [*predator](#).

Möbius syndrome *n.* A rare neurological disorder caused by a defect in the prenatal development of the motor nuclei of the cranial nerves and characterized by loss of control of facial muscles, resulting in an inability to express emotion through **facial expression* and in most cases a diminished ability to interpret emotion in other people's faces, often associated with oculomotor dysfunction and periodic **migraine* headache. Also called *congenital facial diplegia*, *congenital oculofacial paralysis*, *nuclear agenesis*. Compare *BELL'S PALSY*. [Named after the German neurologist Paul Julius Möbius (1853–1907) who first described it in 1884]

modafinil *n.* The generic name of a quick-acting **stimulant drug*, prescribed for the treatment of **narcolepsy*, more generally used to promote daytime wakefulness and sometimes as a **performance enhancer*. It was first introduced in France in 1986 and later marketed in the UK and the US under the proprietary name *Provigil*. Formula $C_{15}H_{15}NO_2S$.

modal completion *n.* Perceptual **filling-in* in which the completed regions of the image are perceptually similar to the rest of the image, having the same properties or modes, such as linearity or brightness. This type of perceptual completion, resulting in the formation of visible surfaces and/or contours in image regions where these properties are not specified locally, is apparent, for example, in the **illusory contours* and uniform brightness of a **Kanizsa triangle*. See also *ARTIFICIAL SCOTOMA*. Compare *AMODAL COMPLETION*. [From Latin *modus* a measure or manner + *-alis* of or relating to]

modality See *SENSORY MODALITY*.

modality effect *n.* Any effect of the presentation of information via different **sensory modalities*, one example being the superior immediate recall of simple verbal information presented in the auditory rather than the visual modality, although the effect is restricted to the terminal part of the message, and another example being the superior long-term recall of complex verbal information presented via the visual rather than the auditory modality. See also *CROSS-MODAL TRANSFER*.

modal logic *n.* The logic of necessity and possibility, first developed in

1912 by the US logician and philosopher C(larence) I(rving) Lewis (1883–1964), in which a *modal proposition* is a [*proposition \(1\)](#) that asserts something to be necessarily or possibly true, and a *modal syllogism* is a [*syllogism](#) in which at least one of the premises is a modal proposition or statement. If *p* is a proposition, then *p* is *possible* means the same as *it is not necessary that not-p*, and *p* is *contingent* means the same as *it is not necessary either that p or that not-p*. See also [CATEGORICAL SYLLOGISM](#), [DEDUCTIVE REASONING](#), [DEONTIC LOGIC](#), [EPISTEMIC REASONING](#), [POSSIBLE WORLD](#). [From Latin *modus* a measure or manner + *-alis* of or relating to]

modal verb *n.* An auxiliary verb that modifies a main verb, expressing necessity or possibility. In English, the modal verbs are *can*, *could*, *may*, *might*, *will*, *would*, *shall*, *should*, *must*, *ought*, and sometimes *dare*, *need*, and *used to*.

mode *n.* In descriptive statistics, a measure of [*central tendency](#) that is the most frequently occurring score or scores among a collection of scores. Compare [MEAN](#), [MEDIAN](#). **modal** *adj.* Of or relating to a (or the) mode. [From Latin *modus* measure]

model *n.* A deliberately simplified and usually idealized and imaginary [*representation \(1\)](#) of a [*phenomenon](#), with fundamental properties that are explicitly defined (or physically built) and from which other properties can be deduced by logical reasoning (or by empirical observation if the model is a physical object). Inferences from the model apply only to the model and not necessarily to the reality that it purports to represent, but if the model captures the important features of the phenomenon, then such inferences may apply also to the phenomenon itself. Among the most successful abstract models in the history of science are Euclid's geometry, which models spatial relationships, and Newton's theory of mechanics, which models the interaction of physical objects and forces operating on them. See also [ADDITIVE MODEL](#), [CONSTRUCT](#), [LINEAR MODEL](#), [MEASUREMENT MODEL](#), [MULTIPLICATIVE MODEL](#), [QUADRATIC MODEL](#). Compare [HYPOTHESIS](#), [THEORY](#).

modelling *n.* A technique of [*behaviour therapy](#) in which the client or patient learns appropriate patterns of behaviour by imitating another person demonstrating the target behaviour either live or on video; often used in

*****ebook converter DEMO Watermarks*****

*assertiveness training. US *modeling*.

moderate mental retardation *n.* An obsolescent term for a level of *intellectual disability associated with *IQ approximately between 35 and 50 (in adults, *mental age from 6 to under 9 years), equivalent to the educational category of trainable mentally retarded. Also called *moderate mental subnormality*.

modern racism *n.* Covert or symbolic opposition to policies or practices designed to help a specific racial group, arising from negative *affect towards members of that group. It is distinguished from overt prejudice, discrimination, stereotyping, or condescension on the basis of race (*racialism), and also from overt belief in the intrinsic superiority of one particular race (*racism). The term was introduced in an article by the US social psychologist John B(arnard) McConahay (1936–98) and two colleagues in the *Journal of Conflict Resolution* in 1981. These researchers deliberately replaced an earlier term *symbolic racism* in order to emphasize the presumed emergence of the phenomenon in the second half of the 1960s in the wake of the US civil rights movement, when overt *racism, including support for laws against racial mixing and belief in the innate inferiority of black people, became unfashionable. It is measured by instruments such as the Modern Racism Scale, a *non-reactive measure of racist attitudes developed by McConahay and his colleagues, in which agreement with such statements as *Discrimination against blacks is no longer a problem in the US* and disagreement with statements such as *It is easy to understand the anger of black people in America* are taken to be indicative of modern racism. See also IMPLICIT ASSOCIATION TEST. [From Latin *modernus* contemporary, from *modo* just recently + English *racism*]

modified Ellsberg paradox *n.* A version of the *Ellsberg paradox in which the failure of *expected utility theory and of *subjective expected utility theory is especially clear. Two urns are each filled with white, red, and green balls. Urn A contains 50 white balls, 25 red balls, and 25 green balls; Urn B contains 50 white balls and 50 red and green balls, the ratio of red to green balls being unknown. You are offered a choice between the following three bets, each of which carries the same prize if you win.

X: You draw a ball at random from Urn A, and you win the prize if it is white or red.

Y: You draw a ball at random from Urn B, and you win the prize if it is white or red.

Z: You draw a ball at random from Urn B, and you win the prize if it is white or green.

Most people prefer X. In X, the probability of winning the prize is obviously .75, whereas in Y or Z the probability could be as low as .50 or as high as 1.00, depending on the unknown proportions of red and green balls. If the decision maker's subjective probability of drawing a red ball from Urn B is p , then the preference for X over Y implies that $.75 > .50 + p$, which means that $p < .25$. But if $p < .25$, then the probability q of drawing a green ball from Urn B must be greater than .25, and the decision maker should therefore prefer Z to X, because $.75 < .50 + q$. The usual preference of X over both Y and Z violates the axioms of expected utility theory, though it is consistent with Ellsberg's suggestion that human decision makers use **maximin* strategies in choices involving **uncertainty* (2). See also [RISK AVERSION](#). Compare [ALLAIS PARADOX](#), [COMMON RATIO EFFECT](#), [ST PETERSBURG PARADOX](#). [Named after the US political analyst Daniel Ellsberg (born 1931) who published the original version of the paradox in the *Quarterly Journal of Economics* in 1961]

modified LSD test *n.* In statistics, the modified least significant difference test, another name for a Bonferroni *t* test. See [BONFERRONI CORRECTION](#).

modifier gene *n.* Any gene that affects the **phenotypic* expression of another gene. See also [REGULATOR GENE](#).

modularity of mind *n.* The notion that cognitive processes are controlled by subsystems that operate as distinct units and with a significant degree of independence from one another. This notion can be traced to the Greek philosopher Aristotle (384–322 BC), who discussed a division of mental functions in *De Anima*; it formed the basis of the pseudoscience of **phrenology*, and in more recent times it has been chiefly associated with the writings of the US philosopher Jerry Alan Fodor (born 1935), especially his

*****ebook converter DEMO Watermarks*****

book *The Modularity of Mind* (1983).

modulation transfer function *n.* Another name for the **contrast sensitivity function*. **MTF** *abbrev.*

modulator *n.* Anything that modulates; in visual perception a hypothetical retinal **ganglion cell* that transmits discrete sensations of colour and regulates the responses of **dominator* cells.

modus ponens *n.* Any argument taking the form: *If p, then q; p; Therefore, q.* For example, *If it is Sunday, then the restaurant is closed; It is Sunday; Therefore, the restaurant is closed.* Such an argument is logically valid. *See also* *AFFIRMING THE ANTECEDENT*. *Compare* *MODUS TOLLENS*. [Latin: mood that affirms]

modus tollens *n.* Any argument taking the form: *If p, then q; Not-q; Therefore not-p.* For example, *If it is Sunday, then the restaurant is closed; The restaurant is not closed; Therefore, it is not Sunday.* Such an argument is logically valid. *See also* *DENYING THE CONSEQUENT*. *Compare* *MODUS PONENS*. [Latin: mood that denies]

molecular biology *n.* The study of biological molecules, especially **proteins* and **nucleic acids*.

molecular genetics *n.* The study of structure and function of the molecules of **genes* and **chromosomes*.

molecular imprinting *See* *GENETIC IMPRINTING*.

Molyneux's question *n.* The question regarding how the world would look to a person who acquired the gift of sight late in life, and in particular whether such a person would at first be able to distinguish a globe (ball) from a cube by sight alone. The English philosopher John Locke (1632–1704), a proponent of **empiricism*, hypothesized in 1690 that the answer was no: 'For, though he has obtained the experience of how a globe, how a cube affects his touch, yet he has not yet obtained the experience that what affects

his touch so or so must affect his sight so or so' (*Essay Concerning Human Understanding*, Book 2, Chapter 9, section 8), but research into [*cross-modal transfer](#) in the 1960s proved him wrong. [Named after the Irish philosopher, astronomer, and politician William Molyneux (1656–98), referred to by Locke as 'the learned and worthy Mr Molineux' *[sic]*, who first posed the question to Locke in 1688]

momentum, representational See [REPRESENTATIONAL MOMENTUM](#).

monad *n.* Literally, a group of one, but more usually denoting a fundamental or indivisible metaphysical unit. According to the German rationalist philosopher and mathematician Gottfried Wilhelm von Leibniz (1646–1716), it is an elementary indestructible element, not belonging to ordinary space, of which reality is composed. See also [ENTELECHY](#). **monadic** *adj.* Of or relating to monads, or (in logic and mathematics) having only one term. [From Greek *monas*, *monados* a unit, from *monos* alone]

Mona Lisa smile *n.* See [HYBRID IMAGE](#).

monaural *adj.* Of, relating to, or involving the use of one ear. Compare [BINAURAL](#). [From Greek *monos* alone or single + Latin *auris* an ear + *-alis* of or relating to]

money pump *n.* A pattern of intransitive or [*cyclic preferences](#) causing a decision maker to be willing to pay repeated amounts of money to have these preferences satisfied without gaining any benefit. The simplest example is a person who evaluates three commodities *x*, *y*, and *z* and prefers *x* to *y*, *y* to *z*, and *z* to *x*. A person may, for example, prefer one lawnmower *x* to another *y* because it is larger, and may prefer *y* to *z* for the same reason, but may prefer *z* to *x* because *x* would be extremely difficult to take to a repair shop if it were to break down. If the person owns *x*, then a salesman could offer to replace it with *z* in return for a fee (there must be *some* price that a person who prefers *z* to *x* is willing to pay for this improvement), then the salesman could offer to replace *z* with *y* for a fee, then to replace *y* with *x* for a fee, and so on indefinitely or until the money runs out. The concept was introduced by the English philosopher, mathematician, and economist Frank (Plumpton) Ramsey (1903–30) and published posthumously in 1931. Also called a

*****ebook converter DEMO Watermarks*****

**Dutch book*, especially when the price of each replacement is reduced until the person is willing to pay for it. *See also* [DECISION THEORY](#), [INTRANSITIVE PREFERENCES](#).

mongolism *n.* An obsolete name for **Down's syndrome*. [Referring to the supposed resemblance of people with the disorder to Mongolians, a comparison now considered offensive]

monism *n.* Any approach to the **mind-body problem* according to which there is no essential difference between the mental and physical realms. *See also* [DOUBLE-ASPECT THEORY](#), [IDENTITY THEORY](#), [MATERIALISM](#), [NEUTRAL MONISM](#). [From Greek *monos* single or alone]

monoamine *n.* An **amine* such as **adrenalin* (epinephrine), **noradrenalin* (norepinephrine), **serotonin*, or **dopamine* containing only one amino group (NH₂).

monoamine oxidase *n.* An **enzyme* that is located between the outer and inner membranes of **mitochondria* in almost all tissues and that metabolizes **monoamines*, notably **catecholamines*, within neurons. *See also* [MONOAMINE OXIDASE INHIBITOR](#). *Compare* [CATECHOL-O-METHYL-TRANSFERASE \(COMT\)](#). **MAO** *abbrev.* [From Greek *monos* single or alone + English *amine* + *oxid(ation)* + Greek *-ase* denoting an enzyme, from *diastasis* separation]

monoamine oxidase inhibitor *n.* Any of a group of **antidepressant* drugs that inhibit the action of the intracellular enzyme **monoamine oxidase* in neurons of the central nervous system, thereby slowing the metabolism of neurotransmitters such as **adrenalin* (epinephrine), **noradrenalin* (norepinephrine), and **dopamine* and allowing their concentrations to increase at the **synapses (1)*. When taken with foods containing **tyramine* or **dopa*, it produces acute hypertension. Also called a *psychoenergizer*. *See* [IPRONIAZID](#), [ISOCARBOXAZID](#), [PHENELZINE](#), [ST JOHN'S WORT](#), [TRANLYCYPROMINE](#). *See also* [CHEESE EFFECT](#). *Compare* [SELECTIVE SEROTONIN REUPTAKE INHIBITOR \(SSRI\)](#), [TETRACYCLIC ANTIDEPRESSANT](#), [TRICYCLIC ANTIDEPRESSANT](#). **MAOI** or **MAO inhibitor** *abbrev.*

monoblepsis *n.* A condition in which vision is clearer when one rather than both eyes are used. Also called *monoblepsia*. [From Greek *monos* alone or single + *blepsis* sight]

monochromatic *adj.* All of one colour, or pertaining to light consisting of a single wavelength. [From Greek *monos* alone or single + *chroma*, *chromatos* a colour + *-ikos* of, relating to, or resembling]

monochromatism *n.* A form of **colour-blindness* characterized by **monochromatic* vision in which all colours are perceived as different shades of the same colour. Also called *monochromasy*. Compare *ACHROMATOPSIA*.
monochromat or **monochromate** *n.* A person with monochromatism.

monoclonal antibody *n.* An **antibody*, produced by a single **clone* (1) of **B lymphocytes* fused with malignant tumour cells and grown in a culture, consisting of a population of identical molecules all specific for a single **antigen* and capable of proliferating indefinitely to produce unlimited copies of itself; widely used in biotechnology, genetic engineering, and the diagnosis of disorders. [From Greek *monos* single or alone + English *clone*]

monocular *adj.* Of, relating to, or involving the use of only one eye. Also called *uniocular*. Compare *BINOCULAR*, *DICHOPTIC*. [From Greek *monos* alone or single + Latin *oculus* an eye]

monocular cue *n.* Any of the visual **cues* (2) functioning as indications or hints of distance that contribute towards visual **depth perception* and that do not depend on integration of information from both eyes. See also *ACCOMMODATION* (1), *AERIAL PERSPECTIVE*, *CHIAROSCURO*, *ELEVATION IN THE VISUAL FIELD*, *INTERPOSITION*, *LINEAR PERSPECTIVE*, *MONOCULAR PARALLAX*, *RELATIVE SIZE*, *SFUMATO*, *TEXTURE GRADIENT*. Compare *BINOCULAR CUE*.

monocular parallax *n.* One of the monocular cues of visual **depth perception*, depending on the fact that movement of the head produces relatively large apparent displacement of nearby objects in the opposite direction and relatively small displacement of distant objects in the same direction. Also called *motion parallax* or *movement parallax*. See also *MOTION*

PERSPECTIVE, PARALLAX, REDUCTION SCREEN. *Compare* BINOCULAR PARALLAX.

monocyte *n.* A giant **leucocyte* with a round nucleus, playing a part in the immune system as a **phagocyte* by consuming foreign or malfunctioning cells. *See also* GRANULOCYTE, LYMPHOCYTE, STEM CELL. [From Greek *monos* single + *kytos* a vessel]

monogamy *n.* The custom or practice of having only one spouse at a time or, in animals, of having only one mate during a breeding season. *Compare* POLYGAMY. [From Greek *monos* single + *gamos* marriage]

monogenic inheritance *n.* Inheritance of a characteristic through a single **gene*, such as occurs in the inheritance of haemophilia or phenylketonuria. *See also* QUALITATIVE INHERITANCE. *Compare* POLYGENIC INHERITANCE, QUANTITATIVE INHERITANCE. [From Greek *monos* single + German *Gen* a gene, from Greek *genein* to produce]

monomania *n.* Pathological preoccupation with a single idea or fanatical devotion to a single activity. [From Greek *monos* single + *mania* madness]

monopede mania *n.* Another name for **acrotomophilia*.

monopedophilia *n.* Another name for **acrotomophilia*.

monophthong *n.* A single vowel sound with no detectable change within it, such as the vowel sounds in *seat*, *set*, *sat*, *coot*, *caught*, *cot*, and *cut*. *Compare* DIPHTHONG, TRIPHTHONG. [From Greek *monos* one + *phthongos* a sound]

monoplegia *n.* Paralysis of one limb or a single muscle group, usually as a result of a lesion in a **motor nerve*. *Compare* DIPLEGIA, HEMIPLEGIA, OPHTHALMOPLÉGIA, PARAPLEGIA, QUADRIPLEGIA, TRIPLEGIA. **monoplegic** *adj.* [From Greek *monos* single + *plege* a blow + *-ia* indicating a condition or quality]

monopolar neuron *n.* Another name for a **unipolar neuron*. Also called

a *monopolar cell*.

monoptic *adj.* 1. Having one eye. 2. Of or relating to the (usually successive) presentation of different stimuli to the same eye. *Compare* **DICHOPTIC**, **MONOCULAR**. [From Greek *monos* alone or single + *optikos* of or relating to vision, from *optos* visible, from *ops* an eye]

monosemy *n.* The property of a word of having only one meaning. *Compare* **POLYSEMY**. [From Greek *monos* one + *sema* a sign]

monosodium glutamate *n.* A white crystalline flavour enhancer that is often added to foods in restaurants and supermarkets and that, on its own, elicits all four primary taste sensations, namely sweet, sour, salty, and bitter. It intensifies the taste of food to which it is added and may have a distinctive taste of its own called **umami*. Formula: $\text{NaC}_5\text{H}_8\text{O}_4$. Also called *sodium glutamate*. *Compare* **MIRACULIN**. **MSG** *abbrev.* [So called because it is the sodium salt of glutamic acid]

monosomy X *n.* Another name for **Turner's syndrome*.

monosynaptic reflex *n.* A reflex involving just one **synapse* (1) between a sensory neuron and a motor neuron, without the involvement of any **interneurons*. **Stretch reflexes* are the only monosynaptic reflexes in humans. Strictly speaking the term is a misnomer and is avoided in careful usage, because there must also be a synapse between the motor neuron and the muscle, hence any reflex necessarily involves at least two synapses. Also called a *single-synapse reflex*. *Compare* **POLYSYNAPTIC REFLEX**. [From Greek *monos* single + *syn* together + *haptein* to fasten]

monotonic *adj.* The property of a sequence or a function of consistently increasing in value or staying the same, or of consistently decreasing in value or staying the same. Also called a *monotone* sequence or function. *See also* **MONOTONICITY**. [From Greek *monos* single, solitary, or alone + *tonos* a tone + *-ikos* of, relating to, or resembling]

monotonicity *n.* The property of being **monotonic*. In **logic*, it refers to

the fact that a valid argument cannot be made invalid, nor an invalid argument made valid, by adding new [*premises](#). More precisely, monotonicity in logic is the property of obeying the [*extension theorem](#) of semantic entailment. *See also* [NON-MONOTONIC REASONING](#).

monozygotic *adj.* Developed from one [*zygote](#). Compare [DIZYGOTIC](#). **MZ** *abbrev.* [From Greek *monos* single + *zygotos* yoked, from *zygon* a yoke + *-itikos* resembling or marked by]

monozygotic twins *n.* Twins that are [*monozygotic](#), being formed when a single [*ovum](#) or egg is fertilized by a single [*spermatozoon](#) and then splits and develops into two separate individuals sharing identical genes. The relative frequency of monozygotic twins is quite stable at about 1 pair per 250 births. Also called *identical twins*, but this is avoided in careful scientific usage, because they are never identical, having been influenced by environmental as well as genetic factors. *See also* [TWIN STUDIES](#). Compare [DIZYGOTIC TWINS](#).

Monte Carlo method *n.* Any of a range of heuristic techniques of statistical analysis, used especially when an [*algorithm](#) or formula is unavailable, in which the phenomenon or process of interest is simulated, usually on a computer, by the generation of random numbers. For example, to estimate the probability of five heads in five successive coin tosses, an analyst unfamiliar with the [*binomial test](#) could simulate five coin tosses thousands of times on a computer and count the proportion that consist of five heads. This would amount to performing a [*randomization test](#). [Named by its pioneer, the Hungarian-born US mathematician John von Neumann (1903–57), after the casino at Monte Carlo where randomization determines outcomes]

Monty Hall problem *n.* A problem of decision making and probability judgement, and a veridical [*paradox](#), first presented and named by the US biostatistician Steve Selvin (born 1941) in two letters in the journal *American Statistician* in 1975 and subsequently popularized by the US columnist Marilyn vos Savant (born 1946) in *Parade* magazine in September 1990. The solution is so difficult to believe that, when it was first published, many people, including university professors of statistics and even the world-

*****ebook converter DEMO Watermarks*****

famous Hungarian mathematician Paul Erdős (1913–96) initially refused to accept it. In the simplest version, a game show host invites you to choose among three doors, behind just one of which is a car. After your initial choice, the host, who knows where the car is, opens another door, always one that has no car behind it, and invites you to switch your choice to the remaining unopened door if you wish. The problem is, should you switch? Surprisingly, switching doubles your probability of winning the car from $1/3$ to $2/3$. The reason is that there is one chance in three that the car is behind your originally chosen door, and accepting the invitation to switch wins the car if your original choice was wrong. The probability that your original choice was wrong is $2/3$, and if it was wrong, then you are certain to win the car if you switch. In many descriptions of the problem, there is a car behind one of the doors and a goat behind each of the others. The probabilistic phenomenon underlying the problem can be traced to Bertrand's box paradox, first discussed by the French mathematician Joseph (Louis François) Bertrand (1822–1900) on pages 3–4 of his book *Calcul des Probabilités* in 1889. Also called the *Monty Hall dilemma*. See also [PRINCIPLE OF RESTRICTED CHOICE](#). [Named after the Canadian-born US entertainer Monty Hall (born Monte Halperin, 1921) who hosted the television game show *Let's Make a Deal* in which the problem was first noticed]

mood *n.* **1.** A temporary but relatively sustained and pervasive affective state, often contrasted in psychology and psychiatry with a more specific and short-term **emotion*. See also [AFFECT](#), [DEPRESSION](#), [DYSPHORIC MOOD](#), [ELEVATED MOOD](#), [EUTHYMIC MOOD](#), [EXPANSIVE MOOD](#), [IRRITABLE MOOD](#). **2.** In linguistics, a category of verb expressing a mode or manner of action or being, typical grammatical moods being indicative, subjunctive, and imperative. **3.** In logic, the form of a **syllogism*, depending on the nature of its three constituent **propositions* (1). [Sense 1 from Old English *mod* mind or feeling; senses 2 and 3 from Latin *modus* manner]

mood-congruent *adj.* Of or relating to a **delusion* or **hallucination* whose content is consistent with the depressed or manic mood of the person experiencing it. Compare [MOOD-INCONGRUENT](#).

mood-dependent memory *n.* A form of **state-dependent memory* associated with effects of moods or emotional states during learning and

*****ebook converter DEMO Watermarks*****

recall.

mood disorders *n.* A class of [*mental disorders](#) with disturbance of [*mood \(1\)](#) as the predominant feature. This term was used in [*DSM-IV](#) but not in DSM-5. See [BIPOLAR DISORDERS](#), [CYCLOTHYMIC DISORDER](#), [DEPRESSIVE DISORDER](#), [MANIA \(1\)](#), [MOOD EPISODES](#), [SEASONAL AFFECTIVE DISORDER \(SAD\)](#), [SUBSTANCE-INDUCED DISORDERS](#), [UNIPOLAR DEPRESSION](#). See *also* [SCHIZOAFFECTIVE DISORDER](#).

mood episodes *n.* A class of [*mental disorders](#) comprising [*depressive episode](#), [*major depressive episode](#), [*manic episode](#), [*mixed episode](#), and [*hypomanic episode](#).

mood-incongruent *adj.* Of or relating to a [*delusion](#) or [*hallucination](#) whose content is inconsistent with the depressed or manic mood of the person experiencing it. Compare [MOOD-CONGRUENT](#).

mood stabilizer *n.* Any drug, such as [*lithium carbonate](#), that is used in the treatment of [*bipolar disorders](#). Compare [ANTIMANIC](#).

moon illusion *n.* A visual illusion that causes the moon to appear relatively larger when it is near the horizon than when it is at its zenith, although in both cases it subtends the same [*visual angle](#) of about one-half of a degree or 30 minutes of arc. The illusion has never been satisfactorily explained. The earth's atmosphere does not act like a lens, enlarging the image near the horizon, as many people believe; we can easily measure the size of the image at different heights, and this confirms that the image size remains constant. Many textbooks and articles suggest that the [*Ebbinghaus illusion](#) makes the moon look larger when it is close to tiny trees and houses near the horizon, or that the [*Ponzo illusion](#) might make it look larger when the surrounding landscape provides [*linear perspective](#) cues; but the illusion is visible even from ships at sea, where no such cues are visible near the horizon. Furthermore, any explanation needs to account for the fact that the illusion disappears if one views the moon upside-down, by bending over and peering through one's legs. The sun is much larger than the moon but by remarkable coincidence almost identical to it in [*angular size](#), fitting behind the moon almost perfectly in a total eclipse, and it is also subject to the moon

*****ebook converter DEMO Watermarks*****

illusion, appearing much larger shortly after sunrise or shortly before sunset than at its zenith. The illusion first appeared in print in the *Meteorology* of the Greek philosopher Aristotle (384–322 BC), who described its effect on the sun and stars but oddly omitted to mention the moon: ‘The sun and stars seem bigger when rising and setting than on the meridian’ (Book 3, Chapter 4, Bekker edition, p. 373b). Also called the *celestial illusion*, especially when referring to the illusion in a stimulus other than the moon. See also [EMMERT’S LAW](#), [HORIZONTAL–VERTICAL ILLUSION](#), [PERSPECTIVE ILLUSION](#), [SIZE–DISTANCE INVARIANCE](#), [VISUAL ANGLE](#).

moral development *n.* The formation and maturation of a sense of right and wrong in children in the normal course of cognitive development. See also [KOHLBERG STAGE](#).

morbid jealousy *n.* Another name for [*jealous delusional disorder](#).

Morgan–Murray Thematic Apperception Test *n.* The original name by which the [*TAT](#) was generally known prior to 1943.

Morgan’s canon See [LLOYD MORGAN’S CANON](#).

Morinaga misalignment illusion *n.* A visual illusion in which three or more arrowheads, some pointing to the left and some to the right, aligned with their apexes or tips in vertical straight lines, appear to be out of alignment, with the left-pointing apexes further to the left than the right-pointing ones. Pairs of arrowheads can be constructed such that the apparent misalignment is opposite to what would be expected from the [*Müller-Lyer illusion](#) (see [illustration](#)). [Named after the Japanese Gestalt psychologist Shiro Morinaga (1908–64) who first drew attention to it in 1941]

Morinaga misalignment illusion. The distance between each of the three pairs of arrowheads is identical, and their apexes are vertically aligned.

Morita therapy *n.* A form of **psychotherapy*, used especially to treat **hypochondriasis* or **somatic* symptom disorder. It begins with 4–7 days of absolute bed rest without reading, talking, or other active pursuits, to be followed by a programme of progressively difficult or demanding work, usually in a communal setting. It is based on Buddhist beliefs and the concept of **mindfulness*. [Named after the Japanese psychiatrist Shoma Morita (1874–1938) who originated it]

morning glory *n.* Any of a number of tropical plants of the family Convolvulaceae, including the Mexican vine *Rivea corymbosa* containing the **psychedelic* and **hallucinogenic* drug **ololiuqui*. [So called because its trumpet-shaped flowers close in the late afternoon]

moron *n.* An obsolete term for a person with moderate **intellectual disability*; also, an abusive term for a person of low intelligence. **moronic** *adj.* [From Greek *moros* foolish]

Moro reflex *n.* A form of the [*startle reflex](#) displayed by infants up to about 12 months of age, elicited by making a sudden loud noise or raising the infant's head slightly and allowing it to drop back on to a pillow, consisting of flexion (bending) of the legs, drawing the arms across the chest, and usually a brief cry. It is often absent in premature babies, and it is sometimes used to test infants for deafness. Also called the *embrace reflex*. [Named after the German paediatrician Ernst Moro (1874–1951) who first drew attention to it]

morpheme *n.* The smallest distinctive unit of a language having a definite grammatical function. For example, *unhappiness* contains three morphemes: *un-* (a morpheme denoting negation) + *happi* (happy) + *-ness* (a morpheme denoting a state); and *Helen's brother is crying* contains six: *Helen* + *'s* (a morpheme denoting possession) + *brother* + *is* + *cry* + *ing* (a morpheme indicating the present participle). See also [ALLOMORPH](#), [BOUND FORM](#), [PSEUDOMORPHEME](#). Compare [KINEMORPH](#). [From Greek *morphe* form + a suffix on the model of *phoneme*]

morphine *n.* A bitter crystalline [*alkaloid](#), being a [*narcotic](#) analgesic extracted from [*opium](#), in which it occurs in amounts up to 15 per cent, used as a [*narcotic analgesic](#) and [*sedative](#). See also [ADDICTION](#), [DEPENDENCE \(2\)](#), [OPIOID-RELATED DISORDERS](#), [SUBSTANCE DEPENDENCE](#), [SUBSTANCE-INDUCED DISORDERS](#), [SUBSTANCE-RELATED AND ADDICTIVE DISORDERS](#), [SUBSTANCE USE DISORDERS](#). [From Greek *Morph(eus)* the god of sleep and dreams + *-ine* indicating an organic compound]

morphology *n.* **1.** A branch of biology devoted to the form and structure of organisms. **2.** The study of the form and structure of words, especially in terms of [*morphemes](#). **morphological** *adj.* [From Greek *morphe* form + *logos* word, discourse, or reason]

mortality table *n.* An actuarial table showing people's life expectancies and death rates depending on demographic factors such as sex, age, and occupation, used for calculating life insurance premiums.

mortido *n.* In [*psychoanalysis](#), a term coined by the Austrian physician

Paul Federn (1871–1950) to denote the form of energy associated with **Thanatos*, intended as a counterpart to **libido*. See also *DESTRUDO*. [From Latin *mors*, *mortis* death + *-ido* on the model of *libido*]

morula *n.* A solid ball of cells that results from the cleavage of a **zygote* or fertilized ovum and that later develops into a **blastocyst*. See also *EMBRYO*, *FOETUS*. [From Latin *morula* a little mulberry, diminutive of *morum* a mulberry]

mosaic *n.* An organism composed of two or more genetically distinct tissue types or created by combining genes from two or more different species. Also called a *chimera*. [From Latin *mosaicus* a mosaic, from Greek *mousoios* of the Muses, from *mousa* a Muse + *-ikos* of, relating to, or resembling]

Moses illusion *n.* A **cognitive illusion* induced by a question such as: ‘How many animals of each kind did Moses take on the Ark?’ A substantial proportion of people (roughly 50 per cent) answer ‘two’ rather than ‘none’, and feel confident about their answer, even when they are given unlimited time to think about it, in spite of the fact that they know that it was Noah and not Moses who took animals on to the Ark. The illusion depends primarily on the **semantic* similarity between the names *Noah* and *Moses* and possibly also on their **phonological* similarity (two syllables, similar stress patterns, the same vowel in the stressed syllable, and so on). It is not explained by the respondent mishearing the question, because people make Moses mistakes even after correctly reading the question aloud, nor is it explained by the misdirection created by the words ‘how many’, because the illusion persists, though it is slightly reduced, when respondents are asked to respond ‘True’ or ‘False’ to the statement: ‘Moses took two animals of each kind on the Ark’. The illusion was first reported in an article by the US psychologists Thomas D(avid) Erickson (born 1956) and Mark E(dward) Mattson (born 1957) in the *Journal of Verbal Learning and Verbal Behavior* in 1981. Compare *YOLK PHENOMENON*. [Named after Moses, the Hebrew prophet who, according to the Old Testament, led the Israelites out of Egypt to the Promised Land and handed down laws revealed to him by God]

Moses test of extreme reaction *n.* In statistics, a **distribution-free*

*****ebook converter DEMO Watermarks*****

***non-parametric** test of the difference between two independent groups in the extremity of scores (in both directions) that the groups contain. Scores from both groups are pooled and converted to ***ranks**, and the test statistic is the span of scores (the range plus 1) in one of the groups chosen arbitrarily. An exact probability is computed for the span and then recomputed after dropping a specified number of extreme scores from each end of its range. [Named after the US statistician Lincoln Ellsworth Moses (1921–2006) who introduced it in 1952]

mossy fibre *n.* One of the two types of ***afferent** neurons conveying signals to the ***cerebellum**, projecting from sites other than the inferior olivary nuclei on to tiny ***granule cells** in the cerebellar cortex, situated immediately under the layer of ***Purkinje cells** with which the granule cells form many synapses, each mossy fibre indirectly exciting many Purkinje cells. US *mossy fiber*. Compare CLIMBING FIBRE. [So called because of its appearance]

mother complex *n.* In ***psychoanalysis**, ***ambivalence** in a girl's feelings towards her mother, being one of the elements of the ***Oedipus complex**. See also COMPLEX (2).

motherese *n.* A popular alternative name for ***caretaker speech**, misleading because it is used also by fathers when talking to young children, although fatherese tends to be more intense and demanding. Even *parentese* is too restrictive a term, because the major features of motherese have been observed in the speech of unrelated adults and of older children talking to younger siblings. Also called *child-directed speech* or (ambiguously) *baby talk*. [From *mother* + *-ese* indicating style]

mother, phallic See PHALLIC WOMAN.

motile *adj.* 1. Exhibiting or capable of motion. *n.* 2. A person whose characteristic style of mental imagery is motor rather than visual, auditory, or tactile, taking the form of feelings of motion such as limb movements or muscular movements associated with the pronunciation of words. Compare AUDILE (2), TACTILE (2), VISUALIZER.

motion aftereffect *n.* An illusion of movement resulting from prolonged perception of motion in the opposite direction, as occurs with the **Plateau spiral* or the **waterfall illusion*. Also called a *movement aftereffect*. **MAE** abbrev.

motion capture *n.* A phenomenon of **apparent movement* in which a target image moving in one direction against a background of randomly moving elements causes those elements to appear to be moving in the same direction as the target.

motion detector *n.* Another name for a **direction-sensitive neuron*.

motion-induced blindness *n.* A tendency for a stationary or slowly moving stimulus to disappear from sight when viewed against a pattern of moving elements. In a standard demonstration of this phenomenon, three stationary or slowly moving yellow dots are viewed against a background of rotating blue dots or other shapes, and the yellow dots tend to disappear, singly or together, for several seconds at a stretch. The phenomenon is a form of **simultanagnosia* and may be related to **change blindness*, **inattentional blindness*, the **Cheshire Cat effect*, and the **Troxler effect*. It was discovered by the Israeli neuroscientist Yoram Bonne (born 1959) and first published in an article in the journal *Nature* in 2001 by Bonne and two colleagues, who pointed out that it could have serious consequences if, for example, moving traffic in a driver's field of vision induces temporary blindness to the tail-lights of a car in front. **MIB** abbrev.

motion parallax *n.* Another name for **monocular parallax*.

motion perspective *n.* A term used by the US psychologist James Jerome Gibson (1904–79) to denote the **optical flow* pattern in the visual field resulting from **monocular parallax*. See also **DIRECT PERCEPTION**.

motion sickness *n.* A debilitating condition brought about by **passive movement* or the illusory perception of passive movement, characterized by pallor, vertigo, hyperventilation, nausea, and sometimes vomiting. It is often associated with vehicular transport, people suffering from it being described

as being *airsick*, *carsick*, or *seasick*, and **antihistamine* drugs or **scopolamine* are often prescribed for its prevention. See also SENSORY CONFLICT THEORY.

motivated error *n.* Another name for a **parapraxis*.

motivation *n.* A driving force or forces responsible for the initiation, persistence, direction, and vigour of goal-directed behaviour. It includes the biological **drives* such as hunger, thirst, sex, and self-preservation, and also social forms of motivation such as **need* for achievement and **need* for affiliation. **motivational** *adj.* [From Latin *motivus* moving, from *motus* moved, from *movere* to move + *-ation* indicating a process or condition]

motivational research *n.* An approach to the study of consumer behaviour, especially advertising and marketing, based loosely on assumptions and concepts of **dynamic psychology* in general and **psychoanalysis* in particular. It seeks to uncover the unconscious motives through the use of **naturalistic observation*, **focus groups*, **depth interviews*, and **projective tests*, and it tends often to focus on sexual factors. It was pioneered in the 1930s by the Austrian-born US psychologist Ernest Dichter (1907–91), one of whose early claims was that, for a woman, baking a cake unconsciously symbolizes having a baby, and that ready-mix cakes, which did not sell as well as expected when they were first introduced, could be made more appealing to housewives by allowing them to add the basic ingredient that they expect to contribute when having a baby, namely a fresh egg. Motivational research has attracted criticism from psychologists and others and was scathingly attacked by the Canadian-born US economist John Kenneth Galbraith (1908–2006) in the first edition of *The Affluent Society* (1958). See also SUBLIMINAL PERCEPTION. **MR** abbrev.

motoneuron *n.* The unit formed by a **motor neuron* or **efferent* neuron and the muscle fibre to which it is connected. Also called a *motor unit*. [A term coined by the British neurophysiologist Sir Charles Scott Sherrington (1857–1952) from *moto(r)* + *neuron*]

motor aphasia See APHASIA.

motor apraxia *n.* Another name for **ideomotor apraxia*. See *APRAXIA*.

motor area *n.* Any area of the **cerebral cortex* responsible for the initiation, coordination, or regulation of nerve impulses transmitted to muscles or glands, especially the areas of the **motor cortex*.

motor cortex *n.* Areas in the **cerebral cortex*, namely the primary motor cortex, premotor cortex, supplementary motor area, and frontal eye field, devoted to the control of bodily movements. The primary motor cortex occupies the **precentral gyrus* immediately in front of the **central sulcus*, directly opposite the primary somatosensory cortex, containing in each cerebral hemisphere an inverted representation of the opposite side of the body with the hand and tongue disproportionately overrepresented. The premotor cortex, in front of the primary motor cortex, is about six times as large as the primary motor cortex and is concerned with postural coordination and execution of movements controlled by visual or tactile feedback. The supplementary motor area (*SMA*), still further forward in the frontal lobe, is concerned with the coordination of preplanned or preprogrammed movements. The frontal eye field, immediately in front of the area where the head is represented in the premotor cortex, is responsible for voluntary **saccadic* eye movements, as when tracking moving images or reading. See *also* *MIRROR NEURON*, *MU WAVE*, *SENSORIMOTOR CORTEX*. [From Latin *motor* a mover, from *motus* moved, from *movere* to move]

motor disorders *n.* An umbrella term in **DSM-5* for a group of **neurodevelopmental disorders* affecting physical movement. See *DEVELOPMENTAL COORDINATION DISORDER*, *STEREOTYPIC MOVEMENT DISORDER*, *TIC DISORDERS*.

motor dissociative disorders See *DISSOCIATIVE MOVEMENT DISORDERS*.

motor end plate *n.* The flattened **neuromuscular junction* at which the **bouton* of a **motor neuron* synapses with the squad of muscle fibres that it innervates.

motor nerve *n.* Any of a number of nerves comprising the axons of

***motor neurons** that transmit signals from the ***motor cortex** or ***spinal cord** to the muscles and glands.

motor neuron *n.* Any of the nerve cells of the ***peripheral nervous system** that transmit signals from the ***motor cortex** or the ***spinal cord** to the muscles or glands (see [illustration](#)). Also called an *efferent neuron*. See [ALPHA MOTOR NEURON](#), [GAMMA MOTOR NEURON](#), [RENSHAW CELL](#). Compare [MOTONEURON](#). [From Latin *motor* a mover, from *motus* moved, from *movere* to move]

Motor neuron

motor neuron disease *n.* A progressive, degenerative, and ultimately fatal disease of the ***motor neurons** affecting approximately 10 people per 100,000, resulting in gradual weakening and wasting of muscles and death usually from respiratory failure after 2–5 years, the cause of the disease being unknown but assumed to be a virus or environmental toxin. See also [AMYOTROPHIC LATERAL SCLEROSIS](#). **MND** *abbrev.*

motor set *n.* A temporary readiness for a particular muscular movement. See also [AUFGABE](#), [SET \(2\)](#).

motor skills disorder *n.* A group of ***mental disorders** associated with motor skills, by far the most prominent being ***developmental coordination disorder**, characterized by ***deficits** in activities involving motor coordination.

motor unit *n.* Another name for a **motoneuron*.

movement aftereffect *n.* Another name for **motion aftereffect*.

movement detector *n.* Another name for a **direction-sensitive neuron*.

movement disorders *n.* Disorders of voluntary movements, including all the **apraxias*, **dissociative movement disorders*, and **stereotypic movement disorder*.

movement illusion *n.* Any misperception of movement, notably any of the phenomena of **apparent movement*, including **alpha movement*, **beta movement*, **delta movement*, **flash-lag effect*, **gamma movement*, **hollow-face illusion*, **optimal movement*, **partial movement*, **phi movement*, **Pinna–Brelstaff illusion*, **random-dot kinematogram*, **representational momentum*. *See also* AUDIOGYRAL ILLUSION, AUTOKINETIC EFFECT, KINETIC DEPTH EFFECT, LISSAJOUS FIGURE, MOTION CAPTURE, OCULOGYRAL ILLUSION, OUCHI ILLUSION, PHANTOM GRATING, PLATEAU SPIRAL, RANDOM-DOT KINEMATOGAM, ROTATING HEAD ILLUSION, SENSORY SALTATION, SPINNING DANCER ILLUSION, TERNUS PHENOMENON, VECTION, WAGON WHEEL ILLUSION, WATERFALL ILLUSION, WINDMILL ILLUSION.

movement parallax *n.* Another name for **monocular parallax*.

movement perception *n.* The perception of motion, processed by the **magnocellular system*, which can be shown through **isoluminant* displays to be totally colour-blind. *See also* DIRECTION-SENSITIVE NEURON.

movement tremor *n.* Another name for **intention tremor*.

moving average *n.* In statistics, a sequence of numbers consisting of the averages of successive subsequences of a sequence of numbers, often computed from **time series* to smooth out short-term fluctuations and make underlying trends clearer. For example, the three-term moving average of the sequence 1, 7, 4, 10, 4 is obtained by taking the mean of the first three numbers, then the mean of the second, third, and fourth, then the mean of the

third, fourth and fifth, yielding 4, 7, 6, which is much smoother. More generally, especially in **time-series analysis*, a moving average is a sequence of numbers consisting of *weighted* sums of successive subsequences of a sequence of numbers, whether or not the weights sum to unity as they do for simple averages. See also *ARIMA*, *WHITE NOISE*.

Mozart effect *n.* A finding, first reported in 1991 by the French otolaryngologist Alfred A. Tomatis (1920–2001) in a book entitled *Pourquoi Mozart?* (Why Mozart?), and then supported in an article in the journal *Nature* in 1993, that listening to compositions by Mozart increases scores on tests of spatial ability for a short while. In the original experiment, college students were given various tests after experiencing each of the following for ten minutes: listening to Mozart's sonata for two pianos in D major K488, listening to a relaxation tape, or silence. Performance on the paper-folding subtest of the **Stanford–Binet intelligence scale* was significantly better after listening to Mozart than after the other two treatments, but the effect dissipated after about 15 minutes, and other (non-spatial) tasks were unaffected. The finding has been contested by other researchers and has been widely misinterpreted to imply that listening to Mozart (or listening to classical music) increases one's intelligence. Several independent research studies have shown that children who receive extensive training in musical *performance* achieve significantly higher average scores on tests of spatial ability, but that long-term consequence is not the Mozart effect. [Named after the Austrian composer Wolfgang Amadeus Mozart (1756–91)]

MPP⁺ *abbrev.* Methylphenylpyridine, a substance that is produced in the body from **MPTP* and that selectively destroys neurons in the **substantia nigra*, causing **Parkinson's disease*.

MPPP *abbrev.* 1-Methyl-4-phenyl-4-propionoxy-piperidine, a **designer drug* similar to **pethidine* (meperidine) and often described as synthetic heroin. It is often contaminated with **MPTP*.

MPTP *abbrev.* 1-Methyl-4-phenyl-1,2,3,6-tetrahydropyridine, a substance that is found as a contaminant in some **designer drugs*, notably **MPPP*, and is converted in the body to **MPP⁺*, causing **Parkinson's disease*.

MRI *abbrev.* Magnetic resonance imaging, a non-invasive method of [*brain imaging](#) or examination of other body organs by recording the responses to radio waves, or other forms of energy, of different kinds of molecules in a magnetic field. An MRI machine is a cylindrical magnet, large enough to contain a human body, producing a constant magnetic field in which protons (subatomic charged particles) spin like tops. A pulse of energy causes the spinning particles to tilt momentarily and then to regain their original orientations, giving up a detectable amount of energy as they do so. Different tissues emit different amounts of energy in response to the pulses, and the tissues that emit the greatest energy appear as the brightest regions in the resulting MRI scan. A series of two-dimensional slices are combined by a computer into a three-dimensional image. MRI can be used for imaging brain structure or (indirectly) brain function. When it is used to provide a dynamic picture of oxygen metabolism during specific mental activities it is called functional MRI or fMRI; this involves imaging blood oxygenation, which is of interest because it correlates with levels of neuronal activity in specific brain regions. Thus, fMRI monitors blood-oxygen-level-dependent ([BOLD](#)) neural activity in the brain. *See also* [NUCLEAR MAGNETIC RESONANCE](#).

MT *abbrev.* Median or middle temporal, another name for Area V5 of the [*visual cortex](#), receiving inputs chiefly from the [*magnocellular system](#), concerned mainly with movement perception. Also called MT/V5. *See also* [MASSAGE THERAPY](#).

mucous membrane *n.* A thin sheet of tissue consisting of a surface layer of [*epithelial](#) tissue and a deeper layer of connective tissue covering or lining the cavities and canals of the body that open to the outside, including the mouth, nose, digestive tract, genito-urinary tract, and uterus, secreting mucus and absorbing water, salts, and other solutes. *See also* [COMMON CHEMICAL SENSE](#). [From Latin *mucus* slime + *membrana* a skin or parchment]

MUD *abbrev.* Multi-user dungeon or multiuser dimension, a class of [*virtual reality](#) constructions accessible simultaneously by several users via the internet, allowing the playing of fantasy adventure games involving simulated interaction, combat, traps, puzzles, and magic, originally developed at the University of Essex in England in the early 1980s. Also written *mud*, and also used as a verb, meaning to play MUD. *See also* [TELEDILDONICS](#).

*****ebook converter DEMO Watermarks*****

[Named after the prototype fantasy game *Dungeons and Dragons*]

muddy children problem *n.* A logical problem illustrating that all members of a group may know a **proposition (1)* to be true without that proposition being **common knowledge* in the group. Suppose that all children in a classroom can see one another's foreheads but not their own, and that exactly two of them have muddy foreheads. The teacher asks all those who know they have muddy foreheads to put up their hands. The two muddy children, who are assumed to be perceptive, intelligent, and honest, have no reason to own up. The teacher then repeats the request a second time, and the two muddy children still have no reason to own up. Now suppose that the teacher had first announced to the class as a whole that at least one child in the class is muddy, turning a proposition that every child already knows to be true—because every child can see at least one muddy child—into an item of common knowledge. When the teacher asked all those with muddy foreheads to put up their hands, the two muddy children would not own up the first time the question was asked, but they would both own up when it was repeated a second time, because at that point each would realize that the failure of the other muddy child to own up the first time implied that there must be two muddy children in the class. It can be proved that if n of the children are muddy, then they will all own up when the question is asked for the n th time. The problem is sometimes cast in terms of a group in which some members have cheating spouses that the others all know about, and it is also called the *unfaithful wives problem* or the *cheating husbands problem*. It is a classic problem in **epistemic reasoning*.

muina See *BILIS*.

Müllerian duct *n.* Either of the pair of ducts that are present in a human embryo, alongside the pair of **Wolffian ducts*, and that in a female develop by default into Fallopian tubes, uterus, and the upper part of the vagina, and in a male atrophy and disappear under the influence of **Müllerian inhibiting substance* secreted by the embryonic testes while the Wolffian ducts develop into the male internal sex organs. Also called the *Müllerian system*. [Named after the German physiologist Johannes Peter Müller (1801–58) who discovered them]

Müllerian inhibiting substance *n.* A [*hormone](#) that is produced by the [*testes](#) of a male embryo and that inhibits the development of the [*Müllerian ducts](#) into Fallopian tubes, uterus, and the upper part of the vagina. Also called *anti-Müllerian hormone* ([AMH](#)) or *Müllerian regression hormone* ([MRH](#)). See also [MASCULINIZING HORMONE](#). **MIS** abbrev.

Müllerian mimicry *n.* A form of [*mimicry](#) in which two or more organisms that are harmful or unpalatable to a [*predator](#) resemble one another in shape or coloration and thereby jointly deter predation. Compare [BATESIAN MIMICRY](#). [Named after the German zoologist Johann Friedrich Theodor (Fritz) Müller (1821–97) who first described it]

Müller-Lyer illusion *n.* The best known of all visual illusions, in which a line with inward-pointing arrowheads appears shorter than a line of the same length with reversed or outward-pointing arrowheads (see [illustration](#)). See also [CARPENTERED WORLD](#), [MORINAGA MISALIGNMENT ILLUSION](#), [STAR ILLUSION](#), [ZANFORLIN ILLUSION](#). [Named after the German sociologist and psychologist Franz Carl Müller-Lyer (1857–1916) who discovered the illusion and published 15 versions of it in the journal *Zeitschrift für Psychologie* in 1889]

Müller-Lyer illusion. The horizontal lines are equal in length.

multi-attribute decision making *n.* Decisions made from sets of alternatives that vary on a number of attributes, aspects, or criteria. Familiar examples include choosing a house by comparing alternatives according to price, location, and number of rooms; selecting a marriage partner by

*****ebook converter DEMO Watermarks*****

comparing suitors on attributes such as physical attractiveness, intelligence, and sense of humour; and hiring an employee by comparing candidates on various qualifications. According to the standard linear additive value-maximization model, the decision maker simply weights the attributes according to their perceived importance, then sums the weights, then finally chooses the alternative with the highest aggregate weight; but there is evidence to suggest that human decision makers do not always behave according to this model. Also called *multi-attribute choice* or *multiple-criteria decision making* or *choice*. See [ELIMINATION BY ASPECTS](#), [LEXICOGRAPHIC CHOICE](#), [LEXICOGRAPHIC SEMIORDER](#). **MADM** *abbrev.*

multidimensional scaling *n.* In statistics, a form of statistical data analysis for analysing similarities and dissimilarities among a collection of elements (organisms, objects, or events) in order to identify and model the dimensional structure underlying the elements, including the number of underlying dimensions, the location of each element on the dimensions, and the nature of the dimensions. The input data are usually represented by a *proximity matrix* showing the degree of similarity between every pair of elements. Multidimensional scaling has been likened to reconstructing a map of an unknown country from information about the distances between pairs of its towns and cities. See also [INDSCAL](#). Compare [CLUSTER ANALYSIS](#), [FACTOR ANALYSIS](#). **MDS** *abbrev.*

multifactorial analysis *n.* Any form of **analysis of variance* involving more than one **independent variable*. See also [REPEATED-MEASURES ANALYSIS OF VARIANCE](#).

multifactorial inheritance *n.* Inheritance of characteristics that are determined by multiple genes.

multiframe task *n.* A **visual search* task in which different groups of stimuli are presented in successive displays. Compare [SINGLE-FRAME TASK](#).

multi-infarct dementia *n.* Another name for **vascular dementia*. **MID** *abbrev.*

multimodal therapy *n.* An approach to **psychotherapy*, developed in
*****ebook converter DEMO Watermarks*****

1972 by the South African-born US psychologist Arnold A(llan) Lazarus (1932–2013), based partly on **behaviour therapy*, but more eclectic in its range of techniques and more concerned with the unique requirements of particular cases, the functional character of symptoms, and the importance of cognitive factors. *See also* [BASIC-ID](#). **MMT** *abbrev.*

multiple-choice *adj.* In psychometrics, pertaining to a question that is accompanied by two or more **response categories* of which the respondent chooses one. A multiple-choice questionnaire, made up of such questions, can be scored automatically. *Compare* [FREE RESPONSE](#).

multiple comparisons *n.* In statistics, tests of the significance of pairwise differences between more than two means, often conducted after **analysis of variance*. Significance tests designed for comparisons between just one pair of means cannot be used for this purpose without violating the assumptions of the tests, because if three comparisons are made between three means, for example, then even if the data were completely random, the probability that one of the comparisons would be significant at $p < .05$ by chance alone would be greater than .05, because there would be three ways in which this could happen: Mean 1 could be significantly different from Mean 2, Mean 1 from Mean 3, or Mean 2 from Mean 3. This means that there would be inadequate protection against a **Type I error*. Various specialized procedures have therefore been devised for handling multiple comparisons. *See also* [BONFERRONI CORRECTION](#), [DUNCAN'S MULTIPLE RANGE TEST](#), [LEAST-SIGNIFICANT DIFFERENCE TEST](#), [NEWMAN-KEULS TEST](#), [SCHEFFÉ TEST](#), [TUKEY-HSD TEST](#). *Compare* [A PRIORI TEST](#).

multiple correlation coefficient R *n.* In statistics, an index of how well a **dependent variable* can be predicted from a linear combination of **independent variables*. It ranges from 0 (zero multiple correlation) to 1 (perfect multiple correlation), and the value of R^2 is the **coefficient of determination*. *See also* [REGRESSION ANALYSIS](#).

multiple determination *n.* In **psychoanalysis*, another name for **overdetermination*.

multiple intelligences *n.* An interpretation of **intelligence* put
*****ebook converter DEMO Watermarks*****

forward by the US psychologist Howard (Earl) Gardner (born 1943) in his book *Frames of Mind: The Theory of Multiple Intelligences* (1983, 1993), taking account of abilities of gifted people and virtuosos or experts in various domains, abilities valued in different cultures, and abilities of individuals who have suffered brain damage. In addition to the linguistic, logical–mathematical, and spatial abilities incorporated in conventional interpretations of intelligence, Gardner’s taxonomy includes *musical intelligence* (used in musical appreciation, composition, and performance), *bodily-kinaesthetic intelligence* (used in sport, dancing, and everyday activities requiring dexterity), *interpersonal intelligence* (used in relating to others, interpreting social signals, and predicting social outcomes), and *intrapersonal intelligence* (used in understanding and predicting one’s own behaviour). In 1997 Gardner added *naturalist intelligence* (used in discriminating among plants, animals, and other features of the natural world, and in classifying objects in general) as an eighth intelligence and *spiritual intelligence* and *existential intelligence* as ‘candidate’ intelligences. Critics have argued that some of these abilities are better interpreted as special talents than as aspects of intelligence. See also [CREATIVITY](#). Compare [GUILFORD’S CUBE](#).

multiple linear regression analysis See [MULTIPLE REGRESSION](#).

multiple line graph See [LINE GRAPH](#).

multiple personality disorder *n.* Another name for **dissociative identity disorder*. **MPD** *abbrev.*

multiple range test *n.* In statistics, a procedure for making **multiple comparisons*, that is, for comparing all possible pairs of a set of group means. See also [DUNCAN’S MULTIPLE RANGE TEST](#).

multiple regression *n.* Multiple linear regression analysis, a statistical method for analysing the joint and separate influences of two or more **predictor variables* (also called **independent variables*) on a **dependent variable*, usually through a **linear model*. It is a generalization of bivariate **regression analysis*. The form of a multiple regression equation for *k* independent variables is a weighted sum:

*****ebook converter DEMO Watermarks*****

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_k X_k$$

where Y is the *predicted* score on the dependent variable, each X_i is one of the predictor variables, β_0 is the intercept indicating the value of Y when all of the predictor variables are equal to zero, and each β_i is a ***standardized regression coefficient** indicating the relative importance of the corresponding independent variable in determining the predicted value of the dependent variable. See also [BETA COEFFICIENT](#), [CROSS-VALIDATION \(2\)](#), [DISCRIMINANT FUNCTION ANALYSIS](#).

multiple sclerosis *n.* A chronic progressive autoimmune disease, triggered by bacteria that mimic the molecular structure of ***myelin**, causing the immune system to attack both the bacteria and normal myelin. It is associated with patchy deterioration of the myelin sheath surrounding neurons in the ***white matter** of the ***central nervous system** and is characterized by muscle weakness or ***paresis**, especially in the legs, clumsiness, numbness or ***paraesthesia**, ***diplopia**, ***scotoma**, and ***tremor**. See also [BSE](#). Compare [CHARCOT–MARIE–TOOTH SYNDROME](#). **MS** abbrev. [From Greek *sklerosis* a hardening, from *skleros* hard + *-osis* indicating a process or state]

multiplicative model *n.* Any statistical or mathematical model in which an effect can be expressed as a weighted product of ***independent variables**, so that if any of the independent variables is zero, then the value of the dependent variable is also zero, because any number multiplied by zero is zero. In ***axiomatic measurement theory**, multiplicative models are divided into those that can be converted into additive models by means of monotonic transformations of their independent and dependent variables and those that cannot, only the latter being considered fundamentally non-additive. Compare [ADDITIVE MODEL](#).

multipolar neuron *n.* A ***neuron** with more than one ***neurite**, invariably a single ***axon** and one or more ***dendrites**, projecting from its ***soma** (1). Also called a *multipolar cell*. Compare [BIPOLAR CELL](#), [UNIPOLAR NEURON](#).

multi-rater feedback *n.* Another name for ***360-degree feedback**. Also

called *multi-source feedback* or *multi-source assessment*.

multistage cluster sampling *n.* A form of **cluster sampling* involving drawing a cluster sample in two or more successive stages. For example, to survey hospital patients throughout a country, a survey researcher might select a sample of hospitals randomly, then within each hospital select a single ward randomly, then select individual patients from each ward randomly.

multitrait–multimethod matrix *n.* A method of interpreting **construct validity* in terms of the **convergent validity* and **discriminant validity* of several different methods of measuring several different psychological **attributes* or **traits*. It consists of a matrix (a rectangular table) of correlations between two or more theoretically distinct traits, each measured by two or more different methods. For example, the traits might be extraversion and conscientiousness, assumed on theoretical grounds to be distinct (see **BIG FIVE**), and each of these traits might be measured by three methods, namely a multiple-choice test, a projective test, and peer ratings; this would produce a matrix with two rows and three columns. The figures along the main diagonal of the matrix, called *monotrait–monomethod* scores, are estimates of the **validity coefficients* of the six measures, and for the measurements to be considered satisfactory they should be the highest in the matrix. Correlations between measures of the same trait by different methods, called *monotrait–heteromethod* scores, provide data about the **convergent validity* of the measures, on the assumption that if they validly measure the same trait they should correlate with each other, and for the measurements to be considered satisfactory these scores should be reasonably high. Correlations between different traits measured by the same method, called *heterotrait–monomethod* scores, provide evidence of the degree to which the results are due to a methods factor, irrespective of what is being measured, and if measures of theoretically different traits, using the same method, do not correlate highly with one another, this constitutes evidence of **discriminant validity*. Finally, correlations between different traits measured by different methods, called *heterotrait–heteromethod* scores, are generally the lowest in the matrix, and they should not be higher than the validity coefficients in their own rows or columns. The technique was introduced by the US psychologists Donald T(homas) Campbell (1916–96) and Donald

*****ebook converter DEMO Watermarks*****

W(inslow) Fiske (1916–2003) in an article in the journal *Psychological Bulletin* in 1959. **MTMM** abbrev.

multi-user dungeon See **MUD**.

multivariate analysis of variance *n.* A statistical procedure that is closely related to ***analysis of variance (ANOVA)** and that determines the significance of differences among several group means, but unlike the standard (univariate) analysis of variance analyses more than one ***dependent variable** simultaneously. **MANOVA** abbrev.

multivariate statistics *n.* The branch of statistics devoted to investigating the influence of one or more ***independent variable** acting on more than one ***dependent variable**. The *multi-* in the name refers to the multiplicity of dependent variables. See also **MULTIVARIATE ANALYSIS OF VARIANCE (MANOVA)**. Compare **BIVARIATE STATISTICS**, **UNIVARIATE STATISTICS**.

multiway frequency analysis *n.* Statistical analysis of frequency data involving more than one ***independent variable** and a ***dependent variable**, the most common technique being ***log-linear analysis**.

Munchausen by proxy syndrome *n.* Another name for ***factitious disorder imposed on another**; named after the disorder of ***Munchausen syndrome**, but not itself a mental disorder or syndrome according to the British paediatrician (Samuel) Roy (later Sir Roy) Meadow (born 1933) who named it in 1977. Also called *Münchhausen syndrome by proxy*. **MBPS** abbrev.

Munchausen syndrome *n.* Another name for ***factitious disorder**. Also spelt *Münchhausen syndrome*, especially in continental Europe, and more correctly in terms of its etymology. Also called *pathomimicry*. See also **COUVADE**, **MUNCHAUSEN BY PROXY SYNDROME**. Compare **COMPENSATION NEUROSIS**, **MALINGERING**, **PSEUDOLOGIA FANTASTICA**. [First described and named, with the misspelling that has been widely adopted, by the British physician Richard (Alan John) Asher (1912–69) in a three-page article in the *Lancet* in 1951, alluding to Baron Münchhausen, a teller of tall stories in the fiction of the German novelist Rudolf Erich Raspe (1737–94), published in 1785, based on
*****ebook converter DEMO Watermarks*****]

a real Baron Münchhausen (1720–97) who served in the Russian army fighting against the Turks and is said to have recounted extravagant tales of his prowess]

Munsell colour system *n.* A method of specifying colours in terms of the three dimensions of **hue*, **lightness*, and **saturation* (1), standardized to the **CIE colour system* and defined to theoretical limits in 1943, the *Munsell hue* scale containing five principal hues (red, yellow, green, blue, purple) and five intermediate hues (yellow–red, green–yellow, blue–green, purple–blue, red–purple); the *Munsell value* scale containing ten steps of lightness from black (zero) to white (10); and the *Munsell chroma* scale showing fourteen steps of saturation from the equivalent neutral grey (zero) to the most saturated level (14). US *Munsell color system*. [Named after the US inventor Albert Henry Munsell (1858–1918) who developed it in 1915]

Münsterberg illusion *n.* A visual illusion created by a pattern of alternating columns of staggered light and dark rectangles whose rows are horizontally aligned but appear non-horizontal and non-parallel (see [illustration](#)). Also called the *café wall illusion*, the *eccentric chessboard figure* (its original name), the *shifted checkerboard figure*, or the *Münsterberg figure*. See also [HOLLOW SQUARES ILLUSION](#), [LAVATORY WALL ILLUSION](#). [Named after the German-born US psychologist Hugo Münsterberg (1863–1916) who published it in 1894 and 1897]

Münsterberg illusion. The figure is composed of rectangles in perfect horizontal alignment.

muscarine *n.* A toxic [*alkaloid](#) drug, chemically related to [*choline](#), that was originally derived from the [*fly agaric](#) mushroom *Amanita muscaria*, and that mimics [*acetylcholine](#) at certain receptor sites in the parasympathetic and central nervous systems, stimulating smooth muscle activity. When ingested it causes abdominal contractions, evacuation of bowels and bladder, constricted pupils, blurred vision, sweating, salivation, bradycardia, and decreased respiration. Formula: $C_8H_{19}NO_3$. *See also* [CHOLINOMIMETIC](#), [MUSCARINIC RECEPTOR](#), [PARASYMPATHOMIMETIC](#). [From Latin *muscar(ius)* of flies, from *musca* a fly + *-ine* indicating an organic compound]

muscarinic receptor *n.* One of two types of [*neuroreceptors](#) for [*acetylcholine](#) found in the central nervous system and the parasympathetic branch of the peripheral nervous system, stimulated by [*muscarine](#) and inhibited by [*atropine](#). The smooth muscles that are target organs of the autonomic nervous system (such as the pupils, blood vessels, and glands) use muscarinic receptors. Also called a *muscarinic cholinceptor*. *Compare* [NICOTINIC RECEPTOR](#). [From Latin *muscarius* the alkaloid poison muscarine found in some mushrooms, so named because muscarine mimics acetylcholine at such a site]

muscimol *n.* A [*hallucinogenic](#) plant alkaloid found in the [*fly agaric](#) mushroom that binds to [*GABA receptor complex](#) in the brain. [From Latin *musca* a fly + English *molecule*]

muscle *n.* Contractile tissue composed of bundles of elongated cells, some with multiple nuclei, by which movement of organs and parts of the body is effected; or a structure such as the biceps consisting of muscle tissue. The three main types of muscle tissue are [*cardiac muscle](#), [*smooth muscle](#), and [*striped muscle](#). *See also* [ACTIN](#), [ACTOMYOSIN](#), [CREATINE](#), [EXTRAFUSAL](#), [FAST-TWITCH FIBRE](#), [GOLGI TENDON ORGAN](#), [INTRAFUSAL](#), [INVOLUNTARY MUSCLE](#), [MINIATURE END-PLATE POTENTIAL](#), [MOTOR END PLATE](#), [MUSCLE SPINDLE](#), [MYOFIBRIL](#), [MYOSIN](#), [PHOSPHOCREATINE](#), [SARCOMERE](#), [SKELETAL MUSCLE](#), [SLOW-TWITCH FIBRE](#), [TONUS](#), [VOLUNTARY MUSCLE](#). **muscular** *adj.* [From Latin *musculus* a little mouse, diminutive of *mus* a mouse, alluding to the supposed resemblance of some muscles to mice]

*****ebook converter DEMO Watermarks*****

muscle dysmorphia *n.* A form of ***body dysmorphic disorder**, primarily affecting men but also occasionally women, characterized by pathological concern about being physically puny or insufficiently muscular. People with this disorder typically wear baggy clothes to disguise their body shapes, lift weights, follow strict diets, exercise compulsively, and sometimes take ***anabolic steroids** in an effort to increase their muscle development, and in severe cases, social and occupational activities are impaired. The term was introduced by US psychiatrist Harrison G. Pope, Jr (born 1947) and several colleagues in an article in the journal *Psychosomatics* in 1997. Sometimes called *reverse anorexia nervosa*, because individuals with muscle dysmorphia typically perceive themselves as small even when they are actually large and muscular. *See also* **ADONIS COMPLEX**, **BIGOREXIA**. *Compare* **ANOREXIA NERVOSA**. [From Latin *musculus* a little mouse, diminutive of *mus* a mouse, alluding to the supposed resemblance of some muscles to mice, + Greek *dys-* bad or abnormal + *morphe* form + *-ia* indicating a condition or quality]

muscle relaxant *n.* Any drug that causes relaxation of ***striated muscles**, apart from the heart muscle.

muscle sense *n.* A form of ***proprioception** and ***kinaesthesia** mediated by ***sensory receptors** in the muscles and stimulated by contraction. The term is also used non-technically to denote proprioception or kinaesthesia in general, but this is avoided in careful usage. *See also* **GOLGI TENDON ORGAN**, **MUSCLE SPINDLE**.

muscle spindle *n.* Any of the stretch receptors composed of ***intrafusal** fibres, up to one centimetre long, that are embedded in ***skeletal muscles** and oriented in parallel with the ***extrafusal** muscles to generate ***action potentials** whenever the muscles stretch. *See also* **IA FIBRE**. *Compare* **GOLGI TENDON ORGAN**. [So called because of its shape, tapering at each end]

muscular dystrophy *n.* A hereditary disease caused by a mutant gene on the ***X chromosome**, characterized by progressive wasting of muscle tissue, the most common form being ***Duchenne muscular dystrophy**. *Compare* **CHARCOT–MARIE–TOOTH SYNDROME**. [From Greek *dys-* bad or abnormal + *trophe* nourishment]

*****ebook converter DEMO Watermarks*****

mush *n.* A street name for the **liberty cap* mushroom. [Abbreviation of *mushroom* and also descriptive of the psychological state that it induces]

music therapy *n.* A form of **psychotherapy* in which clients or patients are encouraged to express their feelings and inner conflicts through music.

mutagen *n.* Any substance or other agent, including X-rays and other forms of **ionizing radiation*, that can cause genetic **mutations*. *See also* *TERATOGEN*. [From *muta(tion)* + Greek *genein* to produce]

mutant *n.* 1. An organism or gene that has undergone genetic **mutation*. *adj.* 2. Of, relating to, undergoing, or resulting from genetic mutation. [From Latin *mutare* to change]

mutation *n.* A change in the **genes* or **chromosomes* of a cell, capable of being transmitted to offspring as a **heritable* alteration of the organism, including a change in an **intron*. *See also* *BACK MUTATION*, *CIS–TRANS COMPLEMENTATION TEST*, *DELETION* mutation, *FRAMESHIFT MUTATION*, *HOT SPOT*, *JUMPING GENE*, *MUTAGEN*, *NEUTRAL MUTATION*, *NONSENSE MUTATION*, *POINT MUTATION*, *REVERSION*, *SALTATION (2)*, *SILENT MUTATION*. [From Latin *mutare*, *mutatus* to change + *-ation* indicating a process or condition]

mutism *n.* A refusal or inability to speak although the organs of speech are undamaged. Also called *aphrasia*. *See* *SELECTIVE MUTISM*. [From Latin *mutus* silent]

mutual gaze *n.* The event of two people simultaneously looking at each other in the vicinity of each other's eyes. Also called *eye contact*. *See also* *GAZE*.

mu wave *n.* An **EEG* wave, with a frequency of 8–13 hertz near the **motor cortex*, that tends to be suppressed when an individual performs a voluntary muscle movement or forms an intention to make such a movement. It is also blocked when a person watches someone else performing a voluntary action, and this effect is attributed to activity of **mirror neurons*.

Also called the *wicket rhythm*. [Named after the 12th letter of the Greek alphabet (M or μ)]

myalgic encephalomyelitis *n.* A severe form of ***chronic** fatigue syndrome accompanied by myalgia (muscle pain). For the disorder to be diagnosed, four or more of the following symptoms must also occur persistently or recurrently for at least six months after (and not before) the onset of the disorder: severe impairment of short-term memory or concentration, sore throat, tender lymph nodes, muscle pain, multiple joint pain without swelling or redness, unfamiliar types of headaches, unrefreshing sleep, and discomfort lasting more than 24 hours following physical exertion. *See also* **POST-VIRAL FATIGUE SYNDROME**. *Compare* **ENCEPHALOMYELITIS**. **ME** *abbrev.* [From Greek *mys* a muscle + *algos* pain + *-ikos* of, relating to, or resembling + *encephalos* a brain + *myelos* the spinal cord + *-itis* inflammation]

myasthenia gravis *n.* A chronic and progressive disease in which the muscles, especially those of the head and face, gradually become weak and easily fatigued. [From Greek *mys* a muscle + *astheneia* weakness, from *a-* without + *sthenos* strength + Latin *gravis* grave]

myelencephalon *n.* A part of the ***rhombencephalon** or hindbrain of an embryo that develops later into the ***medulla oblongata**. [From Greek *myelos* marrow or spinal cord + *enkephalos* the brain, from *en* in + *kephale* the head]

myelin *n.* White lipid-based tissue produced by ***oligodendrocytes** in the central nervous system and by ***Schwann cells** in the peripheral nervous system, forming a protective covering called a myelin sheath around the neural ***axons**. Damage to the myelin sheath is found in neurological disorders such as ***multiple sclerosis**. *See also* **NEUROLEMMA**. **myelinated** *adj.* Having a myelin sheath. [From Greek *myelos* marrow or spinal cord + *-in(e)* indicating an organic compound]

Myers–Briggs Type Indicator *n.* One of the most popular personality questionnaires, especially in commercial and industrial contexts, designed to implement the theory of ***function types** first suggested in 1923 by the Swiss psychologist Carl Gustav Jung (1875–1961). It contains 126

*****ebook converter DEMO Watermarks*****

items in its standard form (G) and 132 in its advanced form (K), all the items being concerned with preferences and inclinations, and it measures four bipolar dimensions: extraversion (E) versus introversion (I), sensing (S) versus intuition (N), thinking (T) versus feeling (F), and judging (J) versus perceiving (P). These four dimensions are combined to yield 16 types, each characterized by a different score pattern represented by a four-letter type description: ESTJ, ESTP,..., INFP. *See also* [COGNITIVE STYLE](#), [TEMPERAMENT THEORY](#). **MBTI** *abbrev.* [Named after the US novelist and playwright Isabel McKelvey Myers (1897–1980) and her mother, the self-taught US psychologist Katharine Elizabeth Briggs (1875–1968), who jointly introduced the earliest version of it in 1943]

myoclonic *adj.* Of, relating to, or resembling an involuntary contraction of the skeletal muscles, such as occurs in a [*convulsion](#). [From Greek *mys* a muscle + *klonos* contraction]

myofibril *n.* Any of the long contractile cells with multiple nuclei of which [*striped muscle](#) is composed. *See* [ACTIN](#), [MYOSIN](#). [From Greek *mys*, *myos* a muscle + Latin *fibrilla* a little fibre, diminutive of *fibra* a fibre]

myopia *n.* Short-sightedness or difficulty in seeing distant objects clearly, caused by an excessively elongated eyeball in which light rays entering the eye are focused in front of the retina. Also called *brachymetropia* or *near-sightedness*. *See also* [ANOMALOUS MYOPIA](#). *Compare* [EMMETROPIA](#), [HYPEROPIA](#), [PRESBYOPIA](#). **myope** or **myops** *n.* A short-sighted person. **myopic** *adj.* Short-sighted. [From Greek *myops* short-sighted, from *myein* to close + *ops* an eye + *-ia* indicating a condition or quality]

myosin *n.* A protein that reacts with [*actin](#) to form the contractile protein [*actomyosin](#) in muscles and that is also present in other body cells. [From Greek *mys* a muscle + *-in(e)* indicating an organic compound]

myostatic reflex *n.* Another name for a [*stretch reflex](#). *See also* [DEEP TENDON REFLEX](#). [From Greek *mys* a muscle + *statikos* bringing to a standstill, from *histanai* to cause to stand or to weigh in a balance + *-itikos* resembling or marked by]

myotonia *n.* Prolonged spasm or rigidity of a muscle. See [CATALEPSY](#), [CEREA FLEXIBILITAS](#), [CLASP-KNIFE RIGIDITY](#), [COGWHEEL RIGIDITY](#). **myotonic** *adj.* [From Greek *mys* a muscle + *tonos* tension, from *teinein* to stretch + *-ia* indicating a condition or quality]

myriachit *n.* The name usually given to the version of [*latah](#) found in Siberia. [From Russian *myriachit* to fool or play the fool]

myristin *n.* A whitish solidified [*ester](#) found in many vegetable fats and oils, especially oil of nutmeg; specifically glyceryl trimyristate, formula: $(C_{14}H_{27}O_2)_3C_3H_5$. Also, a [*psychedelic](#) and [*hallucinogenic](#) drug obtained from [*nutmeg](#) or [*mace](#). [From Latin *Myristica fragrans*, the tropical evergreen tree the seeds of which contain nutmeg, from *myristicus* fragrant, from Greek *myron* an ointment or perfume + *-in(e)* indicating an organic compound]

mystery customer research *n.* A technique of [*market research](#), popular in the US and the UK since the 1990s, in which specially trained assessors called *mystery shoppers* (in the retail industry) or more generally *mystery customers* visit stores, restaurants, banks, or other businesses in which service quality is to be appraised and, posing as ordinary customers, check the attainment of service standards drawn up in consultation with the client company. Examples of service standards that might be assessed include the following: *Did the cashier deal with me courteously? Did the sales assistant check that I had the right size garment? Was a pool table provided in the pub? Was I served within two minutes? Did the bank teller smile? Were the ashtrays emptied regularly?* From the results of such a survey, the standard attained by a client company can be compared with that of its competitors. [So called because of the secrecy regarding which customers are assessors]

myth, urban See [URBAN LEGEND](#).

naive participant *n.* In research methodology, a participant or subject who has no previous experience of the procedure, or one who is unaware of the purpose of the research or the hypothesis being tested. In research involving **confederates*, the term is used to denote a participant who is not one of the confederates.

naive physics *n.* Another name for **intuitive physics*.

naive realism *n.* The philosophical doctrine that perception of a physical object is direct awareness of the object itself rather than of a **representation* (1) of it, a view that is seriously challenged and in the opinion of many philosophers refuted by **perceptual illusions* in general and **visual illusions* in particular.

naive subject *See* NAIVE PARTICIPANT.

nalorphine *n.* A white crystalline compound, derived from morphine by substituting an allyl group (C₃H₅) for a methyl group (CH₃), used as a respiratory stimulant and **narcotic *antagonist* (3) in the treatment of narcotic poisoning and **opioid-related disorders*, also used to detect morphine addiction quickly through the short-lived **withdrawal* reaction that it elicits from a morphine addict. *Compare* NALOXONE, NALTREXONE. [From its chemical name *N-al(lyl)n(or)(mor)phine*]

naloxone *n.* A potent, short-acting **narcotic *antagonist* (3) that acts by binding to the **opiate *neuroreceptors* on cells, often used for treating acute narcotic overdose and **opioid-related disorders*. *Compare* NALORPHINE,

*****ebook converter DEMO Watermarks*****

NALTREXONE. [From its conventional chemical name *N-al(lylnor)ox(ymorph)one*]

naltrexone *n.* A long-acting **narcotic* antagonist that blocks the action of **opiates*, including the **euphoria* that they induce, and that is thus used in the treatment of narcotic overdose and **opioid-related disorders*. *Compare* NALORPHINE, NALOXONE. [A blend of *naloxone* and *Trexan* a trademark]

name–letter effect *n.* A tendency to evaluate letters in one's name more favourably than other letters. This has a small but significant influence on people's choices, including where they choose to live and whom they choose to marry. The effect was discovered by the Belgian psychologist Jozef M. Nuttin (1933–2014) and first named in the title of an article he published in the *European Journal of Social Psychology* in 1985. In a large-scale study of a sample of 582,007 full-time employees in Belgian private companies published in the journal *Psychological Science* in 2008, researchers compared the initial letters of employees' and employing companies' names and found the frequency of matches to be higher than chance expectation for every letter of the alphabet apart from X. *Compare* MERE EXPOSURE EFFECT. **NLE** *abbrev.*

NANC *abbrev.* Non-**adrenergic*, non-**cholinergic*, of or relating to peripheral nerve fibres whose neurotransmitter is neither adrenalin nor acetylcholine.

nandrolone *n.* An **anabolic steroid* with tissue-building properties and a weak **androgenic* action, closely related to **testosterone*, prescribed for the treatment of osteoporosis (brittle bones) and female breast cancer, and used to stimulate growth, weight gain, and production of red blood cells. It is frequently abused by athletes as a **performance* enhancer. Formula $C_{18}H_{26}O_2$. **nandrolone decanoate** *n.* A synthetic **androgen* and one of the most common forms of nandrolone. Formula: $C_{28}H_{44}O_3$. **nandrolone phen(yl)propionate** *n.* An **anabolic steroid* and widely used form of nandrolone. Formula: $C_{27}H_{34}O_3$. [Shortened from its chemical name *19-norandrostenolone*]

nanometre *n.* One billionth of a metre (10^{-9} metre, or one millionth of a

millimetre), used mainly for expressing wavelengths of light and other electromagnetic radiation. The ***visible spectrum** extends from approximately 390 nanometres at the violet end of the spectrum to 740 nanometres at the red end. US *nanometer*. Also (formerly) called a *millimicron*. Compare **ANGSTROM**. **nm** abbrev. [From Greek *nanos* a dwarf + *metron* a measure]

narcissism *n.* Self-love, or sexual gratification obtained by contemplating oneself. In ***psychoanalysis**, ***cathexis** of the ***ego** by ***sexual instincts**, as occurs in ***homosexuality**, according to Sigmund Freud (1856–1939) in his book *Three Essays on the Theory of Sexuality* (1905, *Standard Edition*, VII, pp. 130–243, at p. 145*n*). Freud later formed the view that it is a normal ***psychosexual stage** of development, between stages of ***auto-erotism** and ***object libido**, and in 1914 he published an entire article entitled ‘On Narcissism: An Introduction’ (*Standard Edition*, XIV, pp. 73–102) in which he expounded at length his theory at that time. The Austrian-born US psychoanalyst Heinz Kohut (1913–81) viewed narcissism as a natural part of development, but the British-based Austrian psychoanalyst Melanie Klein (1882–1960) and her followers questioned Freud’s theory, arguing that ***object-relationships** are evident from the earliest stages of sucking. The concept of narcissism was originally introduced in 1898 by the English sexologist Havelock Ellis (1859–1939) in an article entitled ‘Auto-erotism: A Psychological Study’. See also **EGO LIBIDO**, **GRANDIOSE SELF**, **NARCISSISTIC NEUROSIS**, **NARCISSISTIC OBJECT-CHOICE**, **NARCISSISTIC PERSONALITY DISORDER**, **PRIMARY NARCISSISM**, **SECONDARY NARCISSISM**. Compare **OBJECT RELATIONS**. **narcissistic** *adj.* [Named after *Narkissos*, a beautiful youth in Greek mythology who pined away for love of his own reflection in a pool and was punished by being transformed into the flower that bears his name]

narcissistic libido *n.* Another name for ***ego** libido.

narcissistic neurosis *n.* In ***psychoanalysis**, a category of ***psychoneuroses** that Sigmund Freud (1856–1939) distinguished from the ***transference** neuroses. In an article ‘On Narcissism: An Introduction’ (1914, *Standard Edition*, XIV, pp. 73–102), he described its salient characteristic to be the turning of ***libido** from external ***instinctual objects** on to the ***ego**, and he identified it with ***paraphrenia**. The concept lost popularity among psychoanalysts after the Second World War. See also **DECATHEXIS**, **NARCISSISM**,

*****ebook converter DEMO Watermarks*****

NARCISSISTIC PERSONALITY DISORDER.

narcissistic object-choice *n.* In **psychoanalysis*, a type of **object-choice* in which one chooses a love-object according to characteristics that the person shares with oneself. Sigmund Freud (1856–1939) introduced this concept in 1911 in an article ‘Psycho-analytic Notes on an Autobiographical Account of a Case of Paranoia (Dementia Paranoides)’ (*Standard Edition*, XII, pp. 9–82, at pp. 60–1) and developed it fully in 1914 in an article ‘On Narcissism: An Introduction’ (*Standard Edition*, XIV, pp. 73–102, at pp. 88–91), citing the fact that homosexuals take themselves as models in object-choices as ‘the strongest of the reasons that have led us to adopt the hypothesis of narcissism’ (p. 88). *See also* [NARCISSISM](#). *Compare* [ANACLITIC OBJECT-CHOICE](#).

narcissistic personality disorder *n.* A **personality disorder* in **DSM-5* characterized by **grandiose ideas or actions*, beginning by early adulthood, indicated by such signs and symptoms as self-importance and boastfulness; preoccupation with fantasies of unlimited success, power, beauty, or other desirable attributes; self-image as someone who should associate only with high-status people or institutions; excessive need for admiration; unreasonable expectations of favourable treatment; interpersonal exploitativeness; lack of empathy; envy; and patronizing arrogance. The term was introduced by the Austrian-born US psychoanalyst Heinz Kohut (1913–81). *See also* [GRANDIOSE SELF](#), [NARCISSISM](#). **NPD** *abbrev.*

narcoanalysis *n.* A technique of **psychotherapy* in which an attempt is made to bring out repressed emotions in an altered state of consciousness induced by narcotic drugs (usually short-acting **barbiturates*), originally used in the treatment of mental disorders in military personnel. Also called *narcosynthesis*. *Compare* [NARCOSYNTHESIS](#), [NARCOTHERAPY](#). [A blend of *narco(tic)* and *(psycho)analysis*]

narcolepsy *n.* One of the **sleep–wake disorders* in **DSM-5*, in which sudden and unpredictable lapses occur from wakefulness directly into **REM sleep* or from wakefulness into paralysis and **atonia* without loss of consciousness. It is characterized by frequent, involuntary episodes of refreshing sleep, together with either **cataplexy* (1) or recurrent intrusions of

*****ebook converter DEMO Watermarks*****

***REM sleep** during the transition between sleep and wakefulness, accompanied by ***hypnopompic images**, ***hypnagogic images**, or ***sleep paralysis**. It is believed to be caused by a malfunction of the mechanisms in the ***subcoerulear nuclei** or ***magnocellular nuclei** responsible for ***REM atonia**. Compare CATAPLEXY (1), KLEINE–LEVIN SYNDROME, HYPERSOMNIA, PRIMARY HYPERSOMNIA. [From Greek *narke* numbness or torpor + *lepsis* a seizure, from *lambanein* to seize]

narcosis *n.* Drug-induced loss of ***consciousness**. [From Greek *narke* numbness or torpor + *-osis* indicating a process or state]

narcosynthesis *n.* Another name for ***narcoanalysis**, especially when the explicit goal is the reintegration of the patient's ***personality**. Compare NARCOTHERAPY. [A blend of *narco(tic)* and *syntheses*]

narcotherapy *n.* Psychotherapy conducted with the help of narcotic drugs (usually short-acting ***barbiturates**); also, treatment of mental disorders by prolonged ***narcosis**. Compare NARCOANALYSIS, NARCOSYNTHESIS.

narcotic *adj. n.* (Of or relating to) a class of drugs that produce ***narcosis**, or at least drowsiness, torpor, and numbness, and are sometimes prescribed medicinally as ***analgesics** (1), ***anaesthetics** (1), or ***hypnotics** (2) and sometimes taken as street drugs, high dosages leading to depressed respiration, convulsions, coma, and death, and prolonged use often resulting in addiction or ***dependence** (2). The word is often misapplied, even by government agencies, to addictive drugs in general, excluding alcohol but including stimulant drugs such as cocaine or amphetamine, or to illegal drugs in general, including cannabis and LSD, whether or not they have narcotic or depressant effects, but such abuses of language are avoided in careful usage. See CODEINE, FENTANYL, HEROIN, HYDROMORPHONE, LOMOTIL, METHADONE, MORPHINE, NALORPHINE, OPIUM, OXYCODONE, OXYMORPHONE, PAREGORIC, PENTAZOCINE, PETHIDINE (MEPERIDINE), PHENAZOCINE, PROPOXYPHENE. See also NARCOTIC ANALGESIC, NARCOTIC ANTAGONIST, OPIATE, OPIOID-RELATED DISORDERS, SUBSTANCE ABUSE, SUBSTANCE-RELATED AND ADDICTIVE DISORDERS. Compare NALOXONE, NALTREXONE, TRANQUILLIZER. **narcotize** *vb.* To place a person or an animal under the influence of a narcotic drug. [From Greek *narkotikos* of or relating to numbness, from *narke* numbness or torpor + *-ikos* of, relating to, *****ebook converter DEMO Watermarks*****]

or resembling]

narcotic analgesic *n.* Any ***narcotic** such as ***morphine** that is used as an ***analgesic** (1) in cases of severe pain and is sometimes taken as a street drug. See DOVER'S POWDER, FENTANYL, HEROIN, HYDROMORPHONE, LAUDANUM, MEPERIDINE, METHADONE, MORPHINE, OXYCODONE, OXYMORPHONE, PAREGORIC, PENTAZOCINE, PETHIDINE (MEPERIDINE), PHENAZOCINE, PROPOXYPHENE. See also CODEINE (a mildly narcotic analgesic).

narcotic antagonist *n.* Any drug such as ***nalorphine**, ***naloxone**, or ***naltrexone** that binds to the ***neuroreceptor** sites of the ***opiates** in the ***central nervous system** and thereby blocks their action. Also called an *opioid antagonist*. See also ANTAGONIST (3).

narrative psychology *n.* A variant of ***social constructionist psychology**, introduced by the US psychologist Theodore R(oy) Sarbin (1911–2005) in a book entitled *Narrative Psychology: The Storied Nature of Human Conduct* (1986), that studies how people deal with experience by creating and responding to stories. Sarbin argued that people organize their thinking, perceiving, imagining, interaction, and decision making according to the narrative structure of human experience. [From Latin *narrare* to recount]

narrative psychotherapy *n.* A form of ***psychotherapy** in which individuals, couples, or families are encouraged to reinterpret their lives in terms of more beneficial stories.

narrow heritability See HERITABILITY.

nasal *adj.* 1. Of or relating to the ***nose**. *n.* 2. In phonetics, a ***consonant** speech sound articulated by obstructing the mouth passage completely while allowing the airstream to pass through the nose, as in the final ***phonemes** in the words *sum*, *sun*, and *sung*. See also MANNER OF ARTICULATION.

nasal epithelium *n.* Another name for the ***olfactory epithelium**.

nasal hemianopia *n.* Loss of vision of one nasal field (the right field of the left eye or the left field of the right eye) resulting from damage to the lateral region of the **optic chiasm*. Also called *nasal hemianopsia*. See also *HEMIANOPIA*. [So called because the affected area lies on the side nearest the nose]

nasal retina *n.* The half of the retina of each eye that is nearest to the nose and from which nerve fibres are projected to the opposite cerebral hemisphere after crossing over in the **optic chiasm*. Compare *TEMPORAL RETINA*.

Nash equilibrium *n.* In game theory, a profile of **strategy* (2) choices such that every player's strategy is a best reply to the strategies chosen by the other players. Given the strategies chosen by the other players (or, if there is only one, the strategy chosen by the other player), a best reply is a strategy that gives the player choosing it at least as good a payoff as any other strategy. A key property of a Nash equilibrium is that no player has any incentive to deviate unilaterally from it, so that it gives the players no cause to regret their strategy choices when the other players' choices are revealed. It is a basic tenet of game theory that a **rational* solution to any game must be a Nash equilibrium, but many games have multiple Nash equilibria. Also called an *equilibrium point* or an *equilibrium*. See also *MINIMAX THEOREM*. [Named after the US mathematician John F(orbes) Nash (born 1928) who introduced it in articles in the *Proceedings of the National Academy of Sciences* in 1950 and the *Annals of Mathematics* in 1951]

National Intelligence Test *n.* A civilian version of the **Army Alpha and Beta tests*, published in 1919 by the US psychologist Robert Mearns Yerkes (1876–1956), and widely used in schools, universities, and commercial firms.

nativism *n.* The doctrine that the mind contains knowledge that is not derived from the senses; more generally, the theory that the mind and its capacities are innately determined, or any theory emphasizing heredity or biological constitution as determinants of perceptions, attitudes, personality, or behaviour. See also *INNATE IDEA*, *RATIONALISM* (1, 2). Compare *EMPIRICISM*.

NATO phonetic alphabet *n.* The standard list of words used to identify letters of the alphabet unambiguously in police and maritime communications, air traffic control, and military contexts: Alpha, Bravo, Charlie, Delta, Echo, Foxtrot, Golf, Hotel, India, Juliet, Kilo, Lima, Mike, November, Oscar, Papa, Quebec, Romeo, Sierra, Tango, Uniform, Victor, Whiskey, X-ray, Yankee, Zulu. [Named after NATO, the North Atlantic Treaty Organization, which standardized it]

natural category *n.* **1.** A category imposed by the sense organs, such as the class of visual sensations giving rise to the sensation of blue or the class of taste sensations giving rise to the sensation of saltiness, in contradistinction to an artificially chosen category. **2.** Another name for a **basic-level category*, but this is avoided in careful usage.

naturalistic fallacy *n.* The mistake of deriving what ought to be from what is, or occasionally vice versa. It was named and discussed at length by the English philosopher G(eorge) E(dward) Moore (1873–1958) in his book in *Principia Ethica* (1903), without reference to what came to be regarded as the basic authority, namely *A Treatise of Human Nature* (1739) by the Scottish philosopher David Hume (1711–76): ‘In every system of morality that I have hitherto met with...I am surprised to find, that instead of the usual copulations of propositions, *is*, and *is not*, I meet with no proposition that is not connected with an *ought*, or an *ought not*. This change is imperceptible; but is, however, of the last consequence’ (Book III, part 1, section 1). [So called because examples usually centre on what is natural, as in the argument that it is right to eat meat because human beings have always naturally done so]

naturalistic observation *n.* A research method involving the passive observation of behaviour in naturally occurring situations, rather than any active intervention from the researcher such as occurs in an **experiment*. See also OBSERVATIONAL STUDY.

natural language *n.* A language that has evolved spontaneously within a community and that has native speakers. See also LANGUAGE (1). Compare ARTIFICIAL LANGUAGE.

natural-level category *n.* Another name for a **basic-level category*. Also called a *natural-level concept*.

natural selection *n.* The basic mechanism of **evolution* whereby those individuals in a population that are best adapted to the environment survive and produce more offspring than others, thereby altering the composition of the population and eventually the characteristics of the **species*. The term was introduced by the English naturalist Charles (Robert) Darwin (1809–82) in his book *The Origin of Species by Means of Natural Selection or the Preservation of Favoured Races in the Struggle for Life* (1859). See also APOSTATIC SELECTION, BLIND WATCHMAKER, CANALIZING SELECTION, COUNTERACTING SELECTION, DARWINIAN EVOLUTION, DIRECTIONAL SELECTION, DISRUPTIVE SELECTION, FREQUENCY-DEPENDENT SELECTION, GROUP SELECTION, KIN SELECTION, *K*-SELECTION, MEME, REINFORCING SELECTION, R-SELECTION, SELECTION PRESSURE, SELFISH GENE, SEXUAL SELECTION, STABILIZING SELECTION.

nature–nurture controversy *n.* The debate about the relative contributions of heredity and environment to a psychological characteristic, such as **intelligence*. The juxtaposition of the words *nature* and *nurture* in this sense was introduced by the English schoolmaster Richard Mulcaster (1531–1611), though the phrase had already been used in Greek by the philosopher Socrates (469–399 BC). It became popular in psychology after being adopted by the English explorer, amateur scientist, and psychologist Sir Francis Galton (1822–1911). See also HERITABILITY, NURTURE.

Navane *n.* A proprietary name for the neuroleptic drug **thiothixene*. [Trademark]

Navon figure *n.* A compound image composed of smaller images, typically a large letter of the alphabet composed of smaller letters (see *illustration*), used to study global and local cognitive processing. If the large figure has the same shape as its component elements, then the figure is congruent, because the **global feature* and the **local features* are the same; otherwise the figure is incongruent. Human observers generally identify the global features of incongruent Navon figures more quickly than the local features, perceiving a letter H composed of small M letters initially as an H rather than a collection of Ms (this is called the *global advantage*), but people

*****ebook converter DEMO Watermarks*****

with **simultanagnosia* display impaired global processing and have difficulty identifying global features, and non-human **primates*, such as capuchin monkeys, generally display a local advantage, identifying local features more quickly. Compare *HYBRID IMAGE*. [Named after the Israeli cognitive psychologist David Navon (born 1943) who introduced the idea in an article in the journal *Cognitive Psychology* in 1977]

Navon figure. The figure on the left is congruent and the one on the right is incongruent.

near-death experience *n.* An episode with characteristic cognitive and emotional features sometimes experienced by people close to death, typically involving a sensation of moving through a tunnel, feeling unnaturally calm, an **out-of-body experience*, and sometimes mystical or religious feelings. The term was introduced in 1975 by the US parapsychologist Raymond Moody (born 1944) in his book *Life After Life*: ‘During the past few years I have encountered a large number of persons who were involved in what I shall call “near-death experiences”’ (p. 18). **NDE** *abbrev.*

nearest neighbour method *n.* In statistics, any technique of **cluster analysis* in which the distance between two clusters is defined as the distance between their two closest members. Also called *single-linkage clustering*.

near point *n.* The closest point to the eye at which an object or image can be focused on the retina with maximum **accommodation* (1) of the crystalline lens. It is about 10 centimetres (4 inches) in infancy, 25

centimetres (10 inches) in adulthood if vision is normal, and 33 centimetres (13) inches in old age. *See also* [RANGE OF ACCOMMODATION](#). *Compare* [FAR POINT](#).

near sense *n.* Any of the senses such as touch or taste that are mediated by [*proximoreceptors](#) and that require close proximity between the perceiver and the object or event being perceived. *Compare* [FAR SENSE](#).

near-sightedness *n.* A non-technical name for [*myopia](#).

near vision *n.* Close-up viewing, usually defined for objects less than 2 feet or about 60 centimetres from the eyes. *See also* [ACCOMMODATION \(1\)](#), [ACCOMMODATION REFLEX](#), [CILIARY REFLEX](#), [HYPEROPIA](#), [PARASYMPATHETIC NERVOUS SYSTEM](#), [PRESBYOPIA](#). *Compare* [FAR VISION](#).

nebbies *n.* A street name for the barbiturate drug [*pentobarbital](#) (pentobarbitone).

Necker cube *n.* A simple line drawing of a transparent cube that, when viewed continuously, appears to alternate between two different spatial orientations, a classic example of an [*ambiguous figure](#) and more specifically of [*perspective](#) reversal (see [illustration](#)). [Named after the Swiss mineralogist Louis Albert Necker (1786–1861) who in 1832 reported his observation that line drawings of crystals appeared to reverse spontaneously]

Necker cube. The figure alternates spontaneously between two perspectives of the cube.

necromania *n.* A pathological preoccupation with dead bodies, or another name for ***necrophilia**. [From Greek *nekros* a dead body + *mania* madness]

necrophilia *n.* A ***paraphilia** characterized by recurrent sexually arousing fantasies, sexual urges, or behaviour involving intercourse with dead bodies. *Compare* **BIOPHILIA**. **necrophiliac** *n.* A person with necrophilia. [From Greek *nekros* a dead body + *philos* loving, from *phileein* to love + *-ia* indicating a condition or quality]

need *n.* 1. A lack of something that is required for survival. 2. A motivational state resulting from the lack of something that an organism requires or desires, also called a *drive*. 3. In the ***personology** of the US psychologist Henry Alexander Murray (1893–1988), a general course of action or behavioural tendency. *See also* **EDWARDS PERSONAL PREFERENCE SCHEDULE**, **NEED-PRESS**, **PRESS**.

need complementarity hypothesis *n.* The proposition that people tend to be attracted to others who have complementary needs to their own, a person with a high need for dominance, for example, being attracted to a person with a high need for submission, and vice versa. The theory was

*****ebook converter DEMO Watermarks*****

proposed in 1958 by the US sociologist Robert Francis Winch (1911–77) in a book entitled *Mate-Selection: A Study of Complementary Needs*. Despite its superficial plausibility, the theory has received only weak and inconsistent empirical support. Also called the *complementarity hypothesis*. Compare [ATTITUDE SIMILARITY HYPOTHESIS](#).

need for achievement *n.* A social form of [*motivation](#) involving a competitive drive to meet standards of excellence, traditionally measured with a projective test such as the [*TAT](#). The concept was introduced by the US psychologist Henry Alexander Murray (1893–1988) in his book *Explorations in Personality* (1938). Also called *achievement motivation*. **N Ach** or **nAch** *abbrev.*

need for affiliation *n.* A social form of [*motivation](#) involving a need to seek out and enjoy close and cooperative relationships with other people, and to adhere and remain loyal to a friend. The concept was introduced by the US psychologist Henry Alexander Murray (1893–1988) in his book *Explorations in Personality* (1938). Also called *affiliation need*. **N Aff** or **nAff** *abbrev.*

need-hierarchy theory *n.* The proposition put forward by the US psychologist Abraham Maslow (1908–70) in his book *Motivation and Personality* (1954, 1970) that human needs fall into five categories that form the following hierarchy. The strongest and most imperative are the *physiological needs* for food, water, oxygen, and sex; if the physiological needs are gratified, the *needs for safety* emerge, and the person begins to seek out safe environments; next to emerge are *needs for love and belonging*, and the person yearns for a friend, a lover, a place in a group; then *needs for esteem* come to the fore, and the person seeks self-respect, respect from others, status, and achievement; then last, and usually only if all the others have been reasonably well satisfied, there emerges a need for [*self-actualization](#).

need-press *n.* In the [*personology](#) of the US psychologist Henry Alexander Murray (1893–1988), a [*need](#) (3) evoked by environmental circumstances, such as a poor person's need for money or a lonely person's need for affiliation. Also called a *press-need*. See also [PRESS](#).

neencephalon *n.* Another name for the ***neocortex**.

negation *n.* **1.** The contradiction, or denial, or reversal of something, or the act or process of contradicting. **2.** In ***psychoanalysis**, a process whereby one continues to defend oneself against a formerly ***repressed** wish, thought, or feeling that has come to consciousness by disavowing or disowning it, as when a patient says during therapy ‘You might expect me to have felt angry with him, but I never felt any anger’. Sigmund Freud (1856–1939) expounded his theory in an article entitled ‘Negation’ in 1925, where he asserted somewhat cryptically: ‘Only one consequence of the process of negation is undone—the fact, namely, of the ideational content of what is repressed not reaching consciousness. The outcome of this is a kind of intellectual acceptance of the repressed, while at the same time what is essential to the repression persists’ (*Standard Edition*, XIX, pp. 235–9, at pp. 235–6). Some psychoanalysts consider it as a ***defence mechanism**. Also called *disavowal*. **3.** In ***logic**, the operator that reverses the meaning of a proposition *p*, or the resulting proposition *not-p* that is true precisely when *p* is false and vice versa.

negative adaptation *n.* A gradual diminution in sensitivity of a ***sensory** receptor or neuron resulting from prolonged or repeated stimulation.

negative afterimage *n.* **1.** An ***afterimage** in which the lightness contrasts are reversed, light areas of the original stimulus appearing dark and dark areas appearing light. *See also* **COMPLEMENTARY AFTERIMAGE**. *Compare* **POSITIVE AFTERIMAGE**. **2.** Another name for a ***complementary afterimage**, though this usage undermines an important distinction and is avoided in careful usage.

negative capability *n.* Suspension of critical rationality coupled with calm and unquestioning acceptance of uncertainty and doubt. The term, frequently used in British ***psychoanalysis** to describe an attitude adopted by some analysts, is taken from a letter of the English poet John Keats (1795–1821) to his younger brother Tom, who was dying of consumption: ‘Negative Capability, that is, when a man is capable of being in uncertainties, mysteries, doubts, without any irritable reaching after fact or reason’ (letter dated 21 December 1817).

*****ebook converter DEMO Watermarks*****

negative feedback See [FEEDBACK](#).

negative induction See [INDUCTION](#) (4).

negative Oedipus complex See [OEDIPUS COMPLEX](#).

negative practice *n.* A form of [*paradoxical therapy](#) in which the patient or client is enjoined to practise the very behaviour that needs to be eliminated. The US psychologist Knight Dunlap (1875–1949) introduced it in an article entitled ‘A revision of the Fundamental Law of Habit Formation’ in the journal *Science* in 1928, in which he reported: ‘The first opportunity which occurred for the testing of this method lay in an idiosyncrasy of my own in typewriting. For some years I have been annoyed, when typing rapidly, by an occasional transposition of the letters of a word, the word “the” being especially troublesome, so that in reading over a manuscript of my own typing I would sometimes find two, three or more of these transpositions into “hte.”...I now proceeded to try the typing of “hte” voluntarily, as a means of destroying it. I set to work deliberately and wrote about half a page, single spaced, of the “hte” combination, with the futuristic thought that this was a “word” that I would not write in the future (unless deliberately or voluntarily). Somewhat over a week later, I followed this with a second “practice period,” writing less than a third of a page. This was over three months ago. Since that time I have typed many pages, some rapidly, but have not found on reading them over a single case of “hte”!’ (vol. 67, p. 361). Dunlap developed his theory further in an article in *Scientific Monthly* in 1930 and in a book entitled *Habits: Their Making and Unmaking* (1932, pp. 94–6, 163–4, 313–14). See also [PARADOXICAL INTENTION](#).

negative priming *n.* Increased reaction time (slower responding) to a stimulus resulting from attention recently having been focused on stimuli belonging to a different class. It is a form of inhibitory [*priming \(1\)](#) arising from the suppression of irrelevant internal representations. For example, if someone is presented with a picture of a green owl and a red cat and is asked to name the red object, internal representations activated by the green owl will tend to be inhibited, causing increased reaction time in an immediately following task requiring rapid identification of a bird or something green.

*****ebook converter DEMO Watermarks*****

negative reference group *n.* A ***reference group** that an individual disapproves of and uses as a standard representing opinions, attitudes, or behaviour patterns to avoid. *Compare* **POSITIVE REFERENCE GROUP**.

negative reinforcement *n.* In ***operant** conditioning, the strengthening of a response as a consequence of its being followed by the cessation or avoidance of an aversive stimulus. *See* **AVOIDANCE CONDITIONING**, **ESCAPE CONDITIONING**. *Compare* **PUNISHMENT**.

negative symptoms *n.* In the diagnosis of ***schizophrenia**, symptoms such as ***affective flattening**, ***alogia**, and ***avolition**. *Compare* **POSITIVE SYMPTOMS**.

negative therapeutic reaction *n.* A temporary worsening of symptoms as a result of treatment. Sigmund Freud (1856–1939) described this phenomenon in his book *The Ego and the Id* (1923): ‘Every partial solution that ought to result, and in other people does result, in an improvement or a temporary suspension of symptoms produces in them for the time being an exacerbation of their illness; they get worse during the treatment instead of getting better’ (*Standard Edition*, XIX, pp. 12–66, at p. 49). Freud attributed it to ***resistance** and to the patient’s preference for suffering over being cured.

negative transfer *n.* A form of ***transfer of training** in which learning or performance of a task is impaired by training on a different but related task, as when a spell of driving on the right-hand side of the road temporarily impairs one’s ability to drive on the left, or vice versa. Transfer tends to be negative when the two tasks involve similar stimuli and different responses. *See also* **PROACTIVE INTERFERENCE**, **RETROACTIVE INTERFERENCE**. *Compare* **POSITIVE TRANSFER**.

negative transference *n.* In ***psychoanalysis**, hostility on the part of the patient towards the analyst, interpreted as ***displacement** of hostility towards other significant figures, especially parents. *See also* **TRANSFERENCE**. *Compare* **POSITIVE TRANSFERENCE**.

negativism *n.* 1. Refusal to do what is suggested or advised or a tendency to do the opposite, a symptom of some forms of **schizophrenia* and **catatonia*. 2. An attitude of unconstructive criticism. **negativistic** *adj.* [From Latin *negare* to deny + Greek *-ismos* indicating a state or condition]

negativistic personality disorder *n.* Another name for **passive-aggressive personality disorder*.

neglect dyslexia *n.* A type of **dyslexia* in which either the initial parts of words are misread (left neglect dyslexia) or the terminal parts of words are misread (right neglect dyslexia), the errors not being simple deletions but typically guesses of real though incorrect words with approximately the right number of letters.

Nembutal *n.* A proprietary name for the barbiturate drug **pentobarbital* (pentobarbitone). [Trademark]

nemesism *n.* Frustration expressed as aggression turned inward against the self. **nemesistic** *adj.* [From *Nemesis* the Greek goddess of vengeance]

NEO *abbrev.* **Neuroticism*, **extraversion*, **openness to experience*: a questionnaire designed to measure the **Big Five* personality factors, namely those three plus **agreeableness*, and **conscientiousness*. The original NEO Five-Factor Inventory (**NEO-FFI**), constructed by the US psychologists Paul T. Costa (born 1942) and Robert R. McCrae (born 1949) and first published in the journal *Psychological Assessment* in 1992, comprised 60 items, and the subsequent longer version, called the NEO Personality Inventory-Revised (**NEO-PI-R**) comprises 243 items. *See also* *IPIP*.

neobehaviourism *n.* Any form of **behaviourism* coming after that of the founding father, the US psychologist John B(roadus) Watson (1878–1958), the most influential being that of the US psychologist B(urrhus) F(rederic) Skinner (1904–90). Most neobehaviourists, while agreeing with Watson that psychology should be restricted to the study of overt behaviour, have accepted the existence of hidden psychological processes that can be inferred from behaviour. US *neobehaviorism*. **neobehaviourist** or **US**

neobehaviorist *adj. n.* (Of or relating to) one who advocates or practises neobehaviourism.

neo-catastrophism *See* CATASTROPHISM (1).

neocerebellum *n.* The most recently evolved functional part of the ***cerebellum**, comprising the lateral areas of the cerebellar hemispheres, receiving inputs from the ***pons** and projecting to the ***motor cortex** also via the pons. Lesions in this area lead to ipsilateral (same side of the body) incoordination of movements, especially in the upper limbs, ***adiadochokinesia**, ***intention tremor**, and ***dysarthria**. *See also* CEREBELLAR SYNDROME. *Compare* SPINOCEREBELLUM, VESTIBULOCEREBELLUM. [From Greek *neos* new + Latin *cerebellum* a little brain, diminutive of *cerebrum* a brain]

neocortex *n.* The most recently evolved part of the ***cerebral** cortex, composed of six layers of cells, including the ***lateral** surfaces of the frontal, parietal, temporal, and occipital lobes. The older parts of the cerebral cortex, all with fewer than six layers and collectively called the allocortex, are the palaeocortex or olfactory cortex at the front of each temporal lobe, the mesocortex mainly in the cingulate gyrus, and the archaecortex mainly in the hippocampus, which is the oldest of all. In humans, over 90 per cent of the cerebral cortex is neocortex (*see also* PROGRESSION INDEX). Also called *isocortex*, *neencephalon*, or *neopallium*. [From Greek *neos* new + Latin *cortex* bark or outer layer]

neo-Darwinism *n.* A modern version of ***Darwinian evolution** that emerged in the 1920s and 1930s, incorporating the processes of ***gene** transmission and ***mutation** that were unknown to Darwin, and denying the possibility (which Darwin accepted) of the inheritance of acquired characteristics. *See also* DARWINIAN EVOLUTION. *Compare* LAMARCKISM, LYSENKOISM, NEO-LAMARCKISM.

neodissociation theory *n.* A leading interpretation of ***hypnosis**, first proposed in 1973 in an article in the journal *Psychological Review* by the US psychologist Ernest R(ophiequit) Hilgard (1904–2001), according to which hypnosis involves a form of divided consciousness, as in ***hypnotic** analgesia, when a hypnotized person is unaware of the pain being caused by a stimulus

*****ebook converter DEMO Watermarks*****

that would normally be painful but the **hidden observer* is aware of the pain; or in **hypnotic* amnesia, in which a person who has recently been hypnotized is unable to recall what happened during the hypnotic session. It is called *neodissociation* theory to distinguish it from **dissociation* theory. *See also* DISSOCIATION.

neo-Freudian *adj. n.* (Of or relating to) any of the theorists in the US who reformulated **psychoanalysis* on a more sociological and humanistic basis, notably the German-born US psychoanalysts Karen Horney (1885–1952), Erich Fromm (1900–80), and Erik H. Erikson (1902–94), and the US psychiatrist Harry Stack Sullivan (1892–1949).

neo-Lamarckism *n.* A modern version of **Lamarckism* based on the assumption that genetic changes can be brought about by environmental factors and that **natural selection* operates on acquired characteristics. *See also* LYSENKOISM. **neo-Lamarckian** *adj.*

neologism *n.* A newly coined word or phrase or a new meaning given to an established word or phrase. [From Greek *neos* new + *logos* a word]

Neonatal Behavioral Assessment Scale *n.* A simple and straightforward system for assessing newborn infants by examining their reactions to 27 types of stimuli, including a pinprick, a rattle, a light, a moving ball, the sound of a bell, and so on. It was introduced in 1969 by the US paediatrician T(homas) Berry Brazelton (born 1918) in his book *Infants and Mothers: Differences in Development*, and it is capable of detecting a wide range of abnormalities. Also called the *Brazelton assessment*.

neonate *n.* A newborn baby up to four weeks old. **neonatal** *adj.* [From Greek *neos* new + Latin *natus* born]

neopallium *n.* Another name for the **neocortex*. [From Latin *neo* new + *pallium* a cloak]

neostriatum *n.* The more recently evolved part of the **corpus striatum*, consisting of the **caudate* nucleus and **putamen* (and excluding the globus

pallidus). Compare [PALAEOSTRIATUM](#). **neostriata** or **neostriatums** *pl.*

neoteny *n.* Persistence in the adult form of attributes of the foetal form, or attributes that were confined to the foetal form in ancestors, such as the tadpole form of the mature adults of some amphibian species, or the lack of body hair in humans. **neotenous** *adj.* [From Greek *neos* new + *teinein* to stretch]

neothalamus *n.* The most recently evolved parts of the [*thalamus](#) comprising the lateral group of nuclei that function as relay stations for sensory and optic projections to the cerebral cortex. [From Greek *neos* new + *thalamos* an inner room or chamber, from *thalos* a vault]

nepetalactone *n.* A chemical compound, mildly sedative to humans but strongly [*psychotropic](#) to most cats, first isolated in 1941 in [*catnip](#). Formula: C₁₀H₁₄O₂. [From Latin *nepeta* catnip + English *lactone* an organic compound with carbon atoms forming part of a ring, from Latin *lac*, *lactis* milk + *-one* indicating a chemical compound, from *-one* a feminine name suffix]

nephron *n.* Any of the tiny tubules of the kidney that filter blood to produce urine. [From Greek *nephros* a kidney]

nerfiza See [NERVIOS](#).

Nernst heat theorem *n.* The third law of [*thermodynamics](#), according to which as a homogeneous system approaches a temperature of absolute zero its [*entropy](#) tends to zero. [Named after the German physical chemist Walther Hermann Nernst (1864–1941) who formulated it in 1906]

nerve *n.* A cordlike band of [*axon](#) fibres that transmits impulses of sensation (if it is an [*afferent](#) nerve) or movement (if it is an [*efferent](#) nerve) between a sensory receptor and the central nervous system, or between the central nervous system and a muscle or gland. It is often confused with a [*neuron](#), which has a soma and only one axon. See [CRANIAL NERVE](#), [SPINAL NERVE](#). [From Latin *nervus* a nerve, from Greek *neuron* a nerve]

nerve cell *n.* A **neuron*.

nerve conduction velocity *n.* A neural measure of **processing speed* proposed in 1992 by the US psychologist Arthur R(ober) Jensen (1923–2012), obtained by dividing a person's head length (distance from the eye to the **primary visual cortex*) by the latency of an early component of the visual **evoked potential*, usually N70 or P100. It yields consistent though small correlations with psychometric measures of **intelligence*. **NCV** *abbrev.*

nerve deafness *n.* Another name for **sensorineural deafness*.

nerve ending *n.* The terminal part of a **nerve*, usually consisting of an **end organ*, but *see also* **FREE NERVE ENDING**.

nerve fibre *n.* An **axon*. US *nerve fiber*. *See* **ALPHA FIBRE**, **ASSOCIATION FIBRE**, **C FIBRE**, **CLIMBING FIBRE**, **DELTA FIBRE**, **GAMMA FIBRE**, **IA FIBRE**, **IB FIBRE**, **II FIBRE**, **MOSSY FIBRE**.

nerve gas *n.* Any gas, especially an **organophosphate *anticholinesterase* agent such as **sarin* (isopropyl methylphosphonofluoridate) or the more potent agent **VX*, that may be used as a chemical weapon and that, if absorbed through the skin or inhaled, occupies the active sites of **acetylcholinesterase* molecules and thereby interferes with the enzyme's ability to break down the neurotransmitter **acetylcholine* after nerve impulses, causing the neurotransmitter to accumulate at the **synapses* (1) between motor nerve fibres and muscles, and leading to muscle cramps and asphyxia. Also called a *nerve agent*. *See also* **NEUROTOXIN**.

nerve growth factor *n.* A substance that is produced by **smooth muscles* and other tissues stimulated by neurons and is necessary for the maintenance of sympathetic and sensory neurons. *See also* **APOPTOSIS**. **NGF** *abbrev.*

nerve impulse *n.* An electrical impulse travelling along an **axon* when a **neuron* is stimulated, also called an *action potential*. *Compare* **GRADED POTENTIAL**.

nervios *n.* A ***culture-bound syndrome** widespread throughout Latin America and among Latino communities in the United States and elsewhere, also found in Egypt (where it is called *nerfiza*) and Greece (*nevra*), characterized by chronic ***anxiety** and sorrowfulness, interpreted as a general state of vulnerability to ***psychosocial stressors** brought about by personal or family difficulties, with a broad range of signs and symptoms, commonly including ***anorexia**, ***dyssomnias**, headaches, irritability, stomach upsets, tearfulness, loss of concentration, ***tremor**, ***paraesthesia**, and dizziness or ***vertigo**. [Spanish *nervios* nerves, from Latin *nervus* a nerve]

nervous *adj.* 1. Of, relating to, or consisting of nerves or nerve fibres. 2. Apprehensive, agitated, or timid.

nervous breakdown *n.* A non-technical term for any severe ***mental disorder** involving a marked impairment in functioning and impaired ***reality testing**.

nervous system *n.* The sensory and control system enabling ***neurons** to communicate with one another in most animals, consisting in humans of the ***brain**, ***spinal cord**, and ***nerves**. It is divided anatomically into the ***central nervous system** and the ***peripheral nervous system**, and functionally into the ***autonomic nervous system** and the ***somatic nervous system**. The autonomic nervous system is further subdivided into the ***sympathetic nervous system** and the ***parasympathetic nervous system**. The other major intercellular communication system is the ***endocrine system**. These are not the only sensory and control systems: see **PARAMECIUM**. See also **ENDOCRINE GLANDS**.

net benefit index *n.* In ***cost–benefit analysis**, the difference between total present benefits (*B*) and total present costs (*C*) given by the formula $B - C$, a project being more worthwhile the higher the index. Compare **BENEFIT–COST RATIO**.

net reaction potential *n.* In ***Hullian learning theory**, the strength of the propensity of the organism to respond after subtracting inhibitory factors from the ***generalized reaction potential**. $s\bar{E}_R$ abbrev.

network model *n.* Any ***model** consisting of a collection of units, each joined to one or more other units that it may excite or inhibit. See **ACT***, **CONNECTIONISM (1)**, **NEURAL NETWORK**, **PARALLEL DISTRIBUTED PROCESSING**.

neural *adj.* Of, relating to, or resembling ***neurons** in the nervous system.

neural adaptation *n.* Another name for ***field** adaptation.

neural computer *n.* Another name for a ***neurocomputer**.

neural Darwinism *n.* The proposition that synaptic connections in the nervous system are shaped by competition, only those that turn out to be relatively useful surviving, the others disappearing through ***apoptosis** or neural ***pruning**. [So called by analogy with the competitive struggle for existence between organisms in Darwinian evolution]

neuralgia *n.* Intermittent paroxysmal pain following the course of a nerve, often caused by neural damage or malfunction. [From Greek *neuron* a nerve + *algos* pain + *-ia* indicating a condition or quality]

neural network *n.* A system of interconnected ***neurons**, as in the brain or nervous system, or (especially in cognitive science and artificial intelligence) an analogous system of interconnected ***neurochips** constituting a ***neurocomputer** designed to simulate the human brain, or a design for such a system. According to neural network theorists, mental experiences arise from the interaction of many interconnected computing units (or neurons), each in a specified state of activation (or firing rate), and each having the capacity to affect others by either excitatory or inhibitory connections (or synapses), the entire system being activated by a stimulus that affects a subset of the units, activation then propagating through the network until an equilibrium state of minimum energy is attained. The concept of a neural network was foreshadowed by the US psychologist William James (1842–1910) in his *Principles of Psychology* (1890, volume 2, pp. 563–6), and the first neural logic circuit based on a binary code was proposed in 1938 by the Russian-born US mathematical biologist Nicolas Rashevsky (1899–1972). The first detailed neural network was developed in 1943 by the US

neurophysiologist Warren S(turgis) McCulloch (1898–1968) and the self-taught US logician Walter Pitts (1923–69), but that early version lacked the ability to learn, which was introduced in 1948 in an article on ‘Intelligent Machinery’ by the English mathematician Alan Mathison Turing (1912–54) and independently in 1949 by the Canadian psychologist Donald O(lding) Hebb (1904–85). The concept of the neural network became popular only after the publication in 1981 of a connectionist model of human memory developed by the US cognitive scientist James L(oyd) McClelland (born 1948). Still more advanced neural networks often make use of **fuzzy logic*. Also called an *artificial neural network* (drawing attention to the fact that it consists of artificial rather than natural structures) or a *neural net*. See also CONNECTIONISM (1), NETWORK MODEL, PARALLEL DISTRIBUTED PROCESSING, PERCEPTRON, SPREADING ACTIVATION. ANN, CNN, or PDP-CNN abbrev.

neurasthenia *n.* A **mental disorder* characterized by persistent and distressing complaints of exhaustion following expenditure of insignificant amounts of mental or physical effort, including the performance of everyday tasks, with such additional signs and symptoms as muscular aches and pains, **tension headaches*, **dyssomnia*, restlessness, and irritability. The word was coined by the US physician George Beard (1839–83) in his book *American Nervousness: Its Causes and Consequences* (1881). See also ACTUAL NEUROSIS, ASTHENIA. [From Greek *neuron* a nerve + *astheneia* weakness, from *a-* without + *sthenos* strength + *-ia* indicating a condition or quality]

neurilemma *n.* A variant spelling of **neurolemma*.

neurite *n.* A **process* (2) of a **neuron*, whether an **axon* or a **dendrite*. [From Greek *neur(on)* a nerve + *-ite(s)* indicating a part of an organ or biological structure]

neurobiology *n.* The study of the anatomy, physiology, biochemistry, and development of the **nervous* system, including the biochemical and cell biological basis of brain functioning. [From Greek *neuron* a nerve + *bios* life + *logos* word, discourse, or reason]

neuroblast *n.* An embryonic nerve cell. [From Greek *neuron* a nerve + *blastos* a bud]

*****ebook converter DEMO Watermarks*****

neurochip *n.* A computer microchip used in an electronic *neural network.

neurocognitive disorder due to HIV infection *n.* A *neurocognitive disorder in *DSM-5 associated with *HIV dementia.

neurocognitive disorder due to Huntington's disease *n.* A *neurocognitive disorder in *DSM-5 associated with *Huntington's disease.

neurocognitive disorder due to Parkinson's disease *n.* A *neurocognitive disorder in *DSM-5 associated with *Parkinson's disease.

neurocognitive disorder due to prion disease *n.* A *neurocognitive disorder in *DSM-5 associated with *prion diseases, including *Creutzfeldt–Jakob disease, *fatal familial insomnia (FFI), *Gerstmann–Sträussler–Scheinker syndrome (GSS), and *kuru.

neurocognitive disorder due to traumatic brain injury *n.* A *neurocognitive disorder in *DSM-5 associated with *traumatic brain injury.

neurocognitive disorders *n.* An umbrella term introduced in *DSM-5 to bring together *delirium, *dementia, *frontotemporal neurocognitive disorder, and other disorders, including those due to *Alzheimer's disease, *HIV dementia, *Huntington's disease, *Lewy body dementia, *prion disease, *Parkinson's disease, *traumatic brain injury, *vascular dementia, substance/medication use, and other medical conditions. For each of these subtypes, DSM-5 distinguishes between major and mild neurocognitive disorders: a major disorder requires significant cognitive decline or impairment (in attention, executive function, learning, memory, language, perceptual–motor activity, or social cognition) and interference with independent everyday activities; a mild neurocognitive disorder requires evidence of modest cognitive decline or impairment, and independent everyday activities must require special effort or compensation; and in both major and mild neurocognitive disorders, the condition must not consist solely of delirium and must not be better explained by another mental disorder. **NCD** *abbrev.*

neurocognitive disorder with Lewy bodies *n.* A *neurocognitive disorder in *DSM-5 associated with *Lewy body dementia.

neurocomputer *n.* An electronic computer that uses a *neural network to mimic or simulate the operation of the human brain. Also called a *neural computer*. See also CONNECTIONISM (1). [From Greek *neuro(n)* a nerve + English *computer*]

neurodevelopmental disorders *n.* A term introduced in *DSM-5 for a group of *mental disorders with onset in the developmental period (up to 18 years of age), most commonly manifesting in early development, characterized by developmental deficits that cause problems in personal, social, academic, or occupational functioning, and frequently co-occurring with other disorders in the same group. See ATTENTION-DEFICIT/HYPERACTIVITY DISORDER, AUTISM SPECTRUM DISORDER, COMMUNICATION DISORDERS, DEVELOPMENTAL COORDINATION DISORDER, INTELLECTUAL DISABILITY, SPECIFIC LEARNING DISORDER, STEREOTYPIC MOVEMENT DISORDER, TIC DISORDERS.

neuroeconomics *n.* An interdisciplinary field, combining experimental and behavioural economics with aspects of *cognitive psychology, *social psychology, *neuroscience, and also ideas and techniques of evolutionary biology, computer science, and mathematics, to study *decision making and experimental *games (1).

neuroendocrine *adj.* Of or relating to certain functions that are under dual control of the *nervous system and the *endocrine glands. The term has become popular as it has become increasingly apparent that the endocrine system cannot be considered separately from the nervous system, because the same chemical compound (for example, noradrenalin) can function both as a neurotransmitter and as a hormone. [From Greek *neuron* a nerve + *endon* within + *krinein* to separate]

neuroendocrine cell *n.* A cell that is a true *neuron, with axon and dendrite(s), and also a true *endocrine gland, secreting a hormone into the bloodstream. Such cells are found especially in the hypothalamus, secreting hormones that in turn affect secretions of the pituitary gland.

neuroendocrine system *n.* The *nervous system and the *endocrine glands considered as a functional unit.

neuroendocrinology *n.* The study of the interaction of the *nervous system, especially the brain, and the *endocrine system, especially the *HPA axis.

neuroergonomics *n.* The study of brain and behaviour at work; an interdisciplinary field with roots in *neuroscience and *ergonomics, devoted to the study of the neural bases of *perception, *cognition, and *human performance in relation to systems and technologies in the workplace, including computers and vehicles such as aircraft, cars, trains, and ships. The term was coined in 1998 by the Indian-born US psychologist Raja Parasuraman (born 1950) in a web page entitled *Neuroergonomics: The Study of Brain and Behavior at Work*. [A blend of *neuroscience* and *ergonomics*]

neurofibril *n.* Any of the fibres composed chiefly of *neurofilaments and *microtubules, forming a cross-hatched pattern of the *cytoskeleton within the cell body of a neuron and extending longitudinally along its axon and dendrites. [From Greek *neuron* a nerve + *fibrilla* a small fibre]

neurofibrillary tangle *n.* A knotty mass of *neurofibrils and insoluble fibres composed chiefly of breakdown products of the tau protein, occurring in the brains of most people over 70 years old and found abundantly in the hippocampi and amygdalae of patients with *Alzheimer's disease and other disorders. *See also* AMYLOID PLAQUE, PROGRESSIVE SUPRANUCLEAR PALSY. **NFT** *abbrev.*

neurofilament *n.* Any of the minute threadlike fibres found in all parts of a neuron, with side-arms that keep them apart and evenly spaced. *See also* MICROTUBULE, NEUROFIBRIL. [From Greek *neuron* a nerve + *filum* a thread]

neurogenesis *n.* The growth of new *neurons to replace damaged ones. Throughout most of the 20th century, neuroscientists believed that this regenerative capacity was absent from the *central nervous system and that it occurred only in the *peripheral nervous system, but it was discovered

shortly before the end of the century that neural ***stem cells** in the ***ventricles** and the ***hippocampus** of the brain divide and proliferate, and that some of them migrate to other areas of the brain such as the ***olfactory bulbs** to form new neurons. Techniques to stimulate neurogenesis may help in the treatment of ***stroke** patients and people with ***Alzheimer's disease** and other neurodegenerative disorders. [From Greek *neuron* a nerve + *genesis* birth]

neuroglia *n.* The web of non-neural cells forming the connecting tissue that surrounds and supports ***neurons** in the ***nervous** system, outnumbering neurons by about 10 to 1, and divided into ***macroglia** and ***microglia**. Also called *glia* for short. Often mistakenly assumed to be a plural of *neuroglion* (a spurious ***back formation**), but in fact singular like the phrase *nerve glue*. See also **ASTROCYTE**, **EPENDYMAL CELL**, **GLIOSIS**, **OLIGODENDROCYTE**, **SATELLITE CELL**, **SCHWANN CELL**. **neuroglial** *adj.* [Coined in 1846 by the German pathologist Rudolf Ludwig Karl Virchow (1821–1902) from Greek *neuron* a nerve + *glia* glue]

neurogram *n.* Another name for an ***engram** or a ***memory** trace. [A blend of *neural* and *engram*]

neurohormone *n.* A ***hormone** such as ***noradrenalin** (norepinephrine) or ***serotonin** that is produced by specialized cells in the nervous system rather than endocrine glands and that functions as a chemical messenger, interacting with a variety of cell types, in contrast to other ***neurotransmitters** that interact only with neurons, muscles, and glands. Also called a *neurohumour* (US *neurohumor*). Compare **HORMONE**. [From Greek *neuron* a nerve + English *hormone*]

neurohumour *n.* Another name for a ***neurohormone**. US *neurohumor*. [From Greek *neuron* a nerve + Latin *umere* to be moist]

neurohypophysis *n.* The posterior lobe of the hypophysis (pituitary gland), usually called the ***posterior** pituitary. Compare **ADENOHYPOPHYSIS**. [From Greek *neuron* a nerve + *hypophysis* an attachment underneath, from *hypo* under + *phyein* to grow]

neuroimaging *n.* Another name for ***brain** imaging.

*****ebook converter DEMO Watermarks*****

neurolemma *n.* The external ***myelin** sheath of a neuron in the peripheral nervous system, made up of chains of ***Schwann cells**. Also spelt *neurilemma*. Also called an *axolemma*. [From Greek *neuron* a nerve + *eilema* a covering]

neuroleptic *n.* 1. Any of the ***dopamine** antagonist drugs, including any of the ***phenothiazines**, ***butyrophenones**, ***dibenzodiazepines**, or ***thioxanthenes**, that are used in the treatment of ***psychoses**. Also called an *antipsychotic drug* or a *major tranquillizer*. See also **ATYPICAL ANTIPSYCHOTIC**, **FENTANYL**, **NEUROLEPTIC-INDUCED**. *adj.* 2. Capable of affecting the brain or nervous system, especially by reducing the activity of neurons. [Adopted at the Second International Congress of Psychiatry in 1957, from Greek *neuron* a nerve + *lepsis* a taking hold or seizure + *-ikos* of, relating to, or resembling]

neuroleptic-induced *adj.* Of or relating to mental disorders or signs and symptoms induced as side-effects of ***neuroleptic (1)** medication, including neuroleptic-induced ***parkinsonism**, neuroleptic malignant syndrome (severe ***myotonia** and elevated temperature), ***tardive dyskinesia**, ***extrapyramidal syndrome**, ***akinesia**, ***dystonia**, acute ***akathisia**, ***amnesia**, dry mouth, blurred vision, difficulty urinating, or constipation.

neuro-linguistic programming *n.* A form of ***psychotherapy** and a model of interpersonal communication in the tradition of ***humanistic psychology**, based on elements of ***transformational grammar** and preferred sensory representations for learning and self-expression, introduced by the US trainer Richard (Wayne) Bandler (born 1950) and the US linguist and psychologist John Grinder (born 1940), first published in 1975 in books entitled *The Structure of Magic and Patterns of the Hypnotic Techniques of Milton H. Erickson*. It focuses chiefly on the relationship between successful patterns of behaviour and the patterns of thought and other subjective experiences underlying them, and the associated psychotherapy seeks to educate people in self-awareness and effective communication, and to change their patterns of thought and behaviour. The term *neuro-linguistic programming* first appeared in print in 1976 as the title of a book by Grinder, Bandler, and the US psychotherapist Virginia Satir (1916–88). **NLP** *abbrev.* [From Greek *neuron* a nerve + Latin *lingua* a tongue + *icus* of, relating to, or resembling + *pro* before + Greek *gramma* a letter from *graphein* to write]

*****ebook converter DEMO Watermarks*****

neurolinguistics *n.* The study of **language (1)* through an analysis of **deficits* and **impairments* of language function resulting from **neurological* damage. See *COGNITIVE NEUROPSYCHOLOGY*.

neurology *n.* The study of the **nervous* system; the branch of medicine concerned with disorders of the nervous system. **neurological** *adj.* [From Greek *neuron* a nerve + *logos* word, discourse, or reason]

neurolymph *n.* Another name for **cerebrospinal* fluid. [From Greek *neuron* a nerve + Latin *lympa* water]

neurometrics *n.* A group of techniques involving measurements of the activity of neurons in the nervous system, including **EEG*, **evoked potentials (EPs)*, and **event-related potentials (ERPs)*. [From Greek *neuron* a nerve + *metron* measure + *-ikos* of, relating to, or resembling]

neuromodulation *n.* Alteration in the number or sensitivity of **neuroreceptor* sites on **postsynaptic* neurons caused by exposure to a chemical substance. It is one of the mechanisms of drug **tolerance (3)*. See also *NEUROMODULATOR*.

neuromodulator *n.* A chemical substance that amplifies or dampens the activities of neurons but is not a **neurotransmitter*. See also *NEUROMODULATION*. [From Greek *neuron* a nerve + English *modulator*, from Latin *modulari*, *modulatus* to regulate]

neuromuscular junction *n.* A synapse between a terminal bouton of a neural axon and a squad of muscle fibres, normally situated at a **motor end plate*.

neuron *n.* A nerve cell specialized to transmit nerve impulses in the form of **action potentials*, the basic functional unit of the **nervous* system, normally consisting of a cell body or soma together with **dendrites* receiving signals from other neurons via **synapses (1)*, typical neurons being involved in 1,000–10,000 synapses, and an **axon* ranging in length from 3 micrometres to more than a metre, often splitting into many branches near its

end, transmitting signals away from the soma to one or more other neurons, a muscle, or a gland. Often confused with a **nerve*, which has no cell bodies or somata and is made up of bundles of axons. Also spelt *neurone*. See *BASKET CELL*, *BETZ CELL*, *BIPOLAR CELL*, *GOLGI CELL*, *GRANULE CELL*, *HORIZONTAL CELL*, *INTERNEURON*, *MERKEL CELL*, *MIRROR NEURON*, *MITRAL CELL*, *MOTOR NEURON*, *MULTIPOLAR NEURON*, *NON-OPPONENT CELL*, *OPPONENT CELL*, *PACEMAKER NEURON*, *PURKINJE CELL*, *PYRAMIDAL CELL*, *RENSHAW CELL*, *SENSORY NEURON*, *SPINDLE CELL*, *SPIRAL GANGLION CELL*, *STELLATE CELL*, *UNIPOLAR NEURON*. See also *CYTOSKELETON*, *MICROTUBULE*, *POSTSYNAPTIC*, *PRESYNAPTIC*. **neuronal** *adj.* [Greek *neuron* a nerve]

neuronal oscillator *n.* The neural circuitry underlying the execution of any rhythmic activity, such as walking or running, chewing, or (in airborne species) flying.

neuronal transplantation See *FOETAL BRAIN TRANSPLANTATION*.

neuron receptor site *n.* Another name for a **neuroreceptor*.

neuropathic *adj.* Of or related to disorders of the **nervous* system.

neuropath *n.* A person suffering from or predisposed to **neuropathy*.

neuropathy *n.* Disease or disorder of the nervous system. [From Greek *neuron* a nerve + *pathos* suffering + *-ikos* of, relating to, or resembling]

neuropathology *n.* The study of disorders of the **nervous* system.

neuropathological *adj.* [From Greek *neuron* a nerve + *pathos* suffering + *logos* word, discourse, or reason]

neuropathy *n.* Any disorder of the **nervous* system. [From Greek *neuron* a nerve + *pathos* suffering]

neuropeptide *n.* A **peptide* produced in the **nervous* system and functioning either as a **neurotransmitter* or as a **hormone*. [From Greek *neuron* a nerve + *peptein* to digest]

neurophysiology *n.* The study of the working of the nervous system.

neuropil *n.* A dense network of unmyelinated neurons and glia found in areas of concentrated nervous tissue at various sites in the central nervous system, especially in the ***reticular formation**, where it is interwoven with myelinated nerve fibres, and other parts of the brain. [From Greek *neuron* a nerve + *pilos* hair or felt]

neuropsychiatry *n.* The branch of medicine dealing with ***mental disorders** and disorders of the ***nervous** system; a generic name for ***psychiatry** and ***neurology**.

neuropsychanalysis *n.* A movement founded in London in June 2000 'to promote inter-disciplinary work between the fields of psychoanalysis and neuroscience'. A journal entitled *Neuropsychanalysis* was established in 2013 with the goal of creating a dialogue between psychoanalytic and neuroscience perspectives on the mind. [From Greek *neuron* a nerve + *psyche* + mind + *analysis* dissolution, from *ana-* up + *lysis* loosening, from *lyein* to loosen]

neuropsychology *n.* The interface between ***neurology** and ***psychology**; the study of the effects of disorders of the brain and nervous system on behaviour and mental experience.

neuropsychosis *n.* Another name for a ***psychoneurosis**.

neuroreceptor *n.* A site on the surface or inside a neuron to which a ***neurotransmitter**, a ***hormone**, or a ***psychotropic** drug may bind, either exciting or inhibiting ***action potentials**. Also called a *neuron receptor site* a *receptor site*, or simply a *receptor*.

neuroregulator *n.* A general term for any of the substances that affect neuronal activity, including a ***neurotransmitter**, ***neuromodulator**, or ***neurohormone**.

neuroscience *n.* An interdisciplinary field of study concerned with the anatomy, physiology, and biochemistry of the ***nervous** system and its effects on behaviour and mental experience. [From Greek *neuron* a nerve + English

science, from Latin *scientia* knowledge, from *scire* to know]

neurosis *n.* An imprecise term for a relatively mild **mental disorder* with predominantly distressing symptoms and without loss of **insight* (3) or **reality testing*, and without apparent **organic *aetiology*, including anxiety neurosis (see *GENERALIZED ANXIETY DISORDER*); depersonalization neurosis (see *DEPERSONALIZATION/DEREALIZATION DISORDER*); depressive neurosis (see *DYSTHYMIC DISORDER*); hysterical neurosis, conversion and dissociative types (see *CONVERSION DISORDER*, *DISSOCIATIVE DISORDERS*, *HISTRIONIC PERSONALITY DISORDER*); obsessive–compulsive neurosis (see *OBSESSIVE–COMPULSIVE DISORDER*); and phobic neurosis (see *PHOBIA*). The word was coined in 1777 by the Scottish physician William Cullen (1710–90) in a medical treatise entitled *First Lines of the Practice of Physic*. See also *ACTUAL NEUROSIS*, *CHOICE OF NEUROSIS*, *FAILURE NEUROSIS*, *FAMILY NEUROSIS*, *PSYCHONEUROSIS*. Compare *PSYCHOSIS* (1). **neuroses** *pl.* [From Greek *neuron* a nerve + *-osis* indicating a process or state]

neurosis, actual See *ACTUAL NEUROSIS*.

neurosurgery *n.* A branch of surgery devoted to treating disorders of the brain, spinal cord, and other parts of the **nervous* system. Compare *PSYCHOSURGERY*.

neurotic *adj.* 1. Of or pertaining to a **neurosis*. *n.* 2. A person afflicted with a **neurosis*.

neurotic anxiety *n.* In **psychoanalysis*, a form of **anxiety* arising from fear of losing control of the instincts of the **id*. Compare *REALISTIC ANXIETY*.

neurotic character *n.* In **individual psychology*, a term introduced by the Austrian psychiatrist Alfred Adler (1870–1937) to denote the personality characteristics that protect a person from feelings of inferiority. See also *NEUROTIC FICTION*.

neurotic depression *n.* Another name for **dysthymic disorder*.

neurotic fiction *n.* In the **individual psychology* of the Austrian psychiatrist Alfred Adler (1870–1937) and his followers, a person's **self-image* that is unrealistic and false, serving to reduce anxiety about the self. *See also* GUIDING FICTION.

neuroticism *n.* A psychological condition or state characterized by **neurosis*. Also, one of the **Big Five* personality factors, ranging from one extreme of neuroticism, including such **traits* as nervousness, tenseness, moodiness, and temperamentality, to the opposite extreme of emotional stability. *See also* ALPHA PERSONALITY FACTOR, CORE SELF-EVALUATION, GENERAL FACTOR OF PERSONALITY.

neurotic paradox *n.* The persistence of **neurotic* (1) symptoms or behaviour despite their distressing qualities and the desire of the afflicted person to be rid of them. For example, a man with **obsessive–compulsive disorder* may wash his hands many times a day until they bleed, and may consider this behaviour unnecessary and maladaptive, or even ridiculous, yet feel compelled to continue doing it, and this appears paradoxical.

neurotic solution *n.* In the **neo-Freudian* theory of the German-born US psychoanalyst Karen Horney (1885–1952), a method of dealing with a conflict by **repression*.

neurotoxin *n.* Any substance such as **6-hydroxydopamine*, **ibotenic acid*, **kainic acid*, **saxitoxin*, or **tetrodotoxin* that is poisonous to neurons or that interferes with their electrochemical functioning. The venom of many poisonous snakes, spiders, and scorpions contains neurotoxins. *See also* NERVE GAS. **neurotoxic** *adj.* [From Greek *neuron* a nerve + *toxikon* arrow-poison, from *toxon* a bow]

neurotransmitter *n.* Any of about 50 chemical substances, usually a small **amine* or a **peptide* but also a substance such as the gas **nitric oxide*, by which a neuron communicates with another neuron or with a muscle or gland via a **synapse* (1). In the central nervous system **glutamate* is the main excitatory neurotransmitter and **GABA* the main inhibitory one; in the peripheral nervous system **acetylcholine* is predominant for **motor neurons*

and glutamate for **sensory* neurons. **Dopamine* functions as a neurotransmitter mainly in the midbrain, **noradrenalin* (norepinephrine) mainly in the peripheral nervous system and in the pons and medulla oblongata, and **serotonin* mainly near the midline of the brainstem. Other important neurotransmitters include **adenosine*, **adrenalin* (epinephrine), **aspartic acid*, **glutamic acid*, **histamine*, **oxytocin*, **substance P*, and **vasopressin*. See also *EXCITATORY POSTSYNAPTIC POTENTIAL*, *INHIBITORY POSTSYNAPTIC POTENTIAL*, *ISOQUINOLINE*. Compare *FALSE NEUROTRANSMITTER*, *NEUROHORMONE*, *NEUROMODULATOR*. **neurotransmission** *n.* The communication of nerve impulses across a **synapse* (1).

neurotropic virus *n.* Any of a number of viruses that have a strong affinity for neurons in the central nervous system, as contrasted with pantropic viruses, which attack body tissues indiscriminately. [From Greek *neuron* a nerve + *tropos* a turn, from *trepein* to turn]

neutral colour *n.* Another name for an **achromatic* (1) colour. US *neutral color*.

neutral grey *n.* Another name for an **achromatic* (1) colour. US *neutral gray*.

neutralization *n.* The process by which two **phonemes*, which by definition have the power to distinguish **minimal pairs*, can become indistinguishable. For example, in English /p/ and /b/ are different phonemes, as can be seen in the different meanings of *pan* and *ban* or *cap* and *cab*, but following /s/ this opposition is neutralized, and from a phonetic point of view *span* could just as well be written *sban*. See also *ACOUSTIC CUE* (1).

neutralization of libido *n.* In **psychoanalysis*, the expression of **libido* in non-sexual activities, such as artistic creation.

neutral monism *n.* An approach to the **mind–body problem* that is a version of **monism*, asserting that the mental and the physical are both constructs of the same elements that are in themselves neither mental nor physical.

neutral mutation *n.* A **mutation* that is neither advantageous nor disadvantageous in terms of **Darwinian fitness* but can lead to **genetic drift* and contribute to **genetic polymorphism*. A **silent mutation* is one kind of neutral mutation.

nevra See *NERVIOS*.

Newcomb's problem *n.* One of the most difficult problems of logic and decision making. On the table is a transparent box containing \$1,000 and an opaque box containing either \$1 million or nothing. A decision maker has the choice of taking either the opaque box only or both boxes. The decision maker is told, and believes, that a predictor of human behaviour, such as a sophisticated computer programmed with psychological information, has already put \$1 million in the opaque box if and only if it has predicted that the decision maker will take only that box, and not the transparent box as well, and the decision maker knows that the predictor is correct in most cases (95 per cent of cases, say, although the exact figure is not critical). Both strategies can apparently be justified by simple and apparently irrefutable arguments: **expected utility* theory supports the strategy of taking the opaque box only, but the strategy of taking both boxes is a strongly **dominant alternative/strategy*. Also called *Newcomb's paradox*. See also *SURE-THING PRINCIPLE*. [Named after the US theoretical physicist William A(drian) Newcomb (1927–99) who discovered it in 1960 while pondering the paradox of the Prisoner's Dilemma game, although it was first published in 1969 in a book chapter by the US philosopher Robert Nozick (1938–2002), who commented in a footnote: 'It is a beautiful problem. I wish it were mine.']

Newman-Keuls test *n.* In statistics, a method of **multiple comparisons* in which the group means are ranked from smallest to largest, and then the statistic that is used to test for a significant difference between a pair of means is computed on the basis of the number of steps between the two means in the rank order. Also called *Student-Newman-Keuls procedure*. Compare *BONFERRONI CORRECTION*, *DUNCAN'S MULTIPLE RANGE TEST*, *LEAST-SIGNIFICANT DIFFERENCE TEST*, *SCHEFFÉ TEST*, *TUKEY-HSD TEST*. [Named after the English statistician Dennis Newman (1916–88) who published a preliminary article on the test in the journal *Biometrika* in 1939 and the Dutch statistician Matthijs Keuls who developed it further in an article in the journal *Euphytica*

*****ebook converter DEMO Watermarks*****

in 1952]

new-variant Creutzfeldt–Jakob disease See CREUTZFELDT–JAKOB DISEASE.

next-in-line effect *n.* Impaired recall for an event immediately preceding an anticipated public performance. The effect was first reported in 1973 by the US graduate student Malcolm Brenner (born 1946), who performed an experiment in which a group of participants sat around a circular table taking turns reading words aloud, trying to remember as many words as possible. After going round the table several times, so that each participant had read out several words and there were many more read out by others to remember, the participants' recall was tested. Relative to a control condition in which participants merely listened, recall tended to be best for the words that the participants had read out themselves (the ***von Restorff effect**) and worst for the words immediately preceding the words that they had read out (the next-in-line effect). The effect is believed to be due to both attention distraction and ***retrograde amnesia**. See also AUDIENCE EFFECT.

N400 *n.* A single sustained negative ***evoked potential** occurring when a person encounters an unexpected or incongruous word when reading a sentence such as *He spread the warm bread with socks*, in which the N400 potential would be elicited by the final word. It is specifically associated with language processing in the brain, and its name alludes to the fact that its peak occurs about 400 milliseconds after the unexpected stimulus, with onset at about 200 milliseconds and offset at about 500 milliseconds. It was first reported in an article in the journal *Science* in 1980. [From *n(egative) 400 milliseconds*]

nibble See NYBBLE.

nicotine *n.* A colourless, oily, toxic liquid that turns yellow on exposure to air and light and is the principal ***alkaloid** in tobacco, being ingested when tobacco is smoked, chewed, or snuffed. It is a powerful central nervous system ***stimulant**, mimicking ***acetylcholine** at certain neuroreceptor sites in both sympathetic and parasympathetic divisions of the autonomic nervous system, triggering the release of ***dopamine** and ***noradrenalin**

*****ebook converter DEMO Watermarks*****

(norepinephrine) and stimulating the release of **vasopressin*. Prolonged tobacco use often leads to nicotine **dependence* (2) or **addiction*. *See also* CHOLINOMIMETIC, NICOTINE-RELATED DISORDERS, NICOTINIC RECEPTOR. [French, from Latin *herba nicotiana* Nicot's plant, named after the 16th-century French diplomat Jaques Nicot (1530–1600) who supplied tobacco to Catherine de Medici and introduced it into France in 1560 + *-ine* indicating an organic compound]

nicotine-related disorders *n.* **Substance-related and addictive disorders* induced by consuming **nicotine*. *See* SUBSTANCE ABUSE, SUBSTANCE DEPENDENCE, SUBSTANCE-INDUCED DISORDERS, SUBSTANCE USE DISORDERS.

nicotinic receptor *n.* One of two types of receptors for **acetylcholine* found in the central nervous system and in motor neurons controlling skeletal muscles, stimulated by **nicotine* and inhibited by **curare*. Nicotinic receptors are used by the striped voluntary muscles, and slightly different types of nicotinic receptors are found at the autonomic ganglia, relaying both sympathetic and parasympathetic signals. Also called a *nicotinic cholinceptor*. *Compare* MUSCARINIC RECEPTOR. [So named because nicotine mimics acetylcholine at such a site]

nictitating membrane *n.* A thin membrane beneath the eyelids of birds, reptiles, and some mammals such as cats and rabbits that can be drawn across the eye. Also (non-technically) called a *third eyelid*. [From Latin *nictitare* to wink repeatedly, from *nictare* to wink]

night blindness *n.* A non-technical name for **nyctalopia*.

nightmare *n.* 1. A terrifying or extremely upsetting **dream* (1), or figuratively an event or experience resembling such a dream. 2. An evil spirit believed to torment and suffocate sleepers. *See also* NIGHTMARE DISORDER. [From *night* + Old English *maere* an evil spirit or incubus]

nightmare disorder *n.* A **parasomnia* in **DSM-5* characterized by recurrent awakening from sleep, alert and oriented but with vivid recall of long and extremely frightening **nightmares* (1). *Compare* SLEEP TERRORS.

nightshade *n.* Any of a number of plants including the ***deadly nightshade** *Atropa belladonna*.

night terrors *n.* Another name for ***sleep terrors**. Also called *pavor nocturnus*.

night vision *n.* A non-technical name for ***scotopia**.

nigrostriatal bundle *n.* A bundle of ***dopaminergic** nerve fibres in each cerebral hemisphere, originating in the ***substantia nigra** and terminating in the ***striatum** in the same hemisphere. *See also* MESOTELENCEPHALIC PATHWAY. **NSB** *abbrev.*

nihilism *n.* In its most extreme form, denial of reality; more generally, denial of objective truth, or radical philosophical scepticism. The word was first used by the Russian novelist and dramatist Ivan Sergeyevich Turgenev (1818–83) in his novel *Fathers and Sons* (1862) to describe the world-view of radical and disillusioned members of the Russian intelligentsia, epitomized by his character Bazarov, who rejected traditional values and sought to destroy all established systems. *See also* COTARD’S SYNDROME, NIHILISTIC DELUSION. **nihilist** *n.* A person who espouses nihilism. **nihilistic** *adj.* [From Latin *nihil* nothing + Greek *-ismos* indicating a state or condition]

nihilistic delusion *n.* A ***delusion** that nothing exists, or that a significant aspect of the self (such as one’s brain or the outside world) does not exist. *See* COTARD’S SYNDROME, NIHILISM.

nine-dot problem *n.* A ***reasoning** problem in which the task is to connect nine dots, arranged in a square, by four straight lines drawn without lifting the pen from the paper and without retracing any lines (see *illustration*). If symmetric solutions are considered equivalent, then it is a ***well-defined problem**, and it should be easy, because there are only a few possibilities to try, but it is difficult in practice for psychological reasons. Fewer than 5 per cent of undergraduate students manage to solve it in two minutes, and most are convinced by then that no solution exists. It is often used to illustrate ***lateral** thinking and is a perfect example of ‘thinking

outside the box'. It was first discussed by the US psychologist Norman R(aymond) F(rederick) Maier (1900–1977) in an article in the *Journal of Comparative Psychology* in 1930. See also [PROBLEM SOLVING](#).

Nine-dot problem. On the left are shown nine dots to be connected by four straight lines, without lifting the pen from the paper and without retracing any lines. The solution, shown on the right, should be easy but is very hard in practice.

nirvana principle *n.* In **psychoanalysis*, the tendency for the quantity of energy in the mental apparatus to reduce to zero. Sigmund Freud (1856–1939) introduced the concept in 1920 in his book *Beyond the Pleasure Principle* (*Standard Edition*, XVIII, pp. 7–64, at pp. 55–6). In 1924, in an article on ‘The Economic Problem in Masochism’, he defined it ambiguously as the principle of the mental apparatus ‘of extinguishing, or at least of maintaining at as low a level as possible, the quantities of excitation flowing into it’ (*Standard Edition*, XIX, pp. 159–70, at pp. 159–60). The term itself, which Freud attributed to the British psychoanalyst Barbara Low (1877–1955), relates to Buddhism and Hinduism, in which nirvana is the longed-for release from the cycle of reincarnation, attained by the extinction of all desires and individual existence. See also [BOUND ENERGY](#), [FREE ENERGY](#), [THANATOS](#). Compare [PRINCIPLE OF CONSTANCY](#). [From Sanskrit *nirvana* extinction or a blowing out, from *nir-* out + *vati* it blows]

Nissl body *n.* Any of the large granular structures consisting of clumps of **endoplasmic reticulum* in the **cytoplasm* of neurons. [Named after the German neurologist Franz Nissl (1860–1919)]

Nissl granule *n.* Any of the small grains now identified as **ribosomes* in the **endoplasmic reticulum* of a **Nissl body*. Also called a *Nissl substance* or

*****ebook converter DEMO Watermarks*****

chromatin granule.

Nissl stain *n.* A histological stain, usually using methylene blue or cresyl violet, that affects mainly ***Nissl bodies**, exposing neuron cell bodies but not their axons and dendrites. *Compare* **GOLGI STAIN**.

nitric oxide *n.* A gas with ***free-radical** chemical properties that functions as a ***neurotransmitter** in the brain, believed to be involved in ***long-term potentiation**, and is also released in response to sexual stimulation, activating ***cyclic GMP** in the penis and causing vasodilation (expansion of blood vessels) in the ***corpora cavernosa** and ***corpus spongiosum**. It should not be confused with ***nitrous oxide** (N₂O), the chemically stable laughing gas that is used as an anaesthetic. Formula: NO. *See also* **GINSENG**.

nitrite inhalant *n.* Any amyl, butyl, or isobutyl nitrite that is inhaled as a drug, causing peripheral vasodilation and a temporary reduction in oxygen supply to the brain, leading to mild ***euphoria**, a change of time perception, relaxation of smooth muscles, and in some people an intensification of sexual sensations. Known colloquially as *poppers*. *See also* **AMYL NITRITE**, **INHALANT-RELATED DISORDERS**, **SUBSTANCE ABUSE**, **SUBSTANCE-RELATED AND ADDICTIVE DISORDERS**.

nitrogenous base *n.* Any ***base (1)** containing nitrogen, specifically three found in both DNA and RNA (***adenine**, ***guanine**, and ***cytosine**), one found only in DNA (***thymine**), and one found only in RNA (***uracil**). *See also* **PURINE**, **PYRIMIDINE**.

nitrous oxide *n.* A gas that is used as an ***anaesthetic (1)**, especially in dentistry, and that when inhaled causes rapid intoxication, characterized by loss of sensation, light-headedness, and a floating sensation, sometimes accompanied by laughter, such effects disappearing a few minutes after the inhalation is stopped. Also called *laughing gas*. Often confused with ***nitric oxide** (NO), a chemically unstable gas that functions as a neurotransmitter. Formula: N₂O. *See also* **SUBSTANCE ABUSE**, **SUBSTANCE-RELATED AND ADDICTIVE DISORDERS**.

nocebo effect *n.* Ill-health, or a feeling of ill-health, caused by an expectation of harm or injury from a substance or treatment that, without the expectation, would be harmless, an extreme example being ***voodoo death**. The term was introduced in the 1990s as a counterpart of the ***placebo** effect. *See also* **BASKERVILLE EFFECT**, **SELF-FULFILLING PROPHECY**. [From Latin *nocebo* I shall harm, from *nocere* to harm]

nociceptive *adj.* Sensitive to or causing ***pain**. **nociception** *n.* Pain perception. **nociceptor** *n.* Another name for a ***pain** receptor. [From Latin *nocere* to injure + English *(re)ceptive*]

nocireceptor *n.* Another name for a ***pain** receptor.

noctambulation *n.* Another name for ***sleepwalking**. Also called *noctambulism* or *somnambulism*. **noctambulate** *vb.* [From Latin *nox*, *noctis* night + *ambulare* to walk + *-ation* indicating a process or condition]

Noctec *n.* A proprietary name for the depressant drug ***chloral hydrate**. [Trademark]

nocturia *n.* A form of ***enuresis** involving inability to hold urine while asleep, resulting in bedwetting or repeated nocturnal visits to the bathroom and disrupted sleep. [From Latin *nox*, *noctis* night + Greek *ouron* urine + *-ia* indicating a condition or quality]

nocturnal *adj.* Occurring or active during the night or nightly. *Compare* **DIURNAL**. [From Latin *nocturnalis* nocturnal, from *nox*, *noctis* night]

nocturnal myoclonus *n.* The technical name for night cramps. [From Greek *mys* a muscle + *klonos* contraction]

node *n.* 1. Any natural anatomical swelling or bulge. 2. Any point in a ***network model** or graph where lines or pathways intersect or branch, especially (in cognitive psychology) an element representing a concept in a semantic network of relations between nodes (relations such as *x is a member of y* or *x is an attribute of y*), each node being linked to certain other nodes in

the network. *See also* [ACT*](#), [CLOSED NODE](#), [FAN EFFECT](#), [OPEN NODE](#). [From Latin *nodus* a knot]

node expansion *n.* Examining the successor nodes to a [*node \(2\)](#) in a network.

node of Ranvier *n.* Any of the gaps that occur at regular intervals along the [*myelin](#) sheath of a myelinated nerve fibre, exposing the [*axon](#). Also called *Ranvier's node*. *See also* [SALTATION \(1\)](#). [Named after the French histologist Louis-Antoine Ranvier (1835–1922) who drew attention to them]

nodulus *n.* A small [*node \(1\)](#).

noesis *n.* The act or process of [*thinking](#) or [*perceiving](#), the functioning of intellect, or the exercise of [*reason](#). [From Greek *noesis* thought, from *noein* to think]

noise *n.* **1.** Any unwanted or disturbing sound, or any sound without any definite frequency or pitch. *See also* noise (2). *Compare* [TONE \(1\)](#). **2.** Random disturbances in any communication channel in addition to the [*signal](#) that is being transmitted, or more generally any random component in a [*time series](#) that degrades its periodicity. *See* [COLOURED NOISE](#), [FROZEN NOISE](#), [PINK NOISE](#), [WHITE NOISE](#). *See also* [DECIBEL](#), [SIGNAL DETECTION THEORY](#), [SIGNAL-TO-NOISE RATIO](#). [From Latin *nausea* the sensation of being about to vomit]

nominal aphasia *See* [APHASIA](#).

nominalism *n.* In scholastic philosophy, the doctrine propounded by the English philosopher William of Ockham (?1285–?1349) and others that only individual things exist and that universal concepts such as redness have no independent existence beyond being mere names. In modern philosophy, an interpretation of general concepts such as redness in terms of the mutual resemblance of the specific things to which they apply. *Compare* [ESSENTIALISM](#). **nominalist** *adj.* [From Latin *nominalis* of a name, from *nomen* a name + *-alis* of or relating to]

nominal scale *n.* A discrete form of data classification in which items are not quantified or even arranged in order but are merely allocated to different (often numbered) categories as, for example, in assigning numbers to categories of books in a library classification system. In nominal scaling, the numbers serve only as names for the categories to which the items belong. *See also* [MEASUREMENT LEVEL](#), [SCALE \(1\)](#). *Compare* [ABSOLUTE SCALE](#), [INTERVAL SCALE](#), [LOG-INTERVAL SCALE](#), [ORDINAL SCALE](#), [RATIO SCALE](#). [From Latin *nomen* a name]

nomorative determinism *n.* The notion that people's names can influence their career choices and other aspects of their lives. Carl Gustav Jung (1875–1961) gave several examples in an article on [*synchronicity](#) published in 1952. A study by the Canadian psychologist Ernest L(awrence) Abel (born 1943) published in the journal *Names* in 2010 compared doctors and lawyers whose first or last names began with three-letter combinations representative of their professions, such as *Doc* or *Law*, and found a significant relationship between names and professions; also, initial letters of physicians' last names were significantly related to their sub-specialty, men called *Raymond* being significantly more likely to be radiologists than dermatologists, for example. *See also* [APTRONYM](#). [Coined in an article in the British magazine *New Scientist* in 1994, citing a book on polar exploration by Daniel Snowman and an article on incontinence in the *British Journal of Urology* in 1977 by the urologists J. W. Splatt and D. Weedon]

nomological network *n.* A lawful pattern of interrelationships that exists between [*hypothetical constructs](#) and observable [*attributes](#) and that guides a researcher in establishing the [*construct](#) validity of a psychological test or measure. According to the US psychologists Lee J(oseph) Cronbach (1916–2001) and Paul Everett Meehl (1920–2003), who introduced the concept in an article in the journal *Psychological Bulletin* in 1955, a nomological network includes a theoretical framework for what is being measured, specifying linkages between different hypothetical constructs, between different observable attributes, and between hypothetical constructs and observable attributes. Qualitatively different measurement operations may be said to measure the same attributes if their locations in the nomological network link them to the same hypothetical construct variable. Also called a *nomological net*. *Compare* [TRAIT VALIDITY](#). [From Greek *nomos*

*****ebook converter DEMO Watermarks*****

a law + *logos* word, discourse, or reason + Latin *-icalis* of, relating to, or resembling]

nomological validity *n.* In psychometrics, a form of **validity* established via a **nomological network*.

nomothetic *adj.* Of or relating to the general case, especially in relation to the search for general laws or **traits* in the study of **personality*. The term was coined in 1904 by the German philosopher Wilhelm Windelband (1848–1915). *See also* ECOLOGICAL FALLACY. *Compare* IDIOGRAPHIC. [From Greek *nomothetes* a lawgiver, from *nomos* a law + *titheneai* to set + *-ikos* of, relating to, or resembling]

non-adaptive *adj.* In genetics and evolutionary theory, pertaining to any gene that, relative to its alleles, reduces an organism's fitness.

non-additivity *See* ADDITIVITY.

non-classical receptive field *See* RECEPTIVE FIELD.

non-competitive antagonist *n.* An **antagonist* (3) drug that depresses the effect of the **agonist* (3) by acting at different **neuroreceptor* sites. *Compare* COMPETITIVE ANTAGONIST.

non compos mentis *n.* Not of sound mind; incapable of managing one's own affairs. [Latin: not in control of one's mind]

non-Darwinian evolution *n.* Changes in the relative frequencies of genes in a population resulting not from natural selection but from **neutral mutation*. Also called *genetic drift* or *random drift*. *Compare* DARWINIAN EVOLUTION, NATURAL SELECTION. [So called because the Darwinian mechanism of natural selection does not drive it]

non-declarative knowledge *n.* Knowledge that does not involve awareness and understanding of factual information about the world, including especially **procedural knowledge*. *See also* NON-DECLARATIVE

MEMORY. Compare DECLARATIVE KNOWLEDGE.

non-declarative memory *n.* Memory for *non-declarative knowledge, involving memory systems that do not draw on the individual's general knowledge. See also MIRROR DRAWING, PROCEDURAL MEMORY.

non-directional test See DIRECTIONAL TEST.

non-directive therapy *n.* Another name for *client-centred therapy.

non-discrimination point See POINT OF SUBJECTIVE EQUALITY.

non-disjunction *n.* The failure of paired *chromosomes to separate and move to opposite poles during *mitosis or *meiosis (1).

N140 *abbrev.* The first major negative deflection in an *event-related potential or an *average evoked potential, occurring about 140 milliseconds after the onset of the stimulus. Some researchers have claimed that either its magnitude, or the acuteness of the angle between the N140 and the *P200, correlates with *IQ, but empirical findings are inconsistent. Also called the *N140 potential* or *N140 wave*. Compare STRING LENGTH. [From *n(egative) 140 (milliseconds)*]

non-epileptic seizure *n.* An alternative name for a *pseudoseizure, so-called because it is not associated with *epilepsy. Also called a *non-epileptic convulsion*.

non-equivalent groups design *n.* A *quasi-experimental research design in which the investigator does not manipulate the *independent variable but compares existing groups that differ on it. In this research design, the groups may differ in many other ways apart from the independent variable being investigated, and this limits the confidence with which the results can be attributed to the independent variable. See also ONE-GROUP PRETEST–POSTTEST DESIGN, INTERRUPTED TIME-SERIES DESIGN.

non-essential amino acids See AMINO ACID.

*****ebook converter DEMO Watermarks*****

non-fluent aphasia *See* [APHASIA](#).

non-identical twins *n.* A non-technical name for [*dizygotic](#) twins.

non-Mendelian gene *n.* Any gene that does not conform to a [*Mendelian](#) mechanism of inheritance or is not inherited in accordance with [*Mendel's laws](#), notably the genes encoded in [*mitochondrial DNA](#) and in [*plasmids](#).

non-metric analysis *n.* In statistics, an approach to [*multidimensional scaling](#) in which analysis is performed on qualitative rather than quantitative dissimilarities.

non-monotonic reasoning *n.* Any of a number of systems of reasoning that violate the principle of [*monotonicity](#). Formalizations of non-monotonic reasoning are designed to capture some of the features of common-sense reasoning. The canonical example consists of the two [*premises](#) *Birds fly* and *Tweety is a bird* together with the conclusion *Tweety can fly*. In this example, *Birds fly* is interpreted to mean *Normally, birds fly*, or *Typically, birds fly*, or *If x is a bird, then assume by default that x flies*: it is a default assumption that we adopt provisionally, in the absence of information that might override it. An additional premise that Tweety is a penguin, or an ostrich, or an emu, or is coated in heavy crude oil, or is dead, would render the conclusion invalid. This form of reasoning is non-monotonic because it violates the [*extension theorem](#) of semantic entailment in propositional calculus, so that additional premises can negate conclusions derived from a smaller set of premises. Also called *non-monotonic logic*, but this is avoided in careful usage, because it violates monotonicity, which is a fundamental principle of logic. *See also* [DEFAULT REASONING](#), [KNOWLEDGE REPRESENTATION](#). [From Greek *monos* single + *tonos* a tone + *-ikos* of, relating to, or resembling]

Nonne's syndrome *n.* Another name for [*cerebellar syndrome](#). [Named after the German neurologist Max Nonne (1861–1959) who studied and wrote about it]

non-opponent cell *n.* A type of neuron in the *[lateral geniculate nucleus](#) that is excited or inhibited by light of widely differing different wavelengths. Also called a *non-opponent neuron*. Compare [OPPONENT CELL](#).

non-paralytic strabismus *n.* A hereditary form of *[strabismus](#) characterized by an inability to use both eyes together, so that objects or images have to be fixated with one eye or the other. A person with *alternating strabismus* tends to alternate fixation between the eyes, the eyes taking turns of approximately a second each as long as the object is fixated, whereas a person with *monocular* or *non-alternating strabismus* fixates continuously with one eye, the other eye often becoming blind as a result of disuse. See also [AMBLYOPIA EX ANOPSIA](#). Compare [PARALYTIC STRABISMUS](#).

non-parametric statistics *n.* A branch of statistics that does not rely on assumptions about the parameters of the distributions from which scores are drawn and usually deals with data measured on *[ordinal scales](#) or *[nominal scales](#) to which arithmetic operations like addition and multiplication cannot meaningfully be applied. The term was introduced in 1942 by the Polish-born US statistician Jacob Wolfowitz (1910–81). Compare [DISTRIBUTION-FREE TEST](#). [From Latin *non* not + Greek *para* beside or beyond + Greek *metron* measure + English *statistics*]

non-probability sample *n.* Any sample drawn by a technique that does not involve randomization, so that the probabilities of inclusion of members of the population or subgroups within it are not equal. See [ACCIDENTAL SAMPLE](#), [CONVENIENCE SAMPLE](#), [OPPORTUNITY SAMPLE](#), [QUOTA SAMPLE](#), [SELF-SELECTED SAMPLE](#), [SNOWBALL SAMPLE](#). Compare [CLUSTER SAMPLE](#), [PROBABILITY SAMPLE](#), [RANDOM DIGIT DIALLING](#), [SIMPLE RANDOM SAMPLE](#), [STRATIFIED RANDOM SAMPLE](#).

non-rapid eye movement sleep arousal disorder *n.* A *[parasomnia](#) introduced in *[DSM-5](#) characterized by recurrent partial awakening from sleep, usually during the first third of the night, accompanied by either *[sleepwalking](#) or *[sleep terrors](#), with little or no memory of dreaming and amnesia for these episodes. Compare [RAPID EYE MOVEMENT SLEEP BEHAVIOUR DISORDER](#).

non-reactive measure *n.* Any measure of behaviour that is not influenced by awareness on the part of the participants or subjects that their behaviour is being observed or measured. In general, ***unobtrusive measures** are considered non-reactive, and some other techniques, such as ***randomized response**, are also intended to be non-reactive. *See also* **REACTIVITY**.

non-regressiveness bias *n.* A tendency to make insufficient allowance for ***regression** towards the mean when predicting from an imperfectly reliable predictor. Suppose that a student is described by a tutor as being much more intelligent, hard-working, and self-confident than the average student on the course. (a) What percentage of students on the course would you expect to be described even more favourably by the tutor? (b) What percentage of students on the course would you predict to obtain a higher aggregate mark or grade point average? There is more uncertainty about (b) than (a), because a tutor's ratings are an imperfectly reliable predictor of academic performance, and your prediction (b) should therefore be more regressive, and hence closer to 50 per cent, than your expectation (a). In practice, most people show little or no difference between the two percentages, and this is usually interpreted as being due to their use of the ***representativeness heuristic**, in which evaluation and prediction coincide. *Compare* **REGRESSION FALLACY**.

non-REM sleep *See* **NREM SLEEP**.

non-reversal shift *n.* A form of ***serial learning (2)** in which the set of stimuli is changed, but the rewarded and non-rewarded items are not simply interchanged, a typical example being an experiment in which organisms are trained to choose the round rather than the square containers, irrespective of their colours, and are then presented with stimulus sets in which the reward is associated with the yellow rather than the blue containers irrespective of their shapes. *Compare* **HABIT REVERSAL**.

nonsense codon *n.* Another name for a ***stop codon**. [So called because it does not specify any amino acid but is none the less a ***codon**]

nonsense mutation *n.* Any ***mutation** that produces one of the ***stop**

codons, causing premature termination of protein synthesis by the gene in which it occurs. [So called because a stop codon is also called a nonsense codon]

nonsense syllable *n.* A *CVC trigram that forms a meaningless non-word (such as *KEB*) rather than a meaningful word (such as *DOG*). It was introduced into psychology in about 1878 by the German psychologist Hermann von Ebbinghaus (1850–1909) for studying memory. Ebbinghaus had begun by experimenting with fragments of poetry but had found that they aroused mental associations, influencing their ease of learning, so he constructed lists of nonsense syllables, which provided material that was relatively homogeneous, evoked few mental associations, and could easily be broken into objectively equal units for quantitative research, and he reported his results in his book *Über das Gedächtnis* (On Memory) in 1885. *See also* ASSOCIATION VALUE, CONSONANT TRIGRAM.

nonsense syndrome *n.* Another name for *Ganser syndrome.

non-spectral colour *n.* Any colour that does not occur in the *visible spectrum and that cannot be produced by light of a single wavelength, for example purple, which can be generated only by a mixture of red and blue (see COMPLEMENTARY COLOURS). US *non-spectral color*. Also called an *extra-spectral colour/hue* or *extraspectral color/hue*. Compare SPECTRAL COLOUR.

non-taster *See* PROPYLTHIOURACIL, PTC.

non-verbal communication *n.* Any form of communication apart from *language (1), including *paralanguage (non-verbal aspects of speech), *facial expression, communicative *gaze and *eye contact, *kinesics (gestures and other communicative bodily movements), and *proxemics (communicative use of personal space). *See also* CLEVER HANS, EQUILIBRIUM HYPOTHESIS, EXPRESSIVE BEHAVIOUR, SEMIOTICS, SOCIAL SKILLS TRAINING. **NVC** *abbrev.*

non-verbal test *n.* In psychometrics, any test that does not require language skills on the part of the respondent, including *intelligence tests that do not depend on any knowledge of language or linguistic skills, such as

*****ebook converter DEMO Watermarks*****

*Raven's Progressive Matrices, the *Cattell Culture-Fair Test, and other psychometric tests such as the *Porteus Maze Test. *See also* CULTURE-FAIR.

non-zero-sum game *n.* Another name for a *mixed-motive game. [So called because the sum of the payoffs to the players is not zero in every outcome of the game]

nootropic *adj.* Affecting the intellect or enhancing cognitive performance. *See* SMART DRUG. [From Greek *nous* intellect + *tropos* a turn, from *trepein* to turn + *-ikos* of, relating to, or resembling]

noradrenalin *n.* A *biogenic amine and one of the *catecholamine hormones, chemically related to *adrenalin and crucial to the maintenance of alertness, drive, and motivation, synthesized from tyrosine in the presence of the cofactor vitamin C, and secreted by the *chromaffin cells of the adrenal medulla, widely distributed between the brainstem and most areas of the cerebral cortex, stimulating the heart muscle to contract, the blood vessels to constrict, the bronchial tracts of the lungs to dilate, and the contractile strength of the skeletal muscles to increase, also functioning as an important *neurotransmitter in the sympathetic nervous system and in the central nervous system mainly through circuits originating in the *locus coeruleus of the pons and projecting to many areas of the brain, levels of noradrenalin often being significantly reduced in people with depression or attempting suicide. Formula: $(\text{HO})_2\text{C}_6\text{H}_3\text{CH}(\text{OH})\text{CH}_2\text{NH}_2$. Also spelt *noradrenaline*. Also, especially in US, called *norepinephrine* (NE). **NA** *abbrev.* [From *nor(mal)* + *adrenalin*]

noradrenalin reuptake inhibitor *n.* A drug that slows or prevents the metabolism or absorption of *noradrenalin (norepinephrine). US *norepinephrine reuptake inhibitor*. *See* ATOMOXETINE.

noradrenergic *adj.* Releasing *noradrenalin (norepinephrine); also activated by or responding to noradrenalin, this extended usage being widespread but consistently rejected by the English physiologist Sir Henry Hallet Dale (1875–1968), who coined the suffix *-ergic*, and by many other authorities. The term applies especially to nerve fibres such as those of the

***sympathetic nervous system** or the ***locus coeruleus** and many other areas in the central nervous system that use noradrenalin as their ***neurotransmitter**. Compare **ADRENERGIC**, **CHOLINERGIC**, **DOPAMINERGIC**, **GABAERGIC**, **SEROTONERGIC**. [From *noradrenalin* + Greek *ergon* work + *-ikos* of, relating to, or resembling]

norepinephrine *n.* Another name for ***noradrenalin**, especially in US usage. **NE** abbrev. [From *nor(mal)* + Greek *epi* on + *nephros* a kidney + *-ine* indicating an organic compound]

norm *n.* **1.** A generally accepted standard of behaviour within a society, community, or group. See also **SOCIAL INFLUENCE**. **2.** A typical or most common value, pattern, state, condition, or event. In ***psychometrics**, an average score on a test determined by applying the test to a standardization sample. See also **STANDARDIZED TEST**. [From Latin *norma* a carpenter's square or a rule]

normal distribution *n.* In statistics, a symmetrical, bell-shaped ***probability** distribution, also called the *Gaussian distribution*, the *normal curve*, or colloquially the *bell curve*, with the most probable scores concentrated around the ***mean** (average) and progressively less probable scores occurring further from the mean (see **illustration**). In this distribution, 68.26 per cent of scores fall within one ***standard deviation** on either side of the mean, 95.44 per cent within two standard deviations, and 99.74 within three standard deviations. For a reason explained by the ***central limit theorem**, the normal distribution approximates the observed ***frequency** distribution of many psychological and biological variables and is by far the most widely used probability distribution in inferential statistics. See also **DEVIATION IQ**. **normally distributed** *adj.* Distributed according to the normal distribution. [From Latin *norma* a carpenter's square or a rule + *-alis* of or relating to]

Normal distribution. Showing the percentages of observations occurring within various distances from the mean, measured in standard deviations.

normal probability plot *n.* In statistics, a graph used to detect departures from normality in a set of scores whose cumulative proportion at various points is plotted against the expected cumulative proportion based on the **normal distribution* of **standardized* (1) scores. The points should fall close to a straight line if the scores are a sample from a normal distribution. See also [DETRENDED NORMAL PLOT](#).

normal science *n.* According to an influential idea first presented by the US historian and philosopher of science Thomas S(amuel) Kuhn (1922–96) in his book *The Structure of Scientific Revolutions* (1962), a period in the development of any scientific discipline in which there is general acceptance and agreement as to the basic concepts, and steady cumulative progress is made. See also [KUHNIAN](#), [PARADIGM SHIFT](#), [SCIENTIFIC REVOLUTION](#).

normative *adj.* 1. Prescribing or establishing **norms* (1) or standards; prescriptive. For example, **decision theory* and classical **game theory* are normative inasmuch as they seek to prescribe how rational decision makers ought to choose in order to optimize their own interests. Such theories are sometimes contrasted with *descriptive* or *positive* theories that seek to explain
 *****ebook converter DEMO Watermarks*****

and predict the behaviour of actual agents. In an edited book entitled *Decision Making: Descriptive, Normative, and Prescriptive Interactions* (1988), the US decision theorists David E. Bell (born 1949) and Howard Raiffa (born 1924) and the US-based Israeli psychologist Amos Tversky (1937–96) distinguished a third category of *prescriptive* theories that offer advice as to how to act, given our acknowledged cognitive limitations, but some other authorities (and Tversky himself) consider them to be essentially normative theories. **2.** Of or relating to data providing **norms* (2) or average scores, as in the standardization of a psychological test. *Compare* *IPSATIVE*. [From Latin *norma* a carpenter's square or a rule + *-ivus* indicating a tendency, inclination, or quality]

normative reference group *See* *REFERENCE GROUP*.

norm-referenced test *n.* A test that measures an **attribute* of a respondent relative to **norms* (2) derived from a standardization sample rather than by reference to any predefined absolute standard. Modern **IQ* tests are among the best known examples of norm-referenced tests. *Compare* *CRITERION-REFERENCED TEST*, *DOMAIN-REFERENCED TEST*.

nose *n.* The organ of **olfaction* and entrance to the respiratory tract, its smaller external portion protruding from the front of the face and its larger internal portion lying over the roof of the mouth, divided into two hair-lined mucous membranes separated by a nasal septum and containing the **olfactory receptors*. *See also* *COMMON CHEMICAL SENSE*, *DIRHINIC*, *VOMERONASAL ORGAN*.

nose-picking mania *See* *RHINOTILLEXOMANIA*.

nosology *n.* The classification of disorders, or more generally the study of disorders. [From Greek *nosos* a disorder + *logos* word, discourse, or reason]

N-person Prisoner's Dilemma *n.* The first and most fundamental type of multi-person **social dilemma*, a generalization of the **Prisoner's Dilemma game* to include more than two players, discovered simultaneously and independently in 1973 by the US psychologist Robyn Mason Dawes (1936–2010), the US mathematician Henry J. Hamburger (born 1940), and
*****ebook converter DEMO Watermarks*****

the US economist Thomas C. Schelling (born 1921). It is an interactive decision involving three or more players who each face a choice between a cooperative **strategy* (2) labelled *C* and a non-cooperative or defecting strategy labelled *D*. The **payoff* structure is such that *D* is a **dominant strategy* for each player in the sense that each player obtains a better payoff by choosing *D* than *C* no matter how many of the other players choose *C*; but the outcome if all players choose their dominated *C* strategies is preferable from every player's point of view to the outcome if everyone chooses *D*. Apart from the Prisoner's Dilemma game, which is a special (two-person) case, the simplest example is the three-person game in which, if three players choose *C*, then each gets a payoff of 3; if two players choose *C*, then each *C*-chooser gets 2 and the *D*-chooser gets 4; if one player chooses *C*, then the *C*-chooser gets 1 and each *D*-chooser gets 3; and if no player chooses *C*, then each *D*-chooser gets 2. See also *SURE-THING PRINCIPLE*. **NPD** abbrev.

NREM sleep abbrev. Non-rapid-eye-movement sleep, in which four progressively deepening stages can be distinguished by **EEG* measurements: Stage I NREM sleep, without **delta waves*, is the stage of transition between wakefulness and sleep, and it occupies about 5 per cent of sleeping time in healthy adults; Stage II NREM sleep, with delta waves 20 per cent of the time, is characterized by **sleep* spindles and **K complexes*, and it occupies about 50 per cent of normal adult sleeping time; and Stages III and IV NREM sleep, or **slow-wave sleep*, with delta waves more than 50 per cent of the time, are the deepest levels, and they occupy about 10–20 per cent of normal adult sleeping time. Also called *quiet sleep* or *synchronized (S) sleep*. See also *SLEEP*. Compare *REM SLEEP*.

nuclear agenesis *n.* Another name for **Möbius syndrome*.

nuclear family *n.* The basic family unit consisting of a mother and father with their immediate children. Compare *EXTENDED FAMILY*. [From Latin *nux*, *nucis* a nut]

nuclear magnetic resonance *n.* A phenomenon that occurs when the nuclei of molecules resonate during exposure to high-frequency (usually radio-wave) radiation in a strong magnetic field. In strong magnetic fields, certain protons (subatomic particles) spin like tops, and pulses of radiation

*****ebook converter DEMO Watermarks*****

cause them to tilt momentarily and then to regain their original orientations, giving off detectable amounts of energy as they do so. Different molecules absorb different frequencies of the radiation as the protons tilt, depending on the magnetic properties of their nuclei, and from the precise frequencies of radiation that they absorb, information concerning the bonds between their atoms can be deduced, thus enabling the structure of the material to be determined. Magnetic resonance imaging or ***MRI**, one of the techniques of ***brain** imaging, is based on this phenomenon. **NMR** *abbrev.*

nuclear self *n.* In ***self-psychology**, the initial organization of the self that emerges in the second year of life.

nuclear spindle *n.* A spindle-shaped structure, formed from ***microtubules**, that draws the newly duplicated ***chromosomes** apart during ***mitosis** and ***meiosis** (1). Also called a *spindle*.

nucleic acid *n.* A generic name for several complex compounds, especially ***DNA**, ***RNA**, ***messenger RNA**, and ***transfer RNA**, that play important roles in living cells. *See also* **NUCLEOTIDE**. [From Latin *nucleus* a kernel, from *nux*, *nucis* a nut, so called because they are found in the nuclei of cells]

nucleoplasm *n.* The ***protoplasm** in the ***nucleus** (1) of a cell. [From Latin *nucleus* a kernel + *plasma* a form]

nucleotide *n.* A basic building block of ***DNA** or ***RNA**, consisting of a ***base** (1) linked to a sugar (***deoxyribose** or ***ribose** respectively) and a ***phosphate**, long chains of such units constituting ***nucleic acids**. [From Latin *nucleus* a kernel, from *nux*, *nucis* a nut + *-ide* indicating membership of a particular group of chemical compounds]

nucleotide sequence *n.* Another name for a ***DNA** sequence or an equivalent sequence of RNA.

nucleus *n.* 1. The spherical or egg-shaped compartment in the ***protoplasm** of a cell, enclosed in a membrane, containing the chromosomes and other

important structures that determine the behaviour of the cell. *See also* [EUKARYOTE](#), [PROKARYOTE](#). **2.** More generally, the central or core part or element of any structure, especially an anatomically or functionally distinct area of [*grey matter](#) containing a collection of [*neuron](#) cell bodies. *See* [CAUDATE NUCLEUS](#), [DENTATE NUCLEUS](#), [INFERIOR OLIVARY NUCLEUS](#), [LATERAL GENICULATE NUCLEUS](#), [LENTICULAR NUCLEUS](#), [MEDIAL GENICULATE NUCLEUS](#), [NUCLEUS ACCUMBENS](#), [NUCLEUS BASALIS OF MEYNERT](#), [NUCLEUS CUNEATUS](#), [NUCLEUS GIGANTOCELLULARIS](#), [NUCLEUS GRACILIS](#), [RAPHE NUCLEI](#), [SUBTHALAMIC NUCLEUS](#), [SUPERIOR OLIVARY NUCLEUS](#), [SUPRACHIASMATIC NUCLEUS](#). **nuclei** *pl.* [From Latin *nucleus* a kernel, from *nux*, *nucis* a nut]

nucleus accumbens *n.* Either of two clusters of neuron cell bodies and [*opiate](#) receptors in the basal forebrain near the septum pellucidum, where [*dopamine](#)-secreting neurons originating in the [*ventral](#) tegmental area terminate. This dopamine pathway is thought to be involved in reward and [*reinforcement \(1\)](#) and appears to be implicated in most if not all [*addictions](#). It is also involved in attention. Also called the *accumbens nucleus*. *See also* [INCENTIVE—SENSITIZATION THEORY](#).

nucleus basalis of Meynert *n.* Either of two small regions in the forebrain with a high concentration of [*cholinergic](#) neurons that undergoes profound cell loss in [*Alzheimer's disease](#). **nbM** *abbrev.* [Named after the German neurologist and psychiatrist Theodor Hermann Meynert (1833–92) who drew attention to it]

nucleus cuneatus *n.* Either of two areas of the [*medulla](#) oblongata where the left or right [*fasciculus](#) cuneatus terminates, functioning as a relay station for somatosensory information. Also called the *cuneate nucleus*. [From Latin *cuneatus* wedge-shaped, from *cuneus* a wedge]

nucleus gigantocellularis *n.* Either of two clusters of neurons in the [*pons](#) that are thought to generate [*PGO spikes](#) during [*REM sleep](#). [From Latin *gigantis* a giant + *cellularis* of cells, from *cellula* a cell, from *cella* a room]

nucleus gracilis *n.* Either of two areas of the [*medulla](#) oblongata where the [*fasciculus](#) gracilis terminates. Also called the *gracile nucleus*. [From

*****ebook converter DEMO Watermarks*****

Latin *gracilis* slender]

NUD*IST *abbrev.* Non-numerical unstructured data indexing, searching, and theory-building, a popular software package for the analysis of textual data in **qualitative research*.

nuisance variable *n.* Another name for an **extraneous variable*.

null hypothesis *n.* In **inferential statistics*, the provisional hypothesis that there is no difference or no relationship and that the observed experimental results can therefore be attributed to chance alone. If the statistical test rejects the null hypothesis, then the **alternative hypothesis* may be accepted and the effect that has been observed may be considered statistically significant. The term was introduced by English statistician and geneticist Ronald Aylmer Fisher (1890–1962) on page 18 of his book *The Design of Experiments*. See also *SIGNIFICANCE TEST*. [From Latin *nullus* none, from *ne* not + *ullus* any + *hypo* under + *thesis* a placing, from *tithenai* to place]

null hypothesis significance testing *n.* The process of applying a **significance* test. **NHST** *abbrev.*

number-completion test *n.* A type of **intelligence* test item or subtest in which the respondent has to find a number to complete a sequence of numbers. A typical example is: *What is the missing number in the following sequence? 0, 2, 8, 18,...* Although there is always an infinity of mathematically justifiable answers, the ‘correct’ answer in this case is 32, because the steps between adjacent numbers are 2, 6, 10, which are alternate even numbers, so the step between 18 and the missing step should be 14, making the missing number 32. See also *COMPLETION TEST*. Also called a *number sequence*, a *number series*, a *sequence completion*, or a *series completion*.

number sequence *n.* Another name for a **number-completion test*. Also called a *number series*.

numerical rating scale *n.* Any [*rating scale](#) in which the [*response](#) categories are identified by numbers, such as a scale from -3 to +3 or from 0 to 10. The main alternatives are rating scales with unlabelled response categories, indicated by a row of boxes, dashes, or other symbols; [*verbal rating scales](#), and [*graphic rating scales](#).

numeric variable *n.* In statistics and measurement theory, any [*variable](#) whose values are numbers. *Compare* [STRING VARIABLE](#).

numinosum *n.* In [*analytical psychology](#), a type of involuntary mystical or religious experience described by Carl Gustav Jung (1875–1961) in 1937 as ‘a dynamic agency or effect not caused by an arbitrary act of will. On the contrary, it seizes and controls the human subject, who is always rather its victim than its creator. The *numinosum*—whatever its cause may be—is an experience of the subject independent of his will’ (*Collected Works*, 11, paragraph 6). [From Latin *numen* divine will or a nod (indicating a command), from *nuere* to nod + *-osus* having or characterized by]

Numorphan *n.* A proprietary name for the narcotic analgesic drug [*oxymorphone](#). [Trademark]

nurture *n.* The sum total of all [*environmental](#) factors that contribute to the physical and psychological characteristics of an individual, including upbringing or rearing. It is often contrasted with *nature*: the genetic factors that contribute to an individual’s characteristics. *See* [NATURE–NURTURE CONTROVERSY](#). [From Latin *nutrire* to nourish]

nutmeg *n.* The hard, round, seed of a tropical tree, or a spice prepared from it. *See* [MYRISTIN](#). [From Latin *nux* nut + *muscus* musk]

nybble *n.* A measure of [*information \(2\)](#) equivalent to four [*bits](#). It suffices to represent a decimal digit. Also spelt *nibble*, though this is avoided in careful usage and is to be deprecated, because it obscures the pleasing analogy with *byte*. *Compare* [BYTE](#). [An arbitrary formation based on *nibble*, alluding to the fact that it is half a *byte*]

nyctalopia *n.* A form of partial blindness characterized by poor vision in dim light or at night, resulting from inadequate synthesis of **rhodopsin*, or from **vitamin A* deficiency, retinal degeneration, or a congenital defect. Also called *night blindness*. Compare *HEMERALOPIA*. [From Greek *nyx*, *nyktos* night + *alaos* blind + *ops* an eye + *-ia* indicating a condition or quality]

nymphomania *n.* A psychological condition of women characterized by uncontrollable sexual desire and an inability to have lasting sexual relationships. Compare *SATYRIASIS*. **nymphomaniac** *n.* A woman who displays nymphomania. [From Greek *nymphē* a bride or nymph + *mania* madness]

nystagmus *n.* Spasmodic involuntary eye movements. Also called *ocular nystagmus*. See *CALORIC NYSTAGMUS*, *CENTRAL NYSTAGMUS*, *LABYRINTHINE NYSTAGMUS*, *OPTOKINETIC NYSTAGMUS*, *PHYSIOLOGICAL NYSTAGMUS*, *POST-ROTATIONAL NYSTAGMUS*, *VESTIBULAR NYSTAGMUS*. See also *BÁRÁNY TEST*, *REAFFERENCE*. [From Greek *nystagmos* drowsiness, from *nystazein* to nap]

obedience *n.* A form of **social influence* in which a person yields to explicit instructions or orders from an authority figure. Experimental research into this phenomenon was pioneered by the US psychologist Stanley Milgram (1933–84) who conducted a series of experiments, the first of which was published in the *Journal of Abnormal and Social Psychology* in 1963, in which approximately two-thirds of participants administered what they believed to be extremely painful and possibly lethal electric shocks to an innocent victim when instructed to do so by an authoritative experimenter. *See also* LAW OF SOCIAL IMPACT, STANFORD PRISON EXPERIMENT. *Compare* COMPLIANCE, CONFORMITY.

obesity hypoventilation syndrome *n.* *See* PICKWICKIAN SYNDROME, SLEEP-RELATED HYPOVENTILATION. **OHS** *abbrev.*

ob gene *n.* A **gene* that encodes **leptin*. [From *ob(esity) gene*]

object assembly test *n.* A type of **intelligence* test item or subtest in which the respondent tries to fit a number of shapes together to form a recognizable object.

object blindness *n.* A form of **agnosia* characterized by an inability to identify objects that are clearly perceived.

object-cathexis *n.* In **psychoanalysis*, the investment of **libido* in an **instinctual object*.

object-choice *n.* In **psychoanalysis*, the action of selecting a person or a

*****ebook converter DEMO Watermarks*****

type of person as a love-object. The element *object* refers not to an inanimate thing but to an **instinctual object*. See ANACLITIC OBJECT-CHOICE, NARCISSISTIC OBJECT-CHOICE, OEDIPUS COMPLEX. See also GOOD OBJECT, INSTINCTUAL OBJECT, PART OBJECT, SPLITTING OF THE OBJECT, TRANSITIONAL OBJECT, WHOLE OBJECT.

object constancy *n.* The tendency for an object to retain its perceived identity and form despite being briefly occluded or altered in appearance because of a change in orientation, distance, illumination, or movement. See also PERCEPTUAL CONSTANCY, PHENOMENAL REGRESSION.

object instinct *n.* In **psychoanalysis*, a type of instinct that is concerned with relations to an external object, distinguished by Sigmund Freud (1856–1939) in his early (1910–15) classification from an **ego* instinct, which is a **self-preservation instinct*. Freud introduced the concept (though not yet the term) in 1910 in an article on ‘The Psycho-Analytic View of Psychogenic Disturbance of Vision’ (*Standard Edition*, XI, pp. 211–18, at pp. 214–15). After 1920, he recognized two varieties of object instincts, namely libidinal instincts, driven by **Eros* (the life instincts), and destructive instincts, driven by **Thanatos* (the death instinct).

objective psyche *n.* In **analytical psychology*, another name for the **collective unconscious*, so called because it is not personal and therefore not subjective. Carl Gustav Jung (1875–1961) introduced this term (*Collected Works*, 7, paragraph 103*n*).

object language *n.* A language being referred to in a **metalanguage*. The sentence ‘*Snow is white*’ *if and only if snow is white* is expressed in a metalanguage, and the sentence that it contains, enclosed in quotation marks, belongs to the object language. Such an object language may be a metalanguage relative to a third language.

object libido *n.* In **psychoanalysis*, **libido* involved in the **cathexis* of an external **instinctual object*, in contradistinction to **ego* libido, which is libido involved in the cathexis of oneself. According to Sigmund Freud (1856–1939), object libido decreases as ego libido increases, and vice versa. Freud expounded these ideas in 1914 in his article ‘On Narcissism: An Introduction’ (*Standard Edition*, XIV, pp. 73–102, at pp. 77–81). See also

*****ebook converter DEMO Watermarks*****

NARCISSISM.

object loss *n.* In **psychoanalysis*, loss of an **instinctual object*, such as the loss of a loved one or of a relationship with a loved one.

object of instinct *See* INSTINCTUAL OBJECT.

object, part *See* PART OBJECT.

object permanence *n.* A cognitive ability associated with **working memory*, first identified by the Swiss psychologist Jean Piaget (1896–1980). To test for this ability in a child, the child is shown two boxes, one of which contains a toy, then the boxes are closed and the child is deliberately distracted for a short while, and the child is asked to choose the box containing the toy. After several correct choices, the toy is transferred to the other box while the child watches, and further trials are carried out to determine whether the child is able to switch responses in accordance with the updated information. This ability, and the ability to perform **delayed-response tasks*, depends on maturity of the **prefrontal cortex*: in children under about 8 months this area is not fully developed, and they perform poorly on such tasks, behaving as though ‘out of sight is out of mind’, as do monkeys with surgical lesions in the prefrontal cortex.

object recognition *n.* The identification of something as a particular object (such as one’s own jacket) or as a member of a particular class of objects (such as a tabby-cat) in spite of wide variations in the precise pattern of sensory stimulation, which depends on the angle from which it is viewed, lighting conditions, distance, and so on. *Compare* PATTERN RECOGNITION.

object relations *n.* In **psychoanalysis*, the emotional bonds that people form with **instinctual objects*, in contradistinction to interest in and love of oneself. It is given expression through capacity to form loving relationships with other people, any such bond being called an **object-relationship*. The concept is associated with the work of the British-based Austrian psychoanalyst Melanie Klein (1882–1960) as set forth in her books *The Psycho-Analysis of Children* (1932) and *Contributions to Psycho-Analysis, 1921–1945* (1948), and her followers. *See* DEFENSIVE TECHNIQUE, KLEINIAN, *****ebook converter DEMO Watermarks*****

SCHIZOID PERSONALITY, WINNICOTTIAN. *See also* OBJECT INSTINCT, OBJECT-RELATIONS THEORY. *Compare* NARCISSISM.

object-relationship *n.* In *psychoanalysis, a relationship experienced, or an emotion directed, by the *ego towards an *instinctual object. Barely mentioned in the writings of Sigmund Freud (1856–1939), it has played a central role in the theories of later psychoanalysts such as the British-based Hungarian psychiatrist Michael Balint (1896–1970), who pointed out in his book *Primary Love and Psychoanalytic Technique* (1952) that it is virtually the only concept in classical psychoanalysis that does not refer to the individual in social isolation, and the Austrian psychoanalyst René A(rpad) Spitz (1887–1974), who made a similar observation. *See also* FIXATION (2), LIBIDINAL STAGE, OBJECT INSTINCT, PRIMARY IDENTIFICATION, OBJECT-RELATIONS THEORY, PRIMARY OBJECT.

object-relations theory *n.* A theory of *object relations developed in the UK by the British-based Austrian psychoanalyst Melanie Klein (1882–1960), the English psychoanalyst Donald Woods Winnicott (1896–1971), the Scottish psychoanalyst W. Ronald D. Fairbairn (1889–1964), the British-based Hungarian psychiatrist Michael Balint (1896–1970), and others. Also called *object theory*.

object superiority effect *n.* Another name for the *configural superiority effect.

object theory *n.* Another name for *object-relations theory.

object, transitional *See* TRANSITIONAL OBJECT.

oblique décalage *See* DÉCALAGE.

oblique effect *n.* A visual defect in which slanted lines or edges are harder to see than horizontal or vertical lines or edges. [From Latin *obliquus* slanting]

oblique muscle *n.* A muscle attached at an oblique angle to the structure

that it controls, especially two of the **extra-ocular muscles* that are attached externally to each eyeball and that roll the eyeball about the visual axis, namely the *superior oblique muscle* that passes through an eyelet above the eyeball and works like a pulley and the *inferior oblique muscle* that is wrapped at an angle round the bottom of the eyeball. *See also* [CYCLOPHORIA](#), [DIPLOPIA](#), [RECTUS MUSCLE](#), [TROCHLEAR NERVE](#).

obliviscence *n.* Forgetfulness or forgetting. Also spelt *oblivescence*. *Compare* [REMINISCENCE](#) (2). [From Latin *oblivisci* to forget]

observational study *n.* A research methodology most often used in certain areas of **social psychology*, **developmental psychology*, and **ethology* in which the investigator records behaviour as far as possible without influencing it. An observational **field* study is conducted in a naturally occurring situation (*compare* [NATURALISTIC OBSERVATION](#)), and an observational laboratory study is carried out in an artificial laboratory environment.

obsession *n.* A recurrent and persistent thought, impulse, or idea that causes significant distress, is experienced as intrusive or inappropriate (**ego-dystonic*), is not merely an exaggerated worry about a genuine problem, and is recognized by the afflicted person as internally generated. *See also* [GRÜBELSUCHT](#), [OBSESSIONAL TECHNIQUE](#), [OBSESSIVE–COMPULSIVE DISORDER](#). *Compare* [COMPULSION](#). **obsess** *vb.* **obsessional** or **obsessive** *adj.* [From Latin *obsessus* besieged, from *ob* in front + *sidere* to sit + *-ion* indicating an action, process, or state]

obsessional neurosis *n.* Another name for an **obsessive–compulsive disorder*. The term was introduced in German (*Zwangsneurose*) by Sigmund Freud (1856–1939) in an article on ‘Heredity and the Aetiology of the Neuroses’ (1896): ‘I was obliged to begin my work with a nosolographic innovation. I found reason to set alongside of hysteria the obsessional neurosis as a self-sufficient and independent disorder’ (*Standard Edition*, III, pp. 143–56, at p. 146). *See also* [TRANSFERENCE NEUROSIS](#).

obsessional technique *n.* In **psychoanalysis*, one of the four **defensive techniques* proposed by the Scottish psychoanalyst W. Ronald D.

*****ebook converter DEMO Watermarks*****

Fairbairn (1889–1964). It involves **internalization* of both the **good object* and the bad object, causing the obsessional person to consider bad objects as alien internal forces that need to be controlled. *See also* *SPLITTING OF THE OBJECT*. *Compare* *HYSTERICAL TECHNIQUE*, *PARANOID TECHNIQUE*, *PHOBIC TECHNIQUE*.

obsessive–compulsive disorder *n.* An **anxiety disorder* in **DSM-5* characterized by either **obsessions* or **compulsions* that the afflicted person attempts to ignore or suppress, causing significant distress, wasting significant amounts of time, or markedly interfering with everyday life, occupational or academic performance, or social interaction. Also called *anankastic neurosis*, *obsessive–compulsive neurosis*. *See also* *DEFUSION OF INSTINCTS*, *ISOLATION OF AFFECT*, *OBSessional NEUROSIS*, *OBSessional TECHNIQUE*, *PARADOXICAL INTENTION*, *RAT MAN*. *Compare* *OBSessive–COMPulsive PERSONALITY DISORDER*. **OCD** *abbrev.* [From Latin *obsessus* besieged, from *ob* in front + *sidere* to sit + *compulsare* to compel frequently or habitually, from *compellere* to compel]

obsessive–compulsive personality disorder *n.* A **personality disorder* in **DSM-5* characterized by a pervasive pattern of preoccupation with orderliness, perfectionism, and control, at the cost of flexibility, openness, and efficiency, beginning by early adulthood and indicated by such signs and symptoms as excessive preoccupation with details, rules, and order; perfectionism that interferes with task completion; excessive devotion to work at the expense of leisure; excessive conscientiousness and scrupulousness; tendency to hoard worthless objects; reluctance to delegate tasks to others; thrifty or stingy attitude towards money; rigidity and stubbornness. The absence of true **obsessions* or **compulsions* makes this condition easily distinguishable from **obsessive–compulsive disorder*, despite the similarity of their names, and also suggests that *obsessive–compulsive personality disorder* is a misnomer. Also called *anankastic personality disorder*. *See also* *ANAL CHARACTER*, *ANAL TRIAD*.

obstacle sense *n.* Another name for **facial vision*.

obstructive sleep apnoea hypopnoea *n.* A **breathing-related sleep disorder* in **DSM-5* involving **sleep apnoea* or **hypopnoea* in which

*****ebook converter DEMO Watermarks*****

the recurrent episodes of breathing cessation or diminution during sleep are associated with obstruction to the upper airway and are followed by loud snores or gasps as breathing resumes. Sleep is unrefreshing and the condition is accompanied by daytime sleepiness or ***hypersomnia**. US *obstructive sleep apnea hypopnea*. Compare CENTRAL SLEEP APNOEA, PICKWICKIAN SYNDROME. **OSAH** abbrev.

obstruent *n.* A ***consonant** involving substantial obstruction of the airstream through the ***vocal tract**. All ***plosives**, ***fricatives**, and ***affricates** are obstruents; ***nasals** (2) and ***approximants** are not. [From Latin *obstruere* to obstruct, from *ob* in the way of + *struere* to pile up]

Occam's razor *n.* A variant spelling of ***Ockham's razor**. The latter spelling is preferable, because the village in Surrey, England, from which its name is derived is called Ockham, believed to derive from *ock* an oak, and *ham* a village or hamlet.

occipital *adj.* Of or relating to the back of the head, which is called the occiput. [From Latin *ob* against + *caput* the head]

occipital bone *n.* The saucer-shaped bone that forms the back of the skull.

occipital lobe *n.* The ***lobe** at the back of each cerebral hemisphere, separated on its lateral or outer surface from the parietal lobe and temporal lobe by an imaginary line from the top of the ***parieto-occipital sulcus** to the ***pre-occipital notch** and on its medial surface by the ***parieto-occipital sulcus**. It is devoted almost entirely to vision and contains the ***primary visual cortex** (Area V1) in the gyri on both sides of the ***calcarine sulcus**. See also LOBE.

occupational health psychology *n.* A field of ***applied psychology**, at the interface of ***occupational psychology** and ***health psychology**, concerned with the application of psychology to improving the quality of work experience and with the protection and promotion of the health, safety, and well-being of people in work. It emerged as an independent field in the late 1990s. **OHP** abbrev.

*****ebook converter DEMO Watermarks*****

occupational interest inventory *n.* Any questionnaire designed to measure respondents' likes and dislikes for the types of activities involved in different jobs. See [KUDER PREFERENCE RECORD](#), [STRONG–CAMPBELL INTEREST INVENTORY](#), [STRONG VOCATIONAL INTEREST BLANK](#). See also [ALLPORT–VERNON–LINDZEY STUDY OF VALUES](#), [INTEREST INVENTORY](#).

Occupational Personality Questionnaire *n.* A *self-report questionnaire designed to measure personality and motivational characteristics relevant to work situations in the areas of relationships with people, thinking style, feelings and emotions, and social desirability. It was developed in 1984 by the British psychologists Peter Saville (born 1946) and Roger Holdsworth (1935–2011) and colleagues and adapted for use in the US and other countries. **OPQ** *abbrev.*

occupational psychology *n.* A field of applied psychology in which the results of psychological research are applied to all problems related to people in work and unemployment, including vocational guidance and selection, problems of work motivation and job satisfaction, absenteeism, design and implementation of training courses, teaching of social and human relations skills, improvement of promotion structures, evaluation of job performance, and problems of safety and welfare. Its major branches are *personnel psychology, *ergonomics or human factors psychology, and *organizational psychology. It corresponds roughly to *industrial/organizational psychology, the term usually preferred in the US, and it falls under the umbrella of *work psychology. See also [OCCUPATIONAL HEALTH PSYCHOLOGY](#).

occupational therapy *n.* A method of treating a *mental disorder or a *general medical condition by a programme of useful or productive work. **OT** *abbrev.*

oceanic feeling *n.* In *psychoanalysis, a term suggested by the French novelist, dramatist, and essayist Romain Rolland (1866–1944) to Sigmund Freud (1856–1939), who discussed it as a basis of religion in his book *Civilization and its Discontents* (1930, *Standard Edition*, XXI, pp. 64–145 at pp. 64–5, 72). It is a transcendental sense of a limitless and indissoluble bond between oneself and the external world that Freud believed to underlie
*****ebook converter DEMO Watermarks*****

religious sentiments (which he could not discover in himself). *See also* [PEAK EXPERIENCE](#).

Ockham's razor *n.* The principle of economy of explanation according to which entities (usually interpreted as assumptions) should not be multiplied beyond necessity (*Entia non sunt multiplicanda praeter necessitatem*), and hence simple explanations should be preferred to more complex ones. Another version of the principle attributed to Ockham is that 'What can be explained by the assumption of fewer things is vainly explained by the assumption of more things'. Because it is useful in so many fields, the English psychologist Richard L(angton) Gregory (1923–2010) referred to it in 1999 as an 'eclectic razor'. Also spelt *Occam's razor*. *See also* [LLOYD MORGAN'S CANON](#). [Named after the English philosopher William of Ockham (?1285–?1349), so called because he was born in the English village of Ockham, near Guildford, Surrey, perhaps the most influential of the later medieval philosophers, although the words attributed to him are not found in any of his surviving works]

ocnophil *n.* A person who avoids dangerous or unfamiliar situations and tends to lean on other people and objects for security when feeling threatened. *Compare* [PHILOBAT](#). [From Greek *oknos* hesitation, from *oknein* to hesitate + *philos* loving, from *phileein* to love]

octave *n.* The interval between two tones, one of which is twice the frequency or pitch of the other; also, a name for all the tones contained within that interval. An octave contains twelve **semitones*. [From Latin *octavus* eighth, from *octo* eight]

ocular apraxia *See* [APRAXIA](#).

ocular convergence *n.* The turning inwards of the eyes in order to fixate an object or image that is closer than the previous fixation point, also called simply *convergence*. It is one of two binocular cues of visual **depth perception*, in which kinaesthetic information about the degree of ocular convergence indicates the distance of objects being fixated. *See also* [ACCOMMODATION REFLEX](#), [HOROPTER](#), [OCULOMOTOR CUE](#), [REDUCTION SCREEN](#), [VERGENCE](#). *Compare* [OCULAR DIVERGENCE](#). [From Latin *convergere* to bend

*****ebook converter DEMO Watermarks*****

together, from *con-* together + *vergere* to incline]

ocular divergence *n.* The turning outwards of the eyes in order to fixate an object or image that is further away than the previous fixation point, also called simply *divergence*. See also [HOROPTER](#), [VERGENCE](#). Compare [OCULAR CONVERGENCE](#). [From Latin *divergere* to move apart, from *di-* apart + *vergere* to incline]

ocular dominance *n.* The degree to which a [*binocular](#) cell located in the [*visual cortex](#) and receiving inputs from both eyes responds primarily to one eye or the other, usually measured on a seven-point scale in which 1 indicates responsivity to inputs from the left eye only, 4 indicates equal responsivity to inputs from both eyes, and 7 indicates receptivity to inputs from the right eye only. See also [OCULAR-DOMINANCE COLUMN](#).

ocular-dominance column *n.* Any of the alternating slabs of cells perpendicular to the surface of the [*primary visual cortex](#) (Area V1), approximately half a millimetre wide and extending through all six cortical layers, appearing after special staining procedures as orderly stripes, with all the cells in a slab responding mainly to inputs from the same eye, and in layer 4C, which receives inputs directly from the [*lateral geniculate nuclei](#), responding only to inputs from the dominant eye for that particular slab. The anatomical basis of this alternation is that each axon from the lateral geniculate nucleus, after ascending through the deep layers of the cortex, terminates in layer 4C in two or three half-millimetre wide clusters of synaptic endings, such clusters being separated by half-millimetre gaps that are occupied by clusters of synaptic endings of axons from the other eye, resulting in an orderly alternation of left and right dominance columns. Also called an *eye-dominance column*. See also [OCULAR DOMINANCE](#). Compare [ORIENTATION COLUMN](#).

ocular drift *n.* One of the forms of [*physiological nystagmus](#), consisting of a random movement of the eyes through a [*visual angle](#) of up to 5 minutes of arc (sixtieths of a degree). Such movements occur while an observer fixates an object and are necessary to prevent the visual image from disappearing, as an artificially [*stabilized retinal image](#) does after about a second. See also [MICROSACCADE](#), [OCULAR TREMOR](#).

*****ebook converter DEMO Watermarks*****

ocular nystagmus *n.* Another name for **nystagmus*.

ocular pursuit movement *n.* Another name for a **pursuit movement*.

ocular tremor *n.* One of the forms of **physiological nystagmus*, consisting of a continuous high-frequency **tremor* with a frequency between about 60 and 120 hertz and an amplitude of about 30 seconds of arc (1/120 of a degree) that is present when the gaze is fixated on a stationary object or image. *See also* *MICROSACCADE*, *OCULAR DRIFT*.

oculogyral illusion *n.* A visual illusion of motion that arises when a person's body rotates in darkness together with a small light rotating at the same velocity as the body. The impression is created of the light moving horizontally with respect to the body, as adaptation of the **vestibular system* causes the person to underestimate the velocity of the body's rotation. [From Latin *oculus* the eye + *gyrus* a circle + *-alis* of or relating to]

oculomotor apraxia *See* *APRAXIA*.

oculomotor cue *n.* **Kinaesthetic* information about **ocular convergence* received from the **extra-ocular muscles* of the eyes, providing a **cue* (2) for visual **depth perception*. [From Latin *oculus* the eye + *motor* a mover, from *movere*, *motus* to move]

oculomotor nerve *n.* Either of the third pair of **cranial nerves*, arising from the **superior* colliculus and supplying some of the **extra-ocular muscles*, the ciliary muscles that increase the convexity of the lens for **near vision*, and the sphincter muscle of the **pupil*. Paralysis of this nerve causes pupil dilation and divergent squint. *See also* *ARGYLL ROBERTSON PUPIL*, *PTOSIS*. [From Latin *oculus* the eye + *motor* a mover, from *movere* to move]

oddity problem *n.* A discrimination task in which an organism learns to select from a set of stimuli the one that differs from all of the others. It was first used in psychology in an experiment carried out by the US psychologist Andrew Janeway Kinnaman (1863–1928) and reported in the *American Journal of Psychology* in 1902 in which food was hidden in a coloured

beaker and presented to macaque monkeys among four grey beakers carefully matched for brightness with the coloured beaker, and the monkeys learned to choose the coloured beakers quickly and easily, which established their ability to perceive colours. See also [DIMENSION-ABSTRACTED ODDITY](#), [GENERALIZED ODDITY PROBLEM](#).

odd-one-out test *n.* A type of [*intelligence](#) test item or subtest in which the respondent has to choose which of several alternatives is the odd one out. A typical (difficult) example is: *Which of the following is the odd one out? DET, DIS, EOJ, EOZ, NEK.* Although various choices could be justified, the 'correct' answer to this item is *EOZ*, because this is an abbreviated female name written backwards, and all the others are abbreviated male names written backwards.

odor See [ODOUR](#).

odorimetry *n.* The measurement of the characteristics of [*odours](#). Also called *olfactometry*. See also [CROCKER–HENDERSON SYSTEM](#), [HENNING'S PRISM](#), [OLFACTIE](#), [STEREOCHEMICAL THEORY](#), [ZWAARDEMAKER OLFACTOMETER](#), [ZWAARDEMAKER SMELL SYSTEM](#).

odour *n.* The property of an aromatic substance associated with its characteristic smell, scent, fragrance, or aroma, perceived through the [*olfactory receptors](#) in the [*nose](#). US *odor*. See [OLFACTION](#). See also [CROCKER–HENDERSON SYSTEM](#), [CROSS-ADAPTATION](#), [FLAVOUR](#), [HENNING'S PRISM](#), [MIXTURE SUPPRESSION](#), [ODORIMETRY](#), [ODOUR ADAPTATION](#), [ODOUR CONSTANCY](#), [ODOUR HALLUCINATION](#), [STEREOCHEMICAL THEORY](#), [ZWAARDEMAKER SMELL SYSTEM](#). [From Latin *odor* a smell or odour]

odour adaptation *n.* A temporary reduction in sensitivity to an odour following prolonged exposure to it, the phenomenon that causes workers in noisome factories to be oblivious of the stench, except for a short while after they first arrive for work, and that makes people in general insensitive to their own body odours. US *odor adaptation*.

odour constancy *n.* The tendency for the perceived intensity of an odour to remain the same despite differences in the volume of air being
*****ebook converter DEMO Watermarks*****

drawn into the nose and therefore the amount of stimulation of the olfactory receptors. US *odor constancy*. See also [PERCEPTUAL CONSTANCY](#).

odour hallucination *n.* An odour experienced in the absence of any [*olfactory](#) stimulus, often a symptom of a neurological disorder. US *odor hallucination*. See also [HALLUCINATION](#).

odour prism *n.* Another name for [*Henning's prism](#). US *odor prism*.

odour square *n.* Another name for the [*Crocker–Henderson system](#). US *odor square*.

Oedipal phase *n.* Another name for the [*phallic stage](#), during which the [*Oedipus complex](#) is assumed to develop. According to Sigmund Freud (1856–1939), girls develop [*penis](#) envy during this phase.

Oedipus complex *n.* In [*psychoanalysis](#), an organized collection of loving and hostile feelings of a child towards its parents, reaching its peak during the [*phallic stage](#) between 3 and 5 or 6 years of age, dissolving with the onset of the [*latency](#) period, and then re-emerging during the [*genital stage](#), after which it is mastered with greater or lesser success through mature [*object-choices](#). It manifests itself in its *positive* form as a sexual desire for the opposite-sex parent and a jealous hatred of the same-sex parent, in its *negative* (or *inverted*) form as a desire for the same-sex parent and hatred of the opposite-sex parent, and in its *complete* form as a blend of the positive and negative forms. Sigmund Freud (1856–1939) introduced the term in 1910 in an article entitled ‘A Special Type of Choice of Object Made by Men’ (*Standard Edition*, XI, pp. 165–75, at p. 171), and in a note added in 1920 to his book *Three Essays on the Theory of Sexuality* (1905) he asserted the universality of the complex: ‘Every new arrival on this planet is faced with the task of mastering the Oedipus complex’ (*Standard Edition*, VII, pp. 130–243, at p. 226n); but he never fully clarified his views regarding the nature of the complex in girls, and in an article on ‘Female Sexuality’ in 1931, he wrote: ‘It is only in the male child that we find the fateful combination of love for one parent and simultaneous hatred for the other as a rival’ (*Standard Edition*, XXI, pp. 225–43, at p. 229). The British-based Austrian psychoanalyst Melanie Klein (1882–1960) deviated from Freud in dating the

*****ebook converter DEMO Watermarks*****

onset of the complex to the first year of life. *See also* [CASTRATION COMPLEX](#), [COMPLEX \(2\)](#), [ELECTRA COMPLEX](#), [FATHER COMPLEX](#), [MOTHER COMPLEX](#), [PHALLUS](#), [SUPEREGO](#). *Compare* [JOCASTA COMPLEX](#), [ORESTES COMPLEX](#). [Named after the Greek legendary figure Oedipus, who killed his father Laius, married his mother Jocasta, and then blinded himself when the truth about his parenthood emerged, as recounted most famously in the play *Oedipus Rex* by Sophocles]

Oedipus effect *n.* In psychology and the social sciences, the effect of a prediction on the predicted event, the prediction either causing or preventing the event that it predicts, or more generally the influence of an item of information on the situation to which the information refers. The term was coined by the Austrian-born British philosopher Karl R(aimund) Popper (1902–94) in his book *The Poverty of Historicism* (Chapter 1, section 5, p. 13) in 1957, based on a journal article in 1944, and from it he deduced that ‘*exact and detailed* scientific social predictions are therefore impossible’ (1957, p. 14, italics in original). *See* [SELF-DEFEATING PROPHECY](#), [SELF-FULFILLING PROPHECY](#). *See also* [EXPERIMENTER EXPECTANCY EFFECT](#), [PYGMALION EFFECT](#), [UNEXPECTED HANGING PARADOX](#). [So called because the Greek legendary figure Oedipus killed his father, whom he had never seen before, as a direct result of the prophecy that had caused his father to abandon him]

oesophagus *n.* The section of the [*alimentary](#) canal between the [*pharynx](#) and the [*stomach](#). US *esophagus*. Also called the *gullet*. [From Greek *oisein* to be carried, from *pherein* to carry + *phagein* to eat]

oestradiol *n.* A potent [*oestrogenic](#) [*steroid](#) [*sex](#) hormone secreted by the [*ovaries](#), a synthetic form of which is used to treat oestrogen deficiency, especially in menopausal women, and breast cancer. US *estradiol*. *Compare* [OESTRONE](#). [From Latin *oestrus* a gadfly or frenzy + English *diol* a compound containing two hydroxyl groups, from Greek *dis* twice + English *-ol* denoting a compound containing a hydroxyl group, from (*alcoh*)*ol*]

oestrogen *n.* Any of a group of steroid hormones that are secreted by the ovaries during the female [*oestrous cycle](#) and that stimulate the development of female [*secondary sexual characteristics](#). US *estrogen*, *estrogenic*. *See also* [DHEA](#), [STILBOESTROL](#). *Compare* [TESTOSTERONE](#). **oestrogenic** *adj.* [From Latin *oestrus* a gadfly or frenzy, from Greek *oistros* a gadfly + Greek *genes*

*****ebook converter DEMO Watermarks*****

born or produced]

oestrone *n.* An **oestrogenic* hormone secreted by the ovaries and found in the urine of pregnant females, having similar action and uses to **oestradiol*. US *estrone*. [From Latin *oestrus* a gadfly or frenzy + *-one* indicating a ketone, from Greek *-one* a feminine name suffix]

oestrous cycle *n.* The **feedback*-controlled cycle of changes in the reproductive organs of many female mammals, consisting of a **follicular phase* and a **luteal phase*. It includes the menstrual cycle in women (and many female **anthropoid* apes), in whom there is also a **menstrual phase*. The anterior pituitary initially releases **follicle-stimulating hormone*; this causes the ovary to produce **oestrogen*; the oestrogen acts on the hypothalamus to inhibit further release of follicle-stimulating hormone and to stimulate the release of **luteinizing hormone* instead by the anterior pituitary; this hormone triggers **ovulation* and causes the ovary to produce **progesterone*; when this hormone reaches the hypothalamus it inhibits further release of luteinizing hormone, thereby completing the cycle. US *estrous cycle*. See also *MENSTRUAL CYCLE*, *PHEROMONE*. [From Latin *oestrus* a gadfly or frenzy, from Greek *oistros* a gadfly + *kyklos* a circle or cycle]

oestrus *n.* The cyclically recurring period of fertility and sexual receptivity associated with the **oestrous cycle* in most female mammals. In humans, fertility fluctuates but the effect on receptivity is a matter of controversy. US *estrus*. [From Latin *oestrus* a gadfly or frenzy, from Greek *oistros* a gadfly]

off-centre cell *n.* A type of retinal **ganglion* cell having a **centre-surround receptive field* consisting of a central OFF area, in which stimulation tends to suppress neural responses by **lateral* inhibition, and a surrounding ON area, in which stimulation tends to excite neural responses, so that the strongest response occurs when only the surrounding ring is stimulated. US *off-center cell*. Compare *ON-CENTRE CELL*.

offender counselling *n.* A form of **counselling* offered to people with criminal convictions. US *offender counseling*.

Ohm's acoustic law *n.* The proposition that the human auditory system
*****ebook converter DEMO Watermarks*****

responds to a complex sound by generating sensations of the separate components of the sound rather than a sensation of a single integrated sound; thus when we listen to an orchestra we hear the separate instruments although the ears receive only a single complex sound wave. *See also* [FOURIER ANALYSIS](#). [Named after the German physicist Georg Simon Ohm (1784–1854) who formulated it in 1843]

olan *See* [LATAH](#).

olanzapine *n.* An [*atypical antipsychotic](#) drug that blocks both [*dopamine](#) receptors and (more strongly) [*serotonin](#) receptors in the brain and is used in the treatment of [*schizophrenia](#) and other [*psychotic \(1\)](#) disorders. *See also* [DOPAMINE ANTAGONIST](#). Also called Zyprexa (trademark).

old woman/young girl figure *n.* Another name for the [*young girl/old woman figure](#).

olfactie *n.* In [*psychophysics](#), the smallest unit of odour intensity that can be detected reliably, expressed in terms of the tube length in the [*Zwaardemaker olfactometer](#). *See also* [DIFFERENCE THRESHOLD](#), [ODORIMETRY](#).

olfaction *n.* The sense of smell or the act or process of smelling, occurring when molecules of an aromatic substance are drawn into the upper nasal cavity and are captured by [*olfactory receptor](#) neurons that are specialized for specific kinds of [*odours](#) and that respond by generating nerve impulses and transmitting them to the [*olfactory bulbs](#), the type or types of activated neurons indicating the quality of the odour and the number of activated neurons indicating its intensity, the input pattern being analysed in the olfactory bulbs and transmitted directly to the [*olfactory cortex](#) and the [*amygdala](#), and from there to the [*entorhinal cortex](#), where information from disparate sensory receptors is integrated. It is more effective than any other sense in reawakening memories from the distant past, especially the emotions associated with past experiences, though the literary passage most often cited in support of this phenomenon, quoted under [*redintegration](#), actually refers to taste rather than smell. *See* [CHEMORECEPTOR](#), [OLFACTORY BULB](#), [OLFACTORY CORTEX](#), [OLFACTORY EPITHELIUM](#), [OLFACTORY LOBE](#), [OLFACTORY NERVE](#), [OLFACTORY TRACT](#), [RHINENCEPHALON](#). *See also* [CROCKER–HENDERSON SYSTEM](#), [CROSS-*****ebook converter DEMO Watermarks*****](#)

ADAPTATION, FLAVOUR, HENNING'S PRISM, MIXTURE SUPPRESSION, NOSE, ODORIMETRY, ODOUR, ODOUR ADAPTATION, ODOUR CONSTANCY, ODOUR HALLUCINATION, OLFACTORY ACUITY, OSMORECEPTOR (1), PAROSMIA, PHEROMONE, STEREOCHEMICAL THEORY, VOMERONASAL ORGAN, ZWAARDEMAKER SMELL SYSTEM.
olfactory *adj.* Of or relating to the sense of smell. [From Latin *olfacere* to smell, from *olere* to smell + *facere*, *factum* to make + *-ion* indicating an action, process, or state]

olfactology *n.* The study of smells and of **olfaction*.

olfactometry *n.* The measurement of **olfactory acuity* and of the characteristics of odours. Also called *odorimetry*.

olfactory acuity *n.* Keenness or sharpness of the sense of smell. See OLFACTION, ACUITY.

olfactory bulb *n.* The slightly enlarged front end of the **olfactory tract*, resembling a match head projecting from the front lower margin of each cerebral hemisphere, receiving nerve impulses from the olfactory receptors and sending impulses via the **olfactory nerve* directly to the **olfactory cortex* and the **amygdala*, unique among sensory pathways in bypassing the thalamus entirely. See also OLFACTION.

olfactory cortex *n.* The **piriform cortex* in the anterior temporal lobes and the hippocampal convolution, concerned mainly with the sense of smell, connected directly to the **amygdala*, which controls the experience and expression of emotion, and the **hippocampus*, which is responsible for the **consolidation* of long-term memory. See also OLFACTION.

olfactory epithelium *n.* The **mucous membrane* in the upper nasal cavity where the **olfactory receptors* are situated. Also called the *nasal epithelium*. See also OLFACTION.

olfactory lobe *n.* Another name for the rhinencephalon, part of the forebrain in each cerebral hemisphere containing the **olfactory bulb*, **olfactory tract*, and **olfactory cortex*, concerned largely with the sense of

smell, but in humans also with **emotions*. See also OLFACTION.

olfactory nerve *n.* Either of the first pair of **cranial nerves*, supplying the organ of smell and unusual among sensory pathways in being connected via the **olfactory tract* directly to the brain from the **olfactory bulb*. See also OLFACTION.

olfactory receptor *n.* A type of **sensory* receptor that is associated with **olfaction* and that responds to aromatic substances drawn into the upper nasal cavity, where molecules bind to **bipolar* neurons in the **olfactory epithelium*, specialized for specific kinds of **odours*, whose **axons* are part of the **olfactory nerve*, and the bipolar neurons respond by generating nerve impulses and transmitting them to the **olfactory bulbs*. Also called an *osmoreceptor*, though that usage is ambiguous.

olfactory tract *n.* A band of nerve fibres clearly visible on the bottom of each cerebral hemisphere, resembling a long matchstick extending back from the **olfactory bulb* to the **olfactory cortex* and the **amygdala*. See also OLFACTION.

oligodendrocyte *n.* A type of **neuroglial* cell with few **dendrites* and few branches, responsible for wrapping **myelin* sheaths around **axons* in the **central nervous system*. Also called *oligodendroglia*. Compare SCHWANN CELL. [From Greek *oligos* few or little + *dendron* a tree + *kytos* a vessel]

oligophrenia *n.* An old-fashioned term for **intellectual disability*. See also PHENYLPYRUVIC OLIGOPHRENIA. [From Greek *oligos* little or few + *phren* mind, originally midriff, the supposed seat of the soul + *-ia* indicating a condition or quality]

olivary nucleus See INFERIOR OLIVARY NUCLEUS, SUPERIOR OLIVARY NUCLEUS.

ololiuqui *n.* A **psychedelic* and **hallucinogenic* drug obtained from the seeds of the **morning glory* plant *Rivea corymbosa*. [From Nahuatl *ololiuhqui* one that covers, from *ololoa* to cover, alluding to the fact that the plant is a clinging vine]

omega process *n.* In **psychoanalysis*, a term used by Sigmund Freud (1856–1939) to denote any function of the **perception–consciousness system*. Also called a *W process* or a *Pcpt–Cs process*.

ommatidium *n.* Any of the simple eyes that make up the **compound eye* of insects and some crustaceans, consisting typically of an external corneal lens beneath which is a crystalline **cone* and a fourfold **rod* called a *rhabdom* attached to a **photoreceptor* and enclosed in a dark pigment. *Compare* *EYE*. **ommatidia** *pl.* [Latin *ommatidium*, from Greek *ommatidion*, from *omma* an eye]

omnivore *n.* An animal that eats both flesh and plants; more generally, a person or animal with indiscriminate eating habits. *Compare* *CARNIVORE*, *HERBIVORE*. **omnivorous** *adj.* [From Latin *omnis* all + *vorare* to devour]

onanism *n.* Another name for **coitus interruptus* or (less correctly) **masturbation*. [Named after Onan in *Genesis* 38:9 who deliberately spilled his seed on the ground when having intercourse with his brother's wife]

on-centre cell *n.* A type of retinal **ganglion* cell having a **centre-surround receptive field* consisting of a central ON area, in which stimulation tends to excite neural responses, and a surrounding OFF area, in which stimulation tends to suppress neural responses by **lateral* inhibition, so that the strongest response occurs when only the central region is stimulated. US *on-center cell*. *Compare* *OFF-CENTRE CELL*.

Ondine's curse *n.* A rare genetic disorder of the **central nervous system* leading to failure of automatic breathing control while asleep, with normal breathing while awake. The term was first used in an article in the journal *Clinical Research* in 1962 by the US anaesthesiologist John W(endell) Severinghaus (born 1922) and a colleague, alluding to the play *Ondine* (1939) by the French dramatist (Hippolyte) Jean Giraudoux (1882–1944), in which Ondine's unfaithful husband develops a condition in which his body stops performing automatic functions, although Ondine does not curse him or wish him harm. Near the beginning of the play (I.vi), Ondine says: 'I will be your shoes, my husband, I will be your breath'; and near the end (III.vi), as

he approaches death, he describes his condition: 'Since you went away, everything that my body used to do by itself I have to command it to do.... If I stop concentrating for a moment, I shall forget to hear, to breathe.' A gene responsible for the disorder, named Thox2B, was discovered by French researchers in 2003. Also called *obesity hypoventilation syndrome* (*OHS*). Compare CENTRAL SLEEP APNOEA, OBSTRUCTIVE SLEEP APNOEA HYPOPNOEA. [From *ondine*, a water nymph, from Germanic and Scandinavian mythology (spelt *Undine*), from Latin *undina* a water-spirit, from *unda* a wave]

one-group pretest-posttest design *n.* One of the most frequently used *quasi-experimental research designs in which a single group of research participants or subjects is pretested, given some treatment or *independent variable manipulation, then posttested. If the pretest and posttest scores differ significantly, then the difference may be attributed to the independent variable, but because the research design is not strictly experimental and there is no control group, this inference is uncertain, and the difference may be due to *extraneous variables such as *order effects or *regression towards the mean. See also INTERRUPTED TIME-SERIES DESIGN, NON-EQUIVALENT GROUPS DESIGN.

oneiric *adj.* Of or relating to dreams. **oneirocritic** *n.* A dream-interpreter. **oneirocriticism** *n.* Dream interpretation. **oneirodynia** *n.* Troubled sleep. **oneiromancy** *n.* Divination through dream-interpretation. **oneiroscopy** *n.* Examination of dreams. [From Greek *oneiros* a dream]

oneirophrenia *n.* A dreamlike state of consciousness. Also called *oneirism*. [From Greek *oneiros* a dream + *phren* mind, originally midriff, the supposed seat of the soul + *-ia* indicating a condition or quality]

one-sample t test *n.* In statistics, a version of the *related scores *t* test to evaluate the significance of the departure of the mean of a single sample of scores from some specified value. See also *T TEST*.

1-tailed probability *n.* In *inferential statistics, the probability of obtaining a result as extreme as the one observed, and in the same direction, if the *null hypothesis is true. If the probability is small (by convention, often less than $p < .05$), then the null hypothesis may be rejected. Compare 2-

*****ebook converter DEMO Watermarks*****

TAILED PROBABILITY. [The name refers to one tail of the relevant **probability* distribution]

1-tailed test *n.* In **inferential statistics*, a test of the significance of a departure from the **null hypothesis* in one direction only, so that a departure in the opposite direction, no matter how large, is attributed to chance. In a *2-tailed test*, a departure from the null hypothesis in either direction results in its rejection. Also called a *directional test*. See also **1-TAILED PROBABILITY**.

one-way analysis of variance See **ANALYSIS OF VARIANCE (ANOVA)**.

one-way screen *n.* A sheet of glass or other transparent material that both reflects and transmits light. If the area on one side of the screen is brightly lit and the area on the other dimmed, then it is possible to see through the screen from the dimmed side but not from the bright side. This device is used for research in which it is useful to be able to observe people without being observed. If the screen is made of half-silvered glass, then it is often called a *one-way mirror*.

ongoing time disparity *n.* Another name for **phase* delay. Also called *ongoing disparity*.

online counselling See **ONLINE THERAPY**.

online therapy *n.* Psychotherapy conducted over the internet by e-mail, video phone, or internet phone. Also called *e-counselling* (US *e-counseling*) or *e-therapy*. [From *online* + Greek *therapeuein* to heal or take care of, from *theraps* an attendant]

onomastics *n.* The study or science of names and naming. It is usually divided into *anthroponomastics*, the study of personal names, and *toponomastics* or *toponymy*, the study of place names, but onomastics is often interpreted loosely as the study of personal names. [From Greek *onoma* name]

onomatopoeic theory *n.* A theory of the origins of language,

according to which words originated as imitations of natural sounds in the environment. US *onomatopoeic theory*. Also (dismissively) called the *bow-wow theory* or *ding-dong theory*. [From *onomatopoeia* the formation of words that are imitative of the sounds of the concepts designated]

ontogeny *n.* The sequence of development of an individual organism as distinguished from the evolution of a **species* or other **taxonomic* group. Also called *ontogenesis*. Compare *PHYLOGENY*. **ontogenetic** or **ontogenic** *adj.* [From Greek *on*, *ontos* being, present participle of *einai* to be + *genes* born]

ontology *n.* The branch of metaphysics devoted to the study of the nature of being or existence or the essence of things, including the distinction between reality and appearance and whether mathematical entities exist outside of people's minds. [From Greek *on*, *ontos*, the present participle of *einai* to be + *logos* word, discourse, or reason]

onychophagia *n.* Nail biting. [From Greek *onyx*, *onychos* a nail or claw + *phagein* to consume + *-ia* indicating a condition or quality]

open-ended question *n.* A question framed in such a way as to encourage a full expression of an opinion rather than merely a yes/no answer or otherwise constrained response. An open-ended question allows the respondent to answer freely, without having to select an answer from a predetermined set or **response* categories. Such questions are commonplace in **qualitative research*, although responses to them present formidable problems of data analysis. In interviews or informal conversations, open-ended questions such as *What do you feel about X?* are more effective than **closed questions* in initiating interactions or encouraging discussion. Also called an *open question*.

open-field test *n.* A procedure for measuring the activity of a rat or other small animal by placing it in an enclosed area of floor space, divided into squares, and counting the number of squares that it crosses in a specified time period.

open-loop control *n.* In **cybernetics*, a control process in which there is no **feedback* of the system's output to its input, such control being
*****ebook converter DEMO Watermarks*****

characteristic of **ballistic movements*, **action slips*, and some forms of **automatic processing*. *Compare* CLOSED-LOOP CONTROL.

openness to experience *n.* One of the **Big Five* personality factors, characterized at the one extreme by such **traits* as imagination, curiosity, and creativity, and at the other by shallowness and imperceptiveness. Also called *intellect*. *See also* BETA PERSONALITY FACTOR, GENERAL FACTOR OF PERSONALITY.

open node *n.* A **node* (2) that is awaiting processing. *Compare* CLOSED NODE.

open study *n.* A research design in which both the experimenter and the research participants or subjects know the purpose of the study and which experimental treatment has been applied to which individuals. *Compare* DOUBLE-BLIND STUDY, SINGLE-BLIND STUDY.

open vowel *n.* A **vowel* (see the diagram accompanying that entry) produced at a low position in the mouth with the tongue low in the mouth and the jaw lowered, such as the vowels in *father* and *lot*, or the first element of the **diphthongs* in *price* and *mouth*, which is the same as the vowel in the German *Mann*. Also called a *low vowel*. *Compare* CLOSE VOWEL, MID VOWEL.

operant *n.* Any **response* by an organism that is not directly caused by a **stimulus* (7) but is freely **emitted behaviour*.

operant conditioning *n.* One of the two major forms of **conditioning* (1), the **learning* (1) process whereby the relative frequency of a **response* increases as a result of reward or **reinforcement* (1) that is contingent on the response being emitted. Also called *instrumental learning*, *respondent conditioning*, or *Skinnerian conditioning*. *See also* APPLIED BEHAVIOURAL ANALYSIS, AVOIDANCE CONDITIONING, BEHAVIOURISM, CUMULATIVE RECORD, ESCAPE CONDITIONING, REINFORCEMENT SCHEDULE, SECONDARY REINFORCEMENT, SHAPING (1), SKINNER BOX.

operating characteristic *See* MEMORY OPERATING CHARACTERISTIC, RECEIVER OPERATING CHARACTERISTIC.

operation See MENTAL OPERATION.

operational definition *n.* A definition of a concept couched in terms of the operations or procedures by which it may be observed, measured, or distinguished from other things, a standard example being ‘intelligence is what intelligence tests measure’. See also OPERATIONALISM.

operationalism *n.* A largely abandoned doctrine of *logical positivism, propounded by the US philosopher of science Percy Williams Bridgman (1882–1961) in his book *The Logic of Modern Physics* (1927), according to which concepts derive their meaning solely from the operations through which they are observed so that, for example, intelligence is defined as whatever intelligence tests measure. Also called *operationism*. See also OPERATIONAL DEFINITION. **operationalistic** *adj.* Of or relating to operationalism. **operationalize** *vb.* To make operational or to formulate an *operational definition of something.

operational research *n.* A mathematically based approach to corporate decision making using techniques of optimization, dynamic programming, control theory, computer simulation, and statistical analysis. The term was coined and the technique introduced during the Second World War when scientific planning and management of military operations were first implemented. Also (especially in the US) called *operations research*. See also MONTE CARLO METHOD. **OR** *abbrev.*

operational stage *n.* A general term for *concrete operations and *formal operations.

operator (gene) See GENE OPERATOR.

operatory stage *n.* Another name for an *operational stage. See CONCRETE OPERATIONS, FORMAL OPERATIONS.

operculum *n.* Any outer covering or lid of a structure in a living organism, such as one of the flaps covering the gill slits in a fish, and especially the parietal operculum and the temporal operculum that are the

upper and lower lips of the ***lateral** sulcus in each cerebral hemisphere of the brain. **opercula** or **operculum** *pl.* [From Latin *operculum* a lid, from *operire* to cover]

operon *n.* A group of adjacent ***structural genes** that are transcribed into a single molecule of ***RNA** and that function as a unit under the control of a single ***gene** operator. [From *operate*, on the model of *codon*]

ophthalmic *adj.* Of or relating to the ***eye**. **ophthalmologist** *n.* A medical practitioner specializing in disorders of the ***eye**. **ophthalmology** *n.* The branch of medicine concerned with disorders of the ***eye**. **ophthalmoscope** *n.* An instrument for examining the interior of the ***eye**, comprising a light, a mirror perforated by a hole through which the examiner looks, and a rotating disc for positioning lenses of varying strengths in front of the hole. [From Greek *ophthalmos* an eyeball, from *op(sethai)* to see + *thal(a)m(os)* an inner room or chamber, from *thalos* a vault + *-ik(os)* of, relating to, or resembling]

ophthalmoplegia *n.* Paralysis of the ***extra-ocular muscles**. Compare DIPLEGIA, HEMIPLEGIA, MONOPLEGIA, PARAPLEGIA, QUADRIPEGIA, TRIPLEGIA. **ophthalmoplegic** *adj.* [From Greek *ophthalmos* an eye + *plege* a blow + *-ia* indicating a condition or quality]

opiate *n.* Any of a group of chemical substances that contain ***opium** or an ***alkaloid** of opium and that tend to have ***narcotic** effects and are sometimes used as ***analgesics** (1), ***anaesthetics** (1), or cough suppressants. Also called *opioids*, especially when referring to the ***endogenous opioids** produced naturally in the brain. See HEROIN, MORPHINE. See also NUCLEUS ACCUMBENS, OPIOID ANTAGONIST, OPIOID-RELATED DISORDERS. [From Latin *opium* poppy juice, from Greek *opion* diminutive of *opos* sap]

opinion *n.* A ***proposition** (1) that is accepted as true without compelling grounds, therefore falling short of being a ***belief** and far short of constituting ***knowledge**. **opine** *vb.*

opinion leader *n.* An individual belonging to a small minority in any community who tend to respond to messages in the mass media and to have a disproportionate effect on public opinion and behaviour through face-to-face
*****ebook converter DEMO Watermarks*****

communication with many friends, relatives, and acquaintances and by setting behavioural examples. See [TWO-STEP FLOW](#).

opioid See [OPIATE](#).

opioid antagonist *n.* Any drug such as [*nalorphine](#), [*naloxone](#), or [*naltrexone](#) that binds to the neuroreceptor sites of the [*opiates](#) in the central nervous system and thereby blocks their action. Also called a *narcotic antagonist*. See also [ANTAGONIST \(3\)](#).

opioid-related disorders *n.* [*Substance-related and addictive disorders](#) in [*DSM-5](#) induced by consuming [*opiates](#) or opioids, including natural opiates such as [*morphine](#), semi-synthetic compounds such as [*heroin](#), and fully synthetic compounds with morphine-like effects such as [*codeine](#), [*methadone](#), and [*meperidine](#). DSM-5 distinguishes between opioid use disorder, opioid intoxication, and opioid withdrawal. See also [SUBSTANCE ABUSE](#), [SUBSTANCE DEPENDENCE](#), [SUBSTANCE-INDUCED DISORDERS](#), [SUBSTANCE-RELATED AND ADDICTIVE DISORDERS](#), [SUBSTANCE USE DISORDERS](#).

opium *n.* A [*narcotic](#) drug extracted as a bitter-tasting, yellow–brown milky juice from the unripe seed pods of the opium poppy *Papaver somniferum*, containing [*alkaloids](#) such as [*morphine](#) and [*codeine](#), used medicinally to induce [*analgesia](#), also smoked as an intoxicant with euphoric effects, often leading to [*dependence \(2\)](#). See also [DOVER’S POWDER](#), [LAUDANUM](#), [OPIATES](#), [OPIOID-RELATED DISORDERS](#), [PAREGORIC](#), [SUBSTANCE DEPENDENCE](#). [From Latin *opium* poppy juice, from Greek *opion* diminutive of *opos* vegetable juice or sap]

Oppel illusion *n.* Another name for the [*filled-space illusion](#). [Named after the German physicist Johann Joseph Oppel (1815–94) who first reported it in 1860–61]

Oppel–Kundt illusion *n.* Another name for the [*filled-space illusion](#). Also called the *Oppel illusion*. [So called because it was first described in 1860–61 by the German physicist Johann Joseph Oppel (1815–94) and further investigated in 1863 by the German physicist August Adolph Eduard Eberhardt Kundt (1838–94)]

*****ebook converter DEMO Watermarks*****

opponent cell *n.* A type of neuron in the *lateral geniculate nucleus that responds maximally to light of one particular range of wavelengths and is maximally inhibited by light of a different range of wavelengths. Also called an *opponent neuron*. Compare NON-OPPONENT CELL. [From Latin *opponere* to oppose, from *ob* against + *ponere* to place]

opponent-process theory *n.* The theory of colour vision put forward by the German psychologist and physiologist Ewald Hering (1834–1918), or any of its more recent variants, according to which there are three classes of bipolar *photoreceptors or visual *afferent neurons responding to white versus black, red versus green, and blue versus yellow differences in visible light. Physiological research has shown this theory to be essentially correct for stages of the visual system after the initial receptor stage, whereas the *trichromatic theory, according to which colour vision depends on three types of receptors responsive to the *primary colours (1), is essentially correct at the receptor level. Also called the *tetrachromatic theory*. See also ACHROMATIC SYSTEM, BLUE–YELLOW CELL, RED–GREEN CELL.

opportunity sample *n.* A *non-probability sample comprising a pre-existing serviceable group, such as the children on a school outing or the patients on a hospital ward. See also ACCIDENTAL SAMPLE, CONVENIENCE SAMPLE, QUOTA SAMPLE, SELF-SELECTED SAMPLE, SNOWBALL SAMPLE. Compare CLUSTER SAMPLE, PROBABILITY SAMPLE, RANDOM DIGIT DIALLING, SIMPLE RANDOM SAMPLE, STRATIFIED RANDOM SAMPLE.

opposites test *n.* Another name for an *antonym test.

oppositional defiant disorder *n.* In *DSM-5, a *disruptive, impulse-control, and conduct disorder of childhood characterized by recurrent negativistic, defiant, disobedient, or hostile behaviour towards authority figures, including such signs and symptoms as temper tantrums, arguing with adults, actively defying rules, deliberately annoying people, unfairly blaming others for mistakes or misbehaviour, being touchy or easily annoyed, angry, resentful, spiteful, or vindictive, with the pattern of behaviour leading to significant impairment in social, academic, or occupational functioning. Compare DISRUPTIVE MOOD DYSREGULATION DISORDER, INTERMITTENT EXPLOSIVE DISORDER. **ODD** abbrev.

*****ebook converter DEMO Watermarks*****

opsin *n.* A protein that is one of the two constituents of ***rhodopsin**. See also **RETINENE**. [A ***back formation** from *rhodopsin*, as if it were the opsin of the r(h)ods]

optacon *n.* An electronic aid for blind people that transforms a pattern of light-intensity differences into a pattern of vibrations that can be felt by the fingertips, making possible such activities as reading printed text. Compare **BRILLE**, **OPTOHAPT**. [Coined from Greek *optikon* neuter of *optikos* of or relating to vision, modified to avoid *opticon*, a word already in use for an enlargement of the optic lobe in an insect brain associated with its compound eye]

optic agnosia See **AGNOSIA**.

optical character recognition *n.* The process whereby a device called an *optical character reader* scans printed characters, or occasionally and less successfully handwriting, performs some form of ***template matching** to identify letters, numbers, or other characters, and inputs the information to a computer or other storage system. See also **PANDEMONIUM (1)**. **OCR** *abbrev.*

optical flow *n.* The instantaneous velocity of points in a retinal image or visual field, resulting either from movements of objects or images in the visual field or from movements of the head or eyes. Also called *optic flow*.

optical illusion *n.* Another name for a ***visual illusion**.

optic apraxia See **APRAXIA**.

optic ataxia *n.* A form of ***ataxia** involving a selective inability to integrate information about the position of an object from ***proprioceptive** information about the position of one's hand or arm. See **BÁLINT'S SYNDROME**. [From Greek *a-* without + *taxis* order + *-ia* indicating a condition or quality]

optic chiasm *n.* An area at the bottom of the brain immediately below

the hypothalamus where ***decussation** (partial decussation in humans and other animals with forward-pointing eyes and therefore overlapping visual fields) of the ***optic nerve** fibres occurs, with approximately half the fibres from each eye (the fibres from the ***nasal** retina of each eye) crossing over to the opposite ***cerebral** hemisphere. The effect of this is that images from the left visual field of both eyes are transmitted to the right cerebral hemisphere and images from the right visual field to the left cerebral hemisphere, enabling information from corresponding points in the visual fields of the eyes to come together in the visual cortex for binocular depth perception. In animals such as rabbits with much smaller overlap of visual fields, almost all the fibres are crossed. Also called the *optic chiasma*. See also **BINOCULAR CELL**. [From Greek *optikos* optic, from *optos* seen + *chiasma* a cross, named after the shape of the upper-case letter chi (X)]

optic disc *n.* Another name for the ***blind spot (1)**. US *optic disk*.

optic nerve *n.* Either of the second pair of ***cranial nerves**, carrying the entire output of the visual receptors in the retina, consisting of the axons of retinal ***ganglion** cells, passing through the ***optic chiasm** and terminating chiefly in one of the ***lateral** geniculate nuclei. Some fibres of the optic nerve terminate in the ***suprachiasmatic nucleus** of the hypothalamus, which is implicated in the control of biological rhythms, and some travel by the ***pretectal pathway** and terminate in the pretectal nuclei. See also **OPTIC TRACT**.

optic radiation *n.* A fibre of the visual system projecting from the ***lateral** geniculate nucleus to the ***visual cortex**.

optic tectum *n.* Part of the ***tectum** at the base of the pons in the roof of the midbrain containing the two ***superior** colliculi involved in visual orienting and localizing behaviour. [From Greek *optikos* optic, from *optos* seen + Latin *tectum* a roof or canopy]

optic tract *n.* The part of each ***optic nerve** between the ***optic chiasm** and the ***lateral** geniculate nucleus. See also **OPTIC RADIATION**, **TECTAL PATHWAY**.

optimal foraging *n.* Searching for food using strategies that are most efficient or cost-effective in terms of minimizing metabolic energy or
*****ebook converter DEMO Watermarks*****

maximizing **Darwinian fitness*, a phenomenon that has been demonstrated empirically in various species of animals although it is not a necessary prediction of the theory of evolution by **natural selection*, which does not require that optimality ever be attained.

optimal movement *n.* A form of **apparent movement*, indistinguishable from real movement, that occurs when two visual stimuli a few centimetres apart are presented in an alternating pattern with an interstimulus interval too long for the stimuli to appear simultaneous or for **partial movement* to occur but not long enough for **phi movement* or the disappearance of apparent movement and the veridical perception of the stimuli simply alternating. In optimal movement, a single stimulus appears to move smoothly and continuously back and forth across the space between the two actual stimuli. Also called *beta movement*, *stroboscopic movement*, or *optimal motion*. Often misleadingly called the *phi phenomenon*, a term that in careful usage is reserved for the phenomenon of **phi movement*. See also KORTE'S LAWS.

optimism, unrealistic See UNREALISTIC OPTIMISM.

optional stopping *n.* In sequential data collection, halting the process in the light of the data collected up to that point, as when a researcher continues collecting scores just until the data support the hypothesis under investigation. This procedure is unacceptable, and it undermines the validity of any statistical tests that are later performed on the data.

optogram *n.* An image fixed or imprinted on the retina by the photochemical action of light on **rhodopsin*. [From Greek *optikos* of or relating to vision, from *optos* seen, from *ops* an eye + *gramme* a line]

optohapt *n.* An electronic device for blind people that converts printed text into vibrations that are transmitted to various locations on the body. Also called an *optophone*. Compare BRAILLE, OPTACON, TELETACTOR (for deaf people). [Named by the US psychologist Frank A(rthur) Geldard (1904–84) who, with several colleagues, developed it in 1966, from Greek *optos* seen, from *ops* an eye + *haptēin* to touch]

optokinetic nystagmus *n.* A form of **nystagmus* characterized by smooth tracking movements of the eyes interspersed with **saccades*, enabling an object or image moving across the visual field to be perceived more or less continuously. **OKN** *abbrev.* [From Greek *optos* seen + *kinetikos* of or relating to motion, from *kineein* to move + *nystagmos* nystagmus, from *nystazein* to nap]

oral *adj.* Of or relating to the mouth, or expressed in spoken rather than written form (as in an *oral agreement* or an *oral examination*). Compare **PARENTERAL**. [From Latin *os, oris* the mouth]

oral-aggressive character *n.* In **psychoanalysis*, a personality type resulting from **fixation* (2) at the **oral* sadistic phase and **sublimation* of the impulses of that phase in later life. It is characterized by aggressiveness, exploitativeness, ambition, and envy. Also called an *oral-aggressive personality*.

oral apraxia *n.* A syndrome characterized by a reduced ability or inability to produce, on command, voluntary movements of the mouth, such as sticking the tongue out or opening the mouth, although these movements may be produced without difficulty in natural circumstances such as eating and drinking. See also **APRAXIA**. [From Latin *os, oris* the mouth]

oral character *n.* In **psychoanalysis*, a personality pattern determined by **fixation* (2) in early childhood at the **oral* stage, such a person being extremely dependent on others for maintenance of self-esteem and tending to relieve stress and depression by eating, drinking, talking, or smoking. Also called the *oral personality* or *oral-passive character*. See also **ORAL-AGGRESSIVE CHARACTER**, **ORAL DEPENDENCE**.

oral dependence *n.* In **psychoanalysis*, marked reliance on other people resulting from **fixation* (2) at the **oral* stage.

oral erotism *n.* In **psychoanalysis*, sensuous pleasure derived from stimulation of the mouth and lips by kissing, smoking, eating, drinking, talking, engaging in **fellatio* or **cunnilingus*, or playing a wind instrument,

and focusing of **libido* on the mouth during the **oral* stage. Also called *oral eroticism*. **oral-erotic** *adj.*

oral-incorporative phase *n.* Another name for the **early oral phase*.

oral-passive character *n.* Another name for the **oral* character. Also called the *oral-passive personality*.

oral primacy *n.* In **psychoanalysis*, the phenomenon of **libido* being focused first on the mouth and lips.

oral sadistic phase *n.* The second of the two phases of the **oral* stage, corresponding to the teething period, according to a subdivision suggested in 1924 by the German psychoanalyst Karl Abraham (1877–1925) in his book *Versuch einer Entwicklungsgeschichte der Libido* (A Study of the Developmental History of the Libido). It is characterized by biting, in contrast to the **early oral phase*, which is characterized by sucking. In a chapter in a co-authored book *Developments in Psycho-Analysis* in 1952, the British-based Austrian psychoanalyst Melanie Klein (1882–1960) rejected Abraham's distinction between the early sucking and later biting phases of the oral stage, and she declared the oral stage to be sadistic from the start: 'aggression forms part of the infant's earliest relation to the breast, though it is not usually expressed in biting at [the early] stage'. Also called the *oral sadistic stage* or the *cannibalistic stage*. See also [ORAL-AGGRESSIVE CHARACTER](#).

oral stage *n.* In **psychoanalysis*, the first **libidinal stage* of **psychosexual development*, occupying the first year of life, during which **libido* is focused on the mouth and lips, as they are stimulated during feeding, through which the **object-relationship* is expressed, the loving relationship towards the mother being experienced through ideas of eating and being eaten. During this stage, the **instinctual source* is the oral zone, the **instinctual object* is food, and the **instinctual aim* is **incorporation*. Sigmund Freud (1856–1939) had not developed this concept when the first edition of his book *Three Essays on the Theory of Sexuality* appeared in 1905, but the revised edition of 1915 included a full and detailed exposition of the theory. See [EARLY ORAL PHASE](#), [ORAL SADISTIC PHASE](#). See also [ANAL STAGE](#),

*****ebook converter DEMO Watermarks*****

GENITAL STAGE, LATENCY PERIOD, ORAL—AGGRESSIVE CHARACTER, ORAL CHARACTER, PHALLIC STAGE, POLYMORPHOUS PERVERSITY. Also called the *oral phase*.

Orbison illusion *n.* A visual illusion caused by overlaying a simple geometric figure such as a circle or a square on a pattern of concentric circles or radiating lines, the effect being to distort the apparent shape of the figure (see [illustration](#)). It is closely related to [*Ehrenstein's square illusion](#) and the [*Ponzo illusion](#). [Named after US psychologist William Dillard Orbison (1911–52) who first drew attention to it in 1939]

Orbison illusion. The inner square and the bounding square both appear distorted.

orbitofrontal cortex *n.* The area of the [*prefrontal cortex](#) at the base of the anterior frontal lobes. [From Latin *orbis* a circle, alluding to the bony

*****ebook converter DEMO Watermarks*****

cavities of the eye sockets]

order *n.* **1.** An arrangement or sequence of objects or elements; or an established or customary social system or structure, especially a social hierarchy. **2.** A command or instruction issued by a person in a position of authority over another. **3.** In biology, a **taxonomic* group into which a **class* (2) is divided, containing one or more **families* (2). Thus the class of Mammalia (mammals) includes the orders Carnivora and Primates, each of which is divided into families. [From Latin *ordo* an order]

ordered recall *n.* A test of **short-term memory* in which the respondent is presented with a sequence of items, usually numbers, and then tries to repeat them back in the same order. The **Wechsler scales* include both ordered recall and **backward span* subtests.

order effect *n.* In research methods, any **extraneous variable* arising from the serial order in which the procedures are administered or the measurements taken, for example fatigue (which may lead to a decline in performance on later measurements) or learning and practice (which may lead to improved performance on later measurement). *See also* COUNTERBALANCING (1), LATIN SQUARE, ONE-GROUP PRETEST–POSTTEST DESIGN.

ordinal scale *n.* A scale of measurement in which data are arranged in order of magnitude but there is no standard measure of degrees of difference between them, for example a ranking of tennis players. *See also* MEASUREMENT LEVEL, RANK, SCALE (1), UNFOLDING TECHNIQUE. *Compare* ABSOLUTE SCALE, INTERVAL SCALE, LOG-INTERVAL SCALE, NOMINAL SCALE, RATIO SCALE. [From Latin *ordinalis* of the order in a sequence, from *ordo* a row or order]

orectic *adj.* Of or relating to appetite or desire. **orexis** *n.* Appetite or desire. [From Greek *orexis* appetite, from *oregein* to reach for]

Orestes complex *n.* In **psychoanalysis*, a son's desire to kill his mother. *Compare* OEDIPUS COMPLEX. [Named after Orestes in Greek mythology, the son of Agamemnon and Clytemnestra, who killed his mother and her lover in revenge for the murder of his father]

organelle *n.* A specialized structure such as a [*mitochondrion](#), having a particular function or group of functions within a cell. [From Latin *organella* a little organ, diminutive of *organum* an organ]

organ erotism *n.* In [*psychoanalysis](#), the focusing of [*libido](#) in specific organs at different stages or phases of development. Also called *organ eroticism* or *organ libido*. See [ANAL EROTISM](#), [ORAL EROTISM](#), [PHALLIC EROTISM](#), [URETHRAL EROTISM](#).

organic affective disorders *n.* Another name for organic [*mood disorders](#). See [ORGANIC DISORDERS](#).

organic brain syndrome *n.* Another name for an [*organic disorder](#). **OBS** *abbrev.*

organic disorders *n.* Disorders involving a physical [*lesion](#) in an organ or body part. An organic mental disorder is one involving disease, dysfunction, or damage affecting the brain, arising from a primary brain disorder or injury, a disorder in another part of the body with secondary effects in the brain, or the effects of a toxic substance. Included in this category are various forms of [*dementia](#), [*cerebral arteriosclerosis](#), organic [*affective disorders](#), organic [*anxiety disorder](#), organic [*catatonic disorder](#), organic [*delusional disorder](#), organic [*dissociative disorder](#), [*organic hallucinosis](#), organic [*mood disorder](#), organic [*personality disorder](#), [*postencephalitic syndrome](#), [*postconcussional disorder](#), [*traumatic brain injury](#). Also called *organic brain syndromes (OBS)*. [From Greek *organikos* of or pertaining to an organ, from *organon* an implement, or an organ from *ergein* to work]

organic hallucinosis *n.* A [*mental disorder](#) of persistent or recurrent [*hallucinations](#) occurring in clear consciousness, sometimes not recognized by the hallucinator as such, arising as a consequence of an [*organic disorder](#). See also [ALCOHOL HALLUCINOSIS](#), [HALLUCINOSIS](#).

organic mental disorders See [ORGANIC DISORDERS](#). Compare [PSYCHOGENESIS](#).

organism *n.* Any living thing, including a human or other animal, a plant, a fungus, a protist, a bacterium, or a virus. *See also* [KINGDOM \(2\)](#). [From *organize*]

organizational psychology *n.* The field of applied psychology devoted to the structures and functions of organizations and the activities of the people within them. It is applied not only in industrial organizations, but also in schools, hospitals, prisons, military units, and other non-industrial organizations. It focuses on such psychological problems as job satisfaction, employee attitudes and motivation, and their effects on absenteeism, labour turnover, and organizational productivity and efficiency. *See also* [INDUSTRIAL/ORGANIZATIONAL PSYCHOLOGY](#).

organization, Gestalt principle of *n.* Another name for a Gestalt *grouping law.

organized crime *n.* 1. A crime that is premeditated and carefully planned, usually leaving little forensic evidence at the crime scene, perpetrated by an offender who knows right from wrong and tends to lack remorse. It is contrasted with a *disorganized crime* that is usually unplanned, often leaves forensic evidence at the scene, and tends to be perpetrated by an offender who is young, under the influence of alcohol or drugs, often remorseful, and sometimes mentally disordered. The distinction was first drawn in the late 1970s by the Behavioral Science Unit that was set up by the FBI in 1974 to study serial homicide and rape cases. More recent research suggested that serial offenders tend to resemble one another in the organized aspects of their behaviour and differ most strikingly in the disorganized aspects. *See also* [CRIMINAL PROFILING](#). 2. Crime that is planned and carried out systematically and on a large scale; also a collective label for the people who perpetrate this kind of crime. [From French *organiser* to give structure to, from Latin *organizare* to accompany on the organ, from *organum* an organ + *-izare* from Greek *-izein* to cause to become]

organ libido *n.* Another name for *organ erotism.

organ neurosis *n.* A term used in *psychoanalysis to denote a

*psychosomatic disorder.

organ of Corti *n.* A spiral structure within the *cochlea of the inner ear, containing the *basilar membrane in which are situated *hair cells that convert sound waves into nerve impulses. Also called *Corti's organ*. [Named after the Italian anatomist Alfonso Corti (1822–76) who was the first to describe the structure of the inner ear in detail in 1851]

organ of Golgi *n.* Another name for a *Golgi tendon organ. [Named after the Italian cytologist Camillo Golgi (1843–1926) who gave the first complete description of it in 1880]

organophosphate *n.* Any of a group of *anticholinesterase compounds used as insecticides and pesticides that cause irreversible suppression of *cholinesterase. Also called an *organophosphorus compound*. See also NERVE GAS, ORGANOPHOSPHATE POISONING. **OP** abbrev. [From *organo-* indicating a compound containing an organic group + *phosphate*]

organophosphate poisoning *n.* A condition resulting from exposure to *organophosphates, with signs and symptoms such as amnesia, anxiety, depression, aphasia, and asthenia. See also GULF WAR SYNDROME, NERVE GAS. Compare CHRONIC FATIGUE SYNDROME.

organum vasculosum lamina terminalis *n.* A structure bordering the third *ventricle of the brain, believed to contain receptors for *angiotensin II and thus to play a part in *hypovolaemic thirst. **OVL** abbrev. [Latin: vascular organ end plate]

orgasm *n.* The culminating phase of the *sexual response cycle in which sexual pleasure reaches a peak with release of tension and rhythmic contraction of the *perineal muscles and sex organs, accompanied in the male by a sensation of ejaculatory inevitability followed by *ejaculation (1) of semen and contraction of the anal sphincter, and in the female by contractions of the wall of the *vagina and the anal sphincter. See also DE-REFLECTION, DELAYED EJACULATION, FEMALE ORGASMIC DISORDER, IMPOTENCE (2), ORGASMATRON, ORGASMIC DYSFUNCTION DEVICE, ORGONE THERAPY, PERSISTENT SEXUAL AROUSAL SYNDROME, PREMATURE (EARLY) EJACULATION, REFRACTORY PERIOD, SEXUAL
*****ebook converter DEMO Watermarks*****

DYSFUNCTIONS, SEXUAL RESPONSE CYCLE. **orgasmic** *adj.* Of or relating to an orgasm. **orgasmic phase** *n.* The third phase of the *sexual response cycle, when orgasm occurs. [From Greek *orgasmos* a swelling]

orgasmatron *n.* A facetious name for an *orgasmic dysfunction device, inspired by an orgasm-inducing contraption in the film *Sleeper* (1973) directed by the US film director Woody Allen (born 1935). *See also* **ORGASMIC DYSFUNCTION DEVICE**, **ORGONE THERAPY** [From Greek *orgasmos* a swelling + *-tron* denoting an instrument, from *arotron* a plough]

orgasmic dysfunction device *n.* An electrical *spinal cord stimulator used to induce *orgasm in women with *orgasmic dysfunctions. In 1998, the US anaesthesiologist T. Stuart Meloy (born 1958) stumbled on a mid-spinal area associated with orgasmic response while implanting electrodes under local anaesthetic in the spine of a female patient to relieve chronic back pain. When he placed the electrodes in a particular position, she exclaimed: 'You're going to have to teach my husband how to do that.' Also (facetiously) called an *orgasmatron*.

orgasmic dysfunctions *n.* Another name for *female orgasmic disorder, *delayed ejaculation, and *premature (early) ejaculation. Also called *orgasm disorders* or *orgasmic disorders*. *See also* **IMPOTENCE** (2).

orgasmic impotence *See* **IMPOTENCE** (2).

orgone therapy *n.* A form of *psychotherapy and a treatment for cancer and other physical ailments devised by the Austrian (later US-based) psychiatrist Wilhelm Reich (1897–1957), first described briefly though not named in his book *The Function of the Orgasm* (1942), then more fully in *The Cancer Biopathy* (1948) and *Character Analysis* (3rd ed., 1949). Physical orgone therapy involved an orgone accumulator or box designed to concentrate naturally occurring orgone energy believed to permeate the atmosphere. Reich believed that orgasms regulate bio-energy levels and were necessary for maintenance of mental and physical health. Also called *Reichian therapy*. *See also* **BODY THERAPIES**. [Coined as a blend of *org(asm)* and (*horm*)one]

orientation column *n.* A slender slab, extending through the full thickness of the **primary visual cortex* (Area V1), consisting of cells that are selectively responsive to stimuli oriented at a particular angle in their **receptive fields*, the specific angle changing from one orientation column to the next by a regular amount of 10 degrees clockwise or anticlockwise for every horizontal movement of 0.05 millimetre, or a full circuit of 180 degrees per millimetre (approximately). With appropriate biochemical staining, orientation columns in the primary visual cortex of an organism being stimulated by parallel stripes oriented at a particular angle show up as a complex but regular configuration of 1-millimetre stripes unrelated to the pattern of **ocular-dominance columns*.

orientation-specific cell *n.* A general term for a **simple cell*, **complex cell*, or **hypercomplex cell* that responds selectively to stimuli oriented at a specific angle in its **receptive field*. Also called an *orientation-selective cell*. See also *TWISTED-CORD ILLUSION*.

orienting response *n.* The characteristic behavioural and physiological **response* to a novel or potentially threatening stimulus, including focusing attention on the source of the stimulus, turning the head and body towards it, and arousal of the **reticular activating system* and the **sympathetic nervous system*. Also called the *orienting reaction* or *orienting reflex*. See also *TASK-POSITIVE NETWORK*. [From Latin *oriens*, *orientis* rising, present participle of *oriri* to rise]

orphan drug *n.* A potentially useful drug that the major pharmaceutical companies are unwilling to market or promote, typical examples being **inositol*, **lithium carbonate*, and **St John's wort*, none of which can be patented because they occur naturally.

orthodromic *adj.* Of or relating to a nerve impulse conducted in the normal direction, from the axon hillock towards the axon terminal. Compare *ANTIDROMIC*. [From Greek *orthos* right + *dromos* a course or run + *-ikos* of, relating to, or resembling]

orthographic agraphia See *AGRAPHIA*.

orthography *n.* **1.** Correct spelling or the principles underlying spelling. Compare *CACOGRAPHY*. **2.** A system of writing. [From Greek *orthos* straight, right + *graphein* to write]

orthomolecular therapy *n.* An approach to the treatment of **mental disorders* based on the doctrine that every disorder can be alleviated with a specific chemical substance. The approach was developed by the Nobel prizewinning US chemist Linus (Carl) Pauling (1901–94). Also called *megavitamin therapy*, *orthomolecular psychiatry*, *vitamin therapy*. [From Greek *orthos* right + English *molecular*]

orthopsychiatry *n.* An approach to **psychiatry* that emphasizes preventive techniques and collaboration between psychiatry, psychology, social work, and other behavioural, social, and clinical sciences. [From Greek *orthos* right + English *psychiatry*]

oscillating figure *n.* Another name for an **ambiguous figure*.

oscillopsia *n.* Chaotic eye movements occurring involuntarily and causing perceived objects to appear to sway or bounce about. [From Latin *oscillare* to swing, from *oscillum* a swing + Greek *opsis* sight, from *ops* an eye + *-ia* indicating a condition or quality]

osmometric thirst *n.* Another name for **intracellular* thirst. [From *osmosis* + Greek *metron* a measure]

osmoreceptor *n.* **1.** Another name for an **olfactory receptor*. **2.** A type of neuron located primarily in the **preoptic nuclei* at the front of the hypothalamus, sensitive to cellular dehydration, able to signal changes in **osmotic pressure*, triggering **intracellular* thirst, and also monitoring concentrations of substances in the blood and regulating the secretion of **vasopressin*. [A blend of Greek *osme* a smell (sense 1) or English *osmosis* (sense 2) + English *receptor*]

osmosis *n.* The diffusion of a solvent such as water across a **semipermeable membrane* from the side where the solution is less

concentrated to the side where it is more concentrated until the concentration and the ***osmotic pressure** on both sides is equalized. *See also* **CELL MEMBRANE**. *Compare* **DIALYSIS**. **osmotic** *adj.* [From Greek *osmos* thrust or impulse + *-osis* indicating a process or state]

osmotic pressure *n.* The pressure exerted by a solution through the motion of its molecules, measured according to the pressure required to prevent ***osmosis** of the pure solvent into it. *See also* **HYPERTONIC (2)**, **HYPOTONIC (2)**, **ISOTONIC (2)**, **OSMORECEPTOR (2)**, **SODIUM PUMP**.

osmotic thirst *n.* Another name for ***intracellular** thirst.

osphresiologia *n.* A ***paraphilia** characterized by recurrent sexually arousing fantasies, sexual urges, or behaviour involving smells. *See also* **RENIFLEUR**. [From Greek *osphresis* a smell + *lagneia* lust]

osphresis *n.* Another name for ***olfaction**. **osphretic** *adj.* Capable of being smelled. [From Greek *osphresis* sense of smell]

osseous labyrinth *n.* Another name for the ***bony labyrinth**. [From Latin *osseus* bony, from *os* a bone]

ossicle *n.* Any of the three tiny bones in the ***middle ear**, the ***malleus** (hammer), ***incus** (anvil), or ***stapes** (stirrup). [From Latin *ossiculum* a little bone, from *os* a bone]

Othello syndrome *n.* Morbid and irrational jealousy or, if sufficiently severe, ***jealous delusional disorder**. [Named after Shakespeare's play *Othello* and the eponymous character whose sexual jealousy leads him to murder his innocent wife]

other, significant *See* **SIGNIFICANT OTHER**.

otic *adj.* Of or relating to the ear. [From Greek *otikos* of or relating to the ear, from *ous*, *otos* an ear + *-ikos* of, relating to, or resembling]

otitis *n.* Inflammation of the ear, sometimes causing deafness. **otitis externa** *n.* Inflammation of the external canal or the pinna of the outer ear, causing itching, weeping or discharge, and sometimes hearing loss and pain, often related to anxiety or stress. **otitis media** *n.* Inflammation of the middle ear, generally causing hearing loss and pain, a common affliction of childhood. [From Greek *ous* an ear + *-itis* indicating an inflammation]

otoconium *n.* Another name for an ***otolith**. **otoconia** *pl.* [From Greek *ous*, *otos* an ear + *konis*, *konia* ashes, alluding to their appearance when viewed without magnification]

otogenic tone *n.* A ***tone** (1) that is not present in the sound wave entering the ear but is generated by the ear or the auditory system itself. *See also* COMBINATION TONE, MISSING FUNDAMENTAL ILLUSION. [From Greek *ous*, *otos* an ear + *genes* born or produced + *-ikos* of, relating to, or resembling]

otolith *n.* Any of the tiny crystals of calcium carbonate, with a density of 2.95 grams per cubic centimetre, almost three times the density of water, in the ***utricle** and ***sacculle** within the ***vestibular system** of a vertebrate animal, playing an important part in the vestibular system of the inner ear, responsive to linear acceleration, and partly responsible for the sense of balance and orientation. Linear acceleration of the head causes the ***hair cells** embedded in the *otolith receptor* to move with it, but the dense otoliths resist acceleration and tend to hold the gelatinous membrane stationary, causing the hair cells that protrude into the membrane to bend backwards and trigger adjacent neurons to transmit nerve impulses to the brainstem and cerebellum. The otolith organs are also responsive to gravity, which according to the general theory of relativity formulated by the German-born US physicist Albert Einstein (1879–1955) is equivalent to accelerating an object upwards at 9.8 metres per second squared. Also called a *statolith*. *See also* SACCULE, STATOCYST. *Compare* ENDOLYMPH. [From Greek *ous*, *otos* an ear + *lithos* a stone]

otology *n.* The study of the ear, including prevention, diagnosis, and treatment of its disorders. **otologist** *n.* A physician who specializes in otology. [From Greek *ous*, *otos* an ear + *logos* word, discourse, or reason]

otosclerosis *n.* A hereditary disorder of the middle ear, usually appearing before age 30 years, affecting twice as many women as men and often worsening during pregnancy. When it occurs, parts of the ***bony labyrinth** become irregularly ossified and the ***stapes** (stirrup) becomes immobilized, causing tinnitus and then deafness. [From Greek *ous*, *otos* an ear + *sklerosis* a hardening, from *skleros* hard + *-osis* indicating a process or state]

ototoxic *adj.* Damaging to the ***vestibulocochlear nerve** or the organs of hearing or balance, characteristic of drugs including ***aspirin**, ***quinine**, and many antibiotics if taken in excess. **ototoxic deafness** *n.* Deafness caused by ototoxic drugs. *See also* **SENSORINEURAL DEAFNESS**. [From Greek *ous*, *otos* an ear + *toxikon* arrow-poison, from *toxon* a bow + *-ikos* of, relating to, or resembling]

Ouchi illusion *n.* A visual illusion in which a chequered pattern of small black and white rectangles, containing a circular region in which the rectangles are oriented at right angles to those in the rest of the figure, creates an impression of relative motion when the whole pattern is moved (see **illustration**), the illusion being caused by the excitation of spatially overlapping ON and OFF regions of ***centre-surround receptive fields** of retinal neurons. Also spelt *Ōuchi illusion*. Compare **PINNA-BRELSTAFF ILLUSION**. [Named after the Japanese graphic artist Hajime Ōuchi who first published it in a book of graphic designs in 1973]

Ouchi illusion. An illusion of relative motion, most vividly seen if the image is moved slowly from side to side or in a circle.

Ouija board *n.* A board marked with letters of the alphabet, used in **parapsychology* to spell out answers to questions with a pointer or inverted glass held by the fingertips of a group of participants, the answers supposedly coming from the spirits of dead people. [From French *oui* yes + German *ja* yes]

outbreeding *n.* Producing offspring through mating between parents that are not closely related. Also called *exogamy*.

outer ear *n.* The sound-collecting part of the **ear*, comprising the **pinna*

and the **external auditory canal*, separated from the middle ear by the **tympanic membrane*. Also called the *external ear*. Compare *INNER EAR*, *MIDDLE EAR*.

outer hair cell *n.* Any of approximately 25,000 **hair cells* in the **organ of Corti*, specialized as **transducers* of sound waves into nerve impulses and sensitive to low sound levels, easily damaged by loud noise (over 85 decibels), and probably involved in encoding information about the loudness of sounds. Compare *INNER HAIR CELL*. **OHC** *abbrev.* [So called because they are nearer to the outside of the cochlea than are the inner hair cells]

outer nuclear layer *n.* A stratum of the **retina* containing the cell bodies of the **photoreceptors*. [So called because the nuclei of the rods and cones are situated there]

outer plexiform layer *n.* A thin stratum of the **retina*, separating the middle and outer retinal layers, within which the **photoreceptors* terminate and make synaptic connections with **bipolar* cells and **horizontal cells*. See also *INTERPLEXIFORM CELL*. [From Latin *plexus* a network, from *plectere* to weave]

outlier *n.* In statistics, an extreme score that is widely separated from the rest of the scores and raises the possibility of an error in measurement, recording, or data entry.

out-of-body experience *n.* A form of **depersonalization* characterized by a sense of detachment from one's body and perception of oneself from a distance, usually from above. It is often associated with sleep deprivation, some forms of drug intoxication, or mental disorders such as **schizophrenia* and certain **dissociative disorders*. It is sometimes (and perhaps generally) triggered by **sleep* paralysis. The term was introduced in 1968 by the US journalist and psychic Susy Smith (1911–2001) in the title of her book *Out-of-Body Experiences for the Millions*. See also *NEAR-DEATH EXPERIENCE*. **OBE** or **Oobe** *abbrev.*

out-of-level testing *n.* In psychometrics, administering a test that is designed for a different age of grade level from that of the respondent.

*****ebook converter DEMO Watermarks*****

outplacement counselling *n.* A form of **counselling* offered to people facing redundancy from work. US *outplacement counseling*.

oval window *n.* An opening in the wall of the **middle ear*, leading to the **inner ear*, containing the footplate of the **stapes*, which transmits vibrations to the **cochlea*. Also called the *fenestra ovalis*. See also *ROUND WINDOW*. [So called because of its elliptical shape]

ovarian follicle *n.* Another name for a **Graafian follicle*.

ovary *n.* Either of the two female sex glands or gonads that secrete sex hormones such as **oestrogen*, **progesterone*, and **oestrone* into the bloodstream and release **ova*. Compare *TESTIS*. **ovarian** *adj.* [From Latin *ovarium* an egg-container, from *ovum* an egg]

overanxious disorder *n.* A childhood **anxiety disorder*, not included in the **DSM-5* classification, corresponding to **generalized anxiety disorder* in adults, in which anxiety is focused on such matters as personal appearance, health, and academic or sporting achievement at school.

overattribution bias *n.* Another name for the **fundamental attribution error*.

overconfidence effect *n.* Unwarranted belief in the correctness of one's judgements or beliefs. Many studies have used general knowledge quiz questions to which respondents give answers and also confidence ratings indicating their estimates of their probability of being correct, from 0 per cent certain to 100 per cent certain. Average estimates of probability of being correct—confidence ratings—tend to be much higher than average percentages of responses that turn out actually to be correct. For moderately difficult items, average confidence ratings tend to be around 90 per cent when approximately 65 to 70 per cent of the answers are correct, and to approach 100 per cent when approximately 80 per cent of the answers are correct. **Anchoring and adjustment* may account for the effect, and **hindsight bias* is closely related to it. Research in this area can be traced to 1957 and was revived in the late 1970s following extensive research by the US

psychologists Sarah C. Lichtenstein (born 1933) and Baruch Fischhoff (born 1946). *See also* [DEPRESSIVE REALISM](#), [HARD—EASY EFFECT](#). *Compare* [UNREALISTIC OPTIMISM](#).

overcorrection *n.* Another name for [*hypercorrection](#).

overdetermination *n.* In [*psychoanalysis](#), a characteristic of dreams, symptoms, and other psychological phenomena of manifesting their causative factor more than once or providing more than one outlet for a wish or need. In his book *The Interpretation of Dreams* (1900), Sigmund Freud (1856–1939) described it as follows: ‘Each of the elements of the dream’s content turns out to have been “over-determined”—to have been represented in the dream-thoughts many times over’ (*Standard Edition*, IV–V, at p. 283). Overdetermination is a consequence of [*condensation](#). Also called *multiple determination*. *See also* [OVERINTERPRETATION](#), [PSYCHICAL DETERMINISM](#).
overdetermined *adj.*

overdominance *n.* A phenomenon associated with certain [*heritable *traits](#) in which a [*heterozygote](#) has a phenotype that is more extreme on some measurable dimension than either of the corresponding [*homozygotes](#). Also called *superdominance*. *See also* [DOMINANCE \(GENETIC\)](#). *Compare* [FILIAL REGRESSION](#), [REGRESSION TOWARDS THE MEAN](#).

overextension *n.* The interpretation of a word, usually by a child during the course of language development in the second or third year, to denote more than it normally denotes, as when a child understands the word *daddy* to denote all men, or *cat* to denote all animals. *See also* [CONCEPT FORMATION](#). *Compare* [MISMATCH](#), [OVERGENERALIZATION](#), [UNDEREXTENSION](#).

overflow response *n.* Another name for [*vacuum activity](#).

overgeneralization *n.* In language acquisition, the extension of a grammatical rule beyond its range of applicability in standard usage, as in the use by a child of such formations as *foots* instead of *feet* and *goed* instead of *went*, or in response to a request to behave, *I am being have* instead of *I am behaving*. *Compare* [MISMATCH](#), [OVEREXTENSION](#), [UNDEREXTENSION](#).

overinclusiveness *n.* The use of a concept to encompass too broad a range of items, indicating an inability to preserve conceptual boundaries, so that distantly associated items become incorporated into concepts, making them abstract and obscure. It is characteristic of **thought disorder* in **schizophrenia*.

overinterpretation *n.* Deriving more meaning than the information warrants. In **psychoanalysis*, it denotes an additional **interpretation*, especially of a dream, following one that has already proved to be illuminating, the additional interpretations sometimes being worthwhile and sometimes not. In a key passage in his book *Introductory Lectures on Psycho-Analysis* (1916–17) Sigmund Freud (1856–1939) described it thus: ‘The achievements of condensation can be quite extraordinary. It is sometimes possible by its help to combine two quite different latent trains of thought into one manifest dream, so that one can arrive at what appears to be a sufficient interpretation of a dream and yet in doing so can fail to notice a possible “over-interpretation” ’ (*Standard Edition*, XV–XVI, at p. 173). But in a famous passage in his book *The Interpretation of Dreams* (1900), he wrote: ‘There is often a passage in even the most thoroughly interpreted dream which has to be left obscure; this is because we become aware during the work of interpretation that at that point there is a tangle of dream-thoughts which cannot be unravelled and which moreover adds nothing to our knowledge of the content of the dream. This is the dream’s navel, the spot where it reaches down into the unknown’ (*Standard Edition*, IV–V, at p. 525). See also *OVERDETERMINATION*. **overinterpreted** *adj.*

overjustification *n.* Rewarding a person for performing a task that the person considers adequately rewarded or worth doing for its own sake, often resulting in a reduction in the person’s liking for the task. Also called *oversufficient justification*.

overlearning *n.* Additional learning carried out after a skill has been learned to a high criterion. Although the skill does not improve as a result of overlearning, its long-term retention is generally improved and its vulnerability to distractors such as the **audience effect* is generally reduced, as professional musicians and other performing artists are aware. See also *OVERTRAINING EXTINCTION EFFECT*, *OVERTRAINING REVERSAL EFFECT*. **overlearn** *vb.*

*****ebook converter DEMO Watermarks*****

overregularization *n.* A form of language, sometimes generated by children, in which grammatical rules are extended to irregular cases where they do not apply, leading to expressions such as *I eated my ice cream*. Also called *overregulation*.

overshadowing *n.* In **classical conditioning*, the following phenomenon, first described by the Russian physiologist Ivan Petrovich Pavlov (1849–1936) on page 141 of his book *Conditioned Reflexes* (1927). If a response has been conditioned to a compound **conditioned stimulus (CS)* consisting of two components, one more intense or **salient (1)* than the other, then test trials with each component on its own reveal conditioning to the more salient component but not to the less salient. Although the weaker component functions as an adequate CS when the organism is conditioned with it alone, in a compound with the stronger component it is completely overshadowed. For example, in conditioning a dog to salivate, if one component is a loud bell and the other is a dim light, and if the **unconditioned stimulus* is food, then, after conditioning, only the loud bell presented alone will elicit the conditioned response of salivation. Similar overshadowing, though not always in such an extreme form, occurs in a wide variety of learning processes in both classical and **operant conditioning*. This phenomenon is not directly related to **verbal overshadowing*. **overshadow** *vb.* [Translated from the Russian *zatmevayet* overshadowing or rendering insignificant in comparison]

oversufficient justification *n.* Another name for **overjustification*.

overtone *n.* A component of a **complex* tone, having a frequency that is an integral multiple of the **fundamental frequency*. The *first overtone*, also called the *second harmonic*, has twice the frequency of the fundamental and is therefore an **octave* higher; the *second overtone* or *third harmonic* has three times the frequency of the fundamental; and so on. Also called a *harmonic*. See also *MISSING FUNDAMENTAL ILLUSION*.

overtraining *n.* The continuation of **conditioning (1)* beyond the point at which the organism shows no further increase in response rate. See also *OVERLEARNING*. **overtrain** *vb.*

overtraining extinction effect *n.* The tendency for an animal that has been subjected to **overtraining* to show more rapid **extinction* (2) than one that has not been overtrained. **OEE** *abbrev.*

overtraining reversal effect *n.* The tendency for an animal that has been subjected to **overtraining* and is then presented with a **habit* reversal learning task to learn to reverse its responses more quickly than an animal that has not been overtrained. **ORE** *abbrev.*

overvalued idea *n.* An irrational and sustained belief, not generally accepted by members of the culture or subculture of the person who holds it, falling short of being a **delusion* inasmuch as the person is willing to entertain the possibility of its falsity.

ovulate *vb.* To release an **ovum* from the **ovary*. **ovulation** *n.* See **OESTROUS CYCLE**. [From Latin *ovulum* a little egg, diminutive of *ovum* an egg]

ovum *n.* An unfertilized female gamete or egg. Compare **ZYGOTE**. *ova* *pl.* [From Latin *ovum* an egg]

oxidative metabolism See **OXIDATIVE PHOSPHORYLATION**.

oxidative phosphorylation *n.* The process whereby energy released by oxidation is used to synthesize the energy-storing molecule **ATP*. Also called *oxidative metabolism*. See also **KREBS CYCLE**. [From *oxidation* + *phosphorus*, alluding to the fact that ATP is a phosphate, + *-ation* indicating an action, process, state, condition, or result]

oxycodone *n.* Oxycodone terephthalate, a **narcotic* analgesic that is sometimes used as a street drug. Also called *Percodan* (trademark).

oxymethalone *n.* A synthetic **anabolic steroid* used in the treatment of osteoporosis and anaemia, as well as in stimulating muscle growth in undernourished or underdeveloped patients, and often used by bodybuilders and athletes. Also (more correctly) spelt *oxymethylone*. Formula: $C_{21}H_{32}O_3$. [From its systematic name (17 β -hydr)oxymethyl(ene-17 α -methyl-3-

*****ebook converter DEMO Watermarks*****

androstan)one]

oxymoron *n.* A ***figure of speech** involving the combination of semantically contradictory elements, thus forcing a figurative interpretation, as in Milton's *living death* or, according to some, *British intelligence*.
oxymoronic *adj.* [From Greek *oxys* sharp + *moros* stupid]

oxymorphone *n.* Oxymorphone hydrochloride, a ***narcotic** analgesic drug, prescribed for moderate or severe pain and as a preoperative medication. Also called *Numorphan* (trademark).

oxytocin *n.* A ***hormone** and ***neurotransmitter** alphahypophame (formula: $C_{43}H_{66}N_{12}O_{12}S_2$), with a chemical structure similar to ***vasopressin**, secreted by the ***posterior pituitary** and also manufactured synthetically. In females it is secreted during and after childbirth and in response to sucking of the breast, stimulating lactation and contractions of the muscles of the uterus, and in males it is implicated in the ejaculatory response during sexual activity. It tends to increase social and maternal bonding, in-group trust and empathy, and rejection of outsiders. It was discovered in 1906 by the English pharmacologist Sir Henry Hallett Dale (1875–1968). **OT** abbrev. [From Greek *oxys* sharp + *tokos* birth, alluding to the fact that it induces uterine contractions]

pacemaker neuron *n.* Any of a number of different nerve cells in the autonomic nervous system that trigger regular cyclic activities, such as heartbeat, breathing, and EEG waves. The ***suprachiasmatic nucleus** is thought to have a role in regulating them. *See also* **BIOLOGICAL CLOCK**, **BIOLOGICAL RHYTHM**.

pachymeninx *n.* Another name for the ***dura mater**. [From Greek *pachys* thick + Greek *meninx* a membrane]

Pacinian corpuscle *n.* A type of sensory nerve ending, the size and colour of a grain of rice, attached to the end of a single nerve fibre in the ***skin** and joints, abundantly present along the sides of the fingers, in the palms, and in the joints, sensitive to pressure and vibration. Also called a *Pacinian body*, *Pacini's corpuscle*, or a *Vater–Pacini corpuscle*. *See also* **PALLAESTHESIA**. *Compare* **FREE NERVE ENDING**, **GOLGI TENDON ORGAN**, **MEISSNER'S CORPUSCLE**, **MERKEL CELL**, **RUFFINI CORPUSCLE**. [Named after the Italian anatomist Filippo Pacini (1812–83) who rediscovered it in the fingers in 1835 and gave a full description of it in 1840, although the German anatomist Abraham Vater (1684–1751) had discovered it some time prior to 1741]

Pac-Man *n.* A shape consisting of a circular disc with a missing segment, used as an icon in an electronic computer game in which the player's task is to guide the icon through a maze while devouring other icons and eluding attacks; also, because of its resemblance in shape, the name given to the symbol used at each vertex of a ***Kanizsa triangle** to create illusory contours. Also spelt *PacMan*, *Pacman*, or *pacman*. [Trademark]

paedophilia *n.* A ***paraphilia** characterized by recurrent, intense sexual fantasies, urges, or behaviour involving sexual activity with prepubescent girls or boys. US *pedophilia*. See also **PAEDOPHILIC DISORDER**. Compare **GERONTOPHILIA**. **paedophile** *n.* A person who manifests paedophilia. US *pedophile*. [From Greek *pais*, *paidos* a boy or child + *philos* loving, from *philein* to love + *-ia* indicating a condition or quality]

paedophilic disorder *n.* A ***paraphilic disorder** in ***DSM-5** characterized by intense, recurrent sexual arousal from sexual activity with a child who has not yet reached ***puberty**, or associated fantasies or urges over a period of at least six months. To meet the diagnostic criteria, the individual must either have acted out this behaviour, or the fantasies or urges must have caused marked distress or interpersonal problems. US *pedophilic disorder*. See also **PAEDOPHILIA**.

pagophagia *n.* A form of ***pica** characterized by the eating of ice. [From Greek *pagos* ice + *phagein* to consume + *-ia* indicating a condition or quality]

pain *n.* An unpleasant sensation usually caused by noxious stimulation of sensory nerve endings, defined in the *Classification of Nursing Diagnoses* of the North American Nursing Diagnosis Association as a state in which severe discomfort or an unpleasant sensation is experienced and signalled by the following: verbal and non-verbal communication, including self-protective behaviour; narrowed attentional focus evidenced by altered time perspective, social withdrawal, or impaired thought processes; distraction behaviour such as moaning, crying, pacing, restlessness; a facial expression of pain characterized by dull and lustreless eyes, a beaten appearance, and fixed or scattered facial movements or grimaces; alteration of muscle tone ranging from listlessness to rigidity; and autonomic responses such as increased blood pressure and pulse rate, pupil dilation, and increased or decreased respiration rate. See **ACUTE PAIN**, **ANALGESIA**, **CHRONIC PAIN**, **COLD PRESSOR PAIN**, **ISCHAEMIC PAIN**, **PAIN RECEPTOR**, **REFERRED PAIN**, **SUBSTANCE P**. See also **ADAPTATION (2)**, **ALGESIMETER**, **AUDIOANALGESIA**, **C FIBRE**, **CINGULATE GYRUS**, **DELTA FIBRE**, **DOLORIMETER**, **ENDORPHIN**, **ENKEPHALIN**, **FLEXION REFLEX**, **FREE NERVE ENDING**, **GATE-CONTROL THEORY**, **INSULA**, **NEURALGIA**, **PAIN ASYMBOLIA**, **PEPTIDE**, **PERIAQUEDUCTAL GREY MATTER**, **PHANTOM LIMB**, **PROTAGLANDIN**, **SOMATOSENSORY CORTEX**, **SPINORETICULOTHALAMIC SYSTEM**, **SPINOTHALAMIC TRACT**, **SUBSTANTIA GELATINOSA**,

*****ebook converter DEMO Watermarks*****

THERMAL GRILL ILLUSION, VASOPRESSIN. **painful** *adj.* [From Latin *poena* punishment or grief, from Greek *poine* penalty]

pain asymbolia *n.* A condition caused by a lesion in the **insula* resulting in stimuli that normally cause pain being perceived but not experienced as unpleasant and not causing suffering. Its existence shows that the unpleasant feeling of pain is not merely a perception of tissue damage. [From English *pain* + Greek *a-* without + *symbolon* a token, from *syn* together + *ballein* to throw]

pain disorder *n.* In **DSM-IV*, a **somatoform disorder* characterized by pain, causing clinically significant distress or impairment in social, occupational, or other important areas of functioning, with psychological factors judged to play an important role in the onset or maintenance of the pain. This condition was relabelled **somatic symptom disorder* in DSM-5. Compare FACTITIOUS DISORDER, MALINGERING.

pain principle *n.* In **psychoanalysis*, the initial form of **Thanatos*, when the destructive instinct is turned on oneself.

pain receptor *n.* Any of the **free nerve endings* located throughout the body that function as **sensory* receptors, transmitting sensations of **pain* in response to noxious stimulation, one type (the *monomodal nociceptor*) being a thinly myelinated **delta fibre* that responds to severe mechanical deformation, the other (the *polymodal nociceptor*) being a **C fibre* that responds to mechanical deformation, excessive heat or cold, and irritant chemical stimulation, and is responsible for the **axon* reflex. In the epidermis and dermis of the skin and in the mucous membranes, any form of stimulation, if intense enough, can stimulate pain receptors, whereas in the viscera only severe mechanical deformation and certain chemicals are adequate stimuli for pain receptors. **Referred pain* arises only from stimulation of deep-lying pain receptors in viscera, joints, and muscles, and never from pain receptors in the skin. See also SUBSTANCE P.

paired-associate learning *n.* Learning connections between pairs of items, usually words, until one member of the pair elicits recall or recognition of the other. For example, the learner may be presented with a list of pairs

*****ebook converter DEMO Watermarks*****

such as *green—box, long—rope, heavy—stone*, and so on, and recall may be tested by listing the first member of each pair with a list of alternatives, for example *green—apple/box/dress/paper*, the learner trying to recognize the correct alternative. Such memory is called *associative memory*. See also [SERIAL ANTICIPATION METHOD](#). **PA** or **PAL** abbrev.

paired comparisons See [METHOD OF PAIRED COMPARISONS](#).

paired samples t test *n.* Another name for the **related scores t test*.

palaeocortex *n.* The three-layered **olfactory cortex* that evolved in humans earlier than most of the human cerebral cortex but not as early as the archaecortex. The word is sometimes used loosely for any part of the cerebral cortex that is not **neocortex*. US *paleocortex*. Also called the *paleencephalon*. See also [PIRIFORM CORTEX](#). Compare [NEOCORTEX](#), [MESOCORTEX](#). [From Greek *palaios* old + Latin *cortex* bark or outer layer]

palaeostriatum *n.* The **globus pallidus*, which is the phylogenetically older part of the **corpus striatum*. US *paleostriatum*. Compare [NEOSTRIATUM](#). [From Greek *palaios* old + *striatus* streaked, from *stria* a furrow or a flute of a column]

palatal *adj.* Of or relating to speech sounds articulated with the front body of the tongue raised towards the hard palate, as in the initial **phoneme* in the word *yes*. See also [PLACE OF ARTICULATION](#).

palato-alveolar *adj.* Of or relating to speech sounds articulated with the tip of the tongue against the **alveolar* ridge and hard palate (usually with some lip rounding), as in the initial **phonemes* in the words *chin*, *judge*, and *shin*, and the second phoneme in *azure*. See also [PLACE OF ARTICULATION](#). [From *palate* + Latin *alveolus* a small depression, referring to the tooth sockets]

paleencephalon *n.* Another name for the **palaeocortex*. [From Greek *palaios* old + *enkephalos* the brain, from *en* in + *kephale* the head]

pa-leng *n.* A [*culture-bound syndrome](#) found in China and southeast Asia, characterized by pathological fear of cold (frigophobia) and of wind (anemophobia), believed to produce fatigue, impotence, and death. Also called *frigophobia*. [From Chinese *pa* fear + *leng* cold or the cold season]

paleocortex See [PALAEOCORTEX](#).

paleostriatum See [PALAEOSTRIATUM](#).

palilalia *n.* A speech abnormality symptomatic of some forms of [*tic](#) disorder and other mental disorders, characterized by repetition of words or speech fragments with a characteristic acceleration during each cluster of repeated speech. Compare [ECHOLALIA](#). [From Greek *palin* back or again + *lalia* speech]

palinacousis *n.* Hearing voices repeating words that were spoken a short while earlier, or a similar repetition of other types of sounds, a rare neurological symptom of damage to the temporal lobe. [From Greek *palin* again + *akousis* hearing, from *akouein* to hear]

palingenesis *n.* 1. Another name for [*recapitulationism](#). 2. In theology, spiritual rebirth through reincarnation or transmigration of souls into other bodies. [From Greek *palin* again + *genesis* birth]

palingraphia *n.* Mirror writing. [From Greek *palin* back or again + *graphein* to write + *-ia* indicating a condition or quality]

pallaesthesia *n.* Sensation of vibration transmitted through the [*skin](#) and bones. US *pallesthesia*. Also called *palmaesthesia* or *palmesthesia*. See also [MEISSNER'S CORPUSCLE](#), [PACINIAN CORPUSCLE](#), [VIBRATION RECEPTOR](#), [VIBRATORY SENSE](#). Compare [PALLANAESTHESIA](#). [From Greek *pallein* to shake + *aisthesis* feeling + *-ia* indicating a condition or quality]

pallanaesthesia *n.* Diminished or non-functional [*pallaesthesia](#). US *pallanesthesia*. Also called *palmanaesthesia* or *palmanesthesia*. [From Greek *pallein* to shake + *an-* without + *aisthesis* feeling + *-ia* indicating a condition]

or quality]

pallidum *n.* An abbreviated name for the **globus pallidus*. [From Latin *pallidus* pale]

palmaesthesia *n.* Another name for **pallaesthesia*. US *palmesthesia*.

palmanaesthesia *n.* Another name for **pallanaesthesia*. US *palmanesthesia*. [From Greek *palmos* vibration + *aisthesis* feeling + *-ia* indicating a condition or quality]

palpitation *n.* Abnormally rapid or pounding heartbeat. [From Latin *palpitare* to throb, from *palpare* to stroke + *-ation* indicating a process or condition]

palsy *n.* A **paralysis* of the skeletal muscles of the body, as in **cerebral palsy*. See *BELL'S PALS**Y*, *CEREBRAL PALS**Y*, *MÖBIUS SYNDROME*, *PARKINSON'S DISEASE*, *PROGRESSIVE SUPRANUCLEAR PALS**Y*, *PSEUDOBULBAR PALS**Y*. [A corruption of *paralysis*]

pancreas *n.* An elongated organ, situated behind the stomach, containing the **islets of Langerhans* that secrete **insulin* and **glucagon* into the bloodstream and digestive enzymes into the duodenum. **pancreatic** *adj.* [From Greek *pan-* all + *kreas* flesh]

pandemic *n.* 1. Any disorder occurring in a wide area, in many populations, or universally. Compare *EPIDEMIC (1)*. *adj.* 2. In **epidemiology*, of or relating to a pandemic (1). Compare *ENDEMIC*, *EPIDEMIC (2)*. [From Greek *pandemos* universal, from *pan* all + *demos* the people + *-ikos* of, relating to, or resembling]

Pandemonium *n.* 1. In **artificial intelligence*, an **optical character recognition* system that operates in successive stages, by first checking for **features (1)* of the letter such as diagonal lines (as in *X* or *K*); then the output is fed to letter detectors that have been activated in the first stage and that match the letter shape to their templates; and finally recognition is achieved by identifying the letter detector that is most strongly activated. 2. Any very

noisy or disorderly state of affairs. [Named after *Pandemonium*, the capital of Hell in Milton's *Paradise Lost*, from Greek *pas*, *pan* all + *daimon* a spirit]

panel study *n.* A research method in which a sample of research participants or subjects is followed over an extended period of time in order to monitor changes in judgements, attitudes, opinions, developmental changes, or other variables of interest. *See also* [LONGITUDINAL STUDY](#).

pangram *n.* A sentence containing every letter of the alphabet, sometimes used for teaching writing or keyboard skills. The most familiar example in English is the 37-letter typists' sentence: *The quick brown fox jumped over the lazy dogs*. A 26-letter pangram in which each letter occurs just once is: *Jump dogs! Why vex Fritz Blank QC?*, but the use of personal names and abbreviations renders it imperfect, though easily memorable. Only a handful of perfect pangrams (26 letters, without abbreviations, acronyms, contractions, proper nouns, or Roman numerals) are known in English. The most meaningful is *Veldt jynx grimps waqf zho buck* (which means grassland wryneck causes charitable-land hybrid cattle buck to mount), and the words can all be found in large dictionaries, such as the *Oxford English Dictionary* (unabridged): *veldt* is open grassland in South Africa, a *jynx* is a wryneck bird, to *grimp* is to cause something or someone to mount, *waqf* is land given to a religious institution for charitable purposes in Islamic countries, a *zho* is a hybrid bovine animal bred from a yak bull and a common cow, and a *buck* is a male member of a species. [From Greek *pan* all + *gramma* a letter]

panic attack *n.* A period during which there is a sudden onset of intense terror, fear, or apprehension, accompanied by signs and symptoms such as a feeling of impending doom, [*thanatophobia](#), fear of going insane, shortness of breath, smothering or choking sensations, increased heart rate and [*palpitation](#), chest pain or discomfort, dizziness, trembling, sweating, and nausea. Panic attacks occur in several [*anxiety](#) disorders, including [*panic disorder](#), [*agoraphobia](#), [*social anxiety disorder](#), and [*specific phobia](#), and they may also occur in [*post-traumatic stress disorder](#).

panic disorder *n.* An [*anxiety](#) disorder in [*DSM-5](#) characterized by recurrent, unexpected [*panic attacks](#), followed by persistent apprehension about further attacks, concern about the possible effects of the attacks (such

*****ebook converter DEMO Watermarks*****

as having a heart attack or going insane), or a significant alteration in behaviour brought about by the attacks (such as resigning from a job). Panic disorder may occur with or without **agoraphobia*. **PD** *abbrev.*

pansexualism *n.* The doctrine that all mental activity arises from the sexual instinct, a term often used to describe **psychoanalysis*, although even in its early (pre-1920) form, before the introduction of **Thanatos*, the conception of the life instincts in **Eros* was not restricted to the sexual drive. [From Greek *pantos* all + English *sexualism*]

pantheism *n.* Belief in nature, the universe, or the order and lawfulness of everything that happens as representations (usually metaphorical) of God. Compare *AGNOSTICISM*, *ATHEISM*, *DEISM*, *THEISM*. **pantheist** *n.* One who espouses pantheism. **pantheistic** or **pantheistical** *adj.* [From Greek *pan* all + *theos* a god + *-ismos* indicating a state or condition]

panting centre *n.* A region of the hypothalamus that when stimulated quickens the rate of breathing. US *panting center*. [From Old French *pantaisier* to pant, from Greek *phantasioun* to have visions, from *phantasia* a fantasy, from *phantazein* to make visible, from *phainein* to show, from *phaein* to shine]

Panum phenomenon See *PANUM'S LIMITING CASE*.

Panum's fusion area *n.* An area of space, surrounding the **horopter* for a given degree of **ocular convergence*, within which different points projected on to the left and right retinas result in **binocular* fusion, producing a sensation of visual depth, and points lying outside the area result in **diplopia*. It is really a volume rather than an area, because it is a three-dimensional shape with a curved surface. Near the fovea, the maximum binocular disparity resulting in binocular fusion corresponds to a **visual angle* of about 10 minutes of arc or 1/6 of one degree. **PFA** *abbrev.* [Named after the Danish physician and physiologist Peter Ludvig Panum (1820–85) who first described it in 1858]

Panum's limiting case *n.* A visual sensation of three-dimensional depth that occurs when two lines or other elements are presented, one to each
*****ebook converter DEMO Watermarks*****

eye, at positions allowing ***binocular** fusion to occur, and at the same time a third is presented to one of the eyes at a different position, generating a perception in which the fused line appears nearer than the single line. The explanation, and the reason for its being called a limiting case, is that it mimics the stimulus pattern that occurs when two objects at different distances are viewed from such an angle that one of the objects is hidden behind the other from the vantage point of one eye whereas the other eye sees both of them. Also called the *Panum phenomenon* or the *Wheatstone–Panum limiting case*. See also **PANUM'S FUSION AREA**, **STEREOPSIS**. [Named after the Danish physician and physiologist Peter Ludvig Panum (1820–85) who rediscovered it in 1858, although the English physicist and inventor Sir Charles Wheatstone (1802–75) had already discovered and reported it in 1838]

Papez circuit *n.* A neural pathway closely associated with emotional experiences, including many of the structures of and around the limbic system, running from the ***thalamus** through the ***cingulate gyrus**, ***entorhinal cortex**, ***hippocampus**, ***septum pellucidum**, ***hypothalamus**, and ***mammillary bodies**, before returning to the thalamus. [Named after the US neuroanatomist James W. Papez (1883–1958) who first described it in 1937]

papilla *n.* A small nipple-shaped protuberance, including any of the lingual papillae situated chiefly within pits in the surface of the ***tongue** but also on the soft palate, throat, pharynx, and insides of the cheeks, most papillae being studded with ***taste** buds around their bases. Approximately 12 ***circumvallate papillae** are concentrated at the back of the tongue, numerous ***fungiform papillae** and ***filiform papillae** in the middle and front of the tongue, and pairs of ***foliate papillae** on the sides of the back part of the tongue, the only ones without taste buds being filiform papillae. **papillae** *pl.* [From Latin *papilla* a nipple, diminutive of *papula* a pimple]

paracentral vision *n.* Vision arising from images falling in the parafoveal area of the retina immediately surrounding the ***fovea**. [From Greek *para* beside or beyond + *kentron* a sharp point]

parachlorophenylalanine *n.* A substance that inhibits the activity of ***tryptophan** hydroxylase and is used as a drug to reduce levels of ***serotonin**

*****ebook converter DEMO Watermarks*****

in the brain. **p-CPA** or **PCPA** *abbrev.*

parachromatopsia *n.* Partial or incomplete **colour-blindness*. Compare **ACHROMATOPSIA**. [From Greek *para* beside + *chroma* colour + *ops* an eye + *-ia* indicating a condition or quality]

paracontrast *n.* A type of **forward masking* in which the test stimulus and masking stimulus do not overlap spatially. See also **MASKING**, **VISUAL MASKING**. Compare **METACONTRAST**. [From Greek *para* beside + Latin *contra* against + *stare* to stand]

paracusia *n.* Disordered hearing. Also spelt *paracousia*. Also called *paracusis* or *paracousis*. **paracusic** *adj.* [From Greek *para* beside + *akousis* hearing, from *akouein* to hear + *-ia* indicating a condition or quality]

paradigm *n.* 1. A pattern, stereotypical example, model, or general conceptual framework within which theories in a particular area of research are constructed. See also **PARADIGM SHIFT**. 2. (Originally) the set of inflected forms of a word, or a table displaying these forms, such as the conjugation of the regular French verb meaning to speak: *je parle, tu parles, il parle, nous parlons, vous parlez, ils parlent*. **paradigmatic** or **paradigmatical** *adj.* [From Greek *para* beside or beyond + *deiknynai* to show]

paradigm shift *n.* According to a doctrine propounded by the US historian and philosopher of science Thomas S(amuel) Kuhn (1922–96) in his book *The Structure of Scientific Revolutions* (1962), a rapid change, marking the culmination of a **scientific revolution*, from one **paradigm (1)* to another, such as occurred in physics when Einstein's theory replaced Newton's in 1916. See also **KUHNIAN**, **NORMAL SCIENCE**.

paradox *n.* An apparently sound argument yielding either a contradiction or a *prima facie* absurdity. The US philosopher and logician Willard Van Orman Quine (1908–2000), in an article in the journal *Scientific American* in 1962, introduced a threefold classification into *veridical paradoxes*, whose conclusions are true, such as **Hempel's paradox*; *falsidical paradoxes*, whose conclusions are false, such as the **unexpected hanging paradox* or the **sorites* paradox; and *antinomies*, whose conclusions are mutually

*****ebook converter DEMO Watermarks*****

contradictory, such as **Russell's paradox*, the **liar paradox*, or **Grelling's paradox*. The term is also used more loosely for any argument that yields a surprising conclusion, or even for a fact or phenomenon that seems surprising, but the latter is avoided in careful usage. *See also* *ALLAIS PARADOX*, *AUBERT–FLEISCHL PARADOX*, *BARBER'S PARADOX*, *CONDORCET'S PARADOX*, *DURATION ESTIMATION PARADOX*, *ELLSBERG PARADOX*, *FECHNER'S PARADOX*, *GÖDEL'S THEOREM*, *GOODMAN'S PARADOX*, *MELODIC PARADOX*, *METALANGUAGE*, *MIRROR REVERSAL PROBLEM*, *MODIFIED ELLSBERG PARADOX*, *MONTY HALL PROBLEM*, *NEUROTIC PARADOX*, *NEWCOMB'S PROBLEM*, *PARADOXICAL INJUNCTION*, *PARADOXICAL INTENTION*, *PARADOXICAL THERAPY*, *PRISONER'S DILEMMA GAME*, *SEMITONE PARADOX*, *SIMPSON'S PARADOX*, *SKAGGS–ROBINSON PARADOX*, *SOCIOLOGY OF KNOWLEDGE*, *SORITES PARADOX*, *ST PETERSBURG PARADOX*, *TRITONE PARADOX*. **paradoxical** *adj.* [From Greek *paradoxos*, beyond belief, from *para* beyond + *doxa* a belief]

paradoxical cold *n.* A sensation of coldness that is experienced when a warm stimulus touches a **cold spot* on the skin. *Compare* *PARADOXICAL HEAT*, *PARADOXICAL WARMTH*.

paradoxical heat *n.* A sensation of intense heat that is experienced in the absence of a hot stimulus if an area of the skin containing both **cold spots* and **warm spots* is stimulated with a *heat grill* of closely packed alternating warm and cold bars. *Compare* *PARADOXICAL COLD*, *PARADOXICAL WARMTH*.

paradoxical injunction *n.* An instruction to do something that is rendered impossible by the instruction itself, as in *Do not think of a giraffe!*

paradoxical intention *n.* A technique of **logotherapy* and **behaviour therapy*, used in the treatment of **obsessive–compulsive disorder*, in which the client or patient deliberately and repeatedly rehearses a habit or unwanted pattern of thought or behaviour, with the aim of developing a less fearful attitude towards it, gaining control over it, or bringing about its elimination or **extinction* (2). Also called *negative practice*. *See also* *PARADOXICAL THERAPY*.

paradoxical sleep *n.* Another name for **REM sleep*. **PS** *abbrev.* [So called because its characteristic EEG pattern is similar to that of the waking
*****ebook converter DEMO Watermarks*****]

state, but the sleeper is none the less especially difficult to awaken]

paradoxical therapy *n.* Any form of [*psychotherapy](#) involving techniques that appear on the surface to contradict the goals of the treatment, such as [*negative practice](#) and [*paradoxical intention](#).

paradoxical warmth *n.* A sensation of warmth that is experienced when a cold stimulus touches a [*warm spot](#) on the skin. *Compare* [PARADOXICAL COLD](#), [PARADOXICAL HEAT](#).

paradox of voting *n.* Another name for [*Condorcet's paradox](#).

paraesthesia *n.* An abnormal sensation such as tingling, burning, prickling, pins and needles, or numbness in an area of the skin or a part of the body. US *paresthesia*. *See also* [ACROPARAESTHESIA](#), [DYSAESTHESIA](#). [From Greek *para* beside or beyond + *aisthesis* sensation + *-ia* indicating a condition or quality]

parafovea *n.* The area of the retina immediately surrounding the [*fovea](#). *See also* [PARACENTRAL VISION](#). **parafoveal** *adj.* [From Greek *para* beside or beyond + Latin *fovea* a pit]

parageusia *n.* Abnormal taste sensation. *See* [AGEUSIA](#), [CACOGEUSIA](#), [DYSGEUSIA](#), [HYPERGEUSIA](#), [HYPOGEUSIA](#), [TASTE BLINDNESS](#). [From Greek *para* beside or beyond + *geusis* taste + *-ia* indicating a condition or quality]

paragraphia *n.* Habitual writing of a different letter, syllable, or word from the one intended, usually caused by a brain lesion. [From Greek *para* beside + *graphein* to write + *-ia* indicating a condition or quality]

parahippocampal gyrus *n.* The gyrus of the cerebral cortex immediately adjacent to the [*hippocampus](#), considered as part of the [*limbic system](#). It receives a constant stream of information from the association areas that it transmits to the hippocampus, mainly via the entorhinal cortex, for consolidation in long-term memory, and it is also involved in the control of aggression. *See also* [DEFAULT MODE NETWORK](#), [ENTORHINAL CORTEX](#).

paralanguage *n.* The non-verbal aspects of speech that convey information to listeners, including **accent* (1), **loudness*, **pitch*, **rhythm*, **tempo*, **timbre*. See also NON-VERBAL COMMUNICATION, PROSODY. [From Greek *para* beside or beyond + English *language*]

paraldehyde *n.* A colourless strong-smelling liquid obtained from **acetaldehyde* and sulphuric acid that acts as a central nervous system **depressant* and is used as a **sedative–hypnotic* drug. Formula C₆H₁₂O₃. [From Greek *para* beside or beyond + English *aldehyde*, from Latin *al(cohol) dehyd(rogenatum)* dehydrogenated alcohol]

paralexia *n.* A disordered or defective form of reading in which words or syllables are meaninglessly transposed. [From Greek *para* beside or beyond + *lexis* a word]

paralinguistics *n.* The study of **paralanguage*.

parallax *n.* Apparent movement of an object resulting from a change in the vantage point from which it is viewed. See also BINOCULAR PARALLAX, MONOCULAR PARALLAX. [From Latin *parallaxis* parallax, from Greek *parallassein* to change, from *para* beside or beyond + *allassein* to alter, from *allos* another]

parallel distributed processing *n.* A model of **knowledge* representation and **information* processing according to which items of knowledge are represented by patterns of connections of varying strengths between locations within a **network model*, information processing taking the form of parallel processing of collections of activated connections. The term is almost synonymous with **connectionism* (1). See also BACK-PROPAGATION ALGORITHM, CASCADE PROCESSING, CONTENT-ADDRESSABLE MEMORY, DELTA RULE, DISTRIBUTED NETWORK MODEL, GRADIENT DESCENT, HEBBIAN RULE, HILL CLIMBING, NEURAL NETWORK, TEACHER UNIT. Compare DISTRIBUTED COGNITION. **PDP** abbrev.

parallel fibre *n.* Any of the axon branches arising from **granule cells* that run horizontally near the cortical surface of the **cerebellum* and synapse

on [*Purkinje cells](#). US *parallel fiber*.

parallel-form reliability *n.* Another name for [*equivalent-form reliability](#).

parallel forms *n.* In psychometrics, [*alternative forms](#) of a test that have similar [*means](#), [*standard deviations](#), and [*correlations](#) with other tests. Also called *equated forms*.

parallelism *n.* Another name for [*psychophysical parallelism](#).

parallelogram illusion *n.* Another name for the [*Sander parallelogram](#).

parallel processing *n.* Computational processing in which a process is split into subunits that are executed simultaneously by independent processing units. *See also* [CASCADE PROCESSING](#), [CONNECTIONISM](#), [DISCRETE PROCESSING](#), [PARALLEL DISTRIBUTED PROCESSING](#). *Compare* [SERIAL PROCESSING](#).

paralysis *n.* An impairment or loss of function of one or more voluntary muscles, usually resulting from a disorder of the muscle, a neurological disorder, or a mental disorder. [From Greek *para* beside or beyond + *lysis* a loosening]

paralysis agitans *n.* Another name for [*Parkinson's disease](#).

paralytic strabismus *n.* A form of [*strabismus](#) associated with a malfunction of the ocular muscles resulting from a neurological or muscular disorder or dysfunction. *Compare* [NON-PARALYTIC STRABISMUS](#).

paramecium *n.* A freshwater, single-celled creature having a bean-shaped body covered with [*cilia](#) that are used for swimming, the cilia being composed of bundles of [*microtubules](#). It moves about, avoiding obstacles by swimming round them, darts for bacterial food, retreats from danger, turns itself round to escape if enclosed in a glass tube, and is probably capable of learning from experience, according to the results of experiments dating back

to 1908, though some authorities have disputed that it is capable of true learning. Yet it has no **nervous* system, its single cell not even being a **neuron*, which proves that rather complex behaviour can occur without a nervous system. See also *CYTOSKELETON*. **paramecia** *pl.* [From Greek *paramekes* elongated, from *para* beside or beyond + *mekos* length]

parameter *n.* In statistics, a property of a **population* distribution, such as the population mean or population standard deviation, as distinct from a property of a **sample*. [From Greek *para* beside or beyond + *metron* a measure]

parametric statistics *n.* A branch of statistics that makes assumptions about the **parameters* of the distributions from which the data are drawn, often including the assumption that variables conform to the **normal distribution*. It deals mainly with data measured on interval or ratio scales that are suitable for the application of ordinary arithmetic operations such as addition and multiplication, so that parameters such as the **mean* and **standard deviation* can be meaningfully defined. Compare *DISTRIBUTION-FREE TEST*, *NON-PARAMETRIC STATISTICS*.

paramimia *n.* A form of **apraxia* in which there is an impairment in the ability to imitate **gestures* (1). [From Greek *para* beside or beyond + *mimos* a mime, from *mimesis* imitation + *-ia* indicating a condition or quality]

paramnesia *n.* 1. A belief that one is recalling events or experiences that never really occurred. See also *EXPERIMENTALLY INDUCED FALSE MEMORY*, *FALSE MEMORY*, *FALSE MEMORY SYNDROME*, *REALITY MONITORING*. 2. Any disorder of memory involving misremembering rather than failing to remember, including **déjà vu* and **jamais vu*. [From Greek *para* beside + *mnasthai* to remember + *-ia* indicating a condition or quality]

paramnesia, reduplicative See *REDUPLICATIVE PARAMNESIA*.

paranoia *n.* Another name for **delusional disorder* or, more generally, any mental disorder characterized by **delusions*, including **paranoid* personality disorder, **paranoid* schizophrenia, or **shared psychotic disorder*. See also *PARANOID TECHNIQUE*, *SCHREBER CASE*. [From Greek *paranoia* frenzy, from *para* *****ebook converter DEMO Watermarks*****]

beside + *nous* intellect or sense + *-ia* indicating a condition or quality]

paranoia querulans *n.* A form of **paranoia* or **delusional disorder* associated with incessant litigious actions intended to obtain legal remedies for perceived wrongs that appear trivial or insignificant to others. Also called *Querulantenwahn*. [From **paranoia* + Latin *querulus* complaining or peevish, from *queri* to complain]

paranoia scale See *MMPI*.

paranoid *adj.* Of, relating to, characterized by, or resembling **paranoia* or **delusional disorder*.

paranoid disorder See *DELUSIONAL DISORDER*, *PARANOIA*, *PARANOID PERSONALITY DISORDER*, *PARANOID SCHIZOPHRENIA*, *SHARED PSYCHOTIC DISORDER*.

paranoid disorder, shared See *SHARED PSYCHOTIC DISORDER*.

paranoid ideation *n.* Suspicious ideas and beliefs falling short of **delusions* that one is being harassed, persecuted, or treated unfairly.

paranoid personality disorder *n.* A **personality* disorder in **DSM-5* characterized by **paranoid* ideation, indicated by such signs and symptoms as unwarranted suspicion of being exploited, harmed or plotted against; unjustified doubts about the trustworthiness of friends and associates; reluctance to confide in others because of unwarranted fear of the information being maliciously exploited; tendency to interpret innocent remarks or events as demeaning or threatening; persistent bearing of grudges for past insults, injuries, or slights; tendency to perceive personal attacks that are not apparent to others; tendency to become angry, and to counterattack; and harbouring of unjustified suspicions about the faithfulness of sexual partners. Compare *DELUSIONAL DISORDER*, *PARANOID SCHIZOPHRENIA*.

paranoid-schizoid position *n.* In **Kleinian* analysis, a mode of **object relations* occurring during the first 4 months of life, before the **depressive position*, recurring occasionally in later childhood and adulthood,

and becoming dominant in states of ***paranoid** personality disorder and ***schizophrenia**. It is characterized by ***ambivalence** arising from the coexistence of aggressive and libidinal drives directed at an ***instinctual object**, namely the mother's breast, that is a ***part object** and is split into a *good object* and a *bad object*, because it both gratifies and frustrates, and because it evokes emotions of love and hate. The concept was introduced in 1932 by the British-based Austrian psychoanalyst Melanie Klein (1882–1960) and fully developed in a contribution to a co-authored book in 1952 on ‘Some Theoretical Conclusions Regarding the Emotional Life of the Infant’, where she explained her preference for the word *position* to *stage* or *phase*: ‘these groupings of anxieties and defences, although arising first during the earliest stages, are not restricted to them but occur and recur during the first years of childhood and under certain circumstances in later life’ (*Developments in Psycho-Analysis*, p. 236). Also called the *paranoid position*, the element *schizoid* being added to allude to the splitting of the object that it involves.

paranoid schizophrenia *n.* One of the major types of ***schizophrenia**, the essential feature being the presence of prominent ***delusions** or ***auditory hallucinations** involving ***paranoid** ideation in the context of otherwise normal ***cognition** and ***affect**. Compare DELUSIONAL DISORDER, PARANOID PERSONALITY DISORDER.

paranoid technique *n.* In ***psychoanalysis**, one of the four ***defensive techniques** proposed by the Scottish psychoanalyst W. Ronald D. Fairbairn (1889–1964). It involves ***internalization** of the ***good object** and ***externalization** of the bad object, causing the paranoid person to feel persecuted by external forces. See also SPLITTING OF THE OBJECT. Compare HYSTERICAL TECHNIQUE, OBSESSIONAL TECHNIQUE, PHOBIC TECHNIQUE.

paranormal *adj.* Beyond the normal; supernatural or inexplicable by the laws of science or reason. See also PARAPSYCHOLOGY. Also called *psychic* or *psychical*. [From Greek *para* beside or beyond + English *normal*, from Latin *normalis* conforming to a carpenter's square or rule, from *norma* a carpenter's square or a rule + *-alis* of or relating to]

paranostic gain *n.* Another name for ***primary gain**. [From Greek *para*

*****ebook converter DEMO Watermarks*****

beside or beyond + *nosos* a disorder]

paraphasia *n.* A form of **aphasia* characterized by the habitual substitution of one word for another. [From Greek *para* beside or beyond + English *aphasia*]

paraphemia *n.* Disordered speech, characterized by misuse of **phonemes* and words. [From Greek *para* beside or beyond + *pHEME* speech, from *phanai* to speak]

paraphilias *n.* Abnormal sexually arousing fantasies, sexual urges, or behaviour involving non-human objects, children, or other non-consenting sexual partners, or suffering or humiliation of oneself or a sexual partner. See ACROTOMORPHILIA, APOTEMNOPHILIA, AUTOGYNEPHILIA, BESTIALITY (1), COPROPHILIA, EPHEBOPHILIA, EXHIBITIONISM (1), FETISHISM, FETISHISTIC TRANSVESTISM, FROTTEURISM, GERONTOPHILIA, HYPOXYPHILIA, KATASEXUALISM, KLEPTOLAGNIA, KLYSMAPHILIA, NECROPHILIA, OSPHRESIOLAGNIA, PAEDOPHILIA, RENIFLEUR, SCOPOPHILIA, SEXUAL MASOCHISM, SEXUAL SADISM, TELEPHONE SCATALOGIA, UROPHILIA, VOYEURISM, ZOOPHILIA. Paraphilias that meet certain diagnostic criteria are **paraphilic disorders*: See also EXHIBITIONISTIC DISORDER, FETISHISTIC DISORDER, FROTTEURISTIC DISORDER, PAEDOPHILIC DISORDER, SEXUAL MASOCHISM DISORDER, SEXUAL SADISM DISORDER, TRANSVESTIC DISORDER, VOYEURISTIC DISORDER. Also called *sexual deviations*. Formerly called *sexual perversions* or *perversions*. **paraphiliac** *n.* A person with a paraphilia. [From Greek *para* beside or beyond + *philos* loving, from *phileein* to love + *-ia* indicating a condition or quality]

paraphilic disorders *n.* A group of **mental disorders* in **DSM-5* characterized by **paraphilias*. See EXHIBITIONISTIC DISORDER, FETISHISTIC DISORDER, FROTTEURISTIC DISORDER, PAEDOPHILIC DISORDER, SEXUAL MASOCHISM DISORDER, SEXUAL SADISM DISORDER, TRANSVESTIC DISORDER, VOYEURISTIC DISORDER.

paraphobia *n.* An irrational fear of some object, activity, or situation, falling below the threshold of being labelled a true **phobia*. [From Greek *para* beside or beyond + *phobos* fear + *-ia* indicating a condition or quality]

paraphrenia *n.* A term introduced in 1904 by the German psychiatrist Emil Kraepelin (1856–1926) to denote chronic ***delusional disorder** without intellectual deterioration or ***dementia**. *See also* **NARCISSISTIC NEUROSIS**. [From Greek *para* beside or beyond + *phren* mind, originally midriff, the supposed seat of the soul + *-ia* indicating a condition or quality]

paraplegia *n.* Paralysis of the lower limbs, usually as a result of lesions in the middle or lower part of the spinal cord. *Compare* **DIPLEGIA**, **HEMIPLEGIA**, **MONOPLEGIA**, **OPHTHALMOPLEGIA**, **QUADRIPLEGIA**, **TRIPLEGIA**. **paraplegic** *adj.* [From Greek *para* beside or beyond + *plege* a blow + *-ia* indicating a condition or quality]

parapraxis *n.* In ***psychoanalysis**, a minor error in speech or action, such as a ***slip of the tongue**, a ***slip of the pen**, an ***action slip**, or a ***slip of memory**. In his book *The Psychopathology of Everyday Life* (1901, *Standard Edition*, VI), Sigmund Freud (1856–1939) advanced the theory that such errors are not random but often represent fulfilments of unconscious wishes, and the book is crammed with anecdotal examples. Parapraxes can be analysed for possible clues to repressed thoughts and desires by a method similar to ***dream** analysis. Freud's original German word for this phenomenon was *Fehlleistung*, combining two ordinary words and meaning simply a faulty performance. Also called a *motivated error*, and (colloquially) a *Freudian slip*. *See also* **ACTING OUT (2)**, **DÉJÀ VU**, **MOSES ILLUSION**, **YOLK PHENOMENON**. **parapraxes** *pl.* [From Greek *para* beside or beyond + *praxis* a deed, from *prassein* to do]

parapsychology *n.* The study of apparently ***paranormal** psychological phenomena or ***psi** phenomena, especially ***extra-sensory perception** (telepathy, clairvoyance, and precognition) and ***psychokinesis**. Also called *psychical research*. *See also* **FILE DRAWER PROBLEM**, **OUIJA BOARD**, **PSI**, **PSI-MISSING**. **parapsychological** *adj.* **parapsychologist** *n.* One who practises or studies parapsychology. [From Greek *para* beside or beyond + English *psychology*]

parasitosis *n.* Infestation with parasites; also, figuratively, another name for ***formication**.

parasol cell *n.* A large retinal *ganglion cell in the *magnocellular system, with a *centre-surround receptive field, receiving input from all three types of retinal *cones. *Compare* MIDGET CELL.

parasomnias *n.* An umbrella term for abnormal physiological or psychological reactions associated with sleep or the transition between wakefulness and sleep, causing significant distress or impairment in social, occupational, or other important areas of functioning. In *DSM-5 they form a subcategory of *sleep–wake disorders, including *non-rapid eye movement sleep arousal disorder, *nightmare disorder, *rapid eye movement sleep behaviour disorder, and *restless legs syndrome. *See also* BRUXISM, CENTRAL SLEEP APNOEA, OBSTRUCTIVE SLEEP APNOEA HYPOPNOEA, PAVOR DIURNUS, PAVOR NOCTURNUS, SEXSOMNIA, SLEEP APNOEA. *Compare* DYSSOMNIAS. [From Greek *para* beside or beyond + *somnus* sleep]

parasuicide *n.* A deliberate self-inflicted injury or poisoning resembling a suicide attempt but probably not intended to be successful. The term was introduced by the British psychiatrist Norman Kreitman (1927–2012) and three co-authors in the heading of a letter in the *British Journal of Psychiatry* in 1969. **parasuicidal** *adj.* [From Greek *para* beside + English *suicide*]

parasympathetic nervous system *n.* One of the two major subdivisions of the *autonomic nervous system whose general function is to conserve metabolic energy, acting in opposition to and with more specificity than the *sympathetic nervous system by slowing pulse rate, stimulating the smooth muscles of the alimentary canal (*see* PERISTALSIS), promoting secretion of salivary and intestinal juices and voiding of urine, constricting the pupils, and preparing the eyes for *near vision. *See also* CHOLINERGIC. *Compare* SYMPATHETIC NERVOUS SYSTEM. **PNS** *abbrev.* [From Greek *para* beside + *syn* with + *pathos* suffering]

parasympatholytic *adj. n.* (Of, relating to, or having an effect similar to) a drug such as *atropine or *scopolamine that acts against or inhibits the activity of the *parasympathetic nervous system, usually by blocking *muscarinic receptors. *Compare* PARASYMPATHOMIMETIC, SYMPATHOLYTIC. [From *parasympathetic* + Greek *lysis* loosening + *-ikos* of, relating to, or resembling]

*****ebook converter DEMO Watermarks*****

parasympathomimetic *adj. n.* (Of, relating to, or having an effect similar to) a drug such as **carbachol*, **methacholine*, or **muscarine* that mimics or increases the activity of **acetylcholine*, the major neurotransmitter of the **parasympathetic nervous system*, with effects such as constriction of the pupils of the eyes and preparation for close-up vision, salivation, slowing of the heart, secretion of gastric juices, and voiding of urine. *Compare* PARASYMPATHOLYTIC, SYMPATHOMIMETIC. *See also* CHOLINERGIC. [From Greek *para* beside + *syn* with + *pathos* suffering + *mimetes* an imitator + *-ikos* of, relating to, or resembling]

parathyroid gland *n.* Any of the small ovoid endocrine glands, usually four in number, attached to the sides of the thyroid gland at the base of the neck. They secrete **parathyroid hormone* into the bloodstream. [From Greek *para* beside + *thyreoeides* a door-shaped shield, from *thyra* a door + *eidos* form]

parathyroid hormone *n.* A hormone secreted by the **parathyroid glands* that increases the level of **calcium* and **phosphate* in the blood and whose action is regulated by **calcitonin* secreted by the thyroid glands. **PTH** *abbrev.*

paraventricular nucleus *n.* A cluster of neurons at the back of each side of the hypothalamus, synthesizing **vasopressin* and **oxytocin* and transporting them through their axons to the **posterior* pituitary. [From Greek *para* beside + Latin *ventriculus* a little belly, diminutive of *venter*, *ventris* a belly, alluding to its location near the walls of the third ventricle]

paregoric *n.* A **narcotic* analgesic containing **opium*, formerly prescribed in the treatment of coughing and diarrhoea in children. [From Greek *paregoreein* to exhort or comfort, from *para* beside + *agoreuein* to speak publicly, from *agora* an assembly or marketplace + *-ikos* of, relating to, or resembling]

parental investment *n.* Any contribution that a parent makes towards an individual offspring that increases the offspring's chances of survival and reproduction at the cost of the parent's ability to contribute to other offspring,

*****ebook converter DEMO Watermarks*****

including producing sex cells and later feeding and guarding the young. According to the US biologist Robert L. Trivers (born 1943), who introduced the term into ethology in 1972, in species in which females provide more parental investment than males, males compete among themselves for female mates, and females are vulnerable to mate desertion. *See also* [BATEMAN'S PRINCIPLES](#), [SEXUAL SELECTION](#). **PI** *abbrev.*

parenteral *adj.* By a route other than the mouth or alimentary canal, referring to the mode of administration of a drug, usually implying administration by injection. *Compare* [ORAL](#). [From Greek *para* beside + *enteron* the alimentary canal or gut]

parent-figure, combined *See* [COMBINED PARENT-FIGURE](#).

paresis *n.* Partial **paralysis*, as in **general paralysis (paresis) of the insane*. [From Latin *paresis* relaxation, from *para* beside or beyond + *hienai* to release]

paresthesia *See* [PARAESTHESIA](#).

Pareto-optimal *adj.* Of or relating to a distribution of **payoffs* such that any redistribution that benefited one individual would be detrimental to one or more others. **Pareto optimality** *n.* **Paretian** *adj.* Of, relating to, or having the property of Pareto optimality. [Named after the French-born Italian economist and sociologist Vilfredo Pareto (1848–1923) who introduced the concept in his mathematical treatment of income distribution]

parietal lobe *n.* The upper **lobe* on the side of each cerebral hemisphere, separated on its lateral or outer surface from the frontal lobe by the **central sulcus*, from the temporal lobe by the **lateral sulcus* and an imaginary line extending it horizontally towards the occipital lobe, and from the occipital lobe by an imaginary line from the top of the **parieto-occipital sulcus* to the **pre-occipital notch*. The right parietal lobe is especially involved in appreciation of spatial relationships. Lesions in either hemisphere in the somatosensory association area (*see* somatosensory cortex) can result in **astereognosis*, and lesions in the parietal operculum immediately above the lateral sulcus can lead to **spatial neglect*. *See also* [APHASIA](#), [AUTOTOPAGNOSIA](#),
*****ebook converter DEMO Watermarks*****

GERSTMANN SYNDROME, LOBE, MIRROR NEURON, OPERCULUM. [From Latin *parietalis* of a wall, from *paries* a wall]

parietal operculum *See* OPERCULUM.

parieto-occipital sulcus *n.* A **sulcus* towards the back of each cerebral hemisphere on its **medial* surface (hence not visible on the outside), marking the boundary between the parietal lobe and the occipital lobe.

parkinsonism *n.* Mild regular **resting tremor* of the limbs, head, jaw, mouth, or lip (the so-called *rabbit syndrome*), characteristic of **Parkinson's disease* but associated also with other neurological disorders, with oscillations of 3–6 hertz, exacerbated by cold, fatigue, or strong emotion, usually suppressed during voluntary movements and sleep. *See also* ANTIPARKINSONIAN, NEUROLEPTIC-INDUCED, POSTURAL TREMOR. *Compare* INTENTION TREMOR. [Named after Parkinson's disease]

Parkinson's disease *n.* A progressive, degenerative neurological disorder affecting 2 per cent of people over 65 in the developed world, associated with malfunction (usually resulting from damage caused by **free radicals* but occasionally due to a genetic mutation) of neurons that produce **dopamine* in the **substantia nigra* and the extended projections into the **striatum*, which in turn relays signals to the higher motor centres of the brain. The disease is characterized by **parkinsonism*, often occurring first in one hand, where it resembles pill-rolling movements of the thumb and forefinger, masklike facial expression, shuffling gait or **festination*, **cogwheel rigidity* of muscles and difficulty rising from a sitting position, shrinkage of handwriting, **bradykinesia* or **akinesia*, drooling, profuse sweating, lability of **affect*, and defective judgement. Also called *paralysis agitans*. *See also* AMANTADINE, ANTIPARKINSONIAN, FOETAL BRAIN TRANSPLANTATION, L-DOPA, MPP⁺, PROGRESSIVE SUPRANUCLEAR PALSY. **PD** *abbrev.* [Named after the English surgeon James Parkinson (1755–1824) who first described it in 1817 and called it the shaking palsy]

Parlodel *n.* A proprietary name for the dopamine agonist **bromocriptine*. [Trademark]

Parlyaree See [POLARI](#).

parole *n.* A term introduced in 1915 by the Swiss linguist Ferdinand de Saussure (1857–1913) to denote language as manifested in concrete utterances of particular speakers. *Parole* is seen as one of the two major aspects of **langage*, the other being **langue*, and it is analogous to the concept of **performance* (2). [Old French *parole* speech]

paronomasia *n.* Any form of word-play, especially a pun. [From Greek *para* beside or beyond + *onoma* a name + *-ia* indicating a condition or quality]

parosmia *n.* Any abnormality in **olfaction* or the sense of smell. See [ANOSMIA](#), [CACOSMIA](#), [DYSOSMIA](#), [HYPEROSMIA](#), [HYPOSMIA](#), [SPECIFIC ANOSMIA](#). [From Greek *para* beside or beyond + *osme* a smell + *-ia* indicating a condition or quality]

parotid gland *n.* A large salivary gland situated in the oral cavity just below and in front of each ear. [From Greek *para* beside + *ous*, *otos* an ear]

paroxetine *n.* An antidepressant drug with anxiolytic effects belonging to the group of **selective serotonin reuptake inhibitors* ([SSRIs](#)), used especially to treat **social anxiety disorder* and shyness in general. Also called *Paxil* or *Seroxat* (trademarks).

parsimony principle *n.* The proposition that closely related organisms, having diverged comparatively recently in evolutionary history, have fewer differences in their **DNA* than more distantly related organisms. See also [MITOCHONDRIAL DNA](#).

parthenogenesis *n.* A form of reproduction in some insects from a female **gamete* without fertilization by a male gamete. Distinguished in careful usage from **asexual reproduction*, in which gametes are not formed. Compare [SEXUAL REPRODUCTION](#). **parthenogenetic** or **parthenogenic** *adj.* [From Greek *parthenos* a virgin + *genesis* birth]

partial correlation *n.* In statistics, a *correlation between two variables with the effect of a third variable controlled or *partialled out*. For example, if *x*, *y*, and *z* represent the heights, weights, and ages of children, respectively, then a significant positive correlation between *x* and *y* may be due in part to the correlation of each of these variables with *z*. A partial correlation coefficient between *x* and *y* with *z* partialled out, written $r_{xy.z}$, shows the degree of linear relationship between height and weight irrespective of age.

partial instinct *n.* Another name for a *component instinct.

partial movement *n.* A form of *apparent movement that occurs when two visual stimuli a few centimetres apart are presented in an alternating pattern with an interstimulus interval too long for the stimuli to appear simultaneous but not long enough for *optimal movement, *phi movement, or the disappearance of apparent movement and the veridical perception of the stimuli simply alternating. In partial movement, the first stimulus appears to move part of the distance towards the second and then to disappear, then the second stimulus appears in the space between the two stimuli and moves towards its own location, then this cycle is repeated in the opposite direction, and so on. Also called *partial motion*. See also KORTE'S LAWS.

partial reinforcement *n.* In *operant conditioning, any *reinforcement schedule in which the organism is not rewarded after every response. Also called *intermittent reinforcement*. See also PARTIAL REINFORCEMENT EFFECT. Compare CONTINUOUS REINFORCEMENT. **PR** abbrev.

partial reinforcement effect *n.* The finding that responses established by *partial reinforcement are more resistant to *extinction (2) than responses established by continuous reinforcement. **PRE** abbrev.

partial tone *n.* Any *pure tone that is a component of a *complex tone. Also called a *partial*. See also FOURIER ANALYSIS.

participant observation *n.* A research methodology in which the investigator participates in the activities of a group while recording the behaviour of the other group members. See also ETHNOMETHODOLOGY,

NATURALISTIC OBSERVATION, OBSERVATIONAL STUDY.

participant (research or experimental) *n.* Another name for a *subject (research or experimental) or volunteer.

participation mystique *n.* In *analytical psychology, a term introduced in 1912 by Carl Gustav Jung (1875–1961) to denote a form of *projective identification in which a person gains influence over another. Jung borrowed the term from the French anthropologist Lucien Lévy-Bruhl (1857–1939) who used it to denote a phenomenon whereby people identify themselves with a physical object such as a holy artefact or a *totem. [French: literally mystical involvement]

participatory action research *n.* A form of *action research in which the researchers and the people being studied collaborate in defining the research problem, choosing the research methodology and method of data analysis, and disseminating the findings. **PAR** *abbrev.*

particular complex *n.* In *psychoanalysis, a *complex (2) that is peculiar to an individual and, unlike the *Oedipus complex, for example, is not universal.

particulate inheritance *n.* Inheritance of discrete characteristics through factors now identified as *genes, in contrast to the discredited doctrine of *blending inheritance.

partile *n.* In statistics, one of a number of scores that divide a distribution into equal parts, the most common being the *decile, *percentile, and *quartile.

part instinct *n.* Another name for a *component instinct.

part object *n.* In *Kleinian analysis, any part of a person that serves as an *instinctual object satisfying another person's sexual *instinct (3), the first instance in human development being the mother's breast. *See also* GOOD OBJECT, INSTINCTUAL OBJECT, OBJECT RELATIONS, PARANOID–SCHIZOID POSITION,

SPLITTING OF THE OBJECT. *Compare* WHOLE OBJECT.

parvocellular system *n.* The more recently evolved of the two major visual pathways, originating in small **ganglion* cells in the **retina*, projecting to the uppermost four layers of the **lateral* geniculate nucleus that contain neurons with small cell bodies, and terminating in layer 4C β of the **primary visual cortex* (Area V1). It is characterized by colour-sensitivity, slowly conducting axons, low contrast sensitivity, and high resolution of fine detail. Parvocellular neurons that project on to interblobs between the **blobs* in layers 1 and 2 of the primary visual cortex carry high-resolution information about shape, and parvocellular neurons that project on to blobs carry lower-resolution information about colour and shades of grey but not about shape, movement, or depth, whereas **magnocellular neurons* carry information about movement and depth but not colour. Also called the *parvo system*. *See also* MIDGET CELL, P CELL (X CELL), W CELL. *Compare* MAGNOCELLULAR SYSTEM. **P system** *abbrev.* [From Latin *parvus* small + *cella* a room, from *celare* to hide]

Pascal's wager *n.* The argument that it is in one's rational self-interest to assume that God exists, because however small the probability is that God does indeed exist, provided that it is not zero, the infinite gain from belief and the infinite punishment from disbelief outweigh any advantage of disbelief if God does not exist. In modern terms, the argument purports to show that the **expected utility* of assuming that God exists must be greater than the expected utility of believing that God does not exist. The argument was formulated by the French philosopher, mathematician, and physicist Blaise Pascal (1623–62) and published posthumously in *Pensées* (1670): ‘God is or he is not....What is your wager?...Let us weigh the gain and the loss in choosing “heads” that God is....If you gain, you gain all. If you lose, you lose nothing. Wager, then, unhesitatingly that he is’ (Thought 233). Critics have claimed that there are not merely two possibilities—that the Christian God exists or does not exist—but an infinite number, and that this undermines the argument. *See also* RATIONAL CHOICE THEORY.

passing stranger effect *n.* Another name for the **ancient mariner effect*.

passive-aggressive personality disorder *n.* A [*personality disorder](#) (not included in the [*DSM-5](#) classification) characterized by a pervasive pattern of [*negativism](#) (1), with passive resistance, complaints of being misunderstood, sullenness and argumentativeness, unreasonable scorn for authority, envy and resentment, alternation between hostile defiance and contrition, and general discontentment. People with the disorder tend to obtain high scores on measures of assertiveness and low scores on measures of warmth. Also called *negativistic personality disorder*. See also [LITTLE THIRTY](#).

passive analysis *n.* A style of [*psychoanalysis](#) in which the analyst offers a minimum of [*interpretations](#) (2).

passive avoidance conditioning *n.* Learning to abstain from a particular response in order to avoid a punishing or aversive stimulus. Also called *passive avoidance learning*. Compare [ACTIVE AVOIDANCE CONDITIONING](#), [ESCAPE CONDITIONING](#). See also [AVOIDANCE CONDITIONING](#).

passive-dependent personality disorder *n.* Another name for [*dependent personality disorder](#).

passive learning *n.* Another name for [*incidental learning](#) and [*latent learning](#).

passive movement *n.* Movement of an organism resulting from external force and not from the organism's own locomotion or muscular activity, as when a person is transported in a vehicle. Also called *passive motion*. See also [MOTION SICKNESS](#), [VECTION](#).

passive tremor *n.* Another name for [*resting tremor](#).

passive vocabulary *n.* The set of words that a person can understand. Compare [ACTIVE VOCABULARY](#).

pastoral counselling *n.* A form of [*counselling](#) given by ministers of religion to help members of their congregations with emotional problems. US

pastoral counseling.

patellar reflex *n.* A ***deep tendon reflex** elicited by tapping the tendon immediately below the knee-cap, normally resulting in contraction of the quadriceps muscle and extension of the leg in a kicking movement. Lesions in the ***pyramidal tract** are associated with a hyperactive patellar reflex. Also called the *knee-jerk reflex* or the *quadriceps reflex*. See also **STRETCH REFLEX**. [From Latin *patella* a small dish, diminutive of *patina* a dish or pan, alluding to the shape of the knee-cap]

paternity uncertainty *n.* A principle in ***evolutionary psychology** according to which, throughout the animal kingdom, a mother always knows when a child is hers, but a father is never certain that another male did not fertilize the female's egg and that the child is not his and therefore does not carry his genes. Whenever a male spends time and effort raising offspring, there is a possibility that he is wasting energy from an evolutionary point of view, because he may be helping to transmit another male's genes, rather than his own, to the next generation. Consequently, parental investment has more certain payoffs for mothers than for fathers, and the tendency for greater female investment in care of offspring may be a result of natural selection. [From Latin *paternitas* paternity, from *pater* father]

path analysis See **PATH DIAGRAM**.

path diagram *n.* A graphic representation of a causal ***model** derived from a ***correlational study**, showing the strengths of hypothesized ***causal** effects of certain variables on certain other variables. The results of ***multiple regression**, ***structural equation** models, and simple ***analysis** of covariance structures are often depicted by path diagrams, and such analyses are therefore called *path analysis*.

pathergasia *n.* A physical defect or abnormality that limits a person's capacity for psychological adjustment. [From Greek *pathos* suffering + *ergasia* work or business]

pathetic fallacy *n.* Attributing to inanimate objects feelings, dispositions, and reactions that can be manifested only by animate creatures
*****ebook converter DEMO Watermarks*****

or human beings, as when a person accuses a computer of being vindictive for deleting an important file. It is a mistake rather than a fallacy, because it does not arise from any invalid form of reasoning. The term was first used in 1843 by the English author and art critic John Ruskin (1819–1900) in Volume 3, part iv, chapter xii, section 5 of his book *Modern Painters*. Compare [ANTHROPOMORPHISM](#). [From Latin *patheticus* sensitive, from Greek *pathetikos* sensitive, from *pathos* suffering, related to *penthos* sorrow]

pathetic nerve *n.* Another name for the [*abducens nerve](#) (the sixth cranial nerve).

pathogenesis *n.* The [*aetiology](#) of a disorder. **pathogenic** *adj.* Capable of causing a disorder or disease. [From Greek *pathos* suffering + *genes* born]

pathognomonic *adj.* Of or relating to a group of [*signs \(1\)](#) and [*symptoms](#) that are indicative of a specific disorder. [From Greek *pathos* suffering + *gnomon* a judge or index + *-ikos* of, relating to, or resembling]

pathological fire-setting *n.* Another name for [*pyromania](#).

pathological gambling *n.* An [*impulse-control disorder](#) characterized by persistent and maladaptive gambling, indicated by such signs and symptoms as being preoccupied with gambling; needing increasing amounts of money to achieve the desired level of excitement; attempting repeatedly and unsuccessfully to cut down or to stop gambling; becoming restless or irritable while desisting from gambling; using gambling as an escape from worry or unhappiness; attempting to recoup gambling losses by further gambling; lying to family members or therapists to conceal the extent of gambling; committing illegal acts such as fraud or theft to finance gambling; jeopardizing a significant job, personal relationship, or educational opportunity by gambling; or relying on others to relieve financial crises caused by gambling. See also [GAMBLING DISORDER](#).

pathological hair-pulling *n.* Another name for [*trichotillomania](#).

pathological stealing *n.* Another name for [*kleptomania](#).

pathomimicry *n.* A less common name for ***factitious disorder** or ***Munchausen syndrome**. [From Greek *pathos* suffering + *mimos* a mime]

patient *n.* A person receiving medical, surgical, or other forms of treatment for a disorder or illness. Also called a *client*, especially when the treatment is not medical or surgical.

patriarchy *n.* Literally, a community of related families under the authority of a male head called a *patriarch*; applied more generally to any form of social organization in which men have predominant power. *Compare* **MATRIARCHY**. **patriarchal** *adj.* [From Greek *pater*, *patris* father + Greek *arche* a rule]

patrilineal *adj.* Of or relating to descent, kinship, or inheritance through the male line, as in most Western societies. *Compare* **MATRILINEAL**. [From Latin *pater*, *patris* a father + *linea* a line]

patrist *n.* A person whose ***personality** is modelled on or strongly influenced by his or her father. *Compare* **MATRIST**. [From Latin *pater*, *patris* a father + *-ista*, *-istes* indicating a person who performs an action or function]

pattern discrimination *n.* Distinguishing consistently between two or more patterns, or consistently making different responses to them.

pattern-induced flicker colour *n.* A colour produced by ***Benham's top**. US *pattern-induced flicker color*. Also called a *Fechner–Benham colour* or a *subjective colour*. **PIFC** *abbrev.*

patterning *n.* A method of retraining brain-injured children who have suffered disruption of sensory-motor functions by guiding them through developmental sequences of behaviour, starting with early behavioural patterns such as crawling, the object being to enable undamaged brain tissue to take over the functions previously controlled by tissue that has become non-functional.

pattern masking *n.* ***Visual masking** using a differentiated image as a

masking stimulus. *See also* [INSPECTION TIME](#). **pattern masking by noise** *n.* Pattern masking using a masking stimulus that consists of visual [*noise \(2\)](#) in the form of a random array of light and dark areas. **pattern masking by structure** *n.* Pattern masking using a masking stimulus that consists of an array of light and dark areas each of which is similar to an element of the test stimulus.

pattern recognition *n.* Identification of a pattern as the same as one previously encountered despite modifications, as when a printed character or symbol is presented in a different font, colour, or size, or is viewed from a different angle. *See also* [PERCEPTRON](#). *Compare* [OBJECT RECOGNITION](#).

Pavlovian conditioning *n.* Another name for [*classical conditioning](#). [Named after the Russian physiologist Ivan Petrovich Pavlov (1849–1936) who introduced it in 1923]

Pavlov strategy *n.* Another name for the [*win–stay, lose–shift strategy](#), so-called on account of its mindless, reflexive character (*see* [PAVLOVIAN CONDITIONING](#)).

pavor diurnus *n.* A daytime counterpart of pavor nocturnus or [*sleep terrors](#); a form of sleep terrors associated with daytime sleep, usually in children. [From Latin *pavor* fear or dread + *diurnus* of the day]

pavor nocturnus *n.* Another name for [*sleep terrors](#). Also called *night terrors*. [From Latin *pavor* fear or dread + *nocturnus* of the night]

Paxil *n.* A proprietary name for the antidepressant drug [*paroxetine](#). [Trademark]

payoff *n.* A gain or loss resulting from a particular action or event, especially (in [*game theory](#)) a gain or loss of [*utility \(1\)](#) associated with the outcome of a strategic [*game \(1\)](#).

P cell *abbrev.* A type of ganglion cell belonging to the [*parvocellular system](#). Also called an *X cell*. *See also* [MIDGET CELL](#). *Compare* [M CELL](#).

P consciousness See PHENOMENAL CONSCIOUSNESS.

Pcpt–Cs process *n.* In *psychoanalysis, a term used by Sigmund Freud (1856–1939) to denote any function of the *perception–consciousness system. Also called a ω process or a *W process*.

Peabody Picture Vocabulary Test *n.* A multiple-choice test, suitable for children from 2½ to 18 years of age, designed to measure the respondent's receptive vocabulary, generally interpreted as verbal intelligence. It is untimed but takes 15 minutes or less to administer, it is issued in two parallel forms, and like a standard IQ test it yields scores on a scale with a *mean of 100 and a *standard deviation of 15. Administration of the test requires no reading by the respondent: the examiner reads aloud a series of stimulus words, and in each case the respondent selects a picture corresponding to the word from a set of four alternatives, the words being arranged within the test in ascending order of difficulty. The test was developed by the Canadian-born psychologist Lloyd M. Dunn (1917–2006) and published in 1959, and a revised version (with the suffix *-Revised*) was issued in 1981. **PPVT** or **PPVT-R** *abbrev.* [So called because it was constructed at George Peabody College in Nashville, Tennessee, by the Canadian special education researcher Lloyd M. Dunn (1917–2006) and his wife Leota M. Dunn (1917–2001)]

peace pill *n.* A common street name for the depressant drug *phencyclidine. Also spelt *PC pill*.

peak clipping *n.* A common form of distortion in telephones and other auditory transmission systems in which the peaks of the waveform are flattened off—to only one or two per cent of their original height in severe peak clipping—transforming the waveform into a sequence of rectangular pulses. When applied to speech it has surprisingly little effect on its intelligibility, 80 or 90 per cent of words still being correctly interpreted by listeners when the clipping is severe.

peak experience *n.* An *altered state of consciousness resembling a form of *oceanic feeling, in which a person experiences an ecstatic

dissolution of the usual bonds of space and time and an attitude of wonderment and awe. The concept was introduced by the US psychologist Abraham Maslow (1908–70) in his book *Religions, Values, and Peak-Experiences* (1964, pp. 59–68).

peak shift *n.* A phenomenon of ***discrimination** learning, when an animal has learnt to distinguish between a positive and a negative stimulus lying on the same stimulus dimension, such as light stimulus associated with reward and a dark stimulus not associated with reward. If the animal is then tested with a variety of stimuli spanning the stimulus dimension (in this example, stimuli of various shades of lightness), it responds maximally not to the original positive stimulus but to a stimulus further from the negative stimulus (a stimulus even lighter than the original positive stimulus).

Pearson chi-square test *n.* Another name for the ***chi-square test** when the Pearson formula is used. *Compare* **LIKELIHOOD RATIO CHI-SQUARE TEST**. [Named after the English statistician Karl Pearson (1857–1936) who developed it in 1900]

Pearson's correlation coefficient *See* **PRODUCT–MOMENT CORRELATION COEFFICIENT**.

pecking order *n.* A ***dominance** hierarchy within a flock of poultry in which each bird is able to peck without retaliation only those lower in the hierarchy and is liable to be pecked only by those above. There are usually separate pecking orders for males and females, with all the males dominating all the females, and the highest-ranked (alpha or α) male, often with the largest comb (itself determined by high ***testosterone** level), dominating all the others but in practice pecking only his nearest rivals. Also called a *peck order*. *Compare* **HOOK ORDER**. [A literal translation of the German *Hackordnung*, the name given to it in 1922 by the Norwegian zoologist Thorleif Schjelderup-Ebbe (1894–1976) following his pioneering study of domestic hens]

PEC scale *abbrev.* A scale to measure political and economic conservatism of attitudes first published by the German philosopher, sociologist, and psychologist Theodor W(iesengrund) Adorno (1903–69) and
*****ebook converter DEMO Watermarks*****

several colleagues in the book *The Authoritarian Personality* (1950). See also [AUTHORITARIANISM](#).

pederasty *n.* Sex between a man and a boy, especially involving anal intercourse. [From Greek *pais*, *paidos* a boy + *erastes* a lover]

pedophilia *n.* An alternative spelling, especially in the US, of [*paedophilia](#).

peduncle *n.* Any stalklike structure, especially a bundle of white nerve fibres in the brain. See [CEREBELLAR PEDUNCLE](#), [CEREBRAL PEDUNCLE](#). **peduncular** *adj.* [From Latin *pedunculus* a corruption of *pediculus* a little foot, from *pes*, *pedis* a foot]

peeping Tom *n.* Another name for a [*voyeur](#). [Named after a 13th-century English legend according to which Lady Godiva rode naked through the marketplace of Coventry in response to a promise from her husband, Leofric, Earl of Mercia, that he would reduce taxes if she did so. In a later version of the legend, all the townspeople averted their eyes except a tailor called Tom, who was struck blind for his sin]

pegboard test *n.* A test of perceptual–motor skill in which pegs have to be inserted into holes as quickly as possible.

peg-word mnemonic *n.* A flexible and effective [*mnemonic](#) for memorizing long lists of items in a specific numerical sequence by forming mental associations with a list of words that are already known or can be generated to order. A popular set of peg-words, easy to remember because they rhyme with the names of the first ten natural numbers, is: one is a *bun*, two is a *shoe*, three is a *tree*, four is a *door*, five is a *hive*, six is *sticks*, seven is *heaven*, eight is a *gate*, nine is *wine*, ten is a *hen*. To memorize the ten commandments, one might form vivid mental images such as these: (1) a *bun* inscribed with *One God* in icing; (2) a *shoe* decorated with *graven images* of gods, animals, and fishes; (3) a *tree* into which children have climbed and are loudly *taking God's name in vain*; (4) a *door* hung with a calendar showing the *Sabbath days* blacked out; (5) a *hive* being presented to *honour one's father and mother*; (6) *sticks* being used to *kill* someone; (7) *heaven* up

*****ebook converter DEMO Watermarks*****

above, with a sign *No Adultery* written in the clouds; (8) a *gate* with a thief climbing over it to *steal* something; (9) a *wine* bottle sticking out of the pocket of a witness giving *false testimony* in court; (10) a *hen* being *coveted* by a neighbour over a garden fence. When the time comes to recall them, *bun* should bring back the image of the inscription *One God*, *shoe* should remind one of the graven images decorating it, and so on. For lists of unlimited length, the standard system used by experts is to generate peg-words from numbers by using a technique introduced in 1634 by the French mathematician Pierre Hérigone (1580–1643) in which each of the ten digits has one or more consonants assigned to it, and then words lending themselves to vivid images are formed from numbers by inserting vowels freely. In the modern version of the Hérigone code, 1 is associated with *t* or *d*; 2 with *n*; 3 with *m*; 4 with *r*; 5 with *l*; 6 with *ch*, *j*, or *sh*; 7 with *k*, hard *c*, or hard *g*; 8 with *f* or *v*; 9 with *p* or *b*; and 0 with *s* or *z*. The peg-word for the number 1 might be *toe*, 31 might be *mat*, and 131 might be *tomato*, and so on. The system is also useful for memorizing numbers, such as 1879, the year in which the world's first psychological laboratory was opened in Leipzig, which might be translated into a mental image of a *dove cup*—a trophy cup engraved with an image of the dove of peace to commemorate the event; but one's own images always work best, especially if they are more bizarre than that. Also called *keyword mnemonic*. See also [MNEMONIST](#).

pellagra *n.* A disease that is caused by dietary deficiency of niacin or nicotinic acid, a member of the [*vitamin B](#) complex contained in milk, liver, yeast, and other foods, and that results in wasting of the body, itching and scaling of the skin, inflammation of the mouth, diarrhoea, and [*intellectual disability](#). [From Italian *pelle* skin + *agra* rough, or Latin *pellis* skin + Greek *agra* seizure]

penetrability, cognitive See [COGNITIVE PENETRABILITY](#).

penetrance *n.* The degree to which a [*gene](#) is expressed in the [*phenotype](#), often indexed by the proportion of organisms with the specified genotype who show the characteristic. See also [DOMINANCE \(GENETIC\)](#).

penile plethysmograph *n.* An instrument for recording changes in the volume of the [*penis](#), generally used to study sexual responses of men to

*****ebook converter DEMO Watermarks*****

various stimuli. *See also* [PLETHYSMOGRAPH](#). [From *penis* + Greek *plethysmos* enlargement + *graphein* to write]

penis *n.* The external male sexual organ, in humans and other mammals also used for excretion of urine. *See also* [PHALLUS](#), [WOLFFIAN DUCT](#). *Compare* [CLITORIS](#). **penile** *adj.* [Latin *penis* originally a tail]

penis dentata *n.* A fantasy of a toothed penis encountered in some women with neurotic sexual fears. *See also* [VAGINA DENTATA](#). [From Latin *penis* originally a tail + *dentata* toothed, from *dens*, *dentis* a tooth]

penis envy *n.* In [*psychoanalysis](#), a key aspect of female psychology, originating in a girl's discovery of the anatomic differences between the sexes, causing her to feel deprived, and later, during the [*Oedipal phase](#), to develop a desire for a penis, manifested symbolically as a desire to have a child or to possess a penis in sexual intercourse. Sigmund Freud (1856–1939) introduced the concept in 1914 in connection with the [*castration complex](#) in girls in his article 'On Narcissism: An Introduction' (*Standard Edition*, XIV, pp. 73–102, at p. 92) and developed it further in an article in 1917 'On the Transformations of Instinct, as Exemplified in Anal Erotism' (*Standard Edition*, XVII, pp. 127–33). The concept was rejected by the German-born US psychoanalyst Karen Horney (1885–1952) and the Welsh psychoanalyst Ernest Jones (1879–1958), among others, and was given less prominence by the British-based Austrian psychoanalyst Melanie Klein (1882–1960). *See also* [PHALLIC STAGE](#).

Penrose staircase *n.* Another name for the [*staircase illusion](#).

Penrose triangle *n.* An [*impossible figure](#) of a solid triangular frame that could not exist in actual space although each of its corners, considered on its own, is feasibly constructed (see [illustration](#)). Also called an *impossible triangle* or a *tribar*. The first recognizable version of it was depicted in 1934 as an impossible arrangement of nine cubes by the Swedish artist Oscar Reutersvärd (1915–2001) and was used as a design for a postage stamp issued in Sweden in 1982. [Named after the English psychologist/geneticist Lionel S. Penrose (1898–1972) and his mathematical physicist son Roger Penrose (born 1931) who, unaware of Reutersvärd's earlier work, published a

*****ebook converter DEMO Watermarks*****

version of it in 1958]

Penrose triangle

pentazocine *n.* A synthetic **opiate* drug, being a **narcotic* analgesic that is less addictive than morphine and is sometimes taken as a street drug. Also called *Talwin* or *Fortral* (trademark). Formula: $C_{19}H_{27}NO$. Compare *PHENAZOCINE*. [From Greek *pente* five + *azocine* a chemical compound]

pentobarbital *n.* Pentobarbitone sodium, a short-acting **barbiturate* drug and central nervous system **depressant*, used as a sedative and hypnotic, and sometimes taken as a street drug. Also called *Nembutal* (trademark) or *pentobarbitone*. Street names include *nebbies*, *yellow bullets*. Formula: $C_{11}H_{17}N_2O_3Na$. [From Greek *pente* five + *barbit(uric) acid* + *-al* indicating a

*****ebook converter DEMO Watermarks*****

pharmaceutical product]

pentobarbitone *n.* See [PENTOBARBITAL](#).

Pentothal *n.* Sodium Pentothal, a proprietary name for the barbiturate drug [*thiopental](#) sodium (thiopentone sodium). See also [TRUTH DRUG](#). [Trademark]

pentylene tetrazol *n.* A synthetic, white, crystalline, bitter-tasting drug that functions as a central nervous system [*stimulant](#) by reducing the recovery time of neurons following [*action potentials](#), this effect being brought about by increasing the permeability of the neurons' cell membranes to potassium. Also called *Metrazol* (trademark). [From its chemical name *pent(ameth)ylene tetrazol(e)*]

Pepper's ghost *n.* A spectral image produced by a large sheet of clear glass positioned at an angle, allowing people and objects to be seen through it while an image of a person situated elsewhere, if brightly lit, is simultaneously reflected from it. It was used in Victorian theatre productions to project an image of an actor from a well beneath the front of the stage, the lighting on the actor being brightened or dimmed to make the image appear or disappear, the image itself having the quality of an apparition through which other actors on the stage could walk. The device is often wrongly described as being made from half-silvered glass. It should, perhaps, be called *Dircks's ghost* (see [ETYMOLOGY](#) immediately below). [Named after the English analytical chemist John Henry Pepper (1821–1900) who improved it and was the first to demonstrate it in public at the Royal Polytechnic in London in 1862, although it had been invented earlier that year by the retired English civil engineer and patent agent Henry Dircks (1806–73) and was patented jointly by Pepper and Dircks in 1863]

pepper spray *n.* Oleoresin capsicum ([OC](#)), a mixture of the resin and essential oil of the cayenne pepper plant, developed in the 1980s as a dog repellent and later adapted for personal defence and crowd control, sprayed as an aerosol causing immediate but temporary inflammation (rather than irritation as with other [*incapacitants](#)) of the mucous membranes of the eyes, nose, throat, and lungs, with accompanying pain, blindness, and breathing

*****ebook converter DEMO Watermarks*****

difficulty. Compare [BZ GAS](#), [CN GAS](#), [CS GAS](#), [MACE](#), [TEAR GAS](#).

pepsin *n.* Any of a group of digestive enzymes produced in the stomach in the inactive form pepsinogen and activated by the presence of acids to contribute to digestion by breaking down proteins into their component amino acids. Also spelt *pepsine*. See also [GASTRIC GLAND](#). **peptic** *adj.* Of or relating to pepsin or digestion. [From Greek *peptein* to digest]

peptide *n.* Any chemical compound of two or more [*amino acids](#) linked by chemical bonds between their respective amino and carboxyl groups, including a substance such as an [*endorphin](#) that regulates various bodily functions and plays an important part in the experience of [*pain](#). See also [POLYPEPTIDE](#). [From Greek *peptein* to digest]

peptide hormone *n.* Any [*hormone](#) that is a [*peptide](#) or [*polypeptide](#), in contrast to a [*steroid](#) hormone; the hormones of the hypothalamus and most of the endocrine glands being peptide hormones, apart from those of the adrenal cortex, testes, and ovaries, which are steroid hormones. Many peptide hormones function also as [*neurotransmitters](#).

perceive *vb.* To become aware or gain knowledge of something through the senses, or to comprehend or grasp a stimulus. See also [PERCEPTION](#). [From Latin *percipere* to seize thoroughly, from *per* thoroughly + *capere* to grasp]

percentile *n.* Any of the 100 equal groups into which a distribution of scores can be divided, or the value of a variable such that a specified percentage of scores, arranged in order of magnitude, fall below that value, the 95th percentile, for example, being the value of the variable such that 95 per cent of the other scores fall below that value. The 25th, 50th, and 75th percentiles are also [*quartiles](#), and the 50th percentile is the [*median](#) of any distribution. A percentile is also called a *centile*. See also [PARTILE](#). Compare [DECILE](#), [QUARTILE](#). [From Latin *per centum* out of every hundred]

percept *n.* The mental representation of something that is [*perceived](#), an object or image as perceived by the senses rather than the physical stimulus that generates it, distinct from both the [*proximal](#) stimulus and the [*distal](#) stimulus. See also [PERCEPTION](#).

*****ebook converter DEMO Watermarks*****

perception *n.* The act, process, or product of **perceiving*, the ability or capacity to perceive, or a particular way of perceiving (*Newspapers influenced the public's perception of Princess Diana*). In psychology, a distinction is conventionally drawn between **sensation*, the subjective experience or feeling that results from excitation of **sensory* receptors, and perception, sensory experience that has been interpreted with reference to its presumed external stimulus object or event, this distinction having first been made in 1785 by Thomas Reid (1710–96), founder of the Scottish school of psychological philosophy, who pointed out that the agreeable fragrance of a rose is merely a sensation inasmuch as it can be experienced without thinking of a rose or of any other object, whereas the perception of a rose or of anything else always refers to the external object that is its cause. *Compare APPERCEPTION.* **perceive** *vb.* To engage in perception. **perceptual** *adj.* Of or relating to perception. [From Latin *percipere*, *perceptum* to perceive, from *per* through or thoroughly + *capere*, *ceptum* to take + *-ion* indicating an action, process, or state]

perception–consciousness system *n.* In the **psychoanalysis* of Sigmund Freud (1856–1939), a subsystem of the mental apparatus characterized by **consciousness*, receiving input from the outside world via the **sensory* receptors and from the **preconscious* via the activation of memories, and playing a dynamic role in avoidance of unacceptable thoughts or ideas and control of the **pleasure principle*. In *An Outline of Psycho-Analysis* (1938), Freud considered the existence of this system to be ‘a fact without parallel, which defies all explanation or description....Nevertheless, if anyone speaks of consciousness we know immediately and from our most personal experience what is meant by it’ (*Standard Edition*, XXIII, pp. 144–207, at p. 157). **ω** or **W** or **Pcpt–Cs** *abbrev.*

perceptron *n.* In **artificial intelligence*, a pattern-recognition machine into which distinctive **features* (1) of a target pattern are input with weights reflecting their relative importance. The machine is programmed to signal a decision that the target pattern is present whenever the sum of the weights of features in a test pattern presented to it exceeds a critical level, and a process of learning takes place as the weights of features present in a test pattern are increased after every **hit* and decreased after every **false negative*. The first version was introduced in an article in the journal *Psychological Review* in

*****ebook converter DEMO Watermarks*****

1958 by the US psychologist Frank Rosenblatt (1928–71) and is an early example of a **neural* network. *See also* [COMPUTER VISION](#), [PATTERN RECOGNITION](#). [From Latin *percipere*, *perceptum* to perceive, from *per* through + *capere*, *ceptum* to take + Greek *-tron* denoting an instrument, from *arotron* a plough]

perceptual completion *n.* Another name for **filling-in*. *See* [AMODAL COMPLETION](#), [MODAL COMPLETION](#).

perceptual constancy *n.* The tendency for a perceived object or a perceptual quality to appear the same when the pattern of sensory stimulation or **proximal* stimulus alters through a change in orientation, distance, illumination, or some other extraneous influence or factor. *See* [COLOUR CONSTANCY](#), [LIGHTNESS CONSTANCY](#), [MELODIC CONSTANCY](#), [OBJECT CONSTANCY](#), [ODOUR CONSTANCY](#), [PERSON CONSTANCY](#), [POSITION CONSTANCY](#), [SHAPE CONSTANCY](#), [SIZE CONSTANCY](#), [VELOCITY CONSTANCY](#), [WORD CONSTANCY](#). *See also* [BRUNSWIK RATIO](#), [LAND EFFECT](#), [PHENOMENAL REGRESSION](#), [RETINEX THEORY](#), [SHAPE–SLANT INVARIANCE](#), [TEMPLATE MATCHING](#), [THOULESS RATIO](#).

perceptual cycle *n.* A term introduced by the German-born US psychologist Ulrich (Richard Gustav) Neisser (1928–2012) for (a) the set of cognitive **schemata* that direct perceptual processes, (b) the perceptual responses through which perceptual information is sampled, and (c) the physical stimuli that give rise to perception, the assumption being that a cyclic **feedback* mechanism causes a change in (c) to lead to a change of (a), which in turn leads to a change in (b), which affects (c), and so on indefinitely. Also called the *cyclic model of perception*. *See also* [CONSTRUCTIVISM](#).

perceptual defence *n.* The process by which stimuli that are potentially threatening, offensive, or unpleasant are either not perceived or are distorted in perception, especially when presented as brief flashes in a **tachistoscope*. US *perceptual defense*.

perceptual differentiation *n.* The process by which exposure to a range of stimuli belonging to a particular class increases one's ability to discriminate between them.

*****ebook converter DEMO Watermarks*****

perceptual field *n.* A general term for the **visual field* or the analogous range of stimuli available to any other sense organ. *Compare* RECEPTIVE FIELD.

perceptual illusion *n.* A misperception of a stimulus object, event, or experience, or a stimulus that gives rise to such a misperception or misconception; more generally any misleading, deceptive, or puzzling stimulus or the perceptual experience that it generates. *See* AUDITORY ILLUSION, TACTILE ILLUSION, VISUAL ILLUSION. *See also* CONSTANT ERROR, NAIVE REALISM. [From Latin *illusio*, *illusionis* deceit, from *illudere* to mock or make sport with, from *ludere* to play]

perceptual memory *n.* Long-term memory for visual, auditory, and other perceptual information, including memory for people's faces and voices, the appearance of buildings, familiar tunes, the flavours of particular foods and drinks, and so on. Stored information of this type does not fall into the category of **episodic memory*, and it is therefore often included in **semantic* memory, but this is avoided in careful usage because it is not (and in some cases cannot be) encoded in words. It should not be confused with **sensory* memory.

perceptual-motor skill *n.* Any ability or capacity involving the interaction of **perception* and voluntary movement, typical examples being the ability to type and the ability to play a ball game.

perceptual schema *n.* A structured internal **representation* (1) of an object or image acquired through perception. *See also* SCHEMA.

perceptual sensitization *n.* An abnormally lowered threshold for the perception of certain stimuli, tending to result in **false alarms* (2). Also called *perceptual vigilance*.

perceptual set *n.* A temporary readiness or predisposition to perceive in a particular way. *See also* AUFGABE, EINSTELLUNG, SET (2).

perceptual speed *n.* A skill involving the rapid identification of matching items, incorporated into many IQ tests, women tending to

outperform men on measures of this skill.

perceptual vigilance *n.* Another name for **perceptual sensitization*.

percipient *adj.* 1. Perceptive, observant, or able to perceive. *n.* 2. A person, organism, or machine that perceives. [From Latin *percipiens* observing, from *percipere* to perceive, from *per* through or thoroughly + *capere* to take]

Percodan *n.* A proprietary name for a drug containing the narcotic analgesic **oxycodone* that is sometimes taken as a street drug. [Trademark]

perdeviation effect *n.* A form of **adaptation* (2) to an eccentric body posture held for some time, the sensation gradually developing that the posture is normal. *See also* *KOHNSTAMM EFFECT*, *POSTURAL AFTEREFFECT*. [From Latin *per* through or thoroughly + *de* from + *via* a way + *-ation* indicating a process or condition]

perdida del alma *n.* Another name for **susto*. [From Spanish *perdida* loss + *del* of + *alma* soul]

peregrinating patient *n.* Another name for a person with **Munchausen syndrome*.

perfect pitch *n.* Another name for **absolute pitch*, but a term that is avoided in careful usage. Absolute pitch could never be exact, because the **frequency* (1) of a sound wave is a continuous variable, and differences in frequency can be arbitrarily small.

perforant pathway *n.* A major tract of afferent nerve fibres from the **entorhinal cortex* to the **hippocampus*. [From Latin *per* through + *forare* to bore]

performance *n.* 1. The act or process of carrying out a sequence of behaviour, especially the presentation of a dramatic role or piece of music. 2. In linguistics, especially in **generative grammar* and **transformational*

grammar, a term introduced by the US linguist and philosopher (Avram) Noam Chomsky (born 1928) to denote the specific utterances of a native speaker of a language, including hesitations, false starts, and speech errors, in contrast to their underlying ***competence** (2). It is analogous to the concept of ***parole**. Also called *linguistic performance*.

performance anxiety *n.* A form of ***anxiety** preceding or accompanying participation in a musical, theatrical, sporting, or other activity involving public self-presentation before an audience. Also called *stage fright*. See also AUDIENCE EFFECT, BETA-BLOCKER, DRIVE THEORY OF SOCIAL FACILITATION.

performance enhancer *n.* Any drug or treatment that improves an athlete's level of achievement. Among the drugs that have been used for this purpose are ***anabolic steroids**, ***creatine**, ***erythropoietin**, ***testosterone**, ***growth hormone**, ***stimulant drugs**, ***beta-blockers**, and ***smart drugs**. Also called a *performance-enhancing drug*.

performance, human See HUMAN PERFORMANCE.

performance operating characteristic *n.* A graph showing the performance of one task plotted against the performance of a different task, when both tasks are performed at the same time. In general, it shows a trade-off, with relatively good performance on one task being associated with relatively poor performance on the other. See also ATTENTION OPERATING CHARACTERISTIC. **POC** abbrev.

performance test *n.* In psychometrics, any ***non-verbal test** of aptitude, ability, or intelligence.

periaqueductal grey matter *n.* An area surrounding the ***cerebral** aqueduct in the pons and thalamus. It contains opiate ***neuroreceptors** and neurons that release ***endorphins** and is thus implicated in the sensation and suppression of ***pain**, and it is also implicated in the control of aggression and in female sexual behaviour. US *periaqueductal gray matter*. **PAG** abbrev. [From Greek *peri* around + Latin *aqua* water + *ductus* a leading, from *ducere*, *ductus* to lead]

*****ebook converter DEMO Watermarks*****

periglomerular cell *n.* A type of horizontally oriented cell in an **olfactory bulb* responsible for lateral interactions within the bulb. [From Greek *peri* around + Latin *glomerulus* a little ball, diminutive of *glomus* a ball]

perikaryon *n.* The part of a cell surrounding the **nucleus* (1). Also called the *cytoplasm*. [From Greek *peri* around + *karyon* a kernel]

perilymph *n.* The fluid contained within the **scala* tympani and the **scala* vestibuli in the space between the membranous labyrinth and bony labyrinth of the **inner ear*. Compare *ENDOLYMPH*. [From Greek *peri* around + Latin *lympa* water, alluding to the fact that it lies outside the membranous labyrinth, unlike endolymph]

perimetry *n.* Mapping the limits of the **visual field* for stimuli of various kinds (especially colours) with a *perimeter*, a device consisting of a light stimulus on the end of an adjustable arm that moves to various positions while the person being tested maintains a steady fixation on a point immediately ahead and reports visual sensations, the resulting map of the visual field being projected on to the inside of a spherical surface. [From Greek *perimetros* a boundary, from *peri* around + *metron* a measure]

perineal *adj.* Of or relating to the perineum (or perinaeum), the diamond-shaped part of the body between the genital organs and the anus. [From Greek *perinaion* the perineum, from *peri* around + *inein* to empty out]

perineural *adj.* Of or relating to the connective tissue that forms a sheath around a bundle of nerve fibres. Also written *perineurial* or *perineuronal*.
perineurium *n.* [From Greek *peri* around + *neuron* a nerve]

peripheral dyslexia *n.* Another name for **visual word-form dyslexia*.

peripheral nerve *n.* Any nerve belonging to the **peripheral nervous system*.

peripheral nervous system *n.* All of the **nervous* system outside the

brain and spinal cord, including the **cranial nerves* apart from the **optic nerves* (the second pair of cranial nerves), the **spinal nerves*, and the **autonomic* nervous system. *Compare* CENTRAL NERVOUS SYSTEM. **PNS** *abbrev.*

peripheral vision *n.* Perception of stimuli that are not being fixated directly and are projected on to the retina outside the **macula* lutea. *See also* ARAGO PHENOMENON. *Compare* CENTRAL VISION.

peristalsis *n.* Travelling waves of involuntary contractions along the **alimentary* canal, controlled by the parasympathetic nervous system, causing food and waste products to move down it; also similar contractions in other tubular organs. **peristaltic** *adj.* [From Greek *peristellein* to wrap around, from *peri* around + *stellein* to press together]

Perky phenomenon *n.* The act or process of mistaking a physical stimulus for an image of imagination, an effect first demonstrated in a group of viewers who were instructed to stare fixedly at a mark on a ground glass screen and to imagine a red tomato as vividly as possible while a very faint (sub-threshold) and slightly blurred image of a red tomato was back-projected on to the screen and its illumination gradually increased until the observer reported experiencing an image of a tomato, the procedure then being repeated with images of a blue book, a banana, an orange, a leaf, and a lemon, whereupon the observers all mistook the visual stimuli for images of imagination, and not one of them realized that light stimuli were being projected on to the screen. In almost all cases the observers reported the images only after the illumination had been increased well above the threshold at which the stimuli were perceived by a control group of viewers who were not vividly imagining the objects, therefore the phenomenon is interpreted by some authorities as a type of **visual masking* by imaginary mental images, the perception of stimuli apparently being partially suppressed by vividly imagined visual images. [Named after US psychologist Cheves West Perky (1874–1940) who first reported it in 1910, while she was a postgraduate student under the English psychologist Edward Bradford Titchener (1867–1927) at Cornell University]

perlocutionary act *n.* The effect of a **speech act* on a listener. An **illocutionary act* may not produce the intended perlocutionary act on the part

*****ebook converter DEMO Watermarks*****

of the listener, as when a threat fails to induce fear. Compare [LOCUTIONARY ACT](#). [From Latin *per* through + *locutio* an utterance, from *loqui* to speak]

perphenazine *n.* A [*neuroleptic \(1\)](#) drug belonging to the class of [*phenothiazines](#), used in the treatment of anxiety, tension, and agitation in [*schizophrenia](#) and other [*psychotic \(1\)](#) disorders and in the control of nausea, vomiting, and hiccups. Also called *Trilafon* (trademark). [A blend of *piperazine* and *phene* an old name for benzene, from Greek *phainein* to show, alluding to its use in manufacturing illuminating gas]

persecution complex *n.* A [*delusion](#) or fear that others are plotting or conspiring to cause one harm. See [PERSECUTORY DELUSION](#). [From Latin *persecutor* a pursuer, from *persequi* to take revenge on, from *per-* thoroughly + *sequi* to follow]

persecution, delusion of See [PERSECUTORY DELUSION](#).

persecutory delusion *n.* A [*delusion](#) of being conspired or plotted against, cheated, spied on, stalked, poisoned, drugged, slandered, harassed, or obstructed. Also called a *persecution complex*.

persecutory delusional disorder *n.* A type of [*delusional disorder](#) in which the central delusion is a [*persecutory delusion](#).

perseveration *n.* **1.** The continuance or recurrence of a sensation, impression, or idea during subsequent activity; the automatic repetition of an action, utterance, thought, or other form of behaviour; or the difficulty experienced in switching from one pattern of behaviour or method of working to another. **2.** Meaningless or pointless repetition of words, phrases, ideas, or actions, characteristic of some forms of [*thought disorder](#) and some neurological disorders such as [*frontal lobe](#) syndrome. [From Latin *perseverare* to remain steadfast or to persist, from *per* through or thoroughly + *severus* strict + *-ation* indicating a process or condition]

persistent (chronic) motor or vocal tic disorder *n.* A [*tic disorder](#) in [*DSM-5](#) characterized by the presence of either motor tics or

vocal tics, but not both, and apart from that sharing the features of *Tourette's disorder.

persistent depressive disorder *n.* A *depressive disorder introduced in *DSM-5 for a condition characterized by feelings of *depression on most days, lasting for at least two years, or at least one year for children and adolescents, accompanied by poor appetite or overeating, *insomnia or *hypersomnia, *fatigue or lack of energy, low *self-esteem, poor concentration, or feelings of hopelessness, the symptoms falling short of *major depressive disorder. Compare BIPOLAR DISORDERS, CYCLOTHYMIC DISORDER, DYSTHYMIA.

persistent sexual arousal syndrome *n.* A rare *sexual dysfunction of unknown *aetiology causing unwanted and intrusive physiological responses characteristic of sexual arousal, without conscious sexual excitement or desire, triggered by sexual or nonsexual stimuli, persisting for hours to days and not subsiding in response to *orgasm. It was discovered and named by the US psychiatrists Sandra R(isa) Leiblum (born 1943) and Sharon G. Nathan (born 1943) in an article in the *Journal of Sexual and Marital Therapy* in 2001. Compare FEMALE ORGASMIC DISORDER, MALE HYPOACTIVE SEXUAL DESIRE DISORDER. **PSAS** abbrev.

persistent vegetative state *n.* A generally irreversible condition resulting from severe brain damage in which a person is alive, has spontaneous breathing, heartbeat, and sleep–wake cycle, but is incapable of voluntary movement and is judged to lack conscious awareness. People in such a state can make spontaneous movements such as swallowing, smiling, crying, grasping, and moaning, and in rare cases may briefly follow moving objects with their eyes or turn towards loud sounds, but these movements are always reflexive and not purposeful. Also called *persistent vegetative syndrome* or (especially if it has not persisted for long) a *vegetative state*. Compare LOCKED-IN SYNDROME. **PVS** abbrev.

persona *n.* 1. In *analytical psychology, the mask or face that a person presents to the world, often derived from a sense of gender identity (as when a woman plays the role of a loyal wife), or a stage of development (a rebellious adolescent), or an occupation (as in a trustworthy doctor), and over

*****ebook converter DEMO Watermarks*****

the lifespan a person may adopt various different personas derived from ***archetypes** (2). Carl Gustav Jung (1875–1961) believed that a persona can become pathological if a person identifies too closely with it, causing it to stifle awareness of anything beyond the social role and reducing the person's ability to adapt to changing circumstances. **2.** A character in a play or other work of fiction, as in *dramatis personae*, a list of characters. **3.** An assumed identity. **personas** or **personae pl.** [From Latin *persona* an actor's mask]

personal construct theory *n.* A theory of personality, formulated by the US psychologist George A(lexander) Kelly (1905–67) and published in his book *The Psychology of Personal Constructs* (1955), according to which people think like incipient scientists in construing their worlds, constantly formulating hypotheses and testing their predictions against experience. The fundamental postulate of the theory is that ‘a person's processes are psychologically channelized by the ways in which he anticipates events’ (Vol. 1, p. 46), and this postulate is extended by eleven corollaries, including the individuality corollary: ‘Persons differ from each other in their construction of events’ (p. 55), and the dichotomy corollary: ‘A person's construction system is composed of a finite number of dichotomous constructs’ (p. 59), a dichotomous construct being a way of construing reality such that any pair of elements of experience may be classified as being either similar or different. Personal constructs are elicited and studied with the help of the ***Repertory Grid Test**. The theory interprets emotion as follows: *threat* is an awareness of an imminent comprehensive change in one's core constructs when they appear inadequate; *anxiety* is an awareness of the existence of important elements that lie outside the range of convenience of one's construct system; *guilt* is an awareness of being dislodged from one's core role structure; and *hostility* is an effort to extort validation evidence in favour of a social prediction that has already failed. Two treatment techniques based on personal construct theory are ***fixed-role therapy** and ***personal construct therapy**. **PCT** *abbrev.*

personal construct therapy *n.* A technique of ***psychotherapy** based on the ***personal construct theory** of the US psychologist George A(lexander) Kelly (1905–66) in which the client or patient is encouraged to formulate hypotheses and try out new constructs for interpreting experience. *Compare* **COGNITIVE THERAPY**, **FIXED-ROLE THERAPY**.

Personal Data Sheet *n.* The first ***personality** questionnaire of significance ever devised, and the first to be administered to large numbers of respondents, designed to measure maladjustment or neurosis, described as 'emotional fitness for warfare' but completed too late to be used in the First World War, constructed by the US psychologist Robert S(essions) Woodworth (1869–1962) and published in the journal *Psychological Bulletin* in 1919. It consists of 116 yes/no questions, many of them based on common neurotic symptoms (such as *Do you feel low-spirited most of the time? Do you ever feel an awful pressure in or about your head? Did you have a happy childhood?*) and only items that were answered in the keyed direction by fewer than 25 per cent of a control group of normal respondents were included in the final test. Compare **BERNREUTER PERSONALITY INVENTORY**.

personal equation *n.* A person's characteristic ***reaction time**, or a correction for it, first investigated after an incident in which Neville Maskelyne (1732–1811), the eighth Astronomer Royal at Greenwich, reported in 1799 that he had found discrepancies averaging 0.8 second between his own observations of the transit times of stars across a hair-line, measured by counting the ticks of a pendulum clock, and those of his assistant, whom he had therefore fired, but in 1820 the German astronomer and mathematician Friedrich Wilhelm Bessel (1784–1846) followed up this report and discovered that even skilled astronomers vary consistently in the transit times that they report, and on the basis of this finding he introduced the personal equation for calibrating individuals to reflect these differences in what later came to be called reaction time. See also **PRIOR ENTRY LAW**.

personality *n.* The sum total of the behavioural and mental characteristics that are distinctive of an individual. Also, informally, the personal qualities that make a person socially popular, as in *Princess Diana had a lot of personality*, but this sense is avoided in careful psychological usage. See also **ALPHA PERSONALITY FACTOR**, **BERNREUTER PERSONALITY INVENTORY**, **BETA PERSONALITY FACTOR**, **BIG FIVE**, **CHARACTER**, **EYSENCK PERSONALITY INVENTORY**, **EYSENCK PERSONALITY QUESTIONNAIRE**, **GENERAL FACTOR OF PERSONALITY**, **IMPLICIT PERSONALITY THEORY**, **INTERACTIONISM (2)**, **IPIP**, **LANGUAGE PERSONALITY SPHERE**, **MAUDSLEY PERSONALITY INVENTORY**, **OCCUPATIONAL PERSONALITY QUESTIONNAIRE**, **PERSONALITY DISORDERS**, **SITUATIONIST CRITIQUE**. [From Latin *personalitas* personality, from *personalis* of or relating to a person, from

*****ebook converter DEMO Watermarks*****

persona an actor's mask]

personality disorders *n.* An umbrella term for a category of **mental disorders* in **DSM-5*, with onset in adolescence or early adulthood, characterized by pervasive, inflexible, and enduring patterns of cognition, affect, interpersonal behaviour, or impulse control that deviate markedly from culturally shared expectations and lead to significant distress or impairment in social, occupational, or other important areas of functioning and are not due to drugs or other medical conditions. See ANTISOCIAL PERSONALITY DISORDER, AVOIDANT PERSONALITY DISORDER, BORDERLINE PERSONALITY DISORDER, DEPENDENT PERSONALITY DISORDER, HISTRIONIC PERSONALITY DISORDER, NARCISSISTIC PERSONALITY DISORDER, OBSESSIVE—COMPULSIVE PERSONALITY DISORDER, PARANOID PERSONALITY DISORDER, SCHIZOID PERSONALITY DISORDER, SCHIZOTYPAL (PERSONALITY) DISORDER. Also called *character disorders*. See also DISSOCIAL PERSONALITY DISORDER, INADEQUATE PERSONALITY, PASSIVE—AGGRESSIVE PERSONALITY DISORDER SELF-DEFEATING PERSONALITY DISORDER. **PD** abbrev.

personality inventory *n.* A **questionnaire* designed to measure one or more personality characteristics, usually **traits*.

personality, multiple (split) See DISSOCIATIVE IDENTITY DISORDER.

personal space *n.* The area round a person's or an animal's body into which other people or **conspecifics* (1) may not normally intrude without provoking a negative reaction. In special circumstances, such as crowded situations, contact sports, or sexually intimate interactions, invasions of personal space need not cause negative reactions. See also PROXEMICS.

personal unconscious *n.* In **analytical psychology*, another name for the **unconscious* (2), introduced by Carl Gustav Jung (1875–1961) to distinguish it from the **collective unconscious*.

person-centred therapy *n.* Another name for **client-centred therapy*. US *person-centered therapy*.

person constancy *n.* A form of **perceptual constancy* through which a

familiar person tends to remain recognizably the same individual in spite of large variations in such factors as clothes, hairstyle, and facial expression.

personification *n.* The attribution of human characteristics to non-human entities, as when the dying English television dramatist Dennis (Christopher George) Potter (1935–94) named his cancer Rupert, after a media mogul whom he hated; or a **figure of speech* in which a non-human entity is referred to as though it were human, as in the phrases *merciful death* and *angry thunder*.

personnel psychology *n.* A branch of **occupational psychology* or **industrial/organizational psychology* devoted to **job analysis*, **job satisfaction*, personnel selection and placement, and training of employees in industry. *See also* [ERGONOMICS](#).

personology *n.* In **psychoanalysis*, a term introduced by the South African statesman and philosopher Jan Christiaan Smuts (1870–1950) in his book *Holism and Evolution* (1926, p. 262) and adopted by the US psychologist Henry Alexander Murray (1893–1988) to denote a theory of personality and social behaviour in which a person's needs and personality are considered as an integrated whole. *See also* [EDWARDS PERSONAL PREFERENCE SCHEDULE](#), [NEED \(3\)](#), [NEED-PRESS](#), [PRESS](#), [TAT](#).

person perception *n.* The area of social psychology concerned with how people perceive one another, factors such as **impression formation* and **attribution* operating in addition to the normal processes of perception. *See also* [ATMOSPHERE EFFECT](#), [BALANCE THEORY](#), [DUAL-PROCESS MODEL](#), [HALO EFFECT](#), [IMPLICIT PERSONALITY THEORY](#), [SOCIAL PERCEPTION](#), [TRAIT CENTRALITY](#).

perspective *n.* A point of view or way of regarding something; specifically, the appearance of objects relative to their distance from the viewer, or the effects of distance on their appearance, including especially **aerial perspective*, **linear perspective*, and **texture gradient*. [From Latin *ars perspectiva* the art of perspective, from *perspicere*, *perspectum* to inspect thoroughly, from *per* through + *specere* to see + *-ivus* indicating a tendency, inclination, or quality]

perspective illusion *n.* Any illusion in the perception of **perspective*. See AMES ROOM, CORRIDOR ILLUSION, HORIZONTAL–VERTICAL ILLUSION, LEANING TOWER ILLUSION, MOON ILLUSION, NECKER CUBE, PONZO ILLUSION, SCHRÖDER STAIRCASE, SCRIPTURE'S BLOCKS, TEACUP ILLUSION, TRAPEZOIDAL WINDOW, TURNING THE TABLES ILLUSION.

perspective reversal *n.* A phenomenon that occurs while viewing certain **ambiguous figures* such as the **Necker cube*, **Schröder staircase*, or **Scripture's blocks*, in which a change occurs in the apparent spatial orientation of the depicted object. Also called *alternating perspective* or *reversible perspective*. See NECKER CUBE, SCHRÖDER STAIRCASE, SCRIPTURE'S BLOCKS.

persuasion *n.* The process by which **attitude* change is brought about, usually by the presentation of a message containing arguments in favour or against the person, object, or issue to which the attitude applies. See also ELABORATION LIKELIHOOD MODEL, FORCED COMPLIANCE, INOCULATION THEORY, LAW OF SOCIAL IMPACT, REACTANCE, RHETORIC (1), SLEEPER EFFECT, SOCIAL INFLUENCE.

pervasive developmental disorder *n.* In the classification of **DSM-IV*, **mental disorders* characterized by severe and extensive impairment in the development of social interaction and communication skills or by the presence of stereotyped behaviour, interests, and activities. See AUTISM SPECTRUM DISORDER, DEVELOPMENTAL DISORDER. Compare SPECIFIC DEVELOPMENTAL DISORDER.

perversion *n.* An obsolescent term, often considered offensive nowadays, for a **paraphilia*. **pervert** *n.* One who practises a perversion. [From Latin *per-* wrongly + *vertere* to turn]

Pervitin See YABA.

pethidine *n.* Meperidine hydrochloride, a synthetic, white, crystalline, **narcotic* analgesic drug with a morphine-like action, used as a narcotic analgesic and sedative. US *meperidine*. Also called *Demerol* (trademark). See also MPPP, OPIOID-RELATED DISORDERS. [A blend of *piperidine* and *methyl*]

*****ebook converter DEMO Watermarks*****

petit mal seizure *n.* An obsolescent name for an **absence*. [From French *petit mal* little illness]

PET scan *abbrev.* Positron emission tomography scan, a non-invasive technique of **brain* imaging that monitors **regional cerebral blood flow* in the brain by recording the emission of gamma rays when radioactively labelled **glucose* or some other substance introduced into the bloodstream is metabolized by neurons as they are activated. The radioactive atoms used in a PET scan emit subatomic particles called positrons (positive electrons), which collide with their negatively charged counterparts, namely electrons. The two particles annihilate each other and emit two gamma rays that radiate in opposite directions and can be recorded by a ring of detectors round the person's head and traced back to their point of origin. A PET scan is expensive, requiring an onsite cyclotron because of the short half-life of the radioactive materials produced, but it provides a dynamic record, usually colour-coded, of brain activity and can also be used to study other organs such as the heart and lungs. *Compare* *RADIOISOTOPE SCAN*, *SPECT SCAN*.

peyote *n.* Another name for **mescaline* or the cactus from which it is extracted. [Mexican Spanish, from Nahuatl *peyotl*]

P50 *n.* An **evoked potential* in response to a brief **auditory *stimulus* such as a click, occurring about 50 milliseconds after the stimulus. The P50 response usually decreases if the stimulus is repeated many times, and this is usually attributed to **habituation*, but many people with **schizophrenia* manifest abnormally persistent P50 responses, suggesting an impaired ability in such people of the brain to habituate to sensory stimulation. Also called the *P50 potential* or *P50 wave*. [From *p(ositive) 50 (milliseconds)*]

PGO spike *abbrev.* Pontogeniculo-occipital spike, a brief high-amplitude **EEG* wave, representing an alerting response, occurring spontaneously during **REM sleep* in the pons (where it is believed to originate), in the lateral geniculate nuclei, and in the occipital cortex, elicited in all phases of sleep by sounds or tactile stimuli. It is identical in appearance and probably similar in significance to an **eye-movement potential*. Also called a *PGO wave* or *pontogeniculo-occipital wave*. *See also* *NUCLEUS GIGANTOCELLULARIS*. [From *p(ons) + (lateral) g(eniculate nucleus) + o(ccipital cortex)*]

*****ebook converter DEMO Watermarks*****

pH *abbrev.* A measure of the acidity/alkalinity of a solution, originally the logarithm to the base 10 of the reciprocal of the concentration of hydrogen **ions* in moles per cubic decimetre, now indexed to a standard solution of potassium hydrogen phthalate at 15°C, which has a pH of 4 by definition. **Acid* (1) solutions have pH less than 7, pure water pH equal to 7, and **alkaline* solutions have pH more than 7. [Abbreviation of *potential of hydrogen*]

Phaedra complex *n.* The sexual love of a mother for her son. [Named after Phaedra, the wife of Theseus in Greek mythology, who accused her stepson Hippolytus of raping her after he declined her sexual advances]

phagocyte *n.* Any cell such as a **macrophage*, **astrocyte*, **granulocyte*, **monocyte*, or **microglial* cell that is specialized to absorb large solid particles such as invading micro-organisms or debris from dead cells. **phagocytic** *adj.* **phagocytosis** *n.* The process whereby a phagocyte engulfs particles. [From Greek *phagein* to consume + *kytos* a vessel or hollow]

phallic character *n.* In **psychoanalysis*, a personality pattern determined by **fixation* (2) at the **phallic stage*, characterized by reckless, resolute, and self-assured adult personality traits, and sometimes also vanity, exhibitionism, and touchiness. Also called the *phallic personality*.

phallic erotism *n.* In **psychoanalysis*, sensuous pleasure derived from stimulation of the penis or clitoris, and focusing of **libido* in that region during the **phallic stage*. **phallic-erotic** *adj.*

phallic stage *n.* In **psychoanalysis*, the **libidinal stage* of **psychosexual development* from about 3–5 or 6 years of age, following the **oral stage* and the **anal stage* but before the **latency* period and the **genital stage*. Sigmund Freud (1856–1939) introduced the concept late in his writings, in articles entitled ‘The Infantile Genital Organization’ (1923), ‘The Dissolution of the Oedipus Complex’ (1924), and ‘Some Psychical Consequences of the Anatomical Distinction Between the Sexes’ (1925), all of which are in volume XIX of the *Standard Edition* (pp. 141–5, 173–9, 248–58). During the phallic stage, libido is centred on the genital organs, but the
*****ebook converter DEMO Watermarks*****

child, whether male or female, recognizes only the male organ and the difference between the sexes is interpreted as phallic versus castrated. It is during this stage that the **castration complex* predominates and the **Oedipus complex* flourishes and then dissolves. Also called the *phallic phase*. See also *PENIS ENVY*, *PHALLIC CHARACTER*, *PHALLIC WOMAN*.

phallic symbol *n.* Any object that is taken as a symbol of a **phallus*.

phallic woman *n.* An image or fantasy of a woman endowed with a **phallus*, often discussed in **psychoanalysis*, where it is given an **interpretation (2)* in the light of the **phallic stage*. Also called a *phallic mother*. See also *COMBINED PARENT-FIGURE*.

phallocentric *adj.* Focused on or obsessed with the **phallus*, or biased towards cultural assumptions of male dominance symbolized by the phallus.

phallocrat *n.* A believer in or supporter of male superiority or dominance in social, economic, or political spheres. [From Greek *phallos* a phallus + *kratos* power]

phallus *n.* Another name for the **penis*, especially the erect penis considered as a symbol of masculinity, potency, or generation. The Hindu equivalent is **lingam*, the phallic image of the god Shiva. The French psychoanalyst Jacques Lacan (1901–81) developed a theory, published in the *Bulletin de Psychologie* in 1958, of the phallus as a signifier of desire, the **Oedipus complex* being reformulated as a conflict between being versus not being a phallus (or having versus not having a phallus), which plays a different role in the desires of each of the three parties involved in the complex. See also *FORECLOSURE*, *PHALLIC CHARACTER*, *PHALLIC EROTISM*, *PHALLIC STAGE*, *PHALLIC SYMBOL*, *PHALLIC WOMAN*, *PHALLOCENTRIC*. **phallic** *adj.* Of or pertaining to the phallus. **phalluses** or **phalli** *pl.* [From Greek *phallos* a phallus]

phantasm *n.* An illusion, ghost, or apparition. [From Latin *phantasma* a ghost or apparition, from Greek *phantazein* to cause to be seen, from *phanein* to show]

phantasmagoria *n.* A fantastic or dreamlike sequence of real or imagined images. See also [PHANTASTICANT](#). **phantasmagoric** or **phantasmagorical** *adj.* [From French *phantasmagorie* production of phantasms, from Greek *phantasma* an appearance, from *phantazein* to make visible + *agora* an assembly or marketplace + *-ia* indicating a condition or quality]

phantasticant *n.* Any drug that induces vivid perceptual experiences or [*phantasmagoria](#), the most common examples being [*phenylalkylamines](#) such as [*mescaline](#), [*STP](#), and [*ecstasy](#) (2); [*indole](#) alkaloids such as [*psilocybin](#) and [*DMT](#); and various other compounds such as [*LSD](#), [*bufotenin](#), [*harmine](#), [*ibotenic acid](#), [*myristin](#), [*ololiuqui](#), and [*phencyclidine](#). Also spelt *fantasticant*. See also [AMANITA MUSCARIA](#), [FLY AGARIC](#), [MAGIC MUSHROOM](#), [MORNING GLORY](#), [TEONANACTYL](#). Compare [HALLUCINOGEN](#), [PSYCHEDELIC](#). [From Greek *phantastikos* capable of imagining, from *phantazein* to make visible + *-ikos* relating to or resembling + *-ant* indicating an agent]

phantasy *n.* An alternative spelling of [*fantasy](#) (1, 2, 3). This spelling tends to be favoured by British-based psychoanalysts when referring to unconscious thought processes.

phantom grating *n.* An illusory grating of vertical bars that is seen in a blank area of an image when the rest of the image, on both sides of the blank area, consists of a real grating moving slowly in one direction. The phantom grating moves along with the real grating, as if the real grating were moving under the paper and could be seen faintly through it, but the phantom disappears if the real grating stops moving, suggesting that the phantom is activated by [*direction-sensitive neurons](#) in the retina. See also [APPARENT MOVEMENT](#). [From Greek *phantasma* an illusion, from *phantazein* to make visible, from *phainein* to show, from *phaein* to shine]

phantom limb *n.* An illusory sensation, experienced by an amputee, of the limb still being attached to the body, even when all sensory nerve fibres associated with the limb have been removed. It is experienced by almost all amputees, and the sensations include [*pain](#) in approximately 70 per cent of cases. See also [PSEUDAESTHESIA](#). Compare [ALIEN HAND SIGN](#), [RUBBER HAND](#)
*****ebook converter DEMO Watermarks*****

PHENOMENON.

phantom phoneme effect *n.* Another name for **phonemic restoration*.

phantom pregnancy *n.* See *PSEUDOCYESIS*.

pharmacodynamics *n.* The interaction of drugs with the **neuroreceptors* that mediate **drug* action. Compare *PHARMACOKINETICS*. [From Greek *pharmakon* a drug + *dynamikos* of or relating to strength or power, from *dynamis* strength or power + *-ikos* of, relating to, or resembling]

pharmacokinetics *n.* The mathematical analysis of the absorption, movement through the body, metabolism, and excretion of drugs. Compare *PHARMACODYNAMICS*. [From Greek *pharmakon* a drug + *kinetikos* of or relating to motion, from *kinesis* movement + *-ikos* of, relating to, or resembling]

pharmacology *n.* The study of drugs. See also *BEHAVIOURAL PHARMACOLOGY*, *PSYCHOPHARMACOLOGY*. **pharmacological** *adj.* Of or relating to drugs or the study of drugs. **pharmacologist** *n.* A specialist in pharmacology. [From Greek *pharmakon* a drug + *logos* word, discourse, or reason]

pharyngeal reflex *n.* Another name for the **gag reflex*.

pharynx *n.* The throat; the section of the **alimentary* canal between the mouth and the **oesophagus*. **pharyngeal** *adj.* [From Greek *pharynx* the throat]

phase *n.* Any distinct or characteristic period or stage in a process or a sequence of development or evolution, including especially a particular stage (such as the peak or the trough) in the cycle of a periodic oscillation or wave. [From Greek *phasis* a phase, from *phaein* to shine, alluding to the phases of the moon]

phase delay *n.* A continuous or ongoing binaural difference in the **phase* of a sound wave arising from the fact that the peaks arrive momentarily

*****ebook converter DEMO Watermarks*****

sooner at the nearer ear than the further ear. It is used in conjunction with ***transient disparity** as a ***cue (2)** for localization of sounds below about 1,000 hertz (about two octaves above Middle C) that have wavelengths longer than the diameter of the head, bending round the head rather than being absorbed or reflected by it, and that therefore do not cast ***sonic shadows** on the side further from the sound source. It is one of the *binaural time differences* or *interaural time differences* used in sound localization. Also called *phase difference*, *ongoing disparity*, or *ongoing time disparity*. See also [BINAURAL SHIFT](#), [BIOSONAR](#), [CONE OF CONFUSION](#), [SOUND LOCALIZATION](#).

phase-locking *n.* The synchronization of the phases of two or more waveforms, so that their peaks and troughs occur simultaneously, as when auditory receptors in the ***organ of Corti** synchronize their receptor potentials with the vibration of the ***basilar** membrane for sounds below about 4,000 hertz.

phase sequence *n.* A group of ***cell** assemblies that tend to excite one another and that constitute a neural basis for the ***consolidation** of learning and memory, according to an influential hypothesis of the Canadian psychologist Donald O(lding) Hebb (1904–85). See also [REVERBERATING CIRCUIT](#).

phenazocine *n.* An ***opiate** drug and ***narcotic** analgesic with a greater analgesic effect and a slightly lesser narcotic effect than morphine. Formula: $C_{22}H_{27}NO$. Compare [PENTAZOCINE](#). [From *phen(e)* an old name for benzene, from Greek *phainein* to show, alluding to its use in manufacturing illuminating gas + *azocine* a chemical compound]

phencyclidine *n.* 1-1-Phenycyclohexylpiperidine, or phencyclidine hydrochloride for short, a central nervous system ***depressant** developed in the 1950s as an ***anaesthetic (1)** and used in veterinary medicine to produce trancelike anaesthetic states in animals, adopted in the 1960s as a ***psychedelic** street drug capable of inducing vivid imagery. Street names include *hog*, *peace pill*, *tranq*, and most commonly *angel dust*. Formula $C_{17}H_{25}N$. See also [HALLUCINOGEN](#), [PHANTASTICANT](#), [PHENCYCLIDINE-RELATED DISORDERS](#). Compare [KETAMINE](#). **PCP** abbrev.

phencyclidine-related disorders *n.* *Substance-related and addictive disorders in *DSM-5 induced by consuming *phencyclidine or phencyclidine-like compounds such as *ketamine, which may be taken orally, injected intravenously, or smoked. See SUBSTANCE ABUSE, SUBSTANCE DEPENDENCE, SUBSTANCE-INDUCED DISORDERS, SUBSTANCE USE DISORDERS.

phenelzine *n.* Phenelzine sulphate (US *sulfate*), a *monoamine oxidase inhibitor (MAOI) derived from *hydrazine, used in the treatment of severe depression and panic disorder. [From its chemical name *phen(yl) + e(thyl) + (hydra)zine*]

phenmetrazine *n.* Phenmetrazine hydro-chloride, a *sympathomimetic central nervous system *stimulant used as an appetite suppressant for weight control and sometimes taken as a street drug. Also called *Preludin* (trademark). Formula: C₁₁H₁₅NO. [From its chemical name *phen(yl) + me(thyl) + (te)tra + (oxa)zine*]

phennies *n.* A common street name of the barbiturate drug *phenobarbital (phenobarbitone).

phenobarbital *n.* Phenobarbital sodium, a long-acting *barbiturate drug and central nervous system *depressant, used as a sedative and hypnotic, especially in major epilepsy with tonic-clonic convulsions, and sometimes taken as a street drug. Also called *Luminal* (trademark) or *phenobarbitone*. Street names include *phennies*, *purple hearts*. Formula: C₁₂H₁₂N₂O₃Na. [From *phen(e)* an old name for benzene, from Greek *phainein* to show, alluding to its use in manufacturing illuminating gas + *barbital*, from *barbit(uric) (acid) + -al* indicating a pharmaceutical product]

phenobarbitone *n.* See PHENOBARBITAL.

phenome *n.* The full set of characteristics constituting the *phenotype of an organism. Compare GENOME, PROTEOME. [From *phenotype*, on the model of *genome*]

phenomenal *adj.* Of or relating to a *phenomenon or something that is

*****ebook converter DEMO Watermarks*****

directly sensed or perceived, often (as in phenomenal regression) in contradistinction to the objective or physical reality giving rise to the sensation or perception. [From Greek *phainomenon* a thing shown, from *phainein* to show + Latin *-alis* of or relating to]

phenomenal consciousness *n.* According to a distinction introduced by the US philosopher Ned Block (born 1942) in a co-edited book entitled *The Nature of Consciousness* (1997), aspects of consciousness that are **phenomenal* in the sense of being directly experienced, often (but perhaps not always) accompanied by **access consciousness*. An example of phenomenal consciousness initially without access consciousness arises when a person involved in a conversation suddenly notices that the sound of a ticking clock has been clearly audible throughout the conversation. Up to that moment, the person was phenomenal-conscious of the sound but not access-conscious of it, because the sound was available to conscious perception but was not poised for control of action until it was noticed. Also called *P consciousness*. **phenomenal-conscious** or **P-conscious** *adj.*

phenomenal field *n.* The sum total of consciousness at a given moment. Also called the *phenomenological field*.

phenomenal motion *n.* Another name for **apparent movement*.

phenomenal regression *n.* The tendency for one's perceptions of an object viewed obliquely or at a distance to be intermediate in shape or size between the **proximal* stimulus and the actual object, or between the proximal stimulus and the perception that would occur if there were perfect **object constancy*, as when a plate viewed at an angle and from a distance yields a proximal stimulus that is elliptical and small, but the perception is somewhat rounder and larger. Also called *phenomenal regression to the real object*, the term used by the English psychologist Robert Henry Thouless (1894–1984) when he introduced the concept in 1931.

phenomenal self *n.* The **self* as experienced or apprehended directly. See also *I-SELF*, *ME-SELF*.

phenomenistic causality *n.* An important aspect of ***phenomenistic thought**, according to the Swiss psychologist Jean Piaget (1896–1980), in which events or processes that co-occur are interpreted as being causally linked, as when a child believes that trains go fast because they are big. [From Greek *phainomenon* a thing shown, from *phainein* to show + *istikos* like]

phenomenistic thought *n.* A term introduced by the Swiss psychologist Jean Piaget (1896–1980) to characterize the reasoning of young children, whose cognitive processes focus on the physical appearances of objects in the environment. One important aspect of phenomenistic thought is ***phenomenistic causality**.

phenomenological field *n.* Another name for the ***phenomenal** field.

phenomenology *n.* A philosophical method of enquiry, introduced in 1901 by the German philosopher Edmund (Gustav Albert) Husserl (1859–1938), that concentrates on the detailed description of conscious experience while suspending or bracketing all preconceptions, interpretations, and explanations; more generally a ***qualitative research** method in psychology that concentrates on the analysis of mental experience rather than behaviour. *See also* ACT PSYCHOLOGY, *EIGENWELT*, *EPOCHE*, EXISTENTIALISM, INTENTIONALITY (1), INTROSPECTIONISM, *MITWELT*, SOCIOLOGY OF KNOWLEDGE, *UMWELT*. [From Greek *phainomenon* a thing shown, from *phainein* to show + *logos* word, discourse, or reason]

phenomenon *n. sing.* Anything that can be perceived or observed.
phenomena *pl.* **phenomenal** *adj.* [From Greek *phainomenon* a thing shown, from *phainein* to show]

phenothiazine *n.* Any of a number of drugs such as ***chlorpromazine**, ***fluphenazine**, ***perphenazine**, ***thioridazine**, or ***trifluoperazine** that are derived from the phenothiazine compound C₁₂H₉NS and that belong to the ***neuroleptic** (1) subgroup of psychotropic drugs, having a strong affinity for ***dopamine** neuroreceptors, which they block. *See also* DOPAMINE ANTAGONIST, THIOXANTHENE.

phenotype *n.* The characteristics of an organism, determined jointly by its genetic constitution and its environment, including such physical characteristics as stature and eye colour and such psychological characteristics as intelligence and extraversion; more specifically the outward manifestations of a **gene*, in comparison to its **alleles*, in an organism that possesses it. *See also* EXTENDED PHENOTYPE, PHENOME. *Compare* GENOTYPE. **phenotypic** *adj.* [The word was introduced in 1909 by the Danish plant physiologist and geneticist Wilhelm Johannsen (1857–1927) in a book entitled *Elemente der exakten Erblchkeitslehre* (Elements of Exact Heredity), from Greek *phainein* to show + *typos* a mark]

phenylalanine *n.* An essential **amino acid* and precursor of **tyrosine*, contained in milk, eggs, cheese, and many food proteins. People with **phenylketonuria* cannot metabolize it and have to exclude it from their diets. Also spelt *phenylalanin*. *See also* ASPARTAME. **Phe** *abbrev.* [From *phene* an old name for benzene, from Greek *phainein* to show, alluding to its use in manufacturing illuminating gas + *hyle* material + German *Alanin(e)*, from *al(dehyde)* + Greek *-in(e)* indicating an organic compound]

phenylalkylamines *n.* One of the major groups of **hallucinogens* and **psychedelic* drugs, including especially **mescaline*, **STP*, and **ecstasy* (2) or MDMA. *See also* PHANTASTICANT.

phenylethanolamine-N-methyltransferase *See* PNMT.

phenylethylamine *n.* An **amine* that resembles **amphetamine* chemically and pharmacologically and that functions as a **neurotransmitter* in the nervous system. **PEA** *abbrev.* [From *phenyl* (as in phenylalanine) + *ethyl*, from Greek *aither* ether, from *aithein* to burn + *hyle* wood or substance + English *amine*, from *am(monium)* + Greek *-ine* indicating an organic compound]

phenylketonuria *n.* A hereditary disorder caused by a single recessive gene on chromosome 12, leading to the absence or deficiency of an enzyme required for the metabolism of **phenylalanine*, an amino acid found in red meats and other proteins, to **tyrosine*. Unless treated by dietary restriction of

phenylalanine, it leads to a deficiency of **serotonin* and the accumulation in all body fluids of phenylalanine, which is toxic to brain tissue and causes **intellectual disability*. When two carriers of the gene have a child, there is a 1 in 4 chance that it will have the disorder, a 1 in 2 chance that it will be a carrier, and a 1 in 4 chance that it will be normal; and because approximately 1 in 50 people carry the recessive gene, the incidence of the disorder is about 1 in 10,000 births. Also called *phenylpyruvic oligophrenia*. **PKU** abbrev. [From *phenyl(alanine)* + *keton(e)* + *-uria* indicating a diseased state of the urine, from Greek *ouron* urine + *-ia* indicating a condition or quality]

phenylpyruvic oligophrenia *n.* Another name for **phenylketonuria*.

phenylquinine writhing test *n.* Observation of writhing in an experimental animal injected with phenylquinine, which normally causes pain and suffering, to test the efficacy of an **analgesic (1)* drug or procedure.

phenylthiocarbamide *See* *PTC*.

phenytoin *n.* An anticonvulsant drug that is used in the treatment of **epilepsy* and that acts by stabilizing neuron cell membranes, decreasing the intracellular concentration of sodium and thereby causing **hyperpolarization* and preventing **action potentials*. It is also taken as a supposedly **smart drug* to improve IQ, concentration, verbal performance, and long-term memory. [A contraction of its chemical name, *(di)pheny(lhydantoin)*]

pheromone *n.* Any of a number of chemical substances with communicative functions, secreted externally by an organism and affecting the behaviour or physiology of other members of the same species. Human pheromones are poorly understood, the best documented though controversial examples being the **Whitten effect*, manifested as the synchronization of **menstrual cycles* among women living together, occurring only when a man is also present, and the increased regularity of menstrual cycles of women living with men, both effects apparently being mediated by **steroid* pheromones. *See also* *ALARM PHEROMONE*, *BRUCE EFFECT*, *KAIROMONE*, *LEE–BOOT EFFECT*, *SEX PHEROMONE*, *VOMERONASAL ORGAN*. *Compare* *ALLOMONE*. **pheromonal** *adj.* [From Greek *pherein* to bear + *horman* to stimulate]

phi coefficient *n.* In statistics, an index of the degree of association between two truly dichotomous variables, such as male/female or pass/fail. Mathematically it is equivalent to the **product–moment correlation coefficient* applied to two dichotomous variables, and in practice it is most often used to analyse data in **contingency tables*. Symbol: ϕ . *Compare* CRAMÉR'S C, CONTINGENCY COEFFICIENT.

philobat *n.* A person who enjoys the challenge of coping with dangerous or unfamiliar situations. *Compare* OCNOPHIL. [From Greek *philos* loving, from *phileein* to love + English (*acro*)bat, from Greek *akros* highest + *bat(os)* walking from *bainein* to walk]

philosophy *n.* The study of the nature of knowledge and beliefs, the intelligibility of concepts, and the validity of arguments. Its main branches include *metaphysics*, the study of the nature and phenomena of reality; *epistemology*, the theory of knowledge, especially the investigation of what distinguishes mere belief from knowledge; *ethics*, the study of moral principles and judgements; and *semantics*, the study of the relationship between linguistic expressions and their meanings. A useful informal definition of philosophy is thought about thought. [From Greek *philosophia* love of wisdom, from *philos* loving, from *phileein* to love + *sophia* wisdom]

phi movement *n.* A form of pure objectless **apparent movement*, without the appearance of any entity actually moving, that occurs when two visual stimuli a few centimetres apart are presented in an alternating pattern with an interstimulus interval too long for the stimuli to appear simultaneous or for **partial movement* or **optimal movement* to occur but not long enough for the disappearance of apparent movement and the veridical perception of the stimuli simply alternating. The term is often applied to any form of apparent movement, but it was defined precisely by the German psychologist Max Wertheimer (1880–1943) when he introduced it in 1912, and its indiscriminate application is avoided in careful usage. Wertheimer believed movement to be an immediate sense experience (a *quale*) like colour or lightness that under appropriate conditions may be perceived in a pure form as sheer objectless movement. The following demonstration provides an easy way to experience something similar to phi movement: hold a finger close enough to the eyes for a double image to be seen, then alternately open and

*****ebook converter DEMO Watermarks*****

close the left and right eyes—for some people, the finger appears to leap from one place to another without any image moving across the space. Also called *phi motion*, the *phi phenomenon*, or *pure phi*. See also [KORTE'S LAWS](#).

phi phenomenon *n.* Another name for [*phi movement](#). It is also applied to [*apparent movement](#) in general, but this is avoided in careful usage because it blurs the distinction between phi movement and other forms of apparent movement.

phlegm *n.* The slimy, viscous substance secreted in the throat and discharged by coughing, formerly believed to be one of the four cardinal humours of the body. See also [HUMOUR \(3\)](#). **phlegmatic** *adj.* Calm, unemotional, or cool-headed. [From Latin *phlegma* phlegm, from Greek *phlegma* flame, inflammation, or phlegm (thought to be produced by heat), from *phlegein* to burn]

phobia *n.* A persistent, irrational fear of an object, event, activity, or situation called a *phobic stimulus*, resulting in a compelling desire to avoid it. The presence or anticipation of the phobic stimulus triggers [*anxiety](#) or a [*panic attack](#), although the person acknowledges the fear to be irrational, and the phobic stimulus is either avoided or endured with dread. A phobia that leads to clinically significant distress or impairment in social, occupational, or other important areas of functioning may be diagnosed as a [*mental disorder](#)—either a [*specific phobia](#) or a [*social anxiety disorder](#). A comprehensive list of phobias and phobic stimuli is provided in Appendix I at the back of this dictionary. According to a large survey of 704 randomly selected adults in Stockholm, Sweden, reported in the journal *Behaviour Research and Therapy* in 1996, the most common phobic stimuli are heights (6.3 per cent of men, 8.6 per cent of women), snakes (2.4 per cent of men, 8.3 per cent of women), closed spaces (2.4 per cent of men, 5.4 per cent of women), and spiders (1.2 per cent of men, 5.6 per cent of women). Also called a *phobic neurosis*. See also (in the main body of the dictionary) [AGORAPHOBIA](#), [DYSMORPHOPHOBIA](#), [LITTLE HANS](#), [PA-LENG](#), [PARAPHOBIA](#), [PHOBIC TECHNIQUE](#), [SOCIAL PHOBIA](#), [SPECIFIC PHOBIA](#), [THANATOPHOBIA](#). **phobic** *adj.* [From Greek *phobos* fear + *-ia* indicating a condition or quality]

phobic stimulus *n.* Any object, event, or situation that functions as the

*****ebook converter DEMO Watermarks*****

focus of a ***phobia**, eliciting persistent, irrational fear.

phobic technique *n.* In ***psychoanalysis**, one of the ***defensive techniques** proposed by the Scottish psychoanalyst W. Ronald D. Fairbairn (1889–1964). It involves ***externalization** of both the ***good object** and the bad object, causing the phobic person to feel threatened by external forces. *See also* SPLITTING OF THE OBJECT. *Compare* HYSTERICAL TECHNIQUE, OBSESSIONAL TECHNIQUE, PARANOID TECHNIQUE.

phon *n.* The standard unit of ***loudness** level, ranging upwards from zero for the faintest audible sound. The loudness in phons of a sound is defined as the intensity level in units of ***decibel** sound pressure level (dB SPL) of a comparison pure tone of 1,000 hertz that is judged by the listener to be equally loud. Thus if the comparison tone is 20 dB SPL, then the loudness of any tone of another frequency that is judged to be equally loud is defined to be 20 phons; if the comparison tone is 40 dB SPL, then any tone judged equally loud is 40 phons, and so on. *See also* EQUAL-LOUDNESS CONTOUR. [From Greek *phone* sound or voice]

phonagnosia *n.* A form of agnosia involving an impaired ability to identify people by their voices. *See also* AGNOSIA. *Compare* PROSOPAGNOSIA. [From Greek *phone* a voice + *a-* without + *gnosis* knowing + *-ia* indicating a condition or quality]

phone *n.* The smallest perceptible discrete segment of sound in a stream of speech. A phone is a physical realization of a ***phoneme**, and different phones representing the same phoneme are ***allophones**. [From Greek *phone* a voice or sound, from *phonein* to speak]

phoneme *n.* A basic speech sound, with an average duration of 70 to 80 milliseconds at normal speaking rate, distinguishing one word from another in a given language, although it may have various phonetically distinct articulations, called ***allophones**, that are regarded as functionally identical by native speakers of the language. Phonemes are defined by the ***distinctive features** that allow ***minimal pairs** in a language to be distinguished. *See also* NEUTRALIZATION, PHONE. *Compare* KINEME. **phonemic** *adj.* [From Greek *phonema* a sound or utterance, from *phone* a voice or sound]

*****ebook converter DEMO Watermarks*****

phonemic restoration *n.* An ***auditory** illusion that occurs when a single ***phoneme** is deleted from a recording of a sentence (in the original experiment, the first /s/ of the word *legislatures* in the sentence *The state governors met with their respective legislatures convening in the capital city*) and is replaced by a recording of a cough or other intrusive sound; when this doctored recording is played to listeners, the missing phoneme is perceived as clearly as if it were physically present, even when the listeners hear the recording again after being told that the sound is missing. The cough cannot be clearly located in the sentence by listeners, but if the deleted sound is replaced by a silent gap it can be located easily and phonemic restoration does not occur. In spite of its name, the phenomenon is not restricted to single phonemes, a whole syllable such as the *-gis-* in the word *legislatures* being heard clearly when replaced by an extraneous sound of the same length. The phenomenon was discovered by the US psychologist Richard M. Warren (born 1925) and two colleagues and first reported in articles in the journals *Science* and *Scientific American* in 1970. Also called the *phantom phoneme effect*. Compare **AMODAL COMPLETION**.

phonemics *n.* The study of the ***phonemes** of a language.

phonetics *n.* The study of speech sounds, including their production, their use in language, their perception by listeners, and their transcription. [From Greek *phonetikos* of or relating to speech, from *phone* a voice or sound + *-itikos* resembling or marked by]

phonics *n.* **1.** The science of spoken sounds, or of sounds in general. **2.** A method of teaching reading by concentrating on the sounds associated with specific letters or groups of letters. Compare **WHOLE-WORD METHOD**. [From Greek *phonikos* of or relating to speech, from *phone* a voice or sound + *-ikos* of, relating to, or resembling]

phonogram *n.* A character or symbol, or a sequence of characters or symbols, representing a speech sound, such as (in English) *a*, *b*, *c*, *ch*, *ei*, or *th*. Some languages (including German or Spanish) are regular in the sense of having an unvarying correspondence between phonograms and ***phonemes**, while others (including English) are more or less irregular. Compare **IDEOGRAPH**, **LOGOGRAPH**. [From Greek *phonein* to make sounds or to speak +
*****ebook converter DEMO Watermarks*****]

gramma a character]

phonography *n.* A system of writing based on **phonograms*. Compare LOGOGRAPHY.

phonological buffer store *n.* One of the two components of the **phonological loop* of **working memory*, holding phonologically coded information but capable of maintaining the information only for brief periods. Also called a *rehearsal buffer*.

phonological disorder *n.* A **communication disorder* in **DSM-IV* that was renamed **speech sound disorder* in DSM-5.

phonological dyslexia *n.* A form of **dyslexia* involving an impaired ability to read by using spelling-to-sound correspondences, and an over-reliance on established spelling vocabulary. Closely related to **deep dyslexia*.

phonological loop *n.* A subsystem of **working memory* that functions as a **buffer store*, holding information with the help of **inner speech*, as when a person mentally rehearses a telephone number over and over while searching for a pen and paper to write it down. It contains two components, a short-term **phonological buffer store*, holding phonologically coded information for very short periods only, and a **subvocal rehearsal loop* that maintains information by repeating it mentally from time to time.

phonological priming See PRIMING (1).

phonological reading *n.* Another name for **surface dyslexia*.

phonology *n.* The study of the sound systems of languages, especially the study of **phonemes*. See also ADDRESSED PHONOLOGY, ASSEMBLED PHONOLOGY.
phonological *adj.* [From Greek *phonein* to make sounds or to speak + *logos* word, discourse, or reason]

phonoreceptor *n.* Another name for an **auditory* receptor.

phonoreception *n.* The perception of high-frequency variations in air pressure through ***auditory** receptors. [From Greek *phone* a sound or voice + English *receptor*, from Latin *recipere*, *receptum* to receive, from *re-* back + *capere*, *ceptum* to take]

phosphate *n.* Any salt or ***ester** of phosphoric acid. [From Greek *phosphoros* light-bringing, from *phos* light + *pherein* to bring]

phosphene *n.* The perception of a flash of light resulting from anything other than excitation of the photoreceptors of the retina by light, the most common causes being pressure on an eyeball behind closed lids, a blow to the head resulting in pressure of the visual cortex against the inside of the skull (the effect often described as seeing stars), electrical stimulation of the visual cortex, or an ***aura** (2) heralding an epileptic seizure (see **EPILEPSY**) or a ***migraine** headache. Also called a *photoma*. [From Greek *phos* light + *phainein* to show, from *phaein* to shine]

phosphocreatine *n.* Another name for ***creatine** phosphate, the ***phosphate** of creatine stored in muscles to enable adequate quantities of ***ATP** to be produced. [From *phosphate* + Greek *kreas*, *kreatos* flesh]

phosphodiesterase type 5 *n.* An ***enzyme** that metabolizes ***cyclic GMP**. See also **VIAGRA**. **PDE5** abbrev.

phot *n.* An obsolescent unit of illumination equal to one ***lumen** per square centimetre, 1 phot being equal to 10,000 lux. [From Greek *phos*, *photos* light]

photism *n.* 1. A form of ***synaesthesia** (1) in which a visual sensation accompanies stimulation of another ***sensory** modality. 2. The experience of a ***phosphene**.

photochemical *adj.* Of or relating to the production of light by a chemical process. See also **BIOLUMINESCENCE**. [From Greek *phos*, *photos* light + English *chemical*]

photochromatic interval *n.* The range of light intensity that is

sufficiently high to stimulate **rods* but not **cones* in the retina of the eye and that therefore produces vision without colour. *See also* SCOTOPIC. [From Greek *phos, photos* light + *chroma, chromatos* a colour + *-ikos* of, relating to, or resembling]

photographic memory *n.* A colloquial term for the ability to remember visual images very accurately. The technical term for such an image remembered in vivid detail is an **eidetic image*. *Compare* HYPERTHYMESIA.

photoma *n.* Another name for a **phosphene*. [From Greek *phos, photos* light + *-oma* indicating an abnormality]

photometer *n.* An instrument for measuring **luminous intensity*, older types usually involving visual comparisons of the illumination from a specified light source with that from a standard comparison source, and more modern types using photoelectric cells that generate electrical signals in response to light. **photometry** *n.* The measurement of **luminous intensity*, **luminous flux*, and related phenomena, or the branch of physics concerned with these phenomena. [From Greek *phos, photos* light + *metron* a measure]

photon *n.* The basic unit or quantum of light or other electromagnetic radiation, considered as a particle with zero rest mass and energy equal to hf , where h is Planck's constant (6.6262×10^{-34} Joule seconds) and f is the **frequency (1)* of the radiation in hertz. [From Greek *phos, photos* light + *-on* by analogy with *electron*]

photopic *adj.* Of, relating to, or governed by the **cone*-mediated visual system that functions when the eyes are light-adapted for bright illumination or day vision. It is maximally sensitive to light falling on the **fovea*, and it has peak sensitivity at a wavelength of 555 nanometres (green light), but it responds to light across the entire **visible spectrum*, operating with three different types of photoreceptors that normally provide colour vision, and it is less sensitive than the scotopic system except for wavelengths above 650 nanometres (in the red region of the spectrum), where the sensitivities of the two systems are similar. *See also* DUPLEXITY FUNCTION, FIELD ADAPTATION, HEMERALOPIA, LIGHT ADAPTATION, PHOTOPIC LUMINOSITY CURVE, PURKINJE SHIFT, *****ebook converter DEMO Watermarks*****

STILES—CRAWFORD EFFECT. Compare MESOPIC, SCOTOPIC. **photopia** *n.* Photopic vision, also called *daylight vision*. Compare SCOTOPIA. [From Greek *phos*, *photos* light + *ops* an eye + *-ikos* of, relating to, or resembling]

photopic luminosity curve *n.* A *luminosity curve depicting the intensity of light that is required at each point in the visible spectrum for the colours to appear equally bright in bright light, under *photopic vision mediated by *cones. Compare SCOTOPIC LUMINOSITY CURVE.

photopigment *n.* Any light-sensitive *pigment, including the *visual pigments found in the *photoreceptors of the eye.

photoreceptor *n.* A *sensory receptor situated at the back of the *retina, either a large cylindrical *rod or a smaller tapering *cone, specialized to convert light stimulation into electrical nerve impulses or *action potentials. The human retina contains approximately 120 million rods and 6 million cones. Also called a *visual receptor*. [From Greek *phos*, *photos* light + English *receptor*, from Latin *recipere*, *receptum* to receive, from *re-* back + *capere*, *ceptum* to take]

photosensitive epilepsy *n.* A form of *epilepsy in which seizures are precipitated by bright flashing or flickering lights, often from strobe lighting or television images. The physiological effects can be observed in *EEG recordings from the *occipital lobes of the brain.

phototherapy *n.* Controlled exposure to extremely bright light (generally 10,000 lux), simulating daylight, used especially to treat *seasonal affective disorder (SAD) and certain *sleep–wake disorders. Also called *bright light therapy*. [From Greek *phos*, *photos* light + *therapeia* service or treatment, from *therapeuein* to take care of or to heal]

phrase marker *n.* A representation, usually in the form of a tree diagram, of the grammatical structure of a sentence (see *illustration*). The sentence is conventionally labelled S; a noun, N; a verb, V; a noun phrase, NP; a verb phrase, VP; a determiner, DET; and so on. See also CONSTITUENT.

The man drank some wine

Phrase marker. S = sentence, NP = noun phrase, VP = verb phrase, DET = determiner, N = noun, V = verb.

phrase-structure grammar *n.* A form of **generative grammar* that describes the relations between words and **morphemes* of a sentence, but does not analyse syntactic relations in greater depth.

phrase-structure rule *n.* Another name for a **rewrite rule*.

phrenology *n.* A discredited doctrine of mental faculties supposedly located in specific areas of the brain and detectable through bumps at the corresponding points on the external skull. Founded in Germany by the physiologist Franz Joseph Gall (1758–1828) and the physician Johann Kaspar Spurzheim (1809–72), it flourished in the early decades of the 19th century, especially in the United States and Britain, where at one time there were 29 phrenological societies simultaneously active. *See also* *FACULTY PSYCHOLOGY*. [From Greek *phren* mind, originally midriff (the supposed seat of the soul) + *logos* word, discourse, or reason]

phylogeny *n.* The evolution of a ***phylum** or other ***taxonomic** group, as distinguished from the development of an individual organism. *Compare* ONTOGENY. **phylogenetic** or **phylogenic** *adj.* [From Greek *phylon* a race + *genes* born]

phylum *n.* Any of the primary taxonomic groups into which the animal and plant ***kingdoms** (2) are divided, each containing one or more ***classes** (2). Thus the phylum Platyhelminthes contains flatworms, flukes, and tapeworms. **phyla** *pl.* [From Greek *phylon* a race]

physical anthropology *n.* The branch of anthropology devoted to the study of physical and biological characteristics of humans, especially genetic traits, as opposed to cultural or social attributes. *Compare* CULTURAL ANTHROPOLOGY, SOCIAL ANTHROPOLOGY.

physiognomy *n.* 1. A person's physical features or habitual expression. 2. The art or pseudoscience of judging ***personality** from physical appearance, especially from the face. 3. The outward appearance or gross physical structure of anything. **physiognomic** or **physiognomical** *adj.* **physiognomist** *n.* One who practises physiognomy (2). [From Greek *physis* nature + *gnomon* an interpreter]

physiological arousal *See* AROUSAL.

physiological nystagmus *n.* A form of ***nystagmus** occurring continuously during visual ***fixation** (1), consisting of ***ocular drifts** with ***visual angles** up to about 5 minutes of arc (5/60 of a degree), ***microsaccades** between 1 and 2 minutes of arc, and ***ocular tremors** of about 30 seconds of arc (1/120 of a degree). That these eye movements are essential to vision is shown dramatically by experiments on ***stabilized retinal images**. *See also* AUTOKINETIC EFFECT, FILLING-IN ILLUSION, REAFFERENCE, SACCADE, VISUAL SUPPRESSION.

physiological psychology *n.* The branch of psychology devoted to the relations between physiological and psychological processes and events.

physiological time *n.* The fraction of ***reaction time** taken up by the passage of a nerve impulse from the ***sensory** receptor to the brain and of another nerve impulse from the brain to the muscle. According to an analysis introduced in 1868 by the Dutch ophthalmologist Franciscus Cornelius Donders (1818–89), total reaction time is physiological time plus ***central reaction time**.

physiological zero *n.* The temperature at which an object touching the ***skin** feels neither warm nor cold, its precise value not being fixed but approximating the surface temperature of the skin and depending on its state of adaptation to warmth. *See also* **SUCCESSIVE CONTRAST**, **THERMAL ADAPTATION**.

physiology *n.* The study of the functioning of ***organisms**; also the working of a particular organism or one of its organs or parts (as in *the physiology of the human ear*). [From Greek *physio-* of or relating to nature or natural processes, from *physis* nature, from *phyein* to cause to grow + *logos* word, discourse, or reason]

physostigmine *n.* An ***alkaloid** extracted from the ***Calabar bean** that functions as a reversible ***anticholinesterase** drug, inhibiting the breakdown of ***acetylcholinesterase**. Also called *eserine*. Formula $C_{15}H_{21}N_3O_2$. [From Latin *Physostigma venenosum* the Calabar bean plant, from Greek *physis* a bladder + *stigma* a mark]

Piagetian *adj.* Of, relating to, or resembling the theory of cognitive development of the Swiss psychologist Jean Piaget (1896–1980). *See* **ACCOMMODATION (2)**, **ADAPTATION (3)**, **ANIMISM (1)**, **ASSIMILATION (2)**, **CENTRATION**, **CONCRETE OPERATIONS**, **CONSERVATION**, **CONSTRUCTIVISM**, **DÉCALAGE**, **EGOCENTRISM**, **EQUILIBRATION**, **FORMAL OPERATIONS**, **GENETIC EPISTEMOLOGY**, **INDISSOCIATION**, **MENTAL OPERATION**, **OBJECT PERMANENCE**, **PHENOMENISTIC CAUSALITY**, **PHENOMENISTIC THOUGHT**, **PRECONCEPT**, **PREDICATE THINKING**, **PRE-OPERATIONAL STAGE**, **SCHEME**, **SENSORIMOTOR STAGE**, **STRUCTURALISM (1)**, **TRANSDUCTIVE REASONING**. *See also* **PIAGET KIDNAPPING MEMORY**.

Piaget kidnapping memory *n.* A classic example of a ***false memory** from the second year of life described by the Swiss psychologist Jean Piaget

(1896–1980) and reproduced in English translation by the US psychologist Elizabeth F. Loftus in her book *Eyewitness Testimony* (1979): ‘I was sitting in my pram, which my nurse was pushing in the Champs Élysées, when a man tried to kidnap me. I was held in by the strap fastened round me while my nurse bravely tried to stand between me and the thief. She received various scratches, and I can still see vaguely those on her face. Then a crowd gathered, a policeman with a short cloak and a white baton came up and the man took to his heels. I can still see the whole scene, and can even place it near the tube station. When I was about fifteen my parents received a letter from my former nurse saying that she had been converted to the Salvation Army. She wanted to confess past faults, and in particular to return the watch she had been given on this occasion. She had made up the whole story, faking the scratches. I, therefore, must have heard, as a child, the account of the story, which my parents believed, and projected it into the past in the form of a visual memory’ (pp. 62–3). *See also* [CONSTRUCTIVE MEMORY](#), [DEFERRED ACTION](#), [EYEWITNESS MISINFORMATION EFFECT](#), [INFANTILE AMNESIA](#), [REALITY MONITORING](#), [RECOVERED MEMORY](#).

pia mater *n.* A delicate vascular membrane enclosing the brain and spinal cord, forming the innermost of the three [*meninges](#), below the [*arachnoid space](#). *Compare* [ARACHNOID MEMBRANE](#), [DURA MATER](#). [Latin *pia mater* tender mother, a literal translation of the Arabic name *umm raqiqah*]

piano theory *n.* Another name for the [*place theory](#).

pibloktoq *n.* A [*culture-bound syndrome](#), sometimes called *arctic hysteria* in English, restricted mainly to Eskimo communities of North America and Greenland, characterized by a period of fatigue, social withdrawal, confusion, and irritability lasting for a few hours or days, leading up to an abrupt episode of [*dissociation](#) that usually lasts only minutes, during which the afflicted person may strip or tear off clothes, roll in the snow, run about in a frenzied state, shout obscenities, destroy property, engage in other violent, dangerous, or antisocial forms of behaviour, and manifest [*pseudolalia](#), [*echolalia](#), and [*echopraxia](#), before lapsing into [*convulsions](#) and losing consciousness, followed typically by complete [*amnesia](#) for the dissociative episode. [From Inuit *piblokto* frenzy]

pica *n.* An ***eating disorder** in ***DSM-5** characterized by persistent eating of inappropriate substances such as paint, plaster, string, hair, cloth, animal droppings, sand, insects, leaves, pebbles, clay, soil, or other non-nutritive matter, but without any aversion to conventional foods, the behaviour not occurring as part of a culturally sanctioned practice. *See also* **COPROPHAGIA**, **GEOPHAGIA**, **HYALOPHAGIA**, **PAGOPHAGIA**. [From Latin *pica* a magpie, referring to its fondness for inedible objects]

Pick's disease *n.* A progressive disorder commencing in middle age, caused by predominantly ***frontal lobe** or ***temporal lobe** impairment, characterized by ***dementia** with gradual personality change and deterioration of ***intelligence**, ***memory**, and ***language (1)**. *Compare* **ALZHEIMER'S DISEASE**. [Named after the Czech neurologist Arnold Pick (1851–1924) who first described it in 1892]

Pickwickian syndrome *n.* A ***breathing-related sleep disorder** associated with moderate or extreme obesity, hypoventilation (diminished or insufficient breathing, leading to low oxygen content of the blood), chronic drowsiness, cyanosis (a dark bluish to purplish coloration of the skin), and right-sided heart failure. The term *Pickwickian* was first applied to drowsiness caused by obesity by the Canadian physician Sir William Osler (1849–1919) in his book *The Principles and Practice of Medicine* (1918). The phrase *Pickwickian syndrome* first appeared in the title of an article by the US physician C(harles) Sidney Burwell (1893–1956) and three colleagues in the *American Journal of Medicine* in 1956. Also called *obesity hypoventilation syndrome (OHS)*. [The term alludes to Joe, a ‘fat and red-faced boy, in a state of somnolency’ in *The Pickwick Papers* by the English novelist Charles Dickens (1812–70)]

picrotoxin *n.* A bitter-tasting crystalline compound extracted from the seeds of the climbing plant *Cocculus indicus* (the ***fishberry** shrub) that functions as a central nervous system ***stimulant** and ***convulsant** by blocking the neuroreceptors that normally mediate the inhibitory effects of ***GABA**. It is used as an antidote to ***barbiturate** poisoning. *Compare* **STRYCHNINE**, **TETANUS TOXIN**. [From Greek *pikros* bitter + *toxikon pharmakon* arrow-poison, from *toxon* a bow]

pictogram *n.* Another name for a **pictograph*.

pictograph *n.* A symbol used in picture writing, typical examples being the images of human figures, body parts, animals, and other objects used in the writing of the Minoan period of ancient Crete, or the stylized images used in many countries to label men's and women's toilets. *Compare* *IDEOGRAPH*, *LOGOGRAPH*. **pictographic** *adj.* Of or relating to pictographs.

pictorial depth *n.* **Depth perception* arising from cues presented in two-dimensional pictures or images, only some of the monocular cues being functional under such conditions, namely **aerial perspective*, **chiaroscuro*, **elevation in the visual field*, **interposition*, **linear perspective*, **relative size*, **sfumato*, and **texture gradient*. *See also* *CARPENTERED WORLD*, *LEANING TOWER ILLUSION*.

picture-arrangement test *n.* A type of **intelligence* test item or subtest in which the respondent tries to arrange a number of pictures into a sequence that tells a meaningful story.

picture-completion test *n.* A type of **intelligence* test item or subtest in which the respondent tries to point out missing elements in pictures, such as a numeral missing from a clock face or a leg missing from an insect.

picture-frustration test *See* *ROSENZWEIG PICTURE-FRUSTRATION STUDY*.

picture-picture technique *n.* A technique of **evaluative conditioning* whereby a picture (**conditioned stimulus*) that a participant initially rates neutrally on a like-dislike scale, after repeated pairing with one that is strongly liked (**unconditioned stimulus*), tends later to be rated more highly than an initially neutral picture repeatedly paired with one that is disliked.

pidgin *n.* A language constructed from elements taken from two or more other languages and used for communication, especially trade, between members of two language communities. In contrast to a **creole*, a pidgin is not the mother tongue of any speech community. [From Chinese

pronunciation of the English word *business*]

pie chart *n.* A circular graph divided into sectors, resembling slices of a pie, with areas proportional to the sizes of the categories represented (see [illustration](#)). This method of displaying data was introduced in 1801 by the Scottish political economist William Playfair (1759–1823), in a book entitled *The Statistical Breviary*. The Italian-born British nurse Florence Nightingale (1820–1910), with help from the English medical statistician William Farr (1807–83), popularized a version in which the sectors subtend equal angles at the centre and the sizes of the categories are represented by radii of different lengths. An early version, which she called the *bat's wing*, was published in her report entitled *Mortality of the British Army* (1858), and an improved version, with the areas of the sectors rather than the lengths of the radii proportional to the category sizes, first appeared in her confidential report to the government entitled *Notes on Matters Affecting the Health of the British Army* (1858).

Pie chart. Showing percentages of time spent by a group of people in various types of activities.

pigment *n.* Any substance, including the [*visual pigments](#) contained in the rods and cones in the retina of the eye, whose constituent molecules absorb some wavelengths of light and reflect others. *See also* [CHROMOPHORE](#). [From Latin *pigmentum* painted, from *pingere* to paint]

*****ebook converter DEMO Watermarks*****

pigment epithelium *n.* The light-absorbing dark lining at the back of the retina of diurnal animals. *Compare* TAPETUM (1).

piloerection *n.* Raising of hair into an upright position as a result of contraction of *smooth muscles attached to the base of hair follicles, usually in response to cold or as part of a *startle reflex, in humans often accompanied by *goose pimples. Also called a *pilomotor response*. [From Greek *pilos* hair + English *erection*]

pilot study *n.* A preliminary and usually small-scale research study designed to try out procedures, calibrate measures, and generally serve as a dress rehearsal before a major study. Also called simply a *pilot*. [From Medieval Latin *pilotus* a steersman, from Greek *pedon* an oar]

pineal gland *n.* The pea-sized *endocrine gland, shaped like a miniature pine cone, attached to the base of the brain in the roof of the third ventricle below the anterior part of the *corpus callosum, receiving information from the *suprachiasmatic nucleus and secreting *melatonin into the bloodstream at night, involved in *circadian rhythms and probably in the promotion of sleep. It tends to calcify during middle age. It is one of the *circumventricular organs and is also called the *pineal body*. Its rarely used technical name is the *epiphysis* or *epiphysis cerebri*. *See also* CARTESIAN DUALISM, EPITHALAMUS. [From Latin *pinea* a pine cone, from *pinus* pine]

pink lady *n.* A street name for *secobarbital (quinalbarbitone) or *Seconal.

pink noise *n.* A sound wave or any other *time series that resembles *white noise, being essentially random, but with intensity or energy in inverse proportion to frequency, and hence more energy in the bass than the treble because high-frequency sound is more energetic than low-frequency sound. The sound of a waterfall, or waves crashing on a beach, is pink noise. *See also* NOISE (2). *Compare* COLOURED NOISE, FROZEN NOISE. [So called by analogy with white light in which higher frequencies (shorter waves) are damped, leading to a pink tinge]

pinna *n.* Any feather, leaflet, or feather-shaped structure, especially the

external part of the ear, also called the *auricle*. See also [EAR](#). **pinnae** *pl.* [From Latin *pinna* a feather]

Pinna–Brelstaff illusion *n.* A visual illusion of relative movement in a pair of concentric rings composed of small diamond-shaped elements angled in different directions in the inner and outer rings (see [illustration](#)). If the image is moved back and forth relative to the eyes, while the gaze is fixated on the centre of the rings, the rings appear to rotate in opposite directions or contrary motion. The illusion is believed to be caused by elements in [*peripheral vision](#) causing stimulation of direction-sensitive [*bar detectors](#) in Area V1 of the [*visual cortex](#). Also called the *rotating circles illusion* or the *counter-rotating circles illusion*. See also [MOVEMENT ILLUSION](#). Compare [OUCHI ILLUSION](#). [Named after the Italian vision scientist Baingio Pinna (born 1962), who discovered it in 1990, and the English psychologist Gavin J. Brelstaff (born 1961) who co-authored with Pinna the first major article on it in the journal *Vision Research* in 2000]

Pinna–Brelstaff illusion. If the image is moved back and forth relative to the eyes, the inner and outer rings appear to rotate in contrary motion.

Piper's law *n.* In **psychophysics*, a law relating either the **absolute threshold* or the **difference threshold* for visual brightness sensation to the intensity of the stimulus and the area of the retina that is stimulated, usually expressed as $\sqrt{A} \times I = k$, where *A* is the area of the retina stimulated, *I* is the intensity of the stimulus, and *k* is a constant. It is valid for stimuli subtending **visual angles* from about 6 minutes of arc (1/10 of a degree) to about 20 degrees. Compare *RICCO'S LAW*. [Named after the German physiologist Hans Edmund Piper (1877–1915) who formulated it]

piriform cortex *n.* An area in the anterior temporal lobe of each cerebral hemisphere forming part of the **olfactory cortex*, receiving nerve impulses from the olfactory receptors via the olfactory bulb without the prior involvement of the thalamus as in other sensory systems. It is not part of the **neocortex* but is a three-layered **palaeocortex*. Also spelt *pyriform cortex*, an etymologically incorrect but common form. [From Latin *pirum* a pear + *forma* a form or shape]

pitch *n.* The perceived height or depth of a **tone* (1), determined largely though not exclusively by the **frequency* (1) of the vibration that gives rise to it. According to an international standard adopted in 1939, a vibration of 440 hertz is identified as the A above Middle C, and all other notes of the musical scale are defined in relation to it. See also *ABSOLUTE PITCH*, *MEL*, *PITCH PERCEPTION*, *RELATIVE PITCH*.

pitch perception *n.* The process whereby the frequency of a sound wave entering the ear is converted into a sensation of pitch. See also *FREQUENCY THEORY*, *PLACE THEORY*, *VOLLEY THEORY*.

pituitary gland *n.* The master **endocrine gland*, shaped like a miniature bulb of garlic about the size of a pea, suspended by a stalk (the infundibulum) within a specialized bony cavity of the skull (the sella turcica) below the **hypothalamus*, to which it is connected beneath the centre of the brain, and from where it secretes into the bloodstream hormones that affect other endocrine glands throughout the body and that also influence bodily growth. Also called the *pituitary body*, *hypophysis*, or *hypophysis cerebri*. See also *ANTERIOR PITUITARY*, *POSTERIOR PITUITARY*. [From Latin *pituita* phlegm, which it was once mistakenly thought to produce owing to its location just above the
*****ebook converter DEMO Watermarks*****]

back of the nasal passage]

pivot grammar *n.* A grammar, first suggested by the Singaporean-born US psychologist Martin D. S. Braine (1926–96) in an article in the journal *Language* in 1963, based on two grammatical classes of words, namely pivot (*P*) and open (*O*), to describe two-word utterances of children at an early stage of language development, from about 18 months to 2 years of age. The *P* words are taken from a small vocabulary of high-frequency words that seldom occur as single-word utterances, and the *O* words from large, open classes of nouns, verbs, and adjectives. Typical *P* + *O* constructions recorded by Braine and later researchers are *Pretty fan*, *Night-night boat*, and *Allgone ball*. Compare [HOLOPHRASE](#), [TELEGRAPHIC SPEECH](#).

placebo *n.* 1. An assumedly inactive substance or dummy treatment administered to a [*control group](#) to serve as a baseline for comparison of the effects of an active drug or treatment. See also [PLACEBO EFFECT](#), [RANDOMIZED CONTROLLED TRIAL](#). 2. A psychological treatment, in contrast to a pharmacological treatment. [From Latin *placebo* I shall please, the opening word of the Roman Catholic office or service for the dead: *Placebo Domino*, I shall please the Lord]

placebo effect *n.* A positive or therapeutic effect resulting solely from the administration of a [*placebo](#) (1). Across a wide range of mental and physical symptoms and disorders, between 30 and 40 per cent of patients show improvement following the administration of a placebo. See also [SELF-FULFILLING PROPHECY](#). Compare [NOCEBO EFFECT](#).

place of articulation *n.* The location within the mouth where a speech sound is made. In English, there are ten places of articulation for [*consonants](#): [*bilabial](#), [*labiodental](#), [*dental](#), [*alveolar](#), [*post-alveolar](#), [*palato-alveolar](#), [*palatal](#), [*velar](#), [*glottal](#), and [*retroflex](#). There are a few additional places of articulation in other languages.

place theory *n.* A theory of pitch perception first proposed in 1865 by the German physiologist, physicist, and mathematician Hermann Ludwig Ferdinand von Helmholtz (1821–94) according to which the perceived pitch of a tone depends on the position or place on the [*basilar](#) membrane of the

*****ebook converter DEMO Watermarks*****

auditory receptors that transmit nerve impulses. Physiological evidence for the place theory was provided by the Nobel prizewinning Hungarian physicist and physiologist Georg von Békésy (1899–1972) and summarized in his book *Experiments in Hearing* (1962). Because the **cochlea* tapers from one end to the other, the part of the basilar membrane that vibrates the most depends on the frequency of the sound. Resting on the basilar membrane are **hair cells* with auditory nerve cells connected to their bases, and vibrations of the basilar membrane cause the hair cells to bend back and forth, triggering nerve impulses to the brain. For tones above about 5,000 hertz, the pitch that is heard depends on which part of the basilar membrane vibrates the most and which nerve cells are therefore excited. Also called the *harp theory*, the *piano theory*, or the *resonance theory*. Compare [FREQUENCY THEORY](#), [VOLLEY THEORY](#).

planned behaviour, theory of See [THEORY OF PLANNED BEHAVIOUR](#).

planned comparison *n.* A statistical test of a difference between two means, usually carried out after **analysis* of variance but planned before the data were collected, and therefore validly using a *t* test. Also called an *a priori* test. See also [MULTIPLE COMPARISONS](#). Compare [A POSTERIORI TEST](#).

plantar response *n.* A curling inwards of the toes when the sole of the foot is stroked with a hard object such as a key, replacing the infantile **Babinski reflex* from about 2 years of age in neurologically normal infants. Also called the *plantar reflex*. [From Latin *plantaris* of the sole of the foot, from *planta* the sole of the foot]

planum temporale *n.* The flat upper surface at the back of the temporal **operculum* in the region of **Wernicke's area*, extending to the end of the lateral sulcus, crucially involved in language comprehension. It is the most asymmetrical structure in the brain, much larger (approximately nine millimetres longer, on average) in the linguistically dominant (usually left) than the non-dominant cerebral hemisphere, resulting in a significantly longer left lateral sulcus in the left hemisphere. Also called the *temporal plane*. [From Latin *planum* a flat surface + *temporalis* of the temple, from *tempus*, *temporis* the temple (on the side of the head)]

plaque *n.* Any small patch or region of abnormal tissue within the body.

*****ebook converter DEMO Watermarks*****

See [AMYLOID PLAQUE](#), [GLIOSIS](#). [From French *plaquer* to plate, from Middle Dutch *placken* to beat metal]

plasma *n.* **1.** The clear, pale yellow liquid component of blood (blood plasma) or lymph (lymph plasma), within which corpuscles and cells are suspended. **2.** An obsolescent name for the [*cytoplasm](#) of a cell, surviving in a combining form in the word [*plasmagene](#). **3.** In physics, a hot ionized gas (see [ION](#)). [From Greek *plasma* a form, from *plassein* to form or mould]

plasmagene *n.* Any [*gene](#) located in the cytoplasm outside the [*nucleus](#) (1) of a cell, in a [*plasmid](#) or a [*mitochondrion](#), consisting of [*DNA](#) that self-replicates independently of chromosomal DNA. See also [MITOCHONDRIAL DNA](#). [From *plasma* cytoplasm + *gene*]

plasma membrane *n.* Another name for a [*cell](#) membrane.

plasmid *n.* A circular fragment of [*DNA](#) that is not part of a [*chromosome](#) but exists and reproduces autonomously in the [*cytoplasm](#) of a cell. Bacterial plasmids can be transmitted between bacteria of the same or different species and are useful in [*genetic engineering](#). See also [JUMPING GENE](#), [PLASMAGENE](#). Compare [MITOCHONDRIAL DNA](#). [From (cyto)*plasm* + *-is*, *-idos* daughter of, indicating a particle, body, or structure]

plateau *n.* **1.** A flat area of land, or more generally anything flat or any relatively long period of stability. **2.** A period or stage in a learning process when no progress is evident. [From French *plateau* a flat area of land, from Greek *platus* flat]

Plateau spiral *n.* An [*Archimedes spiral](#) or some other spiral that is attached to a circular disc and, when rotating, appears to be continuously expanding from its centre or contracting towards its centre depending on the direction of rotation. After being observed for several seconds it induces a powerful opposite [*motion aftereffect](#) in which an object or surface that is fixated appears to be contracting or expanding, so that a person's face (for example) appears to shrink or enlarge while remaining paradoxically the same size, and this aftereffect is called the *spiral aftereffect*. It is also called a *Talbot–Plateau spiral* or *Archimedes spiral*, though the latter term is
*****ebook converter DEMO Watermarks*****

misleading, partly because the Archimedes spiral is a mathematical concept predating the illusion by many centuries, and partly because other spirals are often used to produce the effect. *See also* [VISUAL ILLUSION](#). *Compare* [WATERFALL ILLUSION](#). [Named after the Belgian physicist Joseph Antoine Ferdinand Plateau (1801–83) who produced the first version of it with the help of an assistant in 1849, although he never saw it himself because he had blinded himself six years earlier by staring at the sun]

platelets *n.* Particles in the blood of vertebrates that are responsible for blood clotting. [So called because of their shape]

platoon-volley theory *See* [VOLLEY THEORY](#).

platykurtic *See* [KURTOSIS](#).

player *n.* **1.** A person who takes part in a game; more specifically a decision maker in an interactive decision problem of the type analysed within [*game](#) theory. A player in this sense may be a person, a committee or other decision making group, an animal, or any other entity that functions as a decision maker in a strategic [*game](#) (1). **2.** An actor or one who plays a musical instrument.

play therapy *n.* A form of [*psychotherapy](#) used with children in which play is used to facilitate communication between client or patient and therapist.

pleasantness *n.* The quality of being pleasing or satisfying. Also, another name for [*agreeableness](#).

pleasure centre *n.* Any region of the brain in which electrical stimulation is rewarding or in which implanted electrodes tend to elicit self-stimulation from experimental animals provided with levers with which they can stimulate the area. The most important pleasure centres are in areas of the [*hypothalamus](#) and the [*limbic system](#), especially the [*septum pellucidum](#) and the [*medial forebrain bundle \(MFB\)](#). US *pleasure center*. *See also* [PRIMING](#) (3).

pleasure-ego *n.* In **psychoanalysis*, one of the two major aspects of the **ego*, based on the **pleasure principle*, differentiated by Sigmund Freud (1856–1939) from the **reality-ego*, based on the **reality principle*. In his article on ‘Formulations on the Two Principles of Mental Functioning’ (1911), he summed up the distinction as follows: ‘Just as the pleasure-ego can do nothing but *wish*, work for a yield of pleasure, and avoid unpleasure, so the reality-ego need do nothing but strive for what is *useful* and guard itself against damage’ (*Standard Edition*, XII, pp. 218–26, at p. 223).

pleasure–pain principle *n.* Another name for the **pleasure principle*.

pleasure principle *n.* In **psychoanalysis*, the precept according to which psychological processes and actions are governed by the gratification of needs and the avoidance or discharge of unpleasurable tension. It is the governing principle of the **id*, in contrast to the **reality principle*, which is a governing principle of the **ego*. Sigmund Freud (1856–1939) borrowed the concept from the German philosopher, physician, psychologist, and mystic Gustav Theodor Fechner (1801–87) who, in an article in the journal *Zeitschrift für Philosophie und philosophische Kritik* in 1848, introduced the term (in its German form *Lustprinzip*) and noted that motives underlying actions can be unconscious. Freud introduced the concept in his book *The Interpretation of Dreams* (1900), where he initially called it the unpleasure principle (*Standard Edition*, IV–V, at p. 574), but later he fell in with Fechner's more natural terminology. Also called the *pleasure–pain principle* or (awkwardly but closer to Freud's original German) the *pleasure–unpleasure principle*. See also [FREE ENERGY](#), [PERCEPTION–CONSCIOUSNESS SYSTEM](#), [PLEASURE-EGO](#), [PRIMARY PROCESS](#), [PRINCIPLE OF CONSTANCY](#).

pleasure–unpleasure principle *n.* Another name for the **pleasure principle*.

pleiotropic *adj.* Of or relating to a **gene* or a **mutation* that has a simultaneous effect on more than one **phenotypic* trait. **pleiotropism** or **pleiotropy** *n.* [From Greek *pleion* more + *tropos* a turn, from *trepein* to turn + *-ikos* of, relating to, or resembling]

plethysmograph *n.* An instrument for recording changes in the size or volume of the penis (***penile plethysmograph**) or another body organ or part, especially changes resulting from variations in blood content. [From Greek *plethysmos* enlargement + *graphein* to write]

plexiform layer *n.* Either of two thin strata in the ***retina**, the ***inner plexiform layer** and the ***outer plexiform layer**, that separate the three major retinal layers and are connected by ***interplexiform cells** conveying information backwards towards the ***photoreceptors**. [From Latin *plexus* a network, from *plectere* to weave]

plexus *n.* Any complex network of nerves, ganglia, blood vessels, or lymphatic vessels, such as the ***choroid plexus**. [From Latin *plexus* a weaving, from *plectere* to weave]

plosive *n.* A ***consonant** speech sound articulated by completely blocking the airstream through the mouth and nose for a moment, as in the initial ***phonemes** in the words *bee*, *dear*, *gear*, *key*, *pea*, *tea*. See also **MANNER OF ARTICULATION**. [French, from (ex)plosif]

pneumoencephalogram *n.* An X-ray image of the brain with its ***cerebrospinal** fluid replaced with air to show the ***ventricles** clearly. Also called a *pneumoencephalograph* or an *air encephalogram*. See also **ENCEPHALOGRAM**. **pneumoencephalography** *n.* The production and interpretation of pneumoencephalograms. [From Greek *pneuma*, *pneumatōs* breath, from *pnein* to breathe + *en* in + *kephale* the head + *gramme* a line]

pneumograph *n.* An instrument for recording respiratory movements, usually from straps fitted around the chest or abdomen. **pneumogram** *n.* A recording from a pneumograph. See also **POLYGRAPH**. [From Greek *pneuma*, *pneumatōs* breath, from *pnein* to breathe + *graphein* to write]

pneumotachograph *n.* An instrument for measuring and recording the airflow from the nose and mouth during speech. [From Greek *pneuma* breath + *tachos* speed + *graphein* to write]

PNMT *abbrev.* An enzyme contained in adrenergic neurons of the adrenal medulla that synthesize ***adrenalin** (epinephrine). It functions as a catalyst in the conversion of noradrenalin (norepinephrine) to adrenalin. [From its chemical name *p(henylethanolamine)-N-m(ethyl)t(ransferase)*]

Poetzl phenomenon *n.* The reappearance in dreams of images or information previously perceived ***subliminally**. Also spelt *Pötzl phenomenon*. [Named after the Austrian neurologist Otto Pötzl (1877–1962) who first reported the phenomenon in 1917]

Poggendorff illusion *n.* A visual illusion in which a diagonal line appears displaced when interrupted by a rectangle appearing to occlude the middle part of it (see **illustration**). [Named after the German physicist Johann Christian Poggendorff (1796–1877) who discovered it, although the German astronomer Johann Karl Friedrich Zöllner (1834–82) first published it in 1860 after Poggendorff had drawn his attention to it]

Poggendorff illusion. The lower of the two lines on the right is a continuation of the line on the left.

poikilitic function *n.* Another name for a **psychometric function*.
[From Greek *poikilos* various + *-itikos* resembling or marked by]

poikilothermic *adj.* Cold-blooded, or having a body temperature that varies with the ambient temperature. Also called *poikilothermal*. Compare *HOMIOOTHERMIC*. **poikilothermy** or **poikilothermism** *n.* [From Greek *poikilos* various + *therme* heat + *-ikos* of, relating to, or resembling]

point-light display *n.* A moving image of small light sources attached to the principal joints of a person's body (usually shoulders, elbows, wrists, hips, knees, and ankles), filmed as the person moves around in the dark, introduced

*****ebook converter DEMO Watermarks*****

by the Swedish psychologist Gunnar Johansson (1911–98) and first published in the journal *Perception and Psychophysics* in 1973. Static point-light displays, even when several are viewed as a sequence, look like meaningless constellations, but the moving image is almost instantly (after two or three frames) and irresistibly interpreted as a human body in motion, and from such displays familiar people can be recognized easily from their characteristic gaits, the sexes of unknown people can be reliably judged even when cues relating to physical size are eliminated, and the weights of objects being lifted can be accurately judged to within 3–4 kg. The perception created by a point-light display is also called *biological motion* or *biomechanical motion*.

point mutation *n.* A **mutation* involving the alteration of a single base pair in a segment of **DNA*. [So called because it occurs at a single point in the sequence of bases]

point of non-discrimination *n.* Another name for a **point of subjective equality*.

point of subjective equality *n.* Any of the points along a stimulus dimension at which a **variable* stimulus is judged by an observer to be equal to a **standard stimulus*; also, any point along a stimulus dimension at which no relevant differences between responses to a variable stimulus and a standard stimulus can be detected in the behaviour of an animal. Also called a *non-discrimination point* or a *point of non-discrimination*. **PSE** abbrev.

point source *n.* A light source that is sufficiently small to be considered as having negligible size.

point subtraction aggression paradigm *n.* A laboratory measure of **aggression* in response to provocation, developed by the US psychiatrist Don (Donald Raymond) Cherek (born 1941) and published in the journal *Psychopharmacology* in 1981. In a slightly revised version that Cherek developed into a computer program in 1992, subjects can earn money by pressing a button marked *A*, take money from opponents with whom they believe that they are paired by pressing *B*, or protect their earned money by pressing *C*. Buttons can be pressed repeatedly, and a participant's accumulated earnings are displayed on the computer screen throughout the

*****ebook converter DEMO Watermarks*****

task. Irrespective of the participant's actions, the fictitious opponent periodically deducts money from the participant's account. From the participant's pattern of button-pressing, it is possible to determine the level of aggression in response to provocation. Compare [HOT SAUCE TASK](#), [TAYLOR AGGRESSION PARADIGM](#). **PSAP** abbrev.

Poisson distribution *n.* In statistics, a very skewed [*probability distribution](#) representing the number of discrete events occurring randomly but at a constant average rate in a specified continuous interval of time or space, for example. It is often used to model the random occurrence of rare events with fixed probability of occurrence. [Named after the French mathematician Siméon-Denis Poisson (1781–1840) who published the results of his researches in a book in 1837]

Polari *n.* An [*argot](#) or [*cant](#) that became popular in [*gay \(1\)](#) subculture in English-speaking countries during the 1960s and declined thereafter, though it survives in English slang words such as *naff* (tasteless), *bevv* (a drink), *cottaging* (frequenting public toilets for sex with strangers) and, less well known, *vada* (see), believed to have originated in the lingua franca of Mediterranean sailors. Also called *Parlyaree*. [From Italian *parlare* to speak, from Latin *parlare* to speak]

political correctness *n.* The avoidance of verbal expressions or actions that may be interpreted as prejudicial or offensive to minorities or groups considered to be disadvantaged by race, sex, disability, sexual orientation, social class, or appearance. As a consequence of political correctness, some [*epicene \(2\)](#) words have become commonplace (for example, *flight attendant* in preference to *air stewardess* and *firefighter* in preference to *fireman*), but certain other manifestations of political correctness have been ridiculed, as when a US television reporter, referring to the South African president Nelson Mandela (1918–2013) and wishing to refer to the fact that he was black without uttering the word *black*, referred to him as African American. See also [ABLEISM](#), [FATTISM](#), [HERSTORY](#), [HETEROSEXISM](#). **politically correct** *adj.* **PC** abbrev. [Coined by the US journalist Elinor Langer (born 1939) in the *New York Times* in 1984, alluding to social conventions in the liberal establishment]

Pollyanna effect *n.* A tendency for people to pay more attention in their thought and speech to positive than negative aspects of their conceptual worlds and to process positive information more easily than negative information. The term was coined in 1964 by the US psychologist Charles E(gerton) Osgood (1916–91) to explain the greater frequency of positive than negative words in written language: *good* occurs almost 10 times as frequently as *bad*, *love* almost 10 times as frequently as *hate*, and so on. *See also* [MERE EXPOSURE EFFECT](#), [TRAIT NEGATIVITY BIAS](#). [Named after Pollyanna Whittier, the ‘glad girl’, whose blindly optimistic and Panglossian disposition always led her to look on the bright side of things, in the novels *Pollyanna* (1913) and *Pollyanna Grows Up* (1915) by the US writer Eleanor H(odgman) Porter (1868–1920)]

polyandry *n.* The custom or practice of having more than one husband at the same time or, in female animals, of mating with more than one male during the same breeding season. *See also* [ADELPHOGAMY \(1\)](#), [POLYGAMY](#). *Compare* [POLYGyny](#). [From Greek *polys* many + *andros* a man]

polydipsia *n.* Excessive thirst, symptomatic of several disorders including **diabetes* mellitus and certain mental disorders. *Compare* [ADIPSIA](#). [From Greek *polys* much or many + *dipsa* thirst + *-ia* indicating a condition or quality]

polyethism *n.* Division of labour, especially in reference to the **social* insects. [From Greek *polys* many + *ethos* a custom]

polygamy *n.* The custom or practice of having more than one spouse (whether husband or wife) at the same time or, in animals, of having more than one mate during the same breeding season. *See* [POLYANDRY](#), [POLYGyny](#). *Compare* [MONOGAMY](#). [From Greek *polys* many + *gamos* marriage]

polygenic inheritance *n.* Inheritance of a characteristic that depends on the cumulative effects of several or many **genes* each having a small individual effect, such as physical stature or intelligence. *See also* [EMERGENESIS](#), [QUANTITATIVE INHERITANCE](#). *Compare* [MONOGENIC INHERITANCE](#), [QUALITATIVE INHERITANCE](#). [From Greek *polys* many + German *Gen* a gene,

from Greek *genein* to produce]

polygraph *n.* An instrument for the simultaneous recording of several largely involuntary physiological responses controlled by the autonomic nervous system, usually skin conductance or **galvanic skin response (GSR)*, respiration rate (monitored by a **pneumograph* and producing separate traces for chest movement and abdominal movement), blood pressure, and heart rate. It is sometimes used as a **lie detector*. The original instrument of this type was the **Keeler polygraph*. [From Greek *polygraphos* writing copiously, from *polys* many + *graphein* to write]

polygyny *n.* The custom or practice of having more than one wife at the same time or, in male animals, of mating with more than one female during the same breeding season. *See also* *POLYGAMY*. *Compare* *POLYANDRY*. [From Greek *polys* + *gyne* a woman]

polymerase chain reaction *n.* A technique for synthesizing numerous copies of a sequence of **DNA* without **genetic engineering* by repeatedly separating it into its two complementary strands and using **DNA* polymerase to catalyse the synthesis of double-stranded DNA from each single strand. *See also* *GENETIC FINGERPRINTING*, *TRANSCRIPTION (2)*. **PCR** *abbrev.* [From *polymer* a large molecule consisting of repeating subunits, from Greek *polys* many + *meros* a part + *-ase* denoting an enzyme, from *diastasis* separation]

polymorphic gene *n.* A gene such as any of the human genes for eye colour or the ABO blood groups that occurs as two or more different **alleles* at the same gene locus within a species or population. *See* *GENETIC POLYMORPHISM*. *See also* *RACE (2)*. [From Greek *polys* many + *morphe* a form or shape]

polymorphism *See* *GENETIC POLYMORPHISM*.

polymorphous perversity *n.* In **psychoanalysis*, the earliest **libidinal stage* of **psychosexual development*, during the **oral stage*, characterized by undifferentiated sexual desire that finds gratification through any **erotogenic zone*. The term is also used to denote the varied bodily
*****ebook converter DEMO Watermarks*****

sources and styles of libidinal gratification in the course of early psychosexual development. Compare ANAL STAGE, GENITAL STAGE, LATENCY PERIOD, ORAL STAGE, PHALLIC STAGE. [From Greek *polys* many + *morphe* a shape or form]

polyonymy *n.* The property of having several names. English has no equivalents for the many words for *camel* in Arabic, *snow* in the language of the Inuit Eskimos of Greenland, Canada, and Northern Alaska, or *hole* in the Australian aboriginal Pintupi; but on the other hand few languages have the polyonymy that English has for different types of vehicles (*car*, *lorry*, *bus*, *motorbike*, *go-cart*, and so on). See also LINGUISTIC DETERMINISM. Compare POLYSEMY. **polyonymous** *adj.* [From Greek *polys* many + *onoma* a name]

polypeptide *n.* A molecule that is smaller than a *protein, consisting of a *peptide chain composed of *amino acids linked together. If the molecular weight (in units of the weight of a single hydrogen atom) is less than 10,000, corresponding to about 100 amino acids, it is arbitrarily called a polypeptide; if the molecular weight exceeds 10,000, corresponding to over 100 amino acids, it is called a protein. The basis for the dividing line is the fact that molecules lighter than 10,000, when in solution, will pass through cellophane, providing a simple discriminative test. [From Greek *polys* many + English *peptide*]

polyphagia *n.* The habit of some creatures (omnivores) of eating many different kinds of foods. Also, loosely, another name for *bulimia (1). [From Greek *polys* much + *phagein* to consume + *-ia* indicating a condition or quality]

polysemy *n.* The property of a word or *lexeme of having several different meanings, a typical English example being the word *kind*, which can mean type (*a different kind of food*); quality (*a difference of kind rather than degree*); goods or services (*payment in kind*); something similar (*respond to the attack in kind*); compassionate (*a kind gesture*); or cordial (*kind regards*). Also called *polysemia*. See also HETERONYMS, LEXICAL AMBIGUITY. Compare MONOSEMY, POLYONYMY. **polysemous** *adj.* [From Greek *polys* many + *sema* a sign]

polysomnography *n.* The simultaneous recording of several physiological processes, usually including ***EEG** and ***electro-oculogram (EOG)** activity, in a sleeping person. [From Greek *polys* many + Latin *somnus* sleep + *graphein* to write]

polysubstance dependence *n.* A ***substance-related and addictive disorder**, specifically a form of ***substance dependence** involving at least three groups of ***drugs** for at least 12 months without any one of them predominating. [From Greek *polys* much + Latin *substantia* substance, from *sub* under + *stare* to stand]

polysynaptic reflex *n.* Any reflex with more than one ***synapse (1)**, not counting the synapse between neuron and muscle, and hence involving one or more ***interneurons**. In humans, all reflexes except ***stretch reflexes** are polysynaptic. *Compare* **MONOSYNAPTIC REFLEX**. [From Greek *polys* many + *neuron* a nerve]

POMC *abbrev.* Pro-opiomelanocortin, a large polypeptide present in the ***pituitary gland** that functions as a precursor of ***beta-endorphin** and ***adrenocorticotrophic hormone (ACTH)**.

pons *n.* A broad band of mostly white fibres connecting the two halves of the brain at the level of the brainstem above the medulla oblongata, containing the ***corticospinal tract** and part of the ***reticular formation** and connected to the cerebral cortex via the ***corticopontine tract**. Not to be confused with the ***PONS**. *See also* **CEREBRAL PEDUNCLE**, **LOCKED-IN SYNDROME**, **LOCUS COERULEUS**, **NUCLEUS GIGANTOCELLULARIS**, **PERIAQUEDUCTAL GREY MATTER**, **SUBCOERULEAR NUCLEUS**, **SUPERIOR OLIVARY NUCLEUS**, **TECTUM**, **TRAPEZOID BODY**.
pontine *adj.* [From Latin *pons* a bridge, short for *pons Varolii* bridge of Varolius, named after the Italian anatomist Costanzo Varolius (?1543–75) who first identified it]

PONS *abbrev.* Profile of non-verbal sensitivity, a test designed to measure ability to decode non-verbal information from the face, body, and voice. It consists of brief film clips of a woman displaying various emotional states, the respondent's task being to identify those states. It was published

commercially in 1979 by the German-born US psychologist Robert Rosenthal (born 1933) and several colleagues, who reported that children's PONS scores tend to increase with age, that females tend to score higher than males, and that non-verbal behaviour of strangers tends to be less accurately decoded than that of familiar people. Not to be confused with the [*pons](#).

pontogeniculo-occipital *adj.* Pertaining to a [*PGO spike](#) or wave. [From *pons* + (*lateral*) *geniculate nucleus* + *occipital cortex*]

Ponzo illusion *n.* A visual illusion in which two lines of equal length appear unequal when drawn horizontally at different heights between a pair of converging lines (see [illustration](#)). It is also called the *railway illusion*, because it is often illustrated with a picture of converging railway lines, and it is closely related to [*Ehrenstein's square illusion](#). See also [CORRIDOR ILLUSION](#), [ORBISON ILLUSION](#), [PERCEPTUAL CONSTANCY](#), [SIZE CONSTANCY](#). [Named after the Italian psychologist Mario Ponzo (1882–1960) who first published it in 1913]

Ponzo illusion. The horizontal lines are equal in length.

pooled variance estimate *n.* In statistics, an estimate of a population's **variance* obtained by combining or pooling data from two or more samples. In the **independent samples t test*, for example, the squared deviations of the scores from their means in both groups are normally pooled to obtain an estimate of what is assumed under the **null hypothesis* to be the common population variance. *Compare* *SEPARATE VARIANCE ESTIMATES*.

poppers *n.* A street name for **nitrite inhalants* generally or **amyl nitrite* in particular. [Alluding to the fact that the capsules containing it make a popping sound when they are opened]

pop-type *n.* An informal name for a **population* stereotype.

population *n.* All the people inhabiting a country or other area or belonging to a specified group. In statistics, an aggregate of individuals from which a **sample* may be drawn and to which the results of a research investigation may be generalized. A population need not encompass every individual in a country: it is quite legitimate to refer to the population of patients diagnosed as schizophrenic or the population of university undergraduates, for example. [From Latin *populus* people + *-ation* indicating a process or condition]

population genetics *n.* A branch of genetics concerned with the relative frequencies of genes and genotypes in populations, as affected by natural selection under conditions of **mutation*, **assortative mating* or **disassortative mating*, and **migration*, focusing especially on phenomena such as **heritability*. *See also* *HARDY–WEINBERG LAW*.

population stereotype *n.* In a situation of seemingly arbitrary choice, a particular option that is chosen by a large proportion of a given population, or an expectation, interpretation, or a manner of perceiving, thinking, or behaving that is statistically prominent within the population. For example, most people in the US and Europe unconsciously expect a knob on an electrical appliance to increase the appliance's output when it is turned clockwise and to decrease the output when it is turned anticlockwise, but they expect a water or gas tap or faucet to function in exactly the opposite way,

decreasing the flow when it is turned clockwise and increasing the flow when it is turned anticlockwise, and controls that do not function in the expected ways cause irritation, inefficiency, and operator errors. Another example, often used by conjurors and people pretending to have telepathic powers, is the marked preference that emerges when people are asked to draw two geometric figures, one inside the other: research reveals that more than one-third of people draw a triangle and circle. Also (informally) called a *pop-type*. See also [THREE–SEVEN EFFECT](#).

pornographomania *n.* A pathological impulse to write obscene messages or graffiti. [From Greek *porne* a prostitute + *graphein* to write + *mania* madness]

pornolagnia *n.* A desire for sexual intercourse with prostitutes. [From Greek *porne* a prostitute + *lagneia* lust]

porphyria *n.* A group of hereditary disorders in which the body over-produces substances called porphyrins, causing abdominal pain, aversion to bright light, and a variety of neurological symptoms. [From Greek *porphyra* purple, referring to the colour of the substance excreted by people with the disorders + *-ia* indicating a condition or quality]

Porter's law *n.* Another name for the [*Ferry–Porter law](#).

Porteus Maze Test *n.* The first widely used [*non-verbal test](#) of ability, designed to supplement the [*Stanford–Binet intelligence scale](#) by measuring aspects of intellectual ability such as foresight, planning, and prudence. It involves finding paths through a series of mazes or labyrinths, and some researchers have considered it [*culture-fair](#). **PMT** *abbrev.* [Named after the Australian psychologist Stanley D. Porteus (1883–1972) who constructed it in 1914]

portfolio theory *n.* A theory of decision making under risk, based on [*unfolding technique](#), developed in the early 1960s by the US psychologist Clyde Hamilton Coombs (1912–88).

portmanteau word *n.* Another name for a **blend*. [From *portmanteau* a large travelling case, from French *porter* to carry + *manteau* a cloak]

portrait illusion *n.* Another name for the **rotating head illusion*.

position constancy *n.* A form of **perceptual constancy* through which stationary objects appear stationary in spite of movements of their retinal images caused by movements of the eyes, head, and body. *See also* [EYE-HEAD MOVEMENT SYSTEM](#), [REAFFERENCE](#).

position preference *n.* Any consistent tendency to choose an option because of its location, as when a person in a discrimination task tends to favour the right-hand option, or when a person responding to a multiple-choice questionnaire tends to favour the middle option of the response categories presented. *See also* [RESPONSE STYLE](#).

positive afterimage *n.* An **afterimage* in which the lightness contrasts of the original stimulus are preserved, light areas of the original stimulus appearing light and dark areas appearing dark. *See also* [COMPLEMENTARY AFTERIMAGE](#). *Compare* [NEGATIVE AFTERIMAGE \(1\)](#).

positive feedback *See* [FEEDBACK](#).

positive induction *See* [INDUCTION \(4\)](#).

positive Oedipus complex *See* [OEDIPUS COMPLEX](#).

positive psychology *n.* The psychology of valued psychological phenomena, such as contentment and satisfaction (with the past), hope and optimism (for the future), and happiness and well-being (in the present). It focuses on positive subjective experiences, such as love and aesthetic appreciation; positive individual qualities, such as courage, interpersonal skill, perseverance, originality, and wisdom; and positive social phenomena, such as cooperation, altruism, and tolerance. The term was introduced by the US psychologist Martin E. P. Seligman (born 1942) in a Presidential Address to the American Psychological Association in 1998, and it was discussed at

length in the journal *American Psychologist* in 2000, in a special issue edited by Seligman and by the Italian-born US psychologist Mihaly Csikszentmihalyi (born 1934). In March 2003, the British Psychological Society's journal *The Psychologist* also devoted a special issue to positive psychology. *See also* EUDAIMONIC WELL-BEING, HAPPINESS, HEALTH PSYCHOLOGY, HEDONIC TREADMILL, HEDONIC WELL-BEING, EGO INVOLVEMENT, POST-TRAUMATIC GROWTH, SELF-CONFIDENCE, SELF-EFFICACY, SELF-ESTEEM, SUBJECTIVE WELL-BEING.

positive reference group *n.* A **reference group* that an individual admires or aspires to and uses as a standard representing opinions, attitudes, or behaviour patterns to emulate. *Compare* NEGATIVE REFERENCE GROUP.

positive symptoms *n.* In the diagnosis of **schizophrenia*, the symptoms of **delusions*, **hallucinations*, **disorganized speech*, **disorganized thinking*, and **catatonia*. *Compare* NEGATIVE SYMPTOMS.

positive theory *See* NORMATIVE (1).

positive transfer *n.* A form of **transfer of training* in which the learning or performance of a task is facilitated or improves as a result of training on a different but related task, as when learning to speak Italian improves one's ability to speak Spanish, or vice versa. Transfer tends to be positive when the two tasks involve different stimuli and similar responses. *Compare* NEGATIVE TRANSFER.

positive transference *n.* In **psychoanalysis*, sexual desire on the part of the patient towards the analyst. *See also* TRANSFERENCE. *Compare* NEGATIVE TRANSFERENCE.

positivism *n.* 1. A philosophical doctrine developed explicitly by the French philosopher and mathematician Auguste Comte (1798–1857), though it can be traced back through the French socialist thinker Claude-Henri de Rouvroy Comte de Saint-Simon (1760–1825) to the English philosopher and statesman Francis Bacon (1561–1626), according to which observation and experiment are the only sources of substantial knowledge. Comte believed that human thought passes through three stages: theological, metaphysical, then finally positive. *See also* EMPIRICISM. 2. Another name for **logical*
*****ebook converter DEMO Watermarks*****

positivism. See also [FRANKFURT SCHOOL](#), [OPERATIONALISM](#).

positivity bias *n.* 1. A pervasive tendency for people, especially those with high [*self-esteem](#), to rate positive [*traits](#) as being more true of themselves than negative traits. 2. In [*balance theory](#), a general preference shown by most people for positive relations, especially *p–o* relations.

positron emission tomography See [PET SCAN](#).

possession trance *n.* A [*trance](#) associated with the replacement of one's customary personal identity with a new identity, and a belief that this is caused by the influence of a spirit, deity, power, or other person. See also [DISSOCIATIVE TRANCE DISORDER](#). [From Old French *possesser* to possess, from Latin *possidere* to occupy or inhabit + French *transe* trance, from Latin *transire* to go across or to die]

possible world *n.* In [*modal logic](#), a formalization of an imaginable state of affairs consistent with certain specified assumptions, such that a [*proposition](#) (1) is true if and only if it is true in every possible world.

post-alveolar *adj.* Of or relating to the area immediately behind the [*alveolar](#) ridge, the hard, bony part of the palate behind the upper front teeth, and descriptive of speech sounds articulated with the tongue tip in that area, examples being the initial sounds in the words *rye*, *try*, and *dry*. See also [PLACE OF ARTICULATION](#). [From Latin *post* after or behind + *alveolus* a small depression, referring to the tooth sockets]

postcategorical acoustic store *n.* A memory store for verbal information that has undergone a degree of [*information](#) processing, especially syntactic analysis. Also called *postcategorical acoustic memory*. Compare [PRECATEGORICAL ACOUSTIC STORE](#).

postcentral gyrus *n.* The gyrus of the parietal lobe immediately behind the central sulcus, occupied by the primary [*somatosensory cortex](#). Also called the *postrolandic gyrus*. [From Latin *post* after or behind + *centrum* the centre]

postconcussional disorder *n.* A condition (included in the *ICD-10 classification and in the *DSM-5 appendix of conditions meriting further study) following head *trauma causing significant *concussion, indicated by *fatigue (1), *dyssomnia, headache, *vertigo or dizziness, irritability, *anxiety, *depression, or labile *affect, changes in personality, and apathy. Also called *postconcussion syndrome*. [From Latin *post* after + *concussus* violently shaken, from *concutere* to shake violently, from *quater* to shake]

postconventional morality *n.* The third and final *Kohlberg stage of moral development, characterized by the internalization of moral principles. It is divided into two levels: at Level 5 the child defines moral behaviour in terms of the social contract and what is generally agreed to be for the public good (*I should not tell lies, because it is in all our best interests for everyone to be truthful*), and at Level 6 it is based on genuine ethical principles that determine a person's personal moral code. Compare CONVENTIONAL MORALITY, PRECONVENTIONAL MORALITY.

postencephalitic syndrome *n.* An *organic mental disorder following recovery from viral or bacterial *encephalitis, characterized by non-specific and variable behavioural change, including paralysis, deafness, *amnesia, *aphasia, *apraxia, or *acalculia.

posterior *adj.* Behind, at the back, or after. Compare ANTERIOR. [From Latin *posterus* coming after, later, or following, from *post* after]

posterior cerebral commissure *n.* A band of nerve fibres beneath the pineal gland in the epithalamus, connecting the midbrain regions of the two cerebral hemispheres, including the two superior colliculi. Also called the *intertectal commissure* or simply the *posterior commissure*. See also COMMISSURE. [From Latin *commissura* a joining together, from *com-* together + *mittere* to send]

posterior funiculus See FUNICULUS.

posterior horn *n.* Either of the two dorsal ends of the H-shaped column of grey matter running throughout the length of the spinal cord and receiving

inputs from most of the afferent nerves. It includes the **substantia gelatinosa*.
See also FUNICULUS. *Compare* ANTERIOR HORN.

posterior pituitary *n.* The back part or lobe of the **pituitary gland* that is responsive to a variety of pituitary, adrenal, gonadal, and hypothalamic hormones and that secretes **oxytocin* and **vasopressin* in response to neural stimulation. It is one of the **circumventricular organs* and is called the *neurohypophysis*. *Compare* ANTERIOR PITUITARY.

posterior probability *n.* In **Bayesian inference*, the probability assigned to an event, in accordance with **Bayes' theorem*, in the light of empirical evidence as to its observed relative frequency. Also called *conditional probability*. *Compare* PRIOR PROBABILITY (2).

post-Freudian *adj. n.* (Of or relating to) any of the **psychoanalysts* who followed Sigmund Freud (1856–1939).

postganglionic *adj.* Pertaining to **efferent* neurons of the **autonomic* nervous system that are peripheral to **ganglia* and that synapse directly on to muscles or glands. *Compare* PREGANGLIONIC. [From Latin *post* after or behind + Greek *ganglion* a cystic tumour + *-ikos* of, relating to, or resembling]

posthallucinogen perception disorder *n.* Another name for **flashback* (3).

post hoc test *n.* Another name for an **a posteriori* test. [From Latin *post* after + *hoc* this]

posthypnotic amnesia *n.* Another name for **hypnotic* amnesia.

postnatal blues *See* POSTPARTUM BLUES.

postnatal depression *See* POSTPARTUM DEPRESSION.

post-operative cognitive dysfunction *n.* Impairment of **cognitive* functions, including memory, learning, concentration, and speed

*****ebook converter DEMO Watermarks*****

of mental processing, emerging days or weeks after major surgery, especially in elderly patients. The condition may persist for months or years, long-term effects being especially common after cardiac surgery with use of heart-lung machines, as was noted soon after such machines were introduced. The first large-scale study of the condition after non-cardiac surgery was the International Study of Postoperative Cognitive Dysfunction ([ISPOCD](#)), initially reported in the journal *The Lancet* in 1998, confirming that anaesthesia and surgery cause long-term post-operative cognitive decline in some elderly patients having major, elective, non-cardiac surgery and that the risk increases with age. The term itself first appeared in print in an article by the US psychiatrist David G. Folks (born 1953) and several colleagues in the *Southern Medical Journal* in 1988. See also [COGNITIVE IMPAIRMENT](#), [PUMPHEAD](#). **POCD** abbrev.

postpartum blues *n.* A common emotional reaction of mothers to childbirth, characterized by transient [*depression](#) lasting up to 72 hours. Also called *postnatal blues*. Compare [POSTPARTUM DEPRESSION](#), [PUERPERAL PSYCHOSIS](#). [From Latin *post* after + *parturire* to give birth]

postpartum depression *n.* A form of [*depression](#) occurring occasionally in mothers between three days and six weeks after giving birth, with symptoms ranging from relatively mild to a [*major depressive episode](#). Also called *postnatal depression*. Compare [POSTPARTUM BLUES](#), [PUERPERAL PSYCHOSIS](#).

postpartum psychosis See [PUERPERAL PSYCHOSIS](#).

postrolandic gyrus *n.* Another name for the postcentral gyrus. [From Latin *post* + English *Rolandic (fissure)*, named after the Italian anatomist Luigi Rolando (1773–1831)]

post-rotational nystagmus *n.* A form of [*vestibular nystagmus](#) resulting from rotation of the body, occurring when the rotation stops abruptly. Also called *postrotatory optic nystagmus*.

postsynaptic *adj.* Of or relating to a [*neuron](#) or part of a neuron, muscle, or gland that receives a signal across a [*synapse \(1\)](#). Compare [PRESYNAPTIC](#).

*****ebook converter DEMO Watermarks*****

postsynaptic excitation See [EXCITATORY POSTSYNAPTIC POTENTIAL](#).
postsynaptic inhibition See [INHIBITORY POSTSYNAPTIC POTENTIAL](#). [From Latin *post* after or behind + Greek *synapsis* contact or junction, from *syn* together + *haptein* to fasten + *-ikos* of, relating to, or resembling]

postsynaptic potential *n.* A change in the [*membrane](#) potential of a [*postsynaptic](#) neuron resulting from a [*neurotransmitter](#) or other signal sent across a synapse by a [*presynaptic](#) neuron. See [EXCITATORY POSTSYNAPTIC POTENTIAL](#), [INHIBITORY POSTSYNAPTIC POTENTIAL](#).

postsynaptic receptor *n.* A [*neuroreceptor](#) molecule in a [*postsynaptic](#) cell membrane specialized to detect and respond to the [*neurotransmitter](#) released by a presynaptic neuron.

post-traumatic growth *n.* Improvement in psychological functioning following a traumatic experience, especially in the areas of self-evaluation (increased self-confidence and acceptance of personal limitations), personal relationships (increased compassion, appreciation of intimacy, and appreciation of friendships), and personal philosophy (replacement of materialistic outlook with deeper understanding of what matters in life). It is summed up in the maxim published in 1889 by the German philosopher Friedrich Wilhelm Nietzsche (1844–1900): ‘Aus der Kriegsschule des Lebens.—Was mich nicht umbringt, macht mich stärker’ (From the military academy of life: What doesn’t kill me makes me stronger). The concept was introduced by the US psychologist Richard G. Tedeschi (born 1950) and the Brazilian-born psychologist Lawrence G. Calhoun (born 1943) in an article in the *Journal of Traumatic Stress* in 1996 and is one of the central concepts in [*positive psychology](#). Compare [POST-TRAUMATIC STRESS DISORDER](#).

post-traumatic stress disorder *n.* A [*trauma-](#) and [stressor-related disorder](#) in [*DSM-5](#), also considered an [*anxiety disorder](#), arising as a delayed and protracted response to experiencing or witnessing a traumatic event involving actual or threatened death, serious injury, or sexual violence to self or others. It is characterized by recurrent, involuntary, intrusive, distressing memories of the traumatic event or dreams related to it; [*flashbacks](#) (2) causing the individual to feel or act as though the trauma were recurring; intense distress and physiological reactions in response to

*****ebook converter DEMO Watermarks*****

anything reminiscent of the traumatic event; persistent avoidance of stimuli associated with the trauma; a numbing of responsiveness and heightened arousal, manifested as insomnia, irritability, difficulty in concentrating, hypervigilance, or exaggerated startle response; and sometimes **depersonalization* or **derealization*. Formerly called *traumatic neurosis*, and before that *shell shock*. See also BATTERED WIFE SYNDROME, COMBAT FATIGUE, DISSOCIATIVE IDENTITY DISORDER, EYE-MOVEMENT DESENSITIZATION AND REPROCESSING, FLOODING, PROLONGED DURESS STRESS DISORDER, STRESS, TRAUMA-AND STRESSOR-RELATED DISORDERS. Compare ACUTE STRESS DISORDER, DISSOCIATIVE DISORDERS, POST-TRAUMATIC GROWTH. **PTSD** *abbrev.* [From Latin *post* after + Greek *trauma* a wound]

postulate *n.* Another name for an **axiom*.

postural aftereffect *n.* A subjective feeling that arises after adopting an eccentric or abnormal body posture for some time, and then adopting a normal posture. The sensation is of an abnormal posture that deviates from normality in the opposite direction to the prior abnormal posture, and this aftereffect is a consequence of the **perdeviation effect*. See KOHNSTAMM EFFECT.

postural tremor *n.* A form of **tremor* not easily classifiable as either a **passive tremor* or an **intention tremor*, appearing when an attempt is made to maintain a posture, resulting sometimes from lesions in the **basal ganglia* as in **parkinsonism*, with a typical frequency of 3–6 hertz, or as a sign of **cerebellar syndrome*, with a typical frequency of 2.5–4 hertz. See also POSTUROGRAPHY.

posturography *n.* Instrumental recording of the stability of erect posture by means of strain gauges attached to a supporting platform to detect swaying, used to detect **neurological* disorders, especially those associated with **postural tremor* in **cerebellar syndrome* and various forms of **ataxia*. In some cases **electromyogram* electrodes are also attached to muscles of the ankles and calves. [From *posture* + *graphein* to write]

post-viral fatigue syndrome *n.* A form of **chronic fatigue syndrome* developing after a viral infection. **PVFS** *abbrev.*

*****ebook converter DEMO Watermarks*****

pot *n.* An obsolescent street name for ***cannabis**. **pot-head** *n.* A habitual cannabis user. [Perhaps from the Mexican Indian *potiguaya* cannabis]

potassium *n.* A light, silvery, alkaline, metallic element that is highly reactive chemically and is an important ***electrolyte** in the body. It is the predominant ***cation** within cells and is required for contraction of ***skeletal muscles** and relaxation of ***cardiac muscle**. **K** *abbrev.* [From Latin *potassa* potash]

potlatch *n.* A competitive winter festival involving extravagant feasting, ostentatious distribution of gifts, and ceremonial destruction of valuable possessions, performed by the Kwakiutl and other American Indians of the north-west coastal area as a display of wealth and a method of maintaining or enhancing the prestige of chiefs and clans. [Chinook, from Nootka *patlatsch* a gift]

Pötzl phenomenon *See* **POETZL PHENOMENON**.

poverty of content *n.* Speech that conveys little information. *Compare* **POVERTY OF SPEECH**.

poverty of speech *n.* Marked deficit in spontaneous speech, and replies to questions that are perfunctory, monosyllabic, or unforthcoming. Also called *hypologia*, *hypophrasia*. *Compare* **POVERTY OF CONTENT**.

power law *n.* Any law expressed by a mathematical power function, especially the ***psychophysical** law that was advocated from 1953 onwards by the US psychologist S(tanley) S(mith) Stevens (1906–73) and discussed by him in an influential article in the journal *Psychological Review* in 1957, a century after it was first proposed by the Belgian physicist Joseph Antoine Ferdinand Plateau (1801–83), and that largely replaced ***Fechner's law**. According to the power law, the magnitude of a sensation is a power function of the intensity of the stimulus causing it, so that equal proportional increases in sensation correspond to equal proportional increases in stimulus intensity, the two proportions not necessarily being the same. It is usually expressed by the equation $\psi = k\phi^n$, where ψ is the magnitude of the sensation, ϕ is the

physical intensity of the stimulus, k is a constant scaling factor that depends on the units of measurement, and n is an exponent or power that is constant for a given type of sensory experience but that varies from one type of sensation to the next, with $n = 0.33$ for visual brightness perception, $n = 0.67$ for loudness perception, $n = 1.45$ for heaviness perception of lifted weights, $n = 1.00$ for visual length perception, of which people have much experience, and so on. Also called *Stevens's law* or *Stevens's power law*. See also [PROSPECT THEORY](#), [PSYCHOPHYSICAL FUNCTION](#). [So called because ϕ is raised to the power of n]

power, statistical See [STATISTICAL POWER](#).

power test *n.* In psychometrics, any test in which ability is measured by the degree of difficulty of the items that can be mastered, rather than the speed of performance. Compare [SPEED TEST](#).

POX triad See [BALANCE THEORY](#).

practice curve *n.* Another name for a [*learning](#) curve.

Prader–Willi syndrome *n.* A rare disorder (occurring in about one in 12,000–15,000 people of both sexes) usually caused by [*deletion](#), at or soon after conception, of several genes on the copy of [*chromosome](#) 15 inherited from the father, resulting in [*hyperphagia](#), with a risk of morbid obesity. Other signs and symptoms include [*hypotonia](#), [*cognitive](#) impairment, short stature and incomplete sexual development, [*obsessive](#) or [*compulsive](#) symptoms and [*tantrums](#). **PWS** *abbrev.* [Named after the Swiss paediatricians Andrea Prader (1919–2001) and Heinrich Willi (1900–71) who first described it briefly in an article in the *Schweizerische medizinische Wochenschrift* in 1956 and more fully in a second article in the *Journal of Pediatrics* in 1963]

pragmatic love *n.* A secondary type of [*love](#) that is practical and utilitarian and is a combination of [*ludic love](#) and [*storgic love](#). Compare [AGAPIC LOVE](#), [EROTIC LOVE](#), [MANIC LOVE](#). [From Greek *pragma* a deed + *-ikos* of, relating to, or resembling]

pragmatics *n.* The study of social and behavioural aspects of practical language usage, the factors governing speakers' choices of words and expressions in particular circumstances, and the effects of such choices on listeners. This was clarified by the English philosopher Peter (Frederick) Strawson (1919–2006) in a famous article 'On Referring' in the journal *Mind* in 1950 in which he pointed out that a phrase such as *the woman in the blue dress* does not, by itself, refer to a particular woman but that it acquires a clear meaning from the circumstances in which it is spoken. *See also* COOPERATIVE PRINCIPLE. [From Greek *pragma* an act or deed + *-itikos* resembling or marked by]

Prägnanz *n.* A principle or law of perception of *Gestalt psychology according to which perception of ambiguous stimuli tends to be as 'good' (meaning simple, regular, and symmetric) as the sensory input allows. The Gestalt psychologist Wolfgang Köhler (1887–1967) grounded this principle on the doctrine of *isomorphism (3), coupled with a belief that electrical brain fields, like other systems, evolve to physical Gestalten representing minimal energy states, a standard example being a soap bubble, which invariably evolves to a perfect sphere—the minimal energy state of a soap film. Köhler's theory was discredited as neuroscience advanced, but the principle of *Prägnanz* was widely embraced, and the underlying notion of a 'good' perception has been clarified in terms of *information theory as one encoded with the minimum *bits of information. Also spelt *Praegnanz* or *pregnance*, though the latter in particular is avoided in careful usage. *See also* GOOD GESTALT, LANDOLT CIRCLE, PRECISION LAW. *Compare* LIKELIHOOD PRINCIPLE. [From German *Prägnanz* pithiness or terseness]

prandial drinking *n.* Drinking stimulated by the eating of dry food. [From Latin *prandium* lunch]

pre-attentive processing *n.* Another name for *automatic processing.

precategory acoustic store *n.* An *echoic store that is believed to hold auditory information for brief periods before it has been subjected to significant *information processing. Evidence for it comes from experiments on serial digit recall, showing that the final two items in a list of digits are recalled better when the list is heard than when it is read but that this effect is

*****ebook converter DEMO Watermarks*****

suppressed if the auditory list is followed by a verbal suffix (such as *that's the end of the list*) that need not be recalled. This ***auditory** suffix effect suggests the existence of an auditory memory trace that decays quickly and can be overwritten by other verbal information, but doubt was cast on its existence during the 1990s. Also called a *precategorical acoustic memory (PAM)*. Compare **POSTCATEGORICAL ACOUSTIC STORE**. **PAS** abbrev.

precedence effect *n.* Hearing only the first of two sounds or sound patterns when the second is similar to the first and follows it within about 50 milliseconds. Compare **AUDITORY FUSION**.

precentral gyrus *n.* The gyrus of the frontal lobe immediately in front of the ***central sulcus**, occupied by the primary ***motor cortex**. [From Latin *prae* in front + *centrum* the centre]

precision law *n.* The most general law of perceptual organization in ***Gestalt** psychology, according to which a Gestalt tends to become as sharply defined, stable, strong, regular, symmetrical, simple, meaningful, and economical as the sensory information allows, these properties being characteristics or features of ***Prägnanz**. Also called the *simplicity principle*. See also **GOOD GESTALT**. [From Latin *praecision* a cutting off, from *prae* before + *caedere* to cut]

precocial *adj.* Of or relating to species of birds whose young are hatched with a covering of down and open eyes and are capable of leaving the nest alone within a few days. Compare **ALTRICIAL**. [From Latin *praecox* early maturing, from *prae* early + *coquere* to ripen]

precognition *n.* ***Extra-sensory perception** of objects or events in the future, or of another person's future mental processes, a conjectural ***paranormal** phenomenon. Compare **CLAIRVOYANCE**, **TELEPATHY**. **precognitive** *adj.* Of or relating to precognition. **precognitive clairvoyance** *n.* ***Extra-sensory perception** of objects or events in the future. **precognitive telepathy** *n.* Extra-sensory perception of another person's future mental processes. [From Latin *prae* before + *cognoscere*, *cognitum* to get to know, from *com-* together + *noscere* to know + *-ion* indicating an action, process, or state]

preconcept *n.* A term introduced by the Swiss psychologist Jean Piaget (1896–1980) to denote any of the primitive action-based concepts developed during the **pre-operational stage* of development.

preconscious *adj. n.* In **psychoanalysis*, (of or relating to) mental contents that are not currently in **consciousness* but are accessible to consciousness by directing attention to them, such as memories that are not at present being recalled but that can be recalled at will. Sigmund Freud (1856–1939) developed the theory of the preconscious early in his career and set it out fully in his book *The Interpretation of Dreams* (1900, *Standard Edition*, IV–V). A barrier of **censorship* exists between the preconscious and the **unconscious* (2), and a second barrier exists between the preconscious and consciousness, though this second barrier differs from the first inasmuch as it selects more than it distorts. In 1920 Freud abandoned this **topography* in favour of the structural model of id–ego–superego. *See also* PERCEPTION–CONSCIOUSNESS SYSTEM, SUBCONSCIOUS (2), THING–PRESENTATION, WORD–PRESENTATION. **pcs** *abbrev. (adj.)*, **Pcs** *abbrev. (n.)*.

preconscious processing *n.* 1. **Information* processing occurring without conscious awareness, as in **subliminal* perception and various phenomena that have been observed in the study of memory and emotion. 2. Another name for **automatic processing*.

preconventional morality *n.* The most primitive **Kohlberg stage* of moral development, in which the child interprets moral behaviour entirely in terms of personal gain and loss. It is divided into two levels: at Level 1 the child's moral behaviour is guided by the avoidance of punishment (*I should not tell lies because I might get into trouble*), and at Level 2 it is influenced also by the desire for gain (*I should not tell lies because then my parents will reward me*). *Compare* CONVENTIONAL MORALITY, POSTCONVENTIONAL MORALITY.

precursor *n.* A forerunner, or something that precedes or heralds something else; in particular, a chemical substance from which another more important substance is derived or synthesized. [From Latin *praecursor* one who runs in front, from *prae* before + *currere*, *cursum* to run]

predator *n.* Any **species* of animal that hunts and kills members of another species for food. Also called a *carnivore*. **predation** *n.* The hunting and killing for food by one animal species (the predator) of another (the **prey*). **predatory** or **predacious** *adj.* Habitually hunting and killing animals of other species for food. [From Latin *praedator* a plunderer or hunter, from *praeda* booty]

predicate calculus *n.* An advanced form of symbolic **logic* incorporating not only **propositions* (1), relations between propositions (*and*, *or*, *not*, and *if...then*), axioms, and rules of inference, but also **quantifiers* (1). First-order predicate calculus is obtained by extending **propositional calculus* to include quantifiers, and it is widely regarded as the most powerful form of symbolic logic. The first systematic description of this form of logic was introduced in 1928 by the German mathematical logicians David Hilbert (1862–1943) and Wilhelm Ackermann (1896–1962). [From Latin *praedicatum* something declared, from *prae* before + *dicare* to declare]

predicate thinking *n.* The fallacy of considering two things to be the same merely because they have attributes in common. According to the Swiss psychologist Jean Piaget (1896–1980), it is characteristic of **pre-operational stage* of development. Also called *predicative thinking*.

predicative *adj.* Of or relating to a part of a sentence that asserts or denies something about the subject of the sentence and is located outside the noun phrase that it refers to. For example, the adjective *good* is **attributive* in the phrase *the good terrorist*, but it is predicative in *the terrorist is good*. [From Latin *praedicare* to assert publicly, from *prae* before + *dicare* to proclaim + *-ivus* indicating a tendency, inclination, or quality]

prediction paradox *n.* Another name for the **unexpected hanging paradox*.

predictive validity *n.* In psychometrics, a form of **criterion validity* in which the predictor scores are obtained in advance of the criterion scores, as when a test of scholastic aptitude is validated against scores on tests of school performance obtained months or years later. *Compare* CONCURRENT VALIDITY.

predictor variable *n.* The name often given in **regression* analysis and **multiple regression* to an **independent variable* whose effect on the **dependent variable* is examined. The term *predictor variable* is preferred by many statisticians because it is not varied independently by the investigator.

prednisolone *n.* A synthetic **corticosteroid* hormone derived from **prednisone* and having similar effects to **cortisone*.

prednisone *n.* A synthetic **corticosteroid* hormone derived from and having similar effects to **cortisone*. [Perhaps from *pre(gnant)* + *d(ie)n(e)* a hydrocarbon with two double bonds between carbon atoms + (*cort*)*isone*]

preference-feedback hypothesis *n.* A conjecture put forward by the South African-born British psychologist Andrew M(ichael) Colman (born 1944), the English psychologist David J(ohn) Hargreaves (born 1948), and the Polish-born British psychologist Wladyslaw Sluckin (1919–85) in articles in the *British Journal of Psychology* and the *British Journal of Social Psychology* in 1981 to explain the fact that for certain classes of stimuli (such as surnames) the relationship between rated familiarity and attractiveness is an inverted U, with both very unfamiliar and very familiar surnames receiving lower ratings of attractiveness than stimuli of intermediate familiarity, whereas for other classes of stimuli (such as first names) the relationship is **monotonic*, with attractiveness increasing indefinitely with familiarity. According to the hypothesis, the underlying relationship is an inverted U, but the decrease in attractiveness for high levels of familiarity does not occur in stimuli such as first names whose frequency of exposure and therefore familiarity is significantly controlled by human choice, because as soon as such stimuli begin to decrease in attractiveness through over-exposure, they tend to be chosen less often and their frequency of exposure in the culture is thus damped by a **feedback* mechanism, the net effect being a monotonic empirical relationship. The **mere exposure effect* is explained partly by this mechanism and partly by the fact that, for complex stimuli, extremely high levels of exposure are required before the peak of the inverted U is passed.

preference reversal *n.* 1. A tendency, when facing a choice between gambles of nearly equal expected values in certain circumstances, to prefer
*****ebook converter DEMO Watermarks*****

one gamble but to place a higher monetary value on the other. Reversals occur when one gamble offers a high probability of winning a small prize and the other offers a low probability of winning a large prize. In a typical example, the high-probability *H* gamble offered an 8/9 probability of winning \$4 and the *L* gamble a 1/9 probability of winning \$40, and most participants preferred *H*; but when they were asked to place a monetary value on each gamble—to state the lowest price at which they would exchange it for cash—most put a higher value on *L*. The phenomenon was first reported in the *Journal of Experimental Psychology* in 1971 by the US psychologist Sarah C. Lichtenstein (born 1933) and the US-based Israeli psychologist Paul Slovic (born 1938), who attributed it to a finding that they had earlier (in 1968) reported, namely that preferences for gambles (and ratings of their attractiveness) are more highly correlated with probabilities of winning than with payoff sizes, whereas buying and selling prices of gambles are more highly correlated with payoff sizes than with probabilities of winning. Subsequent research, beginning with an experiment reported in 1990 by the Israeli-American psychologist Amos Tversky (1937–96), the US psychologist Paul Slovic, and the Israeli-American psychologist Daniel Kahneman (born 1934) showed that most preference reversals are not caused by violations of **expected utility* theory but by overpricing of low-probability gambles relative to the choice preference: a person who chooses between (*H*) \$10 for sure and (*L*) a 1/3 probability of winning \$40 is quite likely to prefer *H* but nevertheless to assign a value above \$10 to *L*, which implies an overpricing of *L* relative to the choice preference. This may be a result of **anchoring and adjustment* on the money scale. 2. A tendency to prefer one alternative when a set of alternatives is presented simultaneously and evaluated jointly but to prefer a different one when the same alternatives are presented in isolation and evaluated separately. The phenomenon was first published in an article in the *Administrative Science Quarterly* in 1992 by the US decision theorists Max H. Bazerman (born 1955), George F. Loewenstein (born 1955), and Sally Blount White (born 1961), who presented decision makers with a hypothetical dispute between neighbours and two potential resolutions involving splitting proceeds from the sale of vacant land between the two properties:

A: \$600 for yourself and \$800 for your neighbour;

B: \$500 for yourself and \$500 for your neighbour.

The results were that 75 per cent of decision makers who were presented with the two alternatives simultaneously and were asked which they considered more acceptable preferred A, but 71 per cent who were presented with the alternatives one at a time and were asked to indicate the acceptability of each on a rating scale preferred B.

preformationism *n.* A discredited theory that organisms are fully formed in miniature within the **ovum* (according to the ovists) or within the **spermatozoon* (according to the animalculists), and that development following fertilization involves mere enlargement and not differentiation or formation of new structures. *See also* [HOMUNCULUS](#). *Compare* [EPIGENESIS \(1\)](#).
preformationist *n.* One who propounds or believes in preformationism.

pre-fortis clipping *See* [CLIPPING](#).

prefrontal cortex *n.* The frontmost portion of the **frontal lobe*, in front of the primary and secondary motor cortex, uniquely large in the human brain, involved in anxiety and also in brain functions such as **working memory*, abstract thinking, social behaviour, and executive functions such as decision making and strategic planning, any or all of which are affected by lesions in this area. The right prefrontal cortex is involved in monitoring behaviour, resisting distractions, and providing an awareness of self and of time. *See also* [ATTENTION-DEFICIT/HYPERACTIVITY DISORDER](#), [DEFAULT MODE NETWORK](#), [DELAYED-RESPONSE TASK](#), [DORSOLATERAL PREFRONTAL CORTEX](#), [OBJECT PERMANENCE](#), [ORBITOFRONTAL CORTEX](#), [VENTROMEDIAL CORTEX](#). **PFC** *abbrev.* [From Latin *prae* in front + *frons* the forehead + *-alis* of or relating to + *cortex* bark or outer layer]

prefrontal leucotomy *See* [FRONTAL LEUCOTOMY](#).

prefrontal lobotomy *See* [FRONTAL LOBOTOMY](#).

preganglionic *adj.* Pertaining to **efferent* neurons of the **autonomic* nervous system that synapse on to other neurons in peripheral **ganglions*. *Compare* [POSTGANGLIONIC](#). [From Latin *prae* in front or before + Greek *ganglion* a cystic tumour + *-ikos* of, relating to, or resembling]

pregenital *adj.* In **psychoanalysis*, pertaining to any stage or phase of **psychosexual development* before the **genital stage*. See ANAL STAGE, LATENCY PERIOD, ORAL STAGE, PHALLIC STAGE, POLYMORPHOUS PERVERSITY.

pregnance See *PRÄGNANZ*.

pregnancy blockage *n.* Another name for the **Bruce effect*.

prehensile *adj.* Capable of grasping or holding, as in the prehensile tail of a monkey. [From Latin *prehendere* to seize or grasp]

prejudice *n.* A preconceived opinion or judgement, formed without adequate consideration of relevant evidence, especially an unfavourable judgement based on group membership, including **racialism*, **ethnocentrism*, **sexism*, or **ageism*. The US psychologist Gordon W(illard) Allport (1897–1967) defined it in his seminal book *The Nature of Prejudice* (1954) as ‘a feeling, favourable or unfavourable, toward a person or thing, prior to, or not based on, actual experience’ (p. 7), but he also suggested a rougher definition that is more often quoted: ‘being down on what you're not up on’ (p. 8). See also ABLEISM, AUTHORITARIANISM, CONFIRMATION BIAS, CONTACT HYPOTHESIS, FATTISM, HETEROSEXISM, JIGSAW CLASSROOM, ROBBERS CAVE EXPERIMENT, SOCIAL CATEGORIZATION, SOCIAL IDENTITY THEORY, SPECIESISM, STEREOTYPE, STIGMATIZE. **prejudiced** *adj.* Characterized by prejudice. **prejudicial** *adj.* Tending to cause prejudice. [From Latin *praeiudicium* a previous judgement or precedent, from *prae* before + *iudicium* a trial or sentence, from *iudex* a judge]

Preludin *n.* A proprietary name for the stimulant drug **phenmetrazine*. [Trademark]

premature (early) ejaculation *n.* A **sexual dysfunction* in **DSM-5* characterized by persistent or recurrent **orgasm* and **ejaculation* following minimal sexual stimulation and before they are wanted, usually prior to or around the time of penetration, making sexual intercourse difficult or impossible and causing significant distress or problems of interpersonal interaction. It is not diagnosed if it is attributable to a drug, many medicinal

drugs producing these symptoms as a side-effect. Also called *ejaculatio praecox*. See also [SQUEEZE TECHNIQUE](#). [From Latin *praematurus* unduly early, from *prae* before + *maturus* ripe + *e* from + *iaculatus* thrown, from *iacere* to throw + *-ation* indicating a process or condition]

premenstrual dysphoric disorder *n.* A [*depressive disorder](#) of women introduced in the [*DSM-5](#) classification in which at least five of the following symptoms appear regularly during the week before the onset of [*menstruation](#) and disappear or become minimal during the following week: labile [*affect](#), including mood swings and hypersensitivity to rejection; marked irritability or anger; [*depressed mood](#), including feelings of helplessness or worthlessness; [*anxiety](#), tension, or feeling 'on edge'; decreased interest in usual activities; difficulty concentrating; [*fatigue](#) (1) or lethargy; change in appetite or food cravings; [*hypersomnia](#) or [*insomnia](#); somatic symptoms such as breast tenderness, headaches, joint or muscle pain, and a sensation of bloating. According to DSM-5, the 12-month [*prevalence](#) is between 1.8 per cent and 5.8 per cent of menstruating women. Also called *late luteal phase dysphoric disorder*, *premenstrual tension* (PMT). **PDD** or **PMDD** *abbrev.* [From Latin *prae* before + *menstrualis* monthly, from *mensis* a month + Greek *dys-* bad or abnormal + *pherein* to bear + *-ikos* of, relating to, or resembling]

premenstrual syndrome *n.* Another name for [*premenstrual dysphoric disorder](#). **PMS** *abbrev.* [From Latin *prae* before + *menstrualis* monthly, from *mensis* a month]

premise *n.* In [*logic](#), a stated reason for believing the conclusion of an argument. In some contexts it refers to a statement or [*proposition](#) (1) that is assumed to be true for the purpose of drawing a conclusion in an argument. Also spelt *premiss*, especially in formal logic. See also [MONOTONICITY](#), [NON-MONOTONIC REASONING](#), [SYLLOGISM](#). [From Latin *praemissa* sent on before, from *prae* before + *mittere*, *missum* to send, meaning a statement to set before a conclusion]

premonition *n.* An intuition or foreboding of a future event, especially an unwelcome one; more generally, an early warning or forewarning of an event. **premonitory** *adj.* [From Latin *prae* before + *monere*, *monitum* to warn

*****ebook converter DEMO Watermarks*****

or advise]

premotor cortex See [MOTOR CORTEX](#). **PMC** *abbrev.*

pre-occipital notch *n.* An indentation in the base of each cerebral hemisphere towards the back, marking the boundary between the temporal lobe and the occipital lobe.

pre-Oedipal *adj.* In [*psychoanalysis](#), pertaining to the period of [*psychosexual development](#) before the development of the [*Oedipus complex](#), when attachment to the mother predominates in both sexes.

pre-operational stage *n.* In the theory of cognitive development of the Swiss psychologist Jean Piaget (1896–1980), the period between the [*sensorimotor](#) stage and the stage of [*concrete operations](#), from about 2 to 7 years of age. See also [CENTRATION](#), [CONSERVATION](#), [EGOCENTRISM](#), [PRECONCEPT](#), [PREDICATE THINKING](#), [TRANSDUCTIVE REASONING](#).

preoptic nucleus *n.* A region in the front of the [*hypothalamus](#), sometimes regarded as being apart from the hypothalamus proper, implicated in sexual behaviour, aggression, slow-wave sleep, and thirst, containing [*osmoreceptors](#) (2). Also called the *preoptic area*. [So called because it lies above the optic chiasm]

presbyacusic *n.* Loss of hearing sensitivity as a result of ageing, usually characterized by gradual loss of sensitivity to high-frequency sounds through deterioration of the [*organ of Corti](#). Also spelt *presbyacousis*. Also called *presbyacusia* or *presbyacousia*. See also [DEAFNESS](#), [SENSORINEURAL DEAFNESS](#).
presbyacusic *adj.* [From Greek *presbys* old + *akousis* hearing, from *akouein* to hear + *-ia* indicating a condition or quality]

presbyopia *n.* Loss of ability to accommodate the eyes to [*near vision](#), caused by loss of elasticity of the crystalline lens as a result of ageing and usually associated with hyperopia (long-sightedness). Compare [HYPEROPIA](#).
presbyopic *adj.* [From Greek *presbys* old + *ops* an eye + *-ia* indicating a condition or quality]

prescriptive theory See [NORMATIVE \(1\)](#).

presenile dementia *n.* A chronic, progressive form of [*dementia](#) starting before 65 years of age with no clear physical cause; another name for [*Alzheimer's disease](#). [From Latin *prae* before + *senilis* old, from *senex* an old man]

Present State Examination *n.* A semi-structured interview, intended to provide an objective evaluation of [*symptoms](#) associated with mental disorders. It contains 140 items, each scored on a 3-point or 4-point scale, and it is designed for use by experienced clinicians. It was constructed by the English psychiatrist John Kenneth Wing (1923–2010) and several colleagues, an early version being published in the *British Journal of Psychiatry* in 1967 and a widely used revision as a separate publication in 1974. See also [SCAN](#). **PSE** *abbrev.*

press *n.* Anything that exerts pressure. In the [*personology](#) of the US psychologist Henry Alexander Murray (1893–1988), another name for a [*stimulus \(1\)](#) or a configuration or pattern of stimuli that, in conjunction with [*needs \(3\)](#), determine behaviour. See also [NEED-PRESS](#).

press-need *n.* Another name for a [*need-press](#).

pressured speech *n.* Continuous, excessive, rapid, loud, and sometimes incoherent speech that is difficult to interrupt and may continue even when no one is listening, often seen in [*manic episodes](#) and other mental disorders. Also called *pressure of speech*. See also [LOGORRHOEA](#).

pressure receptor *n.* Any of a number of different kinds of [*touch](#) receptors that are sensitive to pressure stimulation. See [GOLGI TENDON ORGAN](#), [MEISSNER'S CORPUSCLE](#), [MERKEL CELL](#), [PACINIAN CORPUSCLE](#), [RUFFINI CORPUSCLE](#). See also [PRESSURE-SENSITIVE SPOT](#).

pressure-sensitive spot *n.* A small area of the [*skin](#) that is abundantly supplied by [*pressure receptors](#) and is especially sensitive to pressure stimulation, such spots occurring most numerous in the hands and

mouth.

prestige suggestion *n.* A persuasive message delivered by or attributed to a highly respected or admired source to maximize its **credibility*, as when a celebrity endorses a commercial product on television.

prestriate cortex *n.* A generic name for Areas V2, V3, V4, and V5, of the **visual cortex*, sometimes excluding V2. See *VISUAL CORTEX*. [So called because it is adjacent to the striate cortex or primary visual cortex (Area V1)]

presynaptic *adj.* Of or relating to a **neuron* that transmits a signal across a **synapse* (1). Compare *POSTSYNAPTIC*. [From Latin *prae* before or in front + Greek *synapsis* contact or junction, from *syn* together + *haptein* to fasten + *-ikos* of, relating to, or resembling]

presynaptic facilitation *n.* An increase in the effect of a **presynaptic* neuron on a **postsynaptic* neuron caused by a third neuron that makes an **axoaxonic* synapse with the presynaptic neuron near its terminal bouton.

presynaptic inhibition *n.* A diminution in the effect of a **presynaptic* neuron on its **postsynaptic* neuron caused by a third neuron that makes an **axoaxonic* synapse with the presynaptic neuron near its terminal bouton.

pretectal pathway *n.* Either of the pathways of nerve fibres of the **optic tracts* that do not reach the lateral geniculate nuclei but proceed instead to the pretectal nuclei, which are collections of nerve cell bodies in front of the tectum in the midbrain. Compare *TECTAL PATHWAY*. [From Latin *prae* before or in front + *tectum* a roof or canopy]

prevalence *n.* In **epidemiology*, the total number of existing cases of a disorder as a proportion of a population (usually per 100,000 people) at a specific time. Compare *INCIDENCE*.

prey *n.* An animal species that is hunted and killed for food by a **predator*.
prey on or **prey upon** *vb.* To hunt and kill for food, as in *Barn owls prey on fieldmice*. [From Latin *praeda* booty]

priapism *n.* A condition resulting from a disorder within the penis or the central nervous system, characterized by prolonged erection of the penis, seldom accompanied by sexual arousal, but usually causing pain. [From Greek *priapizein* to be lewd, from *Priapos* Priapus, the ancient deity personifying male fertility and generative power]

primacy effect *n.* **1.** In **serial learning* (1), a tendency for the items near the beginning of the series to be better recalled than those near the middle. *See also* SERIAL POSITION EFFECT. *Compare* RECENCY EFFECT. **2.** In **impression formation*, the tendency for information about a person that is presented first to have a larger effect on the overall impression of the person than the recipient forms than information presented later.

primacy, law of *See* PRIMACY EFFECT (1, 2).

primacy, oral *See* ORAL PRIMACY.

primal anxiety *n.* In **psychoanalysis*, **anxiety* resulting from the **birth trauma*. [From Latin *primalis* of or relating to the first, from *primus* first + *-alis* of or relating to]

primal fantasy *n.* In **psychoanalysis*, a primitive **fantasy* (2) of the **primal scene*, infantile seduction, castration, or similar experiences, believed by Sigmund Freud (1856–1939) to be universal and to be transmitted by genetic inheritance from practices that were common occurrences in prehistory. Freud introduced the concept in an article on ‘A Case of Paranoia Running Counter to the Psycho-Analytic Theory of the Disease’ (1915): ‘I call such phantasies—of the observation of sexual intercourse between the parents, of seduction, of castration, and others—“primal phantasies”’ (*Standard Edition*, XIV, pp. 263–72, at p. 269), and he expounded this genetic theory in his book *Introductory Lectures on Psycho-Analysis* (1916–17, *Standard Edition*, XV–XVI, at p. 371). *See also* SEDUCTION THEORY.

primal father *n.* In **psychoanalysis*, the head of the **primal horde*. *See also* TOTEM.

primal horde *n.* In **psychoanalysis*, an obsolete concept of a state of nature assumed to have existed in the distant past.

primal repression *n.* In **psychoanalysis*, a form of **repression*, when wishes emanating in the **id* are blocked from reaching **consciousness*. Sigmund Freud (1856–1939) introduced the concept in the **Schreber case* in 1911. *Compare* PRIMARY REPRESSION, SECONDARY REPRESSION.

primal scene *n.* In **psychoanalysis*, the spectacle of intercourse between one's parents. *See* PRIMAL FANTASY, WOLF MAN.

primal sketch *n.* In the **computational theory* of vision pioneered in the late 1970s by the English psychologist David Courtenay Marr (1945–80), the first stage in the perceptual process, similar to a rough line drawing, its function being to represent the variations in **luminance* present in the image after eliminating extraneous visual **noise* (2) such as glare that does not convey useful information about the image. The sketch is constructed by first blurring or smoothing the image with **filters* (2) of different **spatial frequencies*, capable of detecting information at different levels of resolution, and then locating regions of maximum change in luminance by finding **zero-crossings*, the result of this process being a two-dimensional black-and-white **representation* (2) of **contours* and shapes present in the image. The *raw primal sketch* incorporates edges and lines (formed wherever a zero-crossing emerges under a blur filter or pairs of zero-crossings emerge in the same place under two adjacent blur filters), bars (formed wherever a line detected under a filter that transmits only low-frequency information is flanked by two edges detected under a filter that transmits only high-frequency information), terminations (ends of bars), and blobs (areas enclosed in single edges). The *full primal sketch* joins together lines and edges that belong with one another, groups other items that appear to be associated, and locates the apparent boundaries of objects. *Compare* 3-D MODEL DESCRIPTION, 2½-D SKETCH.

primal therapy *n.* A form of **psychotherapy*, developed by the US psychologist Arthur Janov (born 1924) in 1970, in which clients or patients are encouraged to scream about their parents and their painful re-experiencing of birth and infancy. Also called *primal scream therapy* or *scream therapy*. *See also* BIRTH TRAUMA, BODY THERAPIES, REBIRTHING.

*****ebook converter DEMO Watermarks*****

primary abilities See PRIMARY MENTAL ABILITIES.

primary anxiety *n.* In *psychoanalysis, *anxiety arising from failure to control the impulses of the *id, its name alluding to the *primary process. Compare SIGNAL ANXIETY.

primary auditory cortex See AUDITORY CORTEX.

primary colour *n.* **1.** Any of the shades of red, green, or blue that can be mixed equally to form white or in different proportions to match all other *spectral colours and also certain *non-spectral colours such as purple. The wavelengths often used to define the primary colours are 670, 535, and 470 nanometres respectively. Also called an *additive primary*. See also CHROMATICITY, CIE COLOUR SYSTEM, COLOUR EQUATION, COMPLEMENTARY COLOUR, GRASSMANN'S LAWS (PERCEPTION), RAYLEIGH EQUATION, SPECTRUM, TRICHROMACY, TRISTIMULUS VALUES. Compare PSYCHOLOGICAL PRIMARY, SECONDARY COLOUR, SUBTRACTIVE PRIMARY. **2.** Any of the *complementary colours of red, green, and blue, namely green-blue (cyan), deep bluish purple (magenta), and yellow respectively, that can be subtracted from white light, equally to form black, or in different proportions (usually by mixing pigments) to match any other spectral colour. Also called a *subtractive primary*. **3.** Any of the four colours red, yellow, green, or blue that are basic to the processing of colour in the visual system and that are perceived as being basic or fundamental, the wavelengths often used to define them being 670, 589, 535, and 470 nanometres respectively. Also called a *principal colour* or a *psychological primary*. US *primary color*. See also BEZOLD–BRÜCKE PHENOMENON.

primary drive See DRIVE.

primary emotions *n.* According to a classification suggested in 1971 by the US psychologists Paul Ekman (born 1934) and Wallace V(erne) Friesen (born 1933), the six *emotions of happiness, sadness, disgust, fear, anger, and surprise, so called partly because their associated *facial expressions appear to be innate, the evidence for this being that they appear soon after birth, even in infants born blind and deaf who could not have learnt them from others, and that they are expressed and decoded similarly in relatively isolated
*****ebook converter DEMO Watermarks*****

cultures that have been studied by anthropologists. Some researchers believe that other emotions or **affects* are blends of these six.

primary gain *n.* In **psychoanalysis*, an immediate benefit, such as relief from **anxiety*, resulting from a **neurosis* or a **defence mechanism*. Sigmund Freud (1856–1939) drew the distinction between primary gain and **secondary gain* in 1916–17 in his book *Introductory Lectures on Psycho-Analysis* (*Standard Edition*, XV–XVI, at pp. 381–5). Also called *paranotic gain*. See also FLIGHT INTO ILLNESS. Compare SECONDARY GAIN.

primary hypersomnia *n.* One of the **dyssomnias*, with excessive sleepiness or **hypersomnia* as the major symptom. Also called *disorder of excessive somnolence* (DOES). See HYPERSOMNOLENCE DISORDER. Compare NARCOLEPSY.

primary identification *n.* In **psychoanalysis*, a primitive form of **identification* (2), occurring during the **oral* stage, before any other type of **object-relationship* is formed. Sigmund Freud (1856–1939) described this phenomenon in his book *The Ego and the Id* (1923): ‘At the very beginning, in the individual’s primitive oral stage, object-cathexis and identification are no doubt indistinguishable from each other’ (*Standard Edition*, XIX, pp. 12–66, at p. 29). Compare SECONDARY IDENTIFICATION.

primary immune response See IMMUNE RESPONSE.

primary impotence See IMPOTENCE (2).

primary integration *n.* In **psychoanalysis*, an infant’s first recognition of itself as a unitary being, separate from its environment.

primary memory *n.* The content of consciousness supplied by **memory* rather than direct perception. See also WORKING MEMORY. Compare SECONDARY MEMORY.

primary mental abilities *n.* A set of seven basic or fundamental cognitive capacities proposed in 1938 by the US psychologist Louis Leon

Thurstone (1887–1955), on the basis of **factor* analysis, as an interpretation of the group factors or clusters of correlations between certain types of test items and subtests. They are labelled verbal comprehension (V), word fluency (W), number (N), spatial ability (S), associative memory (M), perceptual speed (P), and reasoning (R) or induction (I). *Compare* *G. PMA abbrev.*

primary motor cortex *See* *MOTOR CORTEX.*

primary narcissism *n.* In **psychoanalysis*, a form of **narcissism* involving **cathexis* of the self with the whole of the **libido* in an early phase of development. The British-based Austrian psychoanalyst Melanie Klein (1882–1960) and her followers rejected the concept, arguing that object-relationships are evident from the earliest stages of sucking. *Compare* *SECONDARY NARCISSISM.*

primary object *n.* In **psychoanalysis*, the first **instinctual object*, usually the mother or the mother's breast, in an infant's libidinal development. *See also* *OBJECT-RELATIONSHIP.*

primary odour *n.* Any of the fundamental odours of which other odours are believed to be formed by combination, especially the six primary odours of **Henning's prism*: fragrant (like lavender or rose petals), ethereal (like ether or cleaning fluid), resinous (like resin or turpentine), spicy (like cinnamon or nutmeg), putrid (like faeces or rotten eggs), and burnt (like tar oil). *See also* *CROCKER–HENDERSON SYSTEM, STEREOCHEMICAL THEORY, ZWAARDEMAKER SMELL SYSTEM.*

primary prevention *n.* Measures taken to prevent the occurrence of a disorder. *Compare* *SECONDARY PREVENTION, TERTIARY PREVENTION.*

primary process *n.* In **psychoanalysis*, an unconscious, irrational mode of mental functioning, based on the **pleasure principle*, involving **free energy* governed by mechanisms such as **condensation* and **displacement*. Sigmund Freud (1856–1939) developed the concept at the beginning of his psychological work and expounded it at length in Chapter VII of his book *The Interpretation of Dreams* (1900, *Standard Edition*, IV–V). *See also* *****ebook converter DEMO Watermarks*****

BINDING. *Compare* [SECONDARY PROCESS](#).

primary projection area *n.* An area of the brain, such as the primary [*somatosensory cortex](#), [*primary visual cortex](#) (Area V1), or primary [*auditory cortex](#), that is the first to receive information from another system before relaying it elsewhere. *Compare* [SECONDARY PROJECTION AREA](#), [TERTIARY PROJECTION AREA](#).

primary quality *n.* In philosophy, a property such as solidity, physical extension, shape, motion or rest, or number that is inherent in an object or a group of objects and is capable of being experienced directly by an observer. It is distinguished from a *secondary quality*, such as sound, colour, taste, smell, warmth, or cold that is merely a property capable of producing in an observer a sensation that does not correspond to the property itself. This distinction was first made by the Greek philosopher Democritus of Abdera (? 460–?370 BC) and was accepted by the French philosopher René Descartes (1596–1650) and the English physicist and mathematician Sir Isaac Newton (1642–1727) before being fully developed and given its most influential formulation in 1690 by the English philosopher John Locke (1632–1704) in his *Essay Concerning Human Understanding* (Book 2, Chapter 8). *See also* [SUCCESSIVE CONTRAST](#).

primary repression *n.* In [*psychoanalysis](#), a form of [*repression](#) in which anxiety-arousing information already in [*consciousness](#) is removed and blocked from returning. *Compare* [PRIMAL REPRESSION](#), [SECONDARY REPRESSION](#).

primary sexual characteristic *n.* Any difference between the sexes in their sexual organs or gametes. *Compare* [SECONDARY SEXUAL CHARACTERISTIC](#).

primary sleep disorders *n.* A generic term for the [*dyssomnias](#) and the [*parasomnias](#).

primary somatosensory cortex *See* [SOMATOSENSORY CORTEX](#).

primary taste *n.* Any of the fundamental tastes that are believed to underlie all tastes, usually the four vertices of **Henning's tetrahedron*: sweet (like sugar or **aspartame*), sour (like vinegar or lemon juice), salty (like sea water or table salt), and bitter (like quinine or orange peel). *See also* [UMAMI](#).

primary visual cortex *n.* The part of the **visual cortex* to which the **photoreceptors* in the retinas of the eyes are eventually projected, occupying the gyri on both sides of the deep **calcarine sulcus* in the **occipital* cortex, containing 200 million cells within a total area of 25 square centimetres and arranged in an inverted **topographic map* of the object or scene being viewed, with neighbouring cells having **receptive fields* close together and being stacked vertically in **ocular-dominance columns* and **orientation columns*. It contains six layers of cells numbered 1 to 6 from the top, layer 4 being subdivided into three sublayers 4A, 4B and 4C, layer 4C receiving inputs from the photoreceptors in the retina via the **lateral* geniculate nuclei, the upper part 4C α receiving inputs from the **magnocellular* layer and the lower part 4C β from the **parvocellular* layer of the geniculate nuclei. All layers except layers 1 and 4A have neuronal connections outside the primary visual cortex: layers 1 and 2, which contain **blobs* for colour vision and are concerned with both form and colour, receive inputs from layers 4C α and 4C β , and layer 2 projects to Area V2 of the visual cortex; layer 4B, concerned with movement and stereopsis, receives inputs from layer 4C α and projects to Areas V2 and V5 (or MT) of the visual cortex, layer 4C α (in the magnocellular pathway) projects to layer 4A, and layer 4C β (in the parvocellular pathway) projects to layers 2 and 3 and thence to Area V2. Layers 5 and 6 are less well understood but are known to project to deep structures within the brain, layer 5 to the **superior* colliculus and layer 6 back to the lateral geniculate nuclei. Also called the *striate cortex* and known technically as *Area V1* or *Brodmann area 17*. *See also* [RETINOTOPIC MAP](#), [VISUAL CORTEX](#).

primary zone *n.* Another name for an **erotogenic zone*.

primate *n.* Any member of the order Primates, including humans, anthropoid apes, monkeys, lorises, and lemurs. [From Latin *primates* plural of *primas* principal, from *primus* first]

prime *n.* **1.** A **cue* (3) given to facilitate a particular response. See *PRIMING* (1). **2.** A *prime number*, that is, any number that is evenly divisible only by itself and 1. **3.** A typographical symbol (') affixed to a mathematical symbol as a modifier, as in *d'*—see *D PRIME*.

priming *n.* **1.** In a task involving recall, recognition, or some other form of cognitive performance, the provision of a contextual **cue* (3), **prime* (1), or **prompt* that provides information about either the identity or the time of appearance of a target stimulus and that may facilitate a response (in *facilitative priming*) or inhibit it (in *inhibitory priming*). When primes provide information that influences expectancies of targets, as in *associative priming* in which primes are meaningfully related to targets, *expectation-dependent* or *strategic priming* may occur, whereas when primes are unrelated to targets only *automatic priming* can occur, though it occurs more quickly. Associative priming that is dependent on verbal meaning, as when the prime *bread* is provided for the target *butter*, is called *semantic priming*; and a common type of associative priming that is not dependent on verbal meaning is *initial letter priming*, when the first letter of the word to be remembered is provided as a cue. Associative priming based on the sounds of words is called *phonological priming*: see *YOLK PHENOMENON*. **2.** Reduced reaction time (quicker responding) resulting from a signal warning of the imminent presentation of the stimulus. Compare *NEGATIVE PRIMING*. **3.** In research involving animals self-stimulating their **pleasure centres*, the provision of an initial stimulatory impulse at the start of the session to encourage the animal to provide further impulses on its own. [From Latin *primus* first]

primordial image *n.* In **analytical psychology*, a term originally introduced by the Swiss historian Jacob Christopher Burckhardt (1818–97) and adopted in 1912 by Carl Gustav Jung (1875–1961) for what he later came to call an **archetype* (2).

principal colour *n.* Another name for a **psychological primary*. US *principal color*.

principal-components analysis *n.* A statistical technique applied to a correlation matrix to combine observed variables into weighted linear
*****ebook converter DEMO Watermarks*****

combinations of the original variables called *principal components*, which are all uncorrelated with one another. The first principal component explains the maximum proportion of the variance, and successive principal components explain progressively smaller portions of the variance. This technique is closely related to **factor analysis*. See also CLUSTER ANALYSIS, CORRESPONDENCE ANALYSIS. **PCA** *abbrev.*

principal sulcus *n.* Another name for the **longitudinal fissure*.

principle of constancy *n.* In **psychoanalysis*, the proposition that the quantity of psychic energy within the mental apparatus remains constant, regulation being achieved through discharge of excess energy in **abreaction* and avoidance of increase through **defence mechanisms*. This **economic* concept is derived loosely from the first law of **thermodynamics*, the **conservation* of energy law, and may be thought of as a form of **homeostasis*, but the formulations of it by the Austrian physician Josef Breuer (1842–1925) in *Studies on Hysteria* (1895, *Standard Edition*, II, at pp. 183–252) and by Sigmund Freud (1856–1939) in his book *Beyond the Pleasure Principle* (1920, *Standard Edition*, XVIII, pp. 7–64, especially at pp. 9, 55–6) are ambiguous and contradictory; in particular, Freud appears to confuse the regulation of energy with its reduction. See also BOUND ENERGY, EGO LIBIDO, FREE ENERGY, HYDRAULIC THEORY, METAPSYCHOLOGY, OBJECT LIBIDO, QUOTA OF AFFECT. Compare NIRVANA PRINCIPLE.

principle of equipotentiality See EQUIPOTENTIALITY.

principle of least effort *n.* The proposition that, in striving for a goal, an organism generally seeks a method involving the minimum expenditure of energy. The concept was named in 1954 by the US psychologist Gordon W(illard) Allport (1897–1967). See COGNITIVE ECONOMY, COGNITIVE MISER, ELABORATION LIKELIHOOD MODEL, HODOLOGICAL SPACE.

principle of mass action See MASS ACTION.

principle of psychical determinism See PSYCHICAL DETERMINISM.

principle of reinstatement of stimulating conditions *n.*
Another (obsolete) name for **encoding* specificity.

principle of restricted choice *n.* A rule influencing the play of certain card combinations in the game of bridge, first discussed by the British-born US bridge expert Alan F(raser) Truscott (1925–2005) and later developed and named by the English player and author (John) Terence Reese (1913–96) in his book *The Expert Game* (1958), based on the same probabilistic phenomenon as the **Monty Hall problem*, according to which if a certain action could have been taken *either* because there was no alternative *or* as a result of a choice between two alternatives, then the first possibility is twice as likely as the second, other things being equal.

principle of the excluded middle *See* *EXCLUDED MIDDLE LAW*.

prion *n.* An infectious particle of protein that is not a virus or a bacterium and does not contain **nucleic acid* but is none the less capable of self-replication. The normal (alpha) form is harmless, but the rogue (beta) form, when it occurs in the brain and spinal cord, is believed to be a cause of prion diseases. *See also* *PRP*. [Coined in the 1980s from *proteinaceous infectious particle* to denote a mutant or rogue protein]

prion disease *n.* Any of a number of disorders of the nervous system, all fatal, believed to be caused by rogue **prions*, including scrapie in sheep, BSE in cattle, and the human prion diseases new-variant **Creutzfeldt–Jakob disease* (nvCJD), **fatal familial insomnia* (FFI), **Gerstmann–Sträussler–Scheinker syndrome* (GSS), and **kuru*. Unlike all other infectious diseases they do not provoke **immune responses*, and they are therefore difficult to detect because tests based on antibody production cannot be developed.

prion protein *See* *PRP*.

prior entry law *n.* The principle according to which, if two events occur simultaneously, then a person who is attending primarily to one of them will usually perceive that event as occurring before the other. This is believed to be one factor accounting for the **personal equation* in astronomy, because

some observers of star transits apparently attended primarily to the stars and others primarily to the ticking clock.

prior probability *n.* **1.** The **base* rate or relative frequency of an event or characteristic in a **population*. **2.** In **Bayesian inference*, the probability assigned to an event before taking empirical evidence into account. Also called an *a priori probability* or simply a *prior*. See also *INSUFFICIENT REASON*. Compare *POSTERIOR PROBABILITY*.

prism *n.* A transparent solid, usually with triangular or wedge-shaped cross-section and rectangular sides, through which white light is diffracted into a **spectrum*. It is also used to reflect rays of light, as in **inverting spectacles*. Compare *DIFFRACTION GRATING*. [From Greek *prisma* something sawn off, from *prizein* to saw]

prism adaptation *n.* A form of **adaptation* (2) in which a person wearing wedge-shaped **prism* spectacles, resulting in displacement of the visual field usually about 10 degrees to one side, becomes accustomed to the distortion, making normal body movements and no longer reaching out for objects at incorrect positions in space. See also *INVERTING SPECTACLES*.

Prisoner's Dilemma game *n.* A two-person game in which each player chooses between a cooperative *C* **strategy* (2) and a defecting *D* strategy, each receiving a higher payoff from *D* than *C* irrespective of whether the other player chooses *C* or *D*, but each receiving a higher payoff if both choose *C* than if both choose *D*. Its name derives from an interpretation first applied to it by the US mathematician Albert W(illiam) Tucker (1905–95) in a seminar at the Psychology Department of Stanford University in 1950: Two people, charged with involvement in a serious crime, are arrested and prevented from communicating with each other. There is insufficient evidence to obtain a conviction unless at least one of them discloses incriminating information, and each prisoner has to choose between concealing the information (*C*) and disclosing it (*D*). If both conceal, both will be acquitted, the second-best payoff for each; if both disclose, both will be convicted, the third-best payoff for each; and if only one discloses and one conceals, then according to a deal offered to them, the one who discloses will be acquitted and will receive a reward for helping the police, the best possible

*****ebook converter DEMO Watermarks*****

payoff, and the other will receive an especially heavy sentence from the court, the worst possible payoff. The game is ***paradoxical**, because *D* is a ***dominant** strategy for both players, so that it is ***rational** for each player to choose it whatever the other player does, but each player receives a higher payoff if they both choose their dominated *C* strategies than if they both choose *D*. The game was discovered in 1950 by the US mathematician Merrill M(eeks) Flood (1908–91) and the Polish-born US mathematician Melvin Dresher (1911–92). *See also* **MIXED-MOTIVE GAME**, **NEWMOMB'S PROBLEM**, **N-PERSON PRISONER'S DILEMMA**, **SOCIAL DILEMMA**, **SURE-THING PRINCIPLE**, **TIT FOR TAT STRATEGY**. **PD** or **PDG** *abbrev.*

prison psychosis *n.* A misleading name for ***Ganser syndrome**, which is not classified as a ***psychosis (1)** and is not peculiar to prisoners. [So called because Ganser's original description of it was based on three prisoners awaiting sentence]

proactive interference *n.* Impairment of learning or performance of a task caused by having previously learnt similar information or a similar task. Also called *proactive inhibition*. *See also* **RANSCHBURG INHIBITION**, **SKAGGS–ROBINSON PARADOX**. *Compare* **RETROACTIVE INTERFERENCE**. **PI** *abbrev.*

pro-ana *adj.* Pro-anorexia, loosely descriptive of a subculture, associated literature, and especially websites that provide support for people with eating disorders and also sometimes (controversially) promote ***anorexia nervosa** as a lifestyle choice and publish images of anorexic women as ‘thinspiration’ (inspiration to become thin). *Compare* **PRO-MIA**. [From Latin *pro* in favour of + *an(orexi)a*, from Greek *an-* not or without + *orexis* appetite + *-ia* indicating a condition or quality]

probabilistic functionalism *n.* A theory of perception formulated by the Hungarian-born US psychologist Egon Brunswik (1903–55) according to which perception involves the selection of environmental ***cues (2)** that are most useful or functional in responding, the validity of all perceptions and beliefs being necessarily probabilistic rather than certain. *See also* **BRUNSWIKIAN**.

probability *n.* A measure or index of degree of certainty regarding the
*****ebook converter DEMO Watermarks*****

occurrence of an event, on a scale from zero (indicating impossibility) to 1 (indicating certainty), interpreted as the relative frequency of the event (in classical statistics) or as one's subjective belief regarding the likelihood of the event (in [*Bayesian inference](#)). Probabilities are nowadays usually assumed to obey [*Kolmogorov's axioms](#). The theory of probability is the foundation on which the whole of [*statistics](#) is constructed. [From Latin *probabilis* that may be proved, from *probare* to prove + *-abilitas* capacity, from *habilis* able]

probability distribution *n.* In statistics, the probability or relative frequency of a variable for all possible values that the variable can assume.

probability learning *n.* A form of [*discrimination](#) learning in which the positive stimulus is rewarded on a randomized proportion of trials. In humans, this is usually achieved with variations of the light-guessing experiment first described by the US psychologist Lloyd G(irton) Humphreys (1913–2003) in the *Journal of Experimental Psychology* in 1939. An observer tries to predict which of two light bulbs will light up on each trial, and the bulbs are lit up randomly, 80 per cent left and 20 per cent right, for example. People typically began by distributing their guesses roughly equally between the two options, then they increase the frequency of choosing the bulb that is being lit up more often, and finally after very many trials, by which time they have enough information to judge the probabilities reasonably accurately, they usually settle into a non-optimal *matching strategy* of choosing 80 per cent left and 20 per cent right in the example above. This matching strategy yields a probability of $.8 \times .8 + .2 \times .2$ of being correct, which is 68 per cent correct guesses. This is non-optimal, because the strategy of choosing the more frequently illuminated bulb on every single trial yields 80 per cent correct guesses. Animals also tend to respond non-optimally, and when the responses of many animals are pooled, they sometimes correspond to probability matching.

probability matching *See* [PROBABILITY LEARNING](#).

probability sample *n.* Any sample drawn by a technique involving [*randomization](#), so that members of the population or sub-groups within it have known probabilities of inclusion. *See* [CLUSTER SAMPLE](#), [RANDOM DIGIT DIALLING](#), [SIMPLE RANDOM SAMPLE](#), [STRATIFIED RANDOM SAMPLE](#). *Compare*

*****ebook converter DEMO Watermarks*****

ACCIDENTAL SAMPLE, CONVENIENCE SAMPLE, NON-PROBABILITY SAMPLE, OPPORTUNITY SAMPLE, QUOTA SAMPLE, SELF-SELECTED SAMPLE, SNOWBALL SAMPLE.

probable error *n.* A measure of the degree of dispersion, variability, or scatter in a group of scores, equal to half the ***interquartile range**. It can be calculated by multiplying the ***standard deviation** by 0.6745. *Compare* INTERQUARTILE RANGE, RANGE, SEMI-INTERQUARTILE RANGE, VARIANCE. **PE** *abbrev.*

proband *n.* A person with a particular trait or disorder, serving as the starting point for a study in which the person's blood relatives are investigated in order to obtain information about the genetic transmission of the characteristic in question. Also called an *index case*. [From Latin *probandus* to be proved, from *probare* to prove]

probe *n.* Anything that is used to examine or explore, especially (in cognitive psychology) a ***cue (3)** in the form of an item in a list immediately preceding the item to be recalled.

problem solving *n.* Cognitive processing directed at finding solutions to ***well-defined problems**, such as the ***Tower of Hanoi**, ***Wason selection task**, or a ***water-jar problem**, by performing a sequence of operations. Problem solving by means of ***logic** or ***logical analysis** is usually called ***reasoning**. *See also* 2-4-6 PROBLEM, ALGORITHM, BRUTE FORCE ALGORITHM, CONVERGENCE–DIVERGENCE, FUNCTIONAL FIXEDNESS, GENERAL PROBLEM SOLVER, ILL-DEFINED PROBLEM, INSIGHT (2), INTELLIGENCE, LATERAL THINKING, MONTY HALL PROBLEM, MUDDY CHILDREN PROBLEM, NEWCOMB'S PROBLEM, NINE-DOT PROBLEM, ODDITY PROBLEM, PROBLEM-SOLVING STAGES, TAXICAB PROBLEM, TRAVELLING SALESMAN PROBLEM, WELL-DEFINED PROBLEM. [From Latin *problema*, something put forward, from Greek *pro* before or forward + *ballein* to throw]

problem-solving cycle *See* PROBLEM-SOLVING STAGES.

problem-solving stages *n.* The successive phases that can be observed in the process of ***problem solving**. According to the most influential scheme, proposed by the English psychologist Graham Wallas (1858–1932) in his book *The Art of Thought* (1921), the stages are preparation, ***incubation**, illumination or ***insight (2)**, and verification.

*****ebook converter DEMO Watermarks*****

According to the US philosopher John Dewey (1859–1952) in his book *How We Think* (1933), the stages are suggestion, translation of a difficulty into a **well-defined problem*, framing of a hypothesis, **reasoning*, and testing.

problem space *n.* In **problem solving*, the set of all possible operations that can be performed in an attempt to reach a solution.

procedural knowledge *n.* Information about how to carry out sequences of operations—*knowing how* in contrast to *knowing that*—sometimes lacking awareness and understanding of how to perform certain tasks and therefore being a form of **non-declarative knowledge*. The English philosopher Gilbert Ryle (1900–76) argued in *The Concept of Mind* (1949) that it cannot be reduced to declarative knowledge of facts. *See also* KNOWLEDGE, MIRROR DRAWING, PROCEDURAL MEMORY. *Compare* ACQUAINTANCESHIP KNOWLEDGE, DECLARATIVE KNOWLEDGE.

procedural memory *n.* A storage system for **procedural knowledge*, information within it being acquired through a form of learning that is relatively slow, requiring repetition over many trials, often involving associations of sequential stimuli and permitting storage of information about predicative relations between events, expressed primarily by improved performance at skilled tasks, often occurring without conscious awareness or understanding of what is being learned and therefore being a form of **non-declarative memory*. It is distinguished from **episodic memory* and **semantic memory*. *See also* ACT*, MIRROR DRAWING. *Compare* DECLARATIVE MEMORY.

proceptive behaviour *n.* Behaviour of a female that facilitates mating. US *proceptive behavior*. *See also* LORDOSIS. [From Latin *pro* for + (*con*)*ceptus* becoming pregnant]

process *n.* **1.** A sequence of events leading to some change or alteration in the state of a dynamic system. **2.** In anatomy, a projecting part, especially a fine threadlike protrusion from a **neuron*, being an **axon*, a **dendrite*, or one of their branches, also called a *neurite*. [From Latin *processus* an advance, from *procedere* to proceed]

processing speed *n.* The rate at which a person performs simple perceptual or cognitive tasks such as apprehension, scanning, retrieval, and response to stimuli. Measures of processing speed correlate weakly with psychometric measures of intelligence. *See also* CHOICE REACTION TIME, INSPECTION TIME, NERVE CONDUCTION VELOCITY.

process, primary *See* PRIMARY PROCESS.

process, secondary *See* SECONDARY PROCESS.

proclitic *n.* A monosyllabic **clitic* that precedes the word on which it depends, such as the English 't, standing for *it* in the word 'twas. *Compare* ENCLITIC. [From Greek *pro* before + *enclinein* to cause to lean + *-itikos* resembling or marked by]

procyclidine *n.* Procyclidine hydrochloride, an **anticholinergic* drug that is used in the treatment of **parkinsonism*. *See also* ANTIPARKINSONIAN.

prodrome *n.* A precursor or premonitory **sign* (1) or **symptom* of a developing disorder or attack, such as an **aura* (2) before an attack of **epilepsy*. **prodromal** *adj.* Of or denoting a prodrome. [From Greek *prodromos* a forerunner, from *pro* before + *dromos* a run + *-alis* of or relating to]

production method *n.* Another name for **magnitude production*.

production rule *n.* In cognitive psychology, a condition–action or *if–then* sequence (*if X occurs or obtains, then do Y*) designed to implement a procedure, often incorporated in a **production system*.

production system *n.* In cognitive psychology, an ordered set of **production rules* that are implemented by locating the first production rule in the list whose condition is satisfied, implementing its procedure, then beginning again at the top of the list, and so on. *See also* ACT*.

productive orientation *n.* In **neo-Freudian* theory, a term used by the

German-born US psychoanalyst Erich Fromm (1900–80) to denote a character type manifesting full use of potential and realization of latent potentialities, independent thinking, respect for self and others, enjoyment of sensual pleasures without anxiety, and delight in nature and works of art. *Compare* [EXPLOITATIVE ORIENTATION](#), [HOARDING ORIENTATION](#), [MARKETING ORIENTATION](#), [RECEPTIVE ORIENTATION](#).

product-moment correlation coefficient *n.* A statistic representing the degree of linear relationship between two variables. It is defined as the **covariance* of the two variables divided by the product of their standard deviations, hence it may be thought of as a measure of **standardized (1) covariance*. It is symbolized by *r*, and it ranges from 1.00 for perfect positive correlation, through zero for uncorrelated variables, to –1.00 for perfect negative correlation. When one variable is being used to predict another, the square of *r* indicates the proportion of variance in one variable that is explained by the other (given certain linear assumptions), or the proportion of variance shared by the two variables: if $r = .50$, then $r^2 = .25$, indicating that 25 per cent of the variance in one of the variables is explained by the other, or that 25 per cent of the variance is shared by the two variables. Also called *Pearson's correlation coefficient*. *See also* [CORRELATION](#). *Compare* [CORRELATION RATIO](#), [PARTIAL CORRELATION](#), [SPEARMAN RANK CORRELATION COEFFICIENT](#).

profile *n.* An outline, especially of a person's face in side view. In psychometrics, a graphic representation of a person's scores on several tests or subtests using a common scale. *See also* [CRIMINAL PROFILING](#). **profiler** *n.* One who creates profiles. [From Italian *profilo* a profile, from Latin *pro* forth + *filare* to spin or draw a line, from *filum* a thread]

profile of non-verbal sensitivity *See* [PONS](#).

profiling *See* [CRIMINAL PROFILING](#).

profound mental retardation *n.* An obsolete term for a level of **intellectual disability* associated with **IQ* below approximately 20 (in adults, **mental age* below 3 years). Also called *profound mental subnormality*.

*****ebook converter DEMO Watermarks*****

progeria *n.* A congenital condition of premature ageing, characterized by small stature and the appearance during childhood of grey hair, wrinkled skin, and the posture and general demeanour of an old person. [From Greek *pro* before + *geras* old age + *-ia* indicating a condition or quality]

progesterone *n.* A female **steroid* **sex* hormone secreted especially by the **corpus luteum* in the ovary to prepare the uterus for a fertilized ovum and to maintain pregnancy. When it reaches the hypothalamus, it inhibits the release of **luteinizing hormone* from the pituitary gland. *See also* DHEA, OESTROUS CYCLE. [From *proge(stin)*, from *pro* before + *gestation* + *ster(ol)* + *-one* indicating a ketone, from Greek *-one* a feminine name suffix]

prognosis *n.* A prediction or forecast of the course or outcome of a disorder. **prognostic** *adj.* [From Greek *pro* before + *gnosis* knowing]

prognostic test *n.* In psychometrics, any test that is designed to predict the likely outcome for the respondent of a programme of therapy, education, or training. [From Greek *pro* before + *gnosis* knowing + *-ikos* of, relating to, or resembling]

programmed strategy *n.* A predetermined pattern of **strategy* (2) choices used in experimental studies of players' choices in repeated **strategic games*. In a two-person experimental game, a player may be pitted against a simulated co-player in the form of a computer or an accomplice of the experimenter's, programmed in advance to make a predetermined sequence of choices that may or may not depend on the player's choices. In many such experiments the players are led to believe that they are playing against ordinary co-players. The most thoroughly researched programmed strategy for repeated **Prisoner's Dilemma games* is **tit for tat*.

progression index *n.* An index of the comparative **intelligence* of mammalian species, based on a modification of the **encephalization* quotient, defined as volume of **neocortex* in the animal in question divided by volume of neocortex in a standard comparison animal belonging to the same order, correcting for body size. If a chimpanzee is arbitrarily assigned a standard progression index for primates of 1.0, then humans score 3.2.

Compare *A/S RATIO*, *ENCEPHALIZATION QUOTIENT*.

Progressive Matrices test See *RAVEN'S PROGRESSIVE MATRICES*.

progressive relaxation *n.* A form of **psychotherapy* used for treating **anxiety disorders*, in which skeletal muscles throughout the body, often beginning with the feet and legs and working upwards, are first tensed and then deeply relaxed. It is also used as an adjunct to other forms of psychotherapy, especially **systematic desensitization*. It was introduced by the US physician Edmund Jacobson (1888–1983) and was described in his book *Progressive Relaxation* (1938). Also called *Jacobson's progressive relaxation* or *relaxation therapy*.

progressive supranuclear palsy *n.* A neurological disorder of unknown cause, first described in 1964 by the Canadian neurologists John C. Steele (born 1934) and John Clifford Richardson (1909–86) and the Polish-born Canadian neurologist Jerzy Olszewski (1913–66), characterized by loss of balance while walking, a gradual paralysis of the **extra-ocular muscles*, making upward and downward eye movements difficult or impossible, **dysarthria*, and stiffness of the neck and trunk muscles, followed eventually by loss of memory and mild **dementia*. It strikes in middle or old age, and its associated pathology includes degeneration of neurons in the **basal ganglia*, **brainstem*, and **cerebellum*, with subcortical **amyloid plaques* and **neurofibrillary tangles*. It is estimated to affect approximately 1.4 per 100,000 people, slightly more women than men, and it is related to (though much less common than) **Parkinson's disease*. Also called *supranuclear palsy* or (especially in the UK) *Steele–Richardson–Olszewski syndrome (SRO)*. **PSP** *abbrev.* [So called because the paralysis, especially of the eye muscles, occurs above nuclei of the central nervous system]

projection *n.* 1. In **psychoanalysis*, a **defence mechanism* in which intolerable feelings, impulses, or thoughts are falsely attributed to other people. Sigmund Freud (1856–1939) developed the concept initially in relation to paranoia (**delusional disorder*), and later extended it to a wide range of psychological phenomena, but never provided a detailed analysis of it: in his celebrated case study entitled ‘Psycho-Analytic Notes on an Autobiographical Account of a Case of Paranoia (Dementia Paranoides)’

*****ebook converter DEMO Watermarks*****

published in 1911, he wrote: 'let us make up our minds to postpone the investigation of it (and with it that of the mechanism of paranoiac symptom formation in general) until some other occasion' (*Standard Edition*, XII, pp. 9–82, at p. 66), but he never published any such investigation. *See also* EXTERNALIZATION, PROJECTIVE IDENTIFICATION, PROJECTIVE TEST, SCHREBER CASE. 2. An area where *axons from a sense organ or another part of the nervous system terminate.

projection area *n.* Another name for a *sensory projection area.

projective identification *n.* In *Kleinian analysis, a *fantasy (2) in which one inserts oneself, or part of oneself, into an *instinctual object in order to possess it, control it, or harm it. The British-based Austrian psychoanalyst Melanie Klein (1882–1960) introduced the concept in 1932 in her book *The Psycho-Analysis of Children*, in which she described a child's fantasy of invading its mother's body and attacking it sadistically, but she did not introduce the term *projective identification* until 1952, when she described it in a chapter in a co-authored book *Developments in Psycho-Analysis* as 'a particular form of identification which establishes the prototype of an aggressive object-relation'. *See also* IDENTIFICATION (2), PARTICIPATION MYSTIQUE.

projective test *n.* Any of a variety of personality tests in which the respondent gives *free responses to a series of stimuli such as inkblots, pictures, or incomplete sentences. Such tests are based loosely on the psychoanalytic concept of *projection (1), the assumption being that respondents project unconscious aspects of their personalities on to the test items and reveal them in their responses. Among the best known projective tests are the *Blacky pictures, *Draw-a-Person test, *Holtzman Inkblot Technique, *House–Tree–Person Technique, *Make-a-Picture-Story Test, *Rorschach test, *Rosenzweig Picture-Frustration Study, *sentence completion test, *Szondi test, *TAT, and *word-association test. Also called a *projective technique* or a *projective method*. The term *projective method* first appeared in print in the title of an article in the *Journal of Experimental Education* in 1938, where the authors attributed it to the US psychologist Lawrence K. Frank (1890–1968), who published an article entitled 'Projective Methods for the Study of Personality' in the *Journal of*

Psychology in 1939 and later published a book entitled *Projective Methods* (1948) in which he suggested that projective tests provide X-ray images of the unconscious mind. See also [MOTIVATIONAL RESEARCH](#).

prokaryote *n.* A bacterium or a cyanobacterium (blue–green alga) composed of cells each containing genetic material in a single filament, not enclosed in a well defined [*nucleus \(1\)](#). Compare [EUKARYOTE](#). [From Greek *pro* before + *karyon* a kernel]

prokaryotic cell *n.* A biological cell without a [*membrane](#) separating the genetic material from the rest of the cell.

prolactin *n.* A [*gonadotrophic hormone](#) secreted by the anterior pituitary, stimulating the secretion of [*progesterone](#) by the [*corpus luteum](#), initiating and maintaining lactation and functioning as a contraceptive. Also called *luteotrophic hormone (LTH)* or *luteotrophin*. **PrL** abbrev. [From Latin *pro* before + *lac*, *lactis* milk]

proliferative phase *n.* Another name for the [*follicular phase](#) of the [*oestrous cycle](#) or [*menstrual cycle](#).

Prolixin *n.* A proprietary name for the neuroleptic drug [*fluphenazine](#). [Trademark]

prolonged duress stress disorder *n.* An [*anxiety disorder](#) resulting from prolonged exposure to [*stress](#), such as severe work-related stress or continual bullying, with symptoms similar to those of [*post-traumatic stress disorder \(PTSD\)](#) but without any specific trauma involving actual or threatened death or serious injury, as required for a diagnosis of PTSD. It was suggested by the British psychologists Michael J(ames) Scott (born 1948) and Stephen G. Stradling (born 1947) in a book entitled *Counselling for Post-traumatic Stress Disorder* (1992, p. 36) and in an article in the *British Journal of Clinical Psychology* published in 1994. It is not listed in [*DSM-5](#) or [*ICD–10](#). **PDSD** abbrev.

pro-mia *adj.* Pro-bulimia, loosely descriptive of a subculture, literature, and

websites that provide support for people with **bulimia nervosa* and that sometimes (controversially) promote the disorder as a lifestyle choice. Compare *PRO-ANA*. [From Latin *pro* in favour of + (*buli*)*mia*, from Greek *bous* ox + *limos* hunger + *-ia* indicating a condition or quality]

promnesia *n.* The sensation of remembering something that is being experienced for the first time; the sense of **déjà vu*. [From Greek *pro* before + *mneme* memory + *-ia* indicating a condition or quality]

prompt *n.* Anything that urges someone to act or that functions as a reminder, especially (in cognitive psychology) a **cue* (3, 4) intended to aid recall or as a hint to guide performance of a task. See also *PRIMING* (1). [From Latin *promptus* evident, from *promere* to bring forward, from *pro* before + *emere* to buy]

pronation *n.* Lying in a prone (belly-down) position or, if standing with one's arms at one's sides, turning the palms backwards. Compare *SUPINATION*. [From Latin *pronus* bent forward or bowed + *-ation* indicating a process or condition]

proof-reader's illusion *n.* 1. The failure of a proof-reader to notice gross errors in the meaning of the text being checked, because different and incompatible **levels of processing* are required for checking meaning and orthography. 2. The tendency of a proof-reader to overlook small errors of orthography because of the difficulty of suppressing higher **levels of processing* while checking orthography, especially when one is the author of the text. Some professional proof-readers read text backwards to avoid this problem.

pro-opiomelanocortin See *POMC*.

propanediol *n.* An early class of minor tranquillizers or **sedative* drugs, the best known example being **meprobamate* (Miltown). [So called because it is derived from propane-diol]

prophase *n.* The first phase of **mitosis*, when the nuclear membrane

disappears and the chromosomes divide lengthwise into **chromatids*, which become the chromosomes of the daughter cells. [From Greek *pro* before + *phasis* an aspect, from *phainein* to show]

proposition *n.* **1.** The meaning conveyed by a declarative sentence, a declarative sentence being one that asserts or denies something, or in other words one that is capable of being true or false. The proposition is not the sentence itself but its meaning. The sentences *Snow is white* and *Schnee ist weiß* are obviously different, but they express the same proposition in two different languages, and the proposition is true if and only if snow is indeed white. *See also* CATEGORICAL SYLLOGISM, MENTAL MODEL, MODAL LOGIC, POSSIBLE WORLD, PROPOSITIONAL CALCULUS, SENTENCE FUNCTOR, SYLLOGISM, TRUTH FUNCTOR, TRUTH TABLE, VENN DIAGRAM. **2.** More generally, any deal proposed for consideration. **3.** An invitation to engage in sexual intercourse. [From Latin *propositio* a setting forth, from *proponere* to display, from *pro* before + *ponere* to place]

propositional calculus *n.* Any formal system of symbolic **logic* providing a language for expressing **propositions* (1) and the relations between them (*and*, *or*, *not*, and *if...then*), without regard to the internal structure or content of the propositions, together with a set of axioms and rules of inference, enabling the process of constructing a valid argument to be reduced to a mechanical process. *See also* LOGICAL ANALYSIS, SENTENCE FUNCTOR, TRUTH FUNCTOR, TRUTH TABLE. *Compare* PREDICATE CALCULUS.

propositional representation *n.* Another name for **symbolic representation*.

propositus *n.* A person from whom a genealogical lineage is traced when delineating the pattern of inheritance of a psychological or physical trait. [From Latin *propositus* placed before, from *pro* before + *ponere* to place]

propoxyphene *n.* Propoxyphene hydrochloride, a **narcotic* analgesic that is sometimes taken as a street drug. Also called *Darvon* (trademark). [From *propoxy-* composed of propyl united with oxygen + *phene* an old name for benzene, from Greek *phainein* to show, alluding to its use in manufacturing illuminating gas]

*****ebook converter DEMO Watermarks*****

propranolol *n.* Propranolol hydrochloride, the most commonly prescribed **beta-blocker*. [From *pro(pyl)* containing the monovalent group C_3H_7 + *pr(op)anol*, from *propane* + *-ol* denoting a compound containing a hydroxyl group, from (*alcoh*)*ol*]

proprioception *n.* The form of sensation through which one is aware of the position and orientation of one's body relative to the direction of gravity, of one's body parts relative to one another, and of acceleration and changes in position, the information being supplied by **proprioceptors*. See *JOINT SENSE*, *MUSCLE SENSE*, *STATIC SENSE*, *TENDON SENSE*. See also *INTERNAL SENSE*, *KINAESTHESIS*. Compare *EXTEROCEPTION*, *INTEROCEPTION*. **proprioceptive** *adj.* [From Latin *proprius* one's own + English *receptor* + Latin *-ion* indicating an action, process, or state]

proprioceptor *n.* Any **sensory* receptor that supplies information for **proprioception*, especially receptors in the **vestibular system* and in the muscles, tendons, and joints. Compare *EXTEROCEPTOR*, *INTEROCEPTOR*.

propylthiouracil *n.* A crystalline compound that is used to treat abnormal swelling of the thyroid gland and that, depending on a simple hereditary factor, tastes very bitter to some people and tasteless to others, roughly 25 per cent of people being non-tasters, 50 per cent tasters, and 25 per cent **supertasters*. In 2003 a gene influencing the sensitivity to PROP was discovered. The gene, *TAS2R38*, codes for a taste bud receptor and has several natural variations. Formula: $C_7H_{10}N_2OS$. Compare *PTC*. **PROP** *abbrev.* [From *pro(pyl)* containing the monovalent group C_3H_7 + Greek *theion* sulphur + English *uracil*, from *ur(ea)* + *ac(etic)* + Latin *-il(is)* indicating capability or relationship]

prosencephalon *n.* A technical name for the **forebrain*, especially in a developing embryo. Compare *MESENCEPHALON*, *RHOMBENCEPHALON*. [From Greek *proso* forward + *enkephalos* the brain, from *en* in + *kephale* the head]

prosimian *n.* A primate of the primitive suborder Prosimii, including lemurs, tree shrews, lorises, and tarsiers. Compare *ANTHROPOID* (2). [From Latin *pro* before + *simia* an ape]

*****ebook converter DEMO Watermarks*****

prosocial behaviour *n.* Helping behaviour, [*altruism](#), or more generally any behaviour that is positive and calculated to promote the interests of society. US *prosocial behavior*.

prosody *n.* A generic name for the qualities of speech involving [*loudness](#), [*pitch](#), [*rhythm](#), and [*tempo](#). See also [PARALANGUAGE](#). [From Greek *prosoidia* a song set to music, from *pros* towards + *oide* a song]

prosopagnosia *n.* A form of agnosia involving an impaired ability to recognize or identify previously familiar faces, sometimes even those of close relatives, such faces being identified as faces but not faces of particular known people, usually associated with damage to the posterior right hemisphere of the brain. See also [AGNOSIA](#). Compare [PHONAGNOSIA](#). [First used in 1947 by the German neurologist Joachim Bodamer (1910–85) in an article in *Archiv für Psychiatrie und Nervenkrankheiten*, from Greek *prosopon* a face + *a-* without + *gnosis* knowledge + *-ia* indicating a condition or quality]

prospective study *n.* A type of research investigation in which a [*cohort](#) of participants is examined over a period of time in an effort to discover the factor(s) that cause a particular disorder or characteristic to emerge. The initial sample is often selected from groups of participants relatively likely to develop the disorder or characteristic being studied; for example, in a prospective study of [*anorexia](#) nervosa, young women learning to be models might be used. Results from prospective studies carry more persuasive weight than those from [*retrospective studies](#). [From Latin *pro* before or in front + *specere, spectrum* to look]

prospect theory *n.* A theory of preferences among outcomes involving [*risk](#) (2) formulated in 1979 by the Israeli-American psychologists Daniel Kahneman (born 1934) and Amos Tversky (1937–96) as an alternative to [*expected utility](#) theory. According to prospect theory, human preferences tend to violate expected utility (SEU) theory in the following ways: people tend to evaluate outcomes as gains or losses relative to their current situation or the status quo rather than in terms of absolute value; they tend to attach greater weight to losses than to corresponding gains; they tend to show [*risk](#) aversion for gains but [*risk](#) seeking for losses; and they tend to overweight very small probabilities and underweight moderate and high probabilities.

*****ebook converter DEMO Watermarks*****

The theory is usually depicted by an S-shaped **utility* function that associates a subjective utility to any amount that may be gained or lost (see *illustration*); the part of the function representing gains is a concave power function (see *POWER LAW*) with an exponent of $2/3$, and the part representing losses is a convex power function with an exponent of $3/4$, though some researchers have reported slightly smaller exponents. The slope is greater for losses than for gains, depicting the observation that a loss has a greater subjective effect than an equivalent gain (loss aversion). In 1981 Tversky and Kahneman provided experimental data showing that 84 per cent of the undergraduate students preferred a sure gain of \$240 to a gamble involving a 25 per cent chance of gaining \$1,000 and a 75 per cent chance of gaining nothing (risk aversion for gains), but 87 per cent preferred a gamble involving a 75 per cent chance of losing \$1,000 and a 25 per cent chance of losing nothing to a sure loss of \$750 (risk seeking for losses). Combining these prospects, most of these students were expressing a preference for a portfolio containing a 25 per cent chance of winning \$240 and a 75 per cent chance of losing \$760 over a portfolio containing a 25 per cent chance of winning \$250 and a 75 per cent chance of losing \$750, thus violating the principle of rationality according to which a **dominant alternative/strategy* should invariably be preferred. See also *ENDOWMENT EFFECT*, *FRAMING EFFECT*, *HEDONIC TREADMILL*.

Prospect theory. The concave section to the right represents risk aversion for gains, with a sure gain of \$35 having the same value as a 50 per cent probability of gaining \$100; the steeper convex section to the left represents risk seeking for losses, with a sure loss of \$40 having the same value as a 50 per cent probability of losing \$100.

prostaglandin *n.* Any of a group of substances, composed mostly of fatty acids, present in semen and secreted into the bloodstream at various sites in the body, causing fever and inflammation and also playing a part in **pain* perception, muscle contraction, and various other bodily processes. Prostaglandins are produced by the enzyme prostaglandin H₂ synthase or PGHS, which converts arachidonic acid from the **endoplasmic reticulum* to prostaglandins. *See also* [ASPIRIN](#). **PG** *abbrev.* [From *prosta(te)* + *gland* (where it was first discovered) + Greek *-in(e)* indicating an organic compound]

prostitute pupil *n.* An offensive name for an [ARGYLL ROBERTSON PUPIL](#).

protanomaly *n.* A form of partial **colour-blindness* resulting from an abnormality in the **visual pigment* that absorbs long-wave light, resulting in

*****ebook converter DEMO Watermarks*****

a partial loss of sensitivity to light in the red part of the visible spectrum, a tendency to confuse reds and greens, and matches that deviate from the normal **Rayleigh equation*. See also *DALTONISM*. Compare *DEUTERANOPIA*, *PROTANOPIA*, *TRITANOPIA*. [From Greek *protos* first, from *pro* before, alluding to the first of the three **primary colours* (1) red, green, and blue + *anomalos* uneven or inconsistent, from *an-* without + *homalos* even, from *homos* the same]

protanopia *n.* A form of **anomalous dichromacy* in which the **visual pigment* that absorbs long-wave light is non-functional, leading to a loss of sensitivity to red light and a tendency to confuse reds and greens. See also *DALTONISM*. Compare *DEUTERANOPIA*, *PROTANOPIA*, *TRITANOPIA*. [From Greek *protos* first, from *pro* before, alluding to the first of the three **primary colours* (1) red, green, and blue + *anopia* blindness, from *an-* without + *ops* an eye + *-ia* indicating a condition or quality]

protein *n.* Any of a group of complex nitrogenous compounds that are encoded by genes and are the main constituents of living organisms. Every protein is composed of a chain of a hundred or more **amino acids* (if it contains fewer it is a **polypeptide*), linked by **peptide* bonds and folded into a distinctive three-dimensional shape, and some proteins are **enzymes*. The human body is composed of more than 50,000 proteins. [From Greek *proteios* primary, from *protos* first]

protein binding *n.* The attachment of molecules of a drug in the bloodstream to molecules of protein, especially albumin, effectively inactivating the drug by fixing it to a molecule that is too large to reach the target receptor sites. A dynamic equilibrium usually arises in which a portion of the drug is bound and a portion remains in the free form, the strength of the binding determining the quantity of the drug available in its active free form.

protein kinase C *n.* A protein that can move from the cytoplasm of a neuron to the membrane, changing the neuron's electrical and molecular properties and increasing its propensity to respond to stimulation by triggering nerve impulses, such changes providing physical substrates of certain types of memories in dendritic trees. **PKC** *abbrev.*

*****ebook converter DEMO Watermarks*****

protensity *n.* The subjective or psychological experience of duration as opposed to objective duration or time. [From Latin *protendere* to extend or prolong, from *pro* forward + *tendere* to stretch]

proteome *n.* The **proteins* that are encoded by a **genome*, especially the human genome, each protein being potentially capable of affecting the function of cells or organs, and many interacting with other proteins. The term was coined by the US-born Australian biochemist Marc R(onald) Wilkins (born 1967), Vice-President of Bioinformatics at Proteome Systems Limited in Sydney, Australia, and presented at a scientific meeting in Siena in 1994, shortly before the sequencing of the human genome. It appeared in print for the first time in an article by Wilkins and others in the journal *Electrophoresis* in 1995. Compare *PHENOME*. **proteomic** *adj.* **proteomics** *n.* The science devoted to the study of proteomes and the explanation of protein functions and interactions. [A blend of *prote(in)* and (*gen*)ome]

protest, masculine See *MASCULINE PROTEST*.

prothetic stimulus dimension *n.* Any stimulus dimension that varies continuously and produces continuous changes in perception, the standard example being the wavelength or frequency of sound, which produces continuous changes in perceived pitch as it varies continuously, whereas light produces qualitative perceptual changes. Compare *CATEGORICAL PERCEPTION*, *METATHETIC STIMULUS DIMENSION*. [From Greek *prothetikos* placed in front, from *pro* before + *tithenai* to place + *-ikos* of, relating to, or resembling]

protocol analysis *n.* Any of a number of techniques of **qualitative research* in which thought processes elicited from research participants or subjects while they were performing a mental task are studied and classified, often by means of **content analysis*. See also *INTROSPECTION*.

Proto-Indo-European See *INDO-EUROPEAN*.

protoplasm *n.* The living substance of a **cell*, consisting of the **cytoplasm* and the **nucleoplasm*. **protoplasmic** *adj.* [From Greek *protos*

first + *plasma* a form]

prototype *n.* 1. A preliminary version of a product, suitable for testing and modification before the product is manufactured and marketed commercially. 2. An object or item that serves as an example or typical representative of its type or class. *See also* FOCAL COLOUR, PROTOTYPE THEORY, SCHEMA. *Compare* EXEMPLAR. 3. In biology, the ancestral or original form of a species or other taxonomic category. **prototypical**, **prototypic**, or **prototypal** *adj.* [From Greek *protos* first, from *pro* before, + *typos* a mark]

prototype matching *n.* Another name for **template matching*.

prototype theory *n.* A theory of **concepts* and **concept* formation introduced in 1973 by the US psychologist Eleanor Rosch (born 1938) to overcome problems inherent in the classical **componential theory* originally put forward by the Greek philosophers Plato (?427–?347 BC) and Aristotle (384–322 BC). According to the componential theory, concepts can be expressed in terms of their **defining properties*, which are the necessary and sufficient **attributes* that items must have to be instances of the concept. But the Austrian-born British philosopher Ludwig (Josef Johann) Wittgenstein (1889–1951) argued in his *Philosophical Investigations* (1953, paragraph 66) that a concept such as that of a *game* has no necessary or sufficient attributes, and hence no defining properties, and that instances of games are linked to one another by family resemblance, just as some members of the family may share the same build, others the same eye colour, and others the same gait, without any characteristic being shared in common by all members of the family. According to prototype theory, instances of a natural concept are defined by their resemblance to a **prototype (2)* that is a best or most typical example of the concept, sharing the maximum number of **features (1)* or attributes with other instances and a minimum number with instances of other concepts. Thus a prototype consists of **characteristic features* rather than defining properties, and according to this interpretation concepts have indistinct boundaries and may be represented by **fuzzy sets* (but *see* GUPPY EFFECT). If an item is clearly similar to a prototype, as *table* is to the prototypical *furniture*, then it is likely to be perceived as belonging to the concept, whereas if it is somewhat (but not entirely) dissimilar to the prototype, as *carpet* is to *furniture*, then it may be unclear whether or not it

*****ebook converter DEMO Watermarks*****

belongs to the concept. See also [BASIC-LEVEL CATEGORY](#), [SCHEMA](#). Compare [COMPONENTIAL THEORY](#).

proverbs test *n.* Any test in which the respondent is asked to explain the figurative meaning of a series of proverbs. For example, the figurative meaning of the proverb *A rolling stone gathers no moss* is that a restless or wandering person does not become prosperous. In clinical practice it is sometimes used as a rough-and-ready test of [*thought disorder](#), the assumption being that people with thought disorder often have difficulty distinguishing between the literal and figurative meanings of proverbs.

Provigil *n.* The proprietary name for the stimulant drug [*modafinil](#). [From Latin *pro* for + *vigilans* keeping awake, from *vigilare* to be watchful, from *vigil* awake]

provisional tic disorder *n.* A [*tic disorder](#), introduced in [*DSM-5](#), characterized by one or more motor or vocal tics occurring many times a day for at least a month but no longer than a year and, apart from that, sharing the features of [*Tourette's disorder](#). Also called *transient tic disorder*. **PTD** *abbrev.*

proxemics *n.* A branch of [*non-verbal communication](#) concerned with the study of [*personal space](#) and other spatial aspects of human and animal interaction. [From Latin *proximus* nearest, superlative of *prope* near + Greek *-ikos* of, relating to, or resembling]

proximal *adj.* Nearer or nearest to the centre, point of attachment, or origin. Compare [DISTAL](#). [From Latin *proximus* next, superlative of *prope* near]

proximal stimulus *n.* The pattern of physical energy that stimulates or excites a [*sensory receptor](#). See also [REAFFERENCE](#). Compare [DISTAL STIMULUS](#). [From Latin *proximus* next + *-al* from Latin *-alis* of or relating to]

proximity grouping law *n.* One of the four original [*grouping laws](#) of [*Gestalt](#) psychology formulated in 1923 by the German psychologist Max

Wertheimer (1880–1943) to explain the organization of parts into wholes by the visual system. According to the law, elements close together tend to be grouped perceptually, so that the array OO OO OO OO tends to be perceived as four pairs rather than eight separate elements. *See also* [PRÄGNANZ](#), [COMMON FATE](#), [COMMON REGION](#), [CONNECTEDNESS GROUPING LAW](#). *Compare* [CLOSURE GROUPING LAW](#), [GOOD CONTINUATION](#), [SIMILARITY GROUPING LAW](#).

proximodistal *adj.* From the centre of the body towards the extremities, referring to the development of an embryo, and also later stages of development, in which growth is fastest near the head and torso and progressively slower towards the feet and hands. *Compare* [CEPHALOCAUDAL](#). [From Latin *proximus* next + *distare* to be distant, from *dis-* apart + *stare* to stand]

proximoreceptor *n.* A [*sensory](#) receptor such as a [*somatic](#) receptor that can be stimulated only by nearby stimuli and that mediates a [*near sense](#). Also called a *proximoceptor*. *Compare* [TELERECEPTOR](#). [From Latin *proximus* next + *recipere*, *receptum* to receive, from *re-* back + *capere*, *ceptum* to take]

Prozac *n.* Fluoxetine hydrochloride, an [*antidepressant](#) drug belonging to the group of [*selective serotonin reuptake inhibitor \(SSRI\)](#) agents, used in the treatment of depression, obsessive–compulsive disorder, bulimia nervosa, and panic disorder. [Trademark]

PrP *abbrev.* Prion protein, a glycoprotein (a protein in which the amino acid units are bound to sugars) that forms the major or only component of a [*prion](#). In brain tissue molecules of PrP tend to aggregate into rod-shaped structures, and the rods collect in clumps that appear in photomicrographs as fluffy tufts resembling [*amyloid plaques](#).

pruning *n.* Trimming by removing superfluous parts, including naturally occurring neuronal death or [*apoptosis](#) resulting in the elimination of redundant synapses, also occurring excessively in certain pathological states. *See also* [NEURAL DARWINISM](#). [From Old French *proignier* to clip, from Latin *propago* a cutting]

Psammetichus experiment *n.* The earliest recorded psychological
*****ebook converter DEMO Watermarks*****

experiment, reported about 429 BC in *The Histories* (Part 1, Book 2, paragraph 2) of the Greek historian Herodotus (?485–425 BC), the world's first history book. According to Herodotus, the Egyptian Pharaoh Psammetichus I (664–610 BC) performed the experiment to determine whether human beings have an innate capacity for speech, and if so, which particular language is innate. He ordered two infants to be brought up in a remote place by a shepherd who was forbidden to speak in their presence. After two years the children began to speak, and the word that they repeated most often was *becos*, which turned out to be the Phrygian word for bread. Psammetichus concluded that the capacity for speech is innate, and that the natural language of human beings is Phrygian. The experiment is conceptually similar to the [*Kaspar Hauser experiments](#) by the British ethologist William H. Thorpe (1902–86), published in 1958, in which birds were reared in isolation to determine which aspects of their songs are innate.

pseudaesthesia *n.* An illusory tactile sensation without any physical basis, such as a [*phantom limb](#). US *pseudesthesia*. Also called *pseudoaesthesia* or *pseudoesthesia*. [From Greek *pseudes* false + *aisthesis* feeling + *-ia* indicating a condition or quality]

pseudoangina *n.* Chest pain suggestive of a heart attack in a person without any coronary heart disease; a common feature of [*somatic symptom disorder](#). [From Greek *pseudes* false + Latin *angina* quinsy, from Greek *anchone* a strangling]

pseudoanorexia *n.* A condition in which a person eats secretly while claiming to have no appetite and to be unable to eat. Also called *false anorexia*. See also [FACTITIOUS DISORDER](#), [MALINGERING](#). Compare [ANOREXIA](#). [From Greek *pseudes* false + *an-* not or without + *orexis* appetite + *-ia* indicating a condition or quality]

pseudoataxia *n.* Loss of ability to coordinate voluntary movements without any lesion in the [*central nervous system](#). Compare [ATAXIA](#). [From Greek *pseudes* false + *a-* without + *taxis* order + *-ia* indicating a condition or quality]

pseudo-attack *n.* Another name for a [*pseudoseizure](#).

*****ebook converter DEMO Watermarks*****

pseudobulbar palsy *n.* A neurological condition, resulting from a lesion in the ***corticobulbar pathway**, in which the voluntary muscles of the face are paralysed, resulting in ***dysarthria** and ***dysphagia**, but involuntary facial movements such as facial expressions, coughing, and sneezing are unaffected. Also called *pseudobulbar paralysis*. [From Greek *pseudes* false + English (*cortico*)*bulbar* (*pathway*)]

pseudocoma *n.* Another name for ***locked-in syndrome**.

pseudocyesis *n.* In ***DSM-IV**, a ***somatoform disorder** involving a phantom pregnancy, with a false belief of being pregnant together with many of the physical signs of pregnancy. In DSM-5 this condition is listed as a ***somatic symptom disorder**. Also called *false pregnancy*, *pseudopregnancy*. See also **COUVADE**, **SYMPATHETIC PREGNANCY**. [From Greek *pseudes* false + *kyesis* pregnancy]

pseudodementia *n.* A syndrome, usually associated with ***depression**, in which the symptoms of ***dementia** are mimicked but evidence for an ***organic disorder** is lacking. [From Greek *pseudes* false + Latin *dementare* to drive mad, from *de* from + *mens, mentis* mind + *-ia* indicating a condition or quality]

pseudodepression *n.* A condition following a massive lesion in the ***frontal lobe** of the brain, characterized by apathy, indifference, and loss of initiative but no experience of ***depression**.

pseudohallucination *n.* A type of ***hallucination** that seems to come from within one's mind rather than from outside as in a true hallucination, although some authorities consider this distinction obscure and unhelpful.

pseudohermaphrodite *n.* A person who has the reproductive organs of one sex and the external genitalia of the other. Compare **HERMAPHRODITE (1)**.

pseudohermaphroditism *n.* The congenital condition of being a pseudohermaphrodite. [From Greek *pseudes* false + English *hermaphrodite*]

pseudoinomnia *n.* A condition characterized by recurrent dreams of

lying awake, creating the delusion of insomnia. *Compare* [INSOMNIA](#).

pseudo-isochromatic *adj.* Of or relating to a plate or image of two or more colours that appears isochromatic (uniform in colour) to a person with a particular form of [*colour-blindness](#) and is included in a set of plates such as the [*Ishihara test](#) or the [*Stilling test](#) used to test colour vision.

pseudolalia *n.* Speechlike sounds that are not interpretable as language. [From Greek *pseudes* false, from *pseudein* to lie + *lalein* to babble + *-ia* indicating a condition or quality]

pseudolinguistic *adj.* Resembling language superficially, but lacking one or more of the defining properties of true [*language \(1\)](#).

pseudologia fantastica *n.* A syndrome characterized by habitual telling of implausible lies and fantastic exaggerations, usually half believed by the teller but often transparently improbable to the recipients. *Compare* [FACTITIOUS DISORDER](#). **pseudologue** *n.* A person with pseudologia fantastica; a liar. [From Greek *pseudes* false + *logos* discourse + *phantastikos* imaginary, from *phantazein* to make visible + *-ikos* of, relating to, or resembling]

pseudology *n.* The study of lying; the art or science of lying. [From Greek *pseudes* false + *logos* discourse]

pseudomemory *n.* Another name for a [*false memory](#). Also called *pseudomnesia*. [From Greek *pseudes* false + English *memory*]

pseudomnesia *n.* Another name for a [*false memory](#). [From Greek *pseudes* false + *a-* without + *mnasthai* to remember + *-ia* indicating a condition or quality]

pseudomorpheme *n.* A portion of a word that resembles a [*morpheme](#) but is not, in fact, one. For example, in the word *history*, the portion *his* is a pseudomorpheme, appearing to some people to be a morpheme and encouraging the coinage *herstory* to denote history viewed from a feminine or a feminist perspective.

pseudomutuality *n.* A relationship between marriage partners, family members, or other people closely involved with each other in which surface harmony and agreement cloaks deep and damaging interpersonal conflicts that are not confronted openly.

pseudophone *n.* A device that transposes the sounds entering the left and right ears, used for studying **sound localization*. Compare **PSEUDOSCOPE**. [From Greek *pseudes* false + *phone* a sound or voice]

pseudopregnancy *n.* Another name for **pseudocyesis*.

pseudoscope *n.* A device that transposes the images projected on to the retinas of the left and right eyes, causing distance relations to be inverted so that convex objects appear concave and vice versa. Compare **PSEUDOPHONE**. [From Greek *pseudes* false + *skopeein* to view]

pseudoseizure *n.* An attack resembling an epileptic **seizure* or **convulsion* but lacking the **EEG* patterns associated with **epilepsy* and therefore ascribed to **psychogenic* causes. Also called a *non-epileptic seizure* or *convulsion*, *hysterical epilepsy*, a *hysterical seizure* or *convulsion*, a *pseudo-attack*, or a *psychogenic seizure* or *convulsion*.

psi *n.* A generic term for **paranormal* phenomena, including especially **extra-sensory perception* (telepathy, clairvoyance, and precognition) and **psychokinesis*. It is often preferred to more specific terms on the ground that it is difficult or impossible to distinguish between alternative manifestations of psi, as when an apparent demonstration of telepathy in a card-guessing experiment could be explicable by clairvoyance (paranormal perception of the cards themselves rather than of the sender's thoughts) or psychokinesis (paranormal control of the order of the cards during the shuffling process). [Named after *psi* (Ψ), the 23rd letter of the Greek alphabet, alluding to the adjective *psychic* or *psychical*]

psilocybin *n.* A **hallucinogen* belonging to the group of **indole* alkaloids, occurring in the form of a crystalline phosphate ester in the magic mushroom *Psilocybe mexicana*. See also **PHANTASTICANT**, **PSYCHEDELIC**,

TEONANACTYL. [From Greek *psilos* bare + *kybe* head, alluding to the appearance of the magic mushroom]

psi-missing *n.* A **psi* or parapsychological effect that is statistically significant in the opposite direction to the experimental hypothesis, such as a significantly below-chance number of hits in an experiment on telepathy or clairvoyance. *See also* **MISS**.

psittacism *n.* Meaningless, repetitive speech. [From Latin *psittacus* a parrot]

P600 *abbrev.* An **event-related potential* elicited when a person encounters a grammatical anomaly, either when reading text or listening to speech. It is also called the *syntactic positive shift*. It was first reported in 1992 by the US psychologists Lee Osterhout (born 1959) and Philip J. Holcombe (born 1951) in an article in the journal *Psychophysiological Brain Research*. [From *p(ositive) 600 (milliseconds)*]

psychasthenia scale *See* **MMPI**.

psyche *n.* The human mind or soul. In Greek mythology, the soul was personified by Psyche, a young woman who was loved by Eros, the god of love who married Psyche but visited her only at night and insisted that she should never see his face. One night Psyche lit an oil lamp while Eros was asleep, fell in love with him at first sight, and was so startled by his beauty that she spilt a drop of hot oil on his shoulder and awakened him, whereupon he immediately abandoned her. To win him back, Psyche had to endure many trials and dangers, but eventually she was transformed into a goddess and joined him in heavenly bliss. Psyche is often depicted in works of art with butterfly wings or as a butterfly, because she symbolizes the human soul, suffering hardship and struggle in life but re-emerging after death in a new and better existence, like a caterpillar reborn as a butterfly. **psychic** or **psychical** *adj.* [From Greek *psyche* breath, from *psychein* to breathe, alluding to the ancient belief that breathing was evidence that the soul had not yet left the body]

psychedelic *adj.* Of, relating to, or resembling a state of subjectively
*****ebook converter DEMO Watermarks*****

heightened perception and awareness associated with certain drugs, including **phenylalkylamines* such as **mescaline*, **STP*, and **ecstasy* (2); **indole* alkaloids such as **bufotenin*, **DMT*, **harmine*, **LSD*, and **psilocybin*; and various other compounds such as **ibotenic acid*, **myristin*, **ololiuqui*, and **phencyclidine*. Also spelt *psychodelic*. See also *AMANITA MUSCARIA*, *FLY AGARIC*, *MAGIC MUSHROOM*, *MORNING GLORY*, *TEONANACTYL*. Compare *HALLUCINOGEN*, *PHANTASTICANT*. **psychedelia** *n.* The culture and phenomena associated with psychedelic experiences and drugs. Also spelt *psychodelia*, but this is avoided in careful usage. [From Greek *psyche* mind + *delos* visible or clear + *-ikos* of, relating to, or resembling]

psychiatry *n.* The branch of medicine devoted to the diagnosis, classification, treatment, and prevention of **mental disorders*. Compare *CLINICAL PSYCHOLOGY*, *NEUROLOGY*, *NEUROPSYCHIATRY*. **psychiatric** *adj.* **psychiatrist** *n.* A physician who practises psychiatry. [From Greek *psyche* mind + *iatros* a physician]

psychic *adj.* **1.** Another word for **paranormal*, or sensitive to paranormal or spiritual phenomena, influences, or forces. Also written *psychical*. **2.** Mental as opposed to physical. *n.* **3.** A person who professes paranormal or spiritual powers or abilities. [From Greek *psychikos* of or relating to the soul, from *psyche* the soul + *-ikos* of, relating to, or resembling]

psychical apparatus *n.* In **psychoanalysis*, a term used prolifically by Sigmund Freud (1856–1939) and his followers for the mind, including its various conscious and unconscious components. Also called *psychic apparatus*.

psychical conflict *n.* In **psychoanalysis*, the situation that exists when two contradictory tendencies oppose each other in a person's mind. Some such conflicts are conscious, as when a desire is opposed by a moral constraint, but it is unconscious conflicts that are assumed to generate **neurotic* (1) symptoms. In an article on 'The Psycho-Analytic View of Psychogenic Disturbances of Vision' (1910), Sigmund Freud (1856–1939) argued that conflicts between ideas are invariably traceable to conflicts between instincts: 'We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts

*****ebook converter DEMO Watermarks*****

are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggle between the various instincts' (*Standard Edition*, XI, pp. 211–18, at p. 213.) Also called *psychic conflict*.

psychical determinism *n.* In **psychoanalysis*, the assumption, first introduced by Sigmund Freud (1856–1939), that no psychological phenomena, not even **dreams*, **symptoms*, or **parapraxes*, occur by chance, but that they can always be assigned definite causes. Freud discussed this concept at length in his book *The Psychopathology of Everyday Life* (1901, *Standard Edition*, VI), citing numerous anecdotal instances. Also called *psychic determinism*. See also [OVERDETERMINATION](#), [REDUCTIVE INTERPRETATION](#).

psychical reality *n.* In **psychoanalysis*, anything that strikes a person as real, including fantasies that are experienced as memories of actual occurrences, including those of sexual seduction in childhood, whether or not they are based on real events. Sigmund Freud (1856–1939) claimed in his book *Introductory Lectures on Psycho-Analysis* (1916–17) that 'phantasies possess *psychical* as contrasted with material reality' and that '*in the world of the neuroses it is the psychical reality which is the decisive kind*' (*Standard Edition*, XV–XVI, at p. 368, italics in original). This concept has been attacked as an absurd and dangerous blurring of the distinction between truth and fantasy arising from Freud's discovery that his patients' claims of childhood seduction were untrue. Also called *psychic reality*. See also [SEDUCTION THEORY](#).

psychical research *n.* An obsolescent name for **parapsychology*. The world's first Society for Psychical Research was formed in Cambridge, England, in 1882; the American Society for Psychical Research was founded in 1885.

psychic apparatus See [PSYCHICAL APPARATUS](#).

psychic conflict See [PSYCHICAL CONFLICT](#).

psychic determinism See [PSYCHICAL DETERMINISM](#).

psychic reality *See* PSYCHICAL REALITY.

psychoacoustics *n.* The study of the relationship between sounds and their psychological effects. [A blend of *psycho(logy)* + *acoustics*]

psychoactive *adj.* Another word for **psychotropic*.

psychoanaleptic *adj. n.* (Of or relating to) a **stimulant drug*. [From Greek *psyche* the mind + *analeptikos* restorative, from *analambanein* to take up, from *ana* up + *lambanein* to take + *-ikos* of, relating to, or resembling]

psychoanalysis *n.* A theory of mental structure and function, consisting of a loosely connected set of concepts and propositions, a theory of mental disorders, and an associated method of **psychotherapy* (the ‘talking cure’) based on the writings of Sigmund Freud (1856–1939), its distinctive character residing in the emphasis that Freud placed on unconscious mental processes and the various mechanisms people use to repress them. As a therapeutic method, its major techniques are **free association*, **dream analysis*, the **interpretation (2)* of **parapraxes*, and the analysis of the **transference*. The Austrian neurologist Sigmund Freud (1856–1939) introduced the term in 1896 in an article on ‘Heredity and the Aetiology of the Neuroses’ (*Standard Edition*, III, pp. 143–56). Also spelt *psychoanalysis*. *See also* ADLERIAN, EGO PSYCHOLOGY, ERIKSONIAN, FREUDIAN, INSIGHT (3), JUNGIAN, KLEINIAN, KOHUTIAN, LACANIAN, NEO-FREUDIAN, OBJECT-RELATIONS THEORY, PSYCHOANALYTIC CONSTRUCTION, RESISTANCE, SELF-ANALYSIS, SELF-PSYCHOLOGY, WILD PSYCHOANALYSIS, WINNICOTTIAN. *Compare* PSYCHOANALYTIC PSYCHOTHERAPY. **psychoanalytic** *adj.* [From Greek *psyche* mind + *analysis* dissolution, from *ana-* up + *lysis* loosening, from *lyein* to loosen]

psychoanalyst *n.* One who practises **psychoanalysis*. Also called an *analyst*.

psychoanalytic construction *n.* In **psychoanalysis*, an explanation of a person's verbal utterances and actions that is more extensive and further removed from the empirical material than an **interpretation (2)*. Sigmund Freud (1856–1939) introduced this concept in 1937 in an article entitled

‘Constructions in Analysis’ (*Standard Edition*, XXIII, pp. 257–69), where he suggested that when a correct construction is put to a patient it sometimes results in the emergence of a repressed memory, and that it can be useful even when that does not happen: ‘Quite often we do not succeed in bringing the patient to recollect what has been repressed. Instead of that, if the analysis is carried out correctly, we produce in him an assured conviction of the truth of the construction which achieves the same therapeutic result as the recaptured memory’ (pp. 265–6). Freud’s articles ‘Psycho-analytic Notes on an Autobiographical Account of a Case of Paranoia (Dementia Paranoides)’ (1911, *Standard Edition*, XII, pp. 9–82) and ‘A Child is Being Beaten’ (1919, *Standard Edition*, XVII, pp. 179–204) contain virtuosic examples of psychoanalytic construction.

psychoanalytic psychotherapy *n.* A form of **psychotherapy* that evolved out of **psychoanalysis* and that uses many of its assumptions and techniques but that falls short of formal psychoanalysis. It tends to focus on specific problems—often a single conflict such as an inability to respond appropriately to criticism—and on aspects of the client’s social interactions. Also called *analytic therapy*.

psychobabble *n.* A term coined by the US writer Richard Dean Rosen (born 1949) in the title of his book *Psychobabble* (1977) for excessive or superfluous psychological **jargon* (1), especially in connection with various forms of **psychotherapy*.

psychobiology *n.* A term coined by the Swiss-born US psychiatrist and neurologist Adolf Meyer (1866–1950) for the study of the relationships between psychological and biological phenomena.

psychocardiology *n.* The study of psychological factors in the aetiology, diagnosis, treatment, and prevention of coronary heart disease. The field was launched by the German psychologist Jochen Jordan (born 1951) and two colleagues at an international conference (*Statuskonferenz Psychokardiologie*) in Frankfurt in 1998. Also called *behavioural cardiology* (US *behavioral cardiology*) or *cardiac psychology*. See also *TYPE A*, *TYPE D*. [From Greek *psyche* the mind + *kardia* heart + *logos* word, discourse, or reason]

*****ebook converter DEMO Watermarks*****

psychodermatology *n.* A branch of medicine, at the interface of psychiatry and dermatology, devoted to the diagnosis, classification, treatment, and prevention of disorders in which psychological factors are present together with **signs* or **symptoms* in the **skin*. The term was introduced in 1974 by the Dutch psychiatrist, sexologist, and dermatologist Herman Musaph (1915–92) in an article entitled ‘Psychodermatology’ in the journal *Psychotherapy and Psychosomatics*. See also [HYPNODERMATOLOGY](#).
psychodermatologist *n.* One who practises psychodermatology.
psychodermatological *adj.* [From Greek *psyche* soul or mind + English *dermatology*, the study of the skin, from Greek *derma*, *dermatos* the skin + *logos* word, discourse, or reason]

psychodrama *n.* A form of **group therapy* in which people act out their own emotional problems and conflicts in front of audiences in order to gain objectivity and understanding of them. See also [DRAMA THERAPY](#), [SOCIODRAMA](#).

psychodynamic *adj.* Of or relating to the **dynamic* interplay of psychological processes. See [DYNAMIC PSYCHOLOGY](#).

psychodysleptic *adj. n.* (Of or relating to) a **hallucinogen*. [From Greek *psyche* the mind + *dys-* bad or abnormal + *lepsis* a seizure, from *lambanein* to take + *-ikos* of, relating to, or resembling]

psychoendocrinology *n.* The interface between **psychology* and **endocrinology*; the study of the interaction between hormones, behaviour, and mental experience.

psychoenergizer *n.* An **antidepressant* drug belonging to the class of **monoamine oxidase inhibitors* (MAOIs).

psychogalvanic response *n.* Another name for a **galvanic skin response*. **PGR** *abbrev.* [From Greek *psyche* the mind + *galvanic* of or relating to current electricity, named after the Italian physiologist Luigi Galvani (1737–98) who first showed that muscles contract when electricity is passed through them]

psychogenesis *n.* The production of a disorder, including a ***mental disorder**, or a ***sign (1)** or ***symptom**, by a psychological rather than a physical process. **psychogenic** *adj.* Compare **ORGANIC MENTAL DISORDER**. [From Greek *psyche* mind + *genes* born]

psychogenic amnesia *n.* Any form of ***amnesia** arising by ***psychogenesis** rather than as part of an ***organic disorder**, similarly *psychogenic fugue*, *psychogenic pain disorder*, and so on.

psychogenic attack *n.* Another name for a ***pseudoseizure**. Also called a *psychogenic convulsion* or a *psychogenic seizure*. [From Greek *psyche* mind + *genes* born + *-ikos* of, relating to, or resembling]

psychogeriatrics *n.* The branch of medicine devoted to the prevention, diagnosis, and treatment of mental disorders affecting old people. Compare **GERIATRICS**. [From Greek *psyche* mind + *geras* old age + *iatros* a doctor + *-ikos* of, relating to, or resembling]

psychoid *adj.* In ***analytical psychology**, soul-like, a term that Carl Gustav Jung (1875–1961) applied to the ***collective unconscious**, which ‘cannot be directly perceived or “represented”, in contrast to the perceptible psychic phenomena, and on account of its “unrepresentable” nature I have called it “psychoid” ’ (*Collected Works*, 8, paragraph 840). [From Greek *psyche* the soul + *-oid* indicating likeness or resemblance, from *eidos* shape or form]

psychoimmunology *n.* The interface between ***psychology** and ***immunology**; the study of the interaction between behaviour, mental experience, and the immune system. Compare **PSYCHONEUROIMMUNOLOGY**. [From *psycho(logy)* + *immunology*]

psychokinesis *n.* The movement or change of physical objects by mental processes without the application of physical force, a conjectural ***paranormal** phenomenon. See also **ILLUSION OF CONTROL**, **PSYCHOPRAXIA**, **TELEKINESIS**. Compare **EXTRA-SENSORY PERCEPTION**. **PK** *abbrev.* **psychokinetic** *adj.* [From Greek *psyche* mind + *kinesis* movement]

psycholinguistics *n.* A word introduced by collective agreement at an academic conference in 1953 to denote the psychology of language, including language acquisition by children and all aspects of the production and comprehension of speech and writing.

psychological autopsy *n.* A postmortem study of the possible reasons for a person's death, especially after a suspected suicide, by interviewing relatives and acquaintances, examining diaries and letters, and making other personal inquiries.

psychological decision theory *n.* A **normative* (2) and descriptive approach to judgement and decision introduced in the early 1970s by the Israeli-American psychologists Amos Tversky (1937–96) and Daniel Kahneman (born 1934) and the US psychologists Paul Slovic (born 1938), Sarah C. Lichtenstein (born 1933), and Baruch Fischhoff (born 1946). *See* [BASE-RATE FALLACY](#), [CAUSAL SCHEMA](#), [CONJUNCTION FALLACY](#), [ELIMINATION BY ASPECTS](#), [FRAMING EFFECT](#), [HEURISTIC](#), [HINDSIGHT BIAS](#), [NON-REGRESSIVENESS BIAS](#), [PROSPECT THEORY](#), [REGRESSION FALLACY](#), [SAMPLE SIZE FALLACY](#), [TAXICAB PROBLEM](#). *See also* [BOUNDED RATIONALITY](#), [SATISFICING](#), [TIME-SAVING BIAS](#). *Compare* [BEHAVIOURAL DECISION THEORY](#), [DECISION THEORY](#).

psychological differentiation *n.* Another name for field independence. *See* [FIELD DEPENDENCE–INDEPENDENCE](#).

psychological essentialism *n.* The theory that people implicitly assume that things have essences that make them what they are, even when these essences are unknown, and that we classify things according to this assumption. *See also* [COMPONENTIAL THEORY](#), [ESSENTIALISM](#). *Compare* [PROTOTYPE THEORY](#). [From Latin *essentia* essence, from *esse* to be + Greek *-ismos* indicating a state or condition]

psychological primary *n.* Any of the colours red, yellow, green, or blue that are basic to the processing of colour in the visual system and are perceived as cardinal or fundamental rather than as mixtures of other colours. Also called a *unique colour*, *unique hue*, or *primary colour*, though the latter term is ambiguous. *See also* [BEZOLD–BRÜCKE PHENOMENON](#), [SPECTRUM](#).

Compare [ADDITIVE PRIMARY](#), [PRIMARY COLOUR \(1, 2\)](#), [SUBTRACTIVE PRIMARY](#).

psychological refractory period See [REFRACTORY PERIOD \(3\)](#). **PRP** abbrev.

psychologism *n.* An exaggeration of the importance or significance of psychology; a belief that psychology is the basis of philosophy or of all natural and social sciences; any unjustified or fanciful psychological explanation for a non-psychological phenomenon, such as [*drapetomania](#) or [*dysaesthesia aethiopsis](#).

psychology *n.* The study of the nature, functions, and phenomena of behaviour and mental experience. The etymology of the word (see below) implies that it is simply the study of the mind, but much of modern psychology focuses on behaviour rather than the mind, and some aspects of psychology have little to do with the mind. Many textbooks define psychology simply as the study of behaviour, or the science of behaviour, but that too is to exclude much of psychology: the study of [*cognition](#), for example, is concerned with behaviour only indirectly, as evidence of mental processes. The establishment of psychology as an independent discipline, separate from the disciplines of philosophy and biology from which it emerged, is attributable to the German psychologist Wilhelm (Max) Wundt (1832–1920), who stated in the opening sentence of his book *Principles of Physiological Psychology* (1873), the first major textbook of experimental psychology: ‘The book that I herewith offer to the public attempts to mark out a new domain of science’, and who founded the first psychological laboratory in Leipzig in 1879. See also [PSYCHE](#). [From Greek *psyche* soul or mind + *logos* word, discourse, or reason. The Latin *psychologia* emerged from obscure origins in Germany in the 16th century; the English word *psychology* first appeared in 1693 in Steven Blankaart's *The Physical Dictionary: Wherein the terms of Anatomy, the names and causes of Diseases, chyrurgical Instruments and their Use; are accurately Describ'd*: Blankaart refers to ‘*Anthropologia*, the Description of Man, or the Doctrin concerning him [which is divided] into Two Parts; viz. *Anatomy*, which treats of the Body, and *Psychology*, which treats of the Soul’ (p. 13, italics in original)]

psycholytic *adj. n.* (Of or relating to) a ***hallucinogen**. [From Greek *psyche* the mind + *lysis* loosening]

psychometric function *n.* In ***signal** detection theory, a plot of the intensity of stimuli on the horizontal axis against the percentage of correct detections of the stimuli on the vertical axis, the resulting curve being generally S-shaped. Also called a *poikilitic function*. [From Greek *psyche* mind + *metron* a measure + *-ikos* of, relating to, or resembling]

psychometrics *n.* The construction and application of psychological tests; mental measurement. [From Greek *psyche* mind + *metron* a measure + *-ikos* of, relating to, or resembling]

psychomotor *adj.* Of or relating to the relationship between mental activity and bodily movements. [From Greek *psyche* mind + Latin *motus* a movement, from *movere* to move]

psychomotor agitation *n.* Excessive motor activity, usually consisting of purposeless behaviour such as pacing, fidgeting, or hand-wringing, accompanied by a feeling of ***anxiety** or tension. *Compare* **PSYCHOMOTOR RETARDATION**. [From Latin *agitatus* stirred, from *agitare* to set into motion + *-ion* indicating an action, process, or state]

psychomotor depressant *n.* Another name for a central nervous system ***depressant drug**.

psychomotor epilepsy *n.* Another name for ***temporal lobe epilepsy**.

psychomotor retardation *n.* A general slowing of bodily movements, including eye blinking and speech, often associated with ***depression**. *Compare* **PSYCHOMOTOR AGITATION**. [From Latin *retardare*, *retardatum* to slow down, from *re-* again + *tardare* to slow + *-ation* indicating a process or condition]

psychomotor seizure *n.* A ***seizure** of the type found in ***temporal lobe epilepsy**, without any evidence of a ***convulsion**. Also called a *temporal*

lobe seizure.

psychomotor stimulant *n.* Another name for a central nervous system *stimulant drug.

psychoneuroimmunology *n.* The study of the interactions between psychological phenomena, the *nervous system, and the *immune system, including especially psychological effects such as *stress (1) on immune responses. This field of research emerged in the US in the early 1970s. Compare PSYCHOIMMUNOLOGY. **PNI** *abbrev.* [From *psycho*(logy) + Greek *neuro*(n) a nerve + English *immunology*]

psychoneurosis *n.* Another name for a *neurosis. In *psychoanalysis, it is any neurosis that is not an *actual neurosis, and it is also called a *neuropsychosis*. It includes *narcissistic neuroses and *transference neuroses. [From Greek *psyche* mind + *neuron* a nerve + *-osis* indicating a process or state]

psychopathic deviate scale *See* MMPI.

psychopathic personality *n.* A personality disorder characterized by *psychopathy.

psychopathology *n.* The study of *mental disorders; another name for *abnormal psychology. [From Greek *psyche* mind + *pathos* suffering + *logos* word, discourse, or reason]

psychopathy *n.* A *mental disorder roughly equivalent to *antisocial personality disorder, but with emphasis on affective and interpersonal *traits such as superficial charm, pathological lying, egocentricity, lack of remorse, and callousness that have traditionally been regarded by clinicians as characteristic of psychopaths, rather than social deviance traits such as need for stimulation, parasitic lifestyle, poor behavioural controls, impulsivity, and irresponsibility that are prototypical of antisocial personality disorder. Whether psychopathy and antisocial personality disorder share a common referent is an open question. The emotional deficit in psychopathy is

considered to be central, but its interpretation is controversial. According to the *anxiety deficit theory*, people with psychopathy focus on the present and lack normal anxiety or fear responses to future aversive events. According to the *empathy deficit theory*, such people have a primary dysfunction of empathic social responses. See also [PSYCHOPATHY CHECKLIST–REVISED](#). Compare [SOCIOPATHY](#). **psychopath** *n.* A person with psychopathy. **psychopathic** *adj.* [From Greek *psyche* mind + *pathos* suffering]

Psychopathy Checklist–Revised *n.* An instrument for measuring [*psychopathy](#), developed by the Canadian criminologist Robert D(ouglas) Hare (born 1934) and published commercially in 1991, based on an earlier Psychopathy Checklist ([PCL](#)) that he published in the journal *Personality and Individual Differences* in 1980. It comprises 20 items associated with behavioural, affective, and interpersonal attributes of psychopathy, taken from the classic description of the syndrome in *The Mask of Sanity: An Attempt to Reinterpret the So-called Psychopathic Personality* (1941) by the US neuropsychiatrist Hervey (Milton) Cleckley (1903–84). Each item is scored from 0 (not applicable) to 2 (highly applicable) on the basis of a semi-structured interview and collateral file review. [*Factor](#) analysis of scores from the Psychopathy Checklist and the Psychopathy Checklist–Revised has consistently identified two correlated but distinct factors, the first associated with affective and interpersonal attributes, such as superficial charm, selfishness, callousness, manipulativeness, pathological lying, lack of empathy, and shallow affect, and the second associated with socially deviant behaviour and lifestyle, including proneness to boredom, parasitic lifestyle, impulsivity, early behavioural problems, irresponsibility, and delinquent behaviour. The range of possible scores is 0–40, and the conventional cut-off score for diagnosing psychopathy is 30. According to this criterion, a person with true psychopathy has both an emotional disorder and a propensity to manifest antisocial behaviour. Hare found that 28 per cent of male prison inmates in the US scored at or above this cut-off score, and research in the UK has found a similar proportion. Also called the *Hare Psychopathy Checklist*. **PCL–R** *abbrev.*

psychopharmacology *n.* The study of the effects of drugs on behaviour and mental experience, with particular emphasis on changes in mood, emotions, and psychomotor functions and abilities. [From

psycho(logy) + pharmacology]

psychophysical function *n.* In **psychophysics*, a mathematical expression of the relation between the magnitude of sensations and the intensity of the stimuli that excite them, for example a relation between loudness and sound intensity or between perceived heaviness and mass. See FECHNER'S LAW, FULLERTON–CATTELL LAW, MERKEL'S LAW, PIPER'S LAW, POWER LAW, RICCO'S LAW, WEBER'S LAW. See also PSYCHOPHYSICAL SCALE.

psychophysical parallelism *n.* An approach to the **mind–body problem* first suggested by the German philosopher Gottfried Wilhelm Leibniz (1646–1716) in the early 18th century, a form of **dualism* according to which mental and physical processes are perfectly correlated but not **causally* connected, like the movements of two clocks standing side by side. Also called *parallelism*. Compare EPIPHENOMENALISM, INTERACTIONISM (1).

psychophysical scale *n.* In **psychophysics*, a specification of the values of a psychological dimension of perceived magnitude (such as brightness, loudness, or heaviness) corresponding to values of a physical dimension of stimulus intensity (such as luminous intensity, sound intensity, or mass). See DIRECT SCALING, FRACTIONATION, INDIRECT SCALING, LOUDNESS MATCHING, MAGNITUDE ESTIMATION, MAGNITUDE PRODUCTION, METHOD OF ABSOLUTE JUDGEMENT, METHOD OF BISECTION, METHOD OF EQUAL AND UNEQUAL CASES, METHOD OF EQUAL-APPEARING INTERVALS, METHOD OF GRADATION, METHOD OF PAIRED COMPARISONS, PRODUCTION METHOD, SENSE RATIO METHOD, STAIRCASE METHOD, UNFOLDING TECHNIQUE. See also PSYCHOPHYSICAL FUNCTION.

psychophysics *n.* The oldest branch of experimental psychology, concerned with the relationship between the psychological magnitude of sensations and the physical intensity (broadly interpreted to include any perceptible stimulus dimension) of the stimuli that produce them. It is concerned partly with the determination of **absolute thresholds* and **difference thresholds*, using variations of three classical methods called the **method of constant stimuli*, the **method of limits*, and the **method of average error*, and partly with the establishment of **psychophysical functions* and **psychophysical scales*. Among its greatest achievements are **Weber's law*, **Fechner's law*, and the **power law*, and one of its most important

*****ebook converter DEMO Watermarks*****

modern forms is **signal* detection theory. *See also* ABSOLUTE ERROR, ABX PARADIGM, CATCH TRIAL, CONSTANT ERROR, CROSS-MODAL MATCHING, DIRECT SCALING, FRACTIONATION, FULLERTON–CATTELL LAW, GLOBAL PSYCHOPHYSICS, INDIRECT SCALING, INTERVAL OF UNCERTAINTY, LOUDNESS MATCHING, MAGNITUDE ESTIMATION, MAGNITUDE MATCHING, MAGNITUDE PRODUCTION, MERKEL’S LAW, METHOD OF ABSOLUTE JUDGEMENT, METHOD OF BISECTION, METHOD OF EQUAL AND UNEQUAL CASES, METHOD OF EQUAL-APPEARING INTERVALS, METHOD OF GRADATION, METHOD OF PAIRED COMPARISONS, OLFACTIE, PIPER’S LAW, PRODUCTION METHOD, RELATIVE ERROR, RICCO’S LAW, SENSE RATIO METHOD, STAIRCASE METHOD, STANDARD STIMULUS, UNFOLDING TECHNIQUE, VARIABLE ERROR, VARIABLE STIMULUS, WEBER FRACTION. **psychophysical** *adj.*

psychophysiology *n.* The branch of psychology devoted to studying the physiological correlates of psychological functions and phenomena.

psychoplegic *adj. n.* (Of or relating to) a **neuroleptic* (1) drug. [From Greek *psyche* the mind + *plege* a blow + *-ikos* of, relating to, or resembling]

psychopomp *n.* One who conducts souls to the other world after death, a function ascribed in Greek mythology to Hermes. In **analytical psychology*, the word used by Carl Gustav Jung (1875–1961) to describe the role of the **anima* and **animus* (3) as go-betweens, linking the **ego* and the **unconscious* (2). **psychopomps** or **psychopompoi** *pl.* [From Greek *psyche* a soul + *pompos* a guide, from *pompein* to send or conduct]

psychopraxia *n.* A concept intended to unify **psychology* and **parapsychology*, eliminating the conceptual distinction between **extra-sensory perception* (ESP) and **psychokinesis* (PK), and also the distinction between normal information-acquisition and normal motor control. It was introduced by the Australian psychologist Michael (Anthony) Thalbourne (born 1955) in *A Glossary of Terms Used in Parapsychology* (1982, pp. 62–63). **psychopractic** *adj.* Of or relating to psychopraxia. [From Greek *psyche* spirit or soul + *praxis* a deed, from *prassein* to do]

psychoprophylaxis *n.* A training system based on breathing and relaxation exercises designed to prepare women for childbirth. [From Greek *psyche* the mind + *prophylaxis* protecting against affliction, from *pro* before

*****ebook converter DEMO Watermarks*****

+ *phylax* a guard]

psychose passionelle *n.* Another name for **erotomantic delusional disorder*. [French, literally insanity of passion]

psychosexual development *n.* In **psychoanalysis*, the progress during infancy and childhood through a sequence of **libidinal stages*. See ANAL STAGE, GENITAL STAGE, LATENCY PERIOD, ORAL STAGE, PHALLIC STAGE, POLYMORPHOUS PERVERSITY. See also MIRROR PHASE, NARCISSISM.

psychosexual dysfunctions *n.* Another name for **sexual dysfunctions*.

psychosexual stage *n.* Another name for a **libidinal stage*.

psychosis *n.* 1. Any mental disorder characterized by **delusions* and/or prominent **hallucinations* with or, in the narrowest definition of the term, without **insight* (3) into their pathological nature. Broader definitions include mental disorders characterized by other **positive symptoms* of **schizophrenia* such as **disorganized thinking* or **catatonia*. 2. In older psychological and psychiatric literature, mental impairment grossly interfering with the capacity to meet ordinary demands of life, or gross impairment in **reality testing*. Compare NEUROSIS. **psychoses** *pl.* [A word introduced in 1845 by the Austrian psychiatrist Ernst von Feuchtersleben (1806–49) in his *Lehrbuch der ärztlichen Seelkunde* (translated into English in 1847 as *The Principles of Medical Psychology*), from Greek *psyche* mind + *-osis* indicating a process or state]

psychosocial moratorium *n.* In **ego* psychology, a term introduced by the German-born psychoanalyst Erik H. Erikson (1902–94) to denote a ‘time out of life’ during which a person can retain a fluid identity, such a period often being a feature of early post-adolescent life in modern industrial societies, when young adults can take time out by travelling, for example, before settling into more fixed identities constrained by work and relationships.

psychosocial stressor *n.* Any life event or change, such as divorce, marriage, bereavement, loss or change of a job, or moving house, that causes **stress (1)* and may be associated with the onset or deterioration of a **mental disorder*. *See also* ADJUSTMENT DISORDERS.

psychosomatic *adj.* Of or relating to certain **organic disorders*, such as hypertension, that are believed to be caused or aggravated by psychological factors, such as **stress (1)*. [From Greek *psyche* mind + *soma* body + *-itikos* resembling or marked by]

psychosomatic disorder *n.* Any disorder that is **psychosomatic*. Also, in **psychoanalysis*, called an *organ neurosis*.

psychosomatic medicine *n.* The branch of medicine devoted to **psychosomatic disorders*.

psychostimulant *n.* Another name for a central nervous system **stimulant drug*.

psychosurgery *n.* Surgical operations such as **frontal leucotomy* performed on physically normal brain tissue to treat mental disorders rather than brain pathologies. *Compare* NEUROSURGERY.

psychotherapy *n.* The treatment of **mental disorders* and allied problems by psychological methods. *See* ACCEPTANCE AND COMMITMENT THERAPY, ANALYTIC PSYCHOLOGY, ART THERAPY, ASSERTIVENESS TRAINING, AUTOGENIC TRAINING, BEHAVIOUR THERAPY, BIBLIOTHERAPY, BIOENERGETICS (2), BODY THERAPIES, BRIEF PSYCHOTHERAPY, CLIENT-CENTRED THERAPY, CO-COUNSELLING, COGNITIVE–ANALYTIC THERAPY, COGNITIVE BEHAVIOUR MODIFICATION (CBM), COGNITIVE THERAPY, CONJOINT THERAPY, CONTINGENCY MANAGEMENT, COUPLES THERAPY, CRISIS INTERVENTION, DANCE THERAPY, DRAMA THERAPY, EST, EXISTENTIAL THERAPY, EXPERIENTIAL THERAPY, EYE-MOVEMENT DESENSITIZATION AND REPROCESSING (EMDR), FACILITATED COMMUNICATION (FC), FAMILY THERAPY, FIXED-ROLE THERAPY, FOCAL THERAPY, GESTALT THERAPY, GROUP THERAPY, HYPNOTHERAPY, LOGOTHERAPY, MARITAL THERAPY, MILIEU THERAPY, MODELLING, MORITA THERAPY, MULTIMODAL THERAPY (MMT), MUSIC THERAPY,

NARCOANALYSIS, NARCOSYNTHESIS, NARCOTHERAPY, NEURO-LINGUISTIC PROGRAMMING, ONLINE THERAPY, ORGONE THERAPY, PARADOXICAL THERAPY, PERSONAL CONSTRUCT THERAPY, PHOTOTHERAPY, PLAY THERAPY, PRIMAL THERAPY, PROGRESSIVE RELAXATION, PSYCHOANALYSIS, PSYCHOANALYTIC PSYCHOTHERAPY, RATIONAL EMOTIVE BEHAVIOUR THERAPY (REBT), REBIRTHING, REFLEXOLOGY (1), ROLFING, SEX THERAPY, SOCIODRAMA, T-GROUP, TRANSACTIONAL ANALYSIS (TA), TRANSCENDENTAL MEDITATION (TM), WILL THERAPY. *See also* DISTRESS RELIEF QUOTIENT, DODO BIRD CONJECTURE, EDUCATIONAL PSYCHOTHERAPY, NEGATIVE THERAPEUTIC REACTION. **psychotherapeutic** *adj.* **psychotherapist** *n.* One who practises psychotherapy. [From Greek *psyche* mind + *therapeia* service or treatment, from *therapeuein* to take care of or to heal]

psychotic *adj.* 1. Of, pertaining to, or resembling ***psychosis** (1). *n.* 2. A person with a ***psychosis** (1). [From Greek *psyche* mind + *-osis* indicating a process or state + *-itikos* resembling or marked by]

psychotic depression *n.* A form of ***depression** accompanied either by symptoms of ***psychosis** (1) such as ***delusions** or ***hallucinations** or by depressive ***stupor**.

psychotic disorder *n.* Any ***mental disorder** characterized by ***hallucinations**, ***delusions**, ***disorganized speech**, ***negative symptoms**, or grossly abnormal body movements. *See* SCHIZOPHRENIA SPECTRUM AND OTHER PSYCHOTIC DISORDERS.

psychotic disorder due to another medical condition *n.* In ***DSM-5**, a disorder characterized by prominent ***hallucinations** or ***delusions** resulting from a medical condition such as an ***endocrine disorder**, a metabolic disorder, an autoimmune disorder, or (most commonly) ***temporal lobe epilepsy**. For ***differential diagnosis**, it must be distinguished from ***delirium**, ***substance/medication-induced psychotic disorder**, and other ***psychotic disorders**. *See also* SCHIZOPHRENIA SPECTRUM AND OTHER PSYCHOTIC DISORDERS.

psychoticism *n.* A psychological condition or state characterized by ***psychosis** (1). Also, one of the three major dimensions of personality in the later writings (from 1975 onwards) of the German-born British psychologist

*****ebook converter DEMO Watermarks*****

Hans J(ürgen) Eysenck (1916–97), characterized by **traits* such as aggressiveness, coldness, impulsiveness, antisocial behaviour, tough-mindedness, and creativity. Also called *tough-mindedness*.

psychotogen *n.* A chemical substance or drug that induces a **psychotic* (1) state. **psychotogenic** *adj.* [From *psychotic* + Greek *gainein* to produce]

psychotomimetic *n.* Another name for a **hallucinogen*. [From *psychotic* + Greek *mimesis* imitation, from *mimeisthai* to imitate + *-ikos* of, relating to, or resembling]

psychotropic *adj.* Affecting mental experience or behaviour, generally referring to a **drug* that has such effects. Also called *psychoactive*. See ANAESTHETIC (2), ANALGESIC (2), ANTICHOLINERGIC, ANTICONVULSANT, ANTIDEPRESSANT, ANTIMANIC, ANTIPARKINSONIAN, ANXIOLYTIC, APHRODISIAC, BETA-BLOCKER, CHOLINOMIMETIC, CONVULSANT, DEPRESSANT DRUG, EMPATHOGEN, ENDOGENOUS OPIOID, EUPHORANT, FALSE NEUROTRANSMITTER, HALLUCINOGEN, HYPNOTIC (2), INDOLE ALKALOIDS, MONOAMINE OXIDASE INHIBITOR, MOOD STABILIZER, NARCOTIC, NARCOTIC ANALGESIC, NARCOTIC ANTAGONIST, NERVE GAS, NEUROLEPTIC (1), OPIATE, OPIOID ANTAGONIST, PHANTASTICANT, PHENYLALKYLAMINES, PSYCHEDELIC, SEDATIVE, SELECTIVE SEROTONIN REUPTAKE INHIBITOR, SMART DRUG, SOCIABILIZER, STIMULANT DRUG, SYMPATHOMIMETIC, TRICYCLIC ANTIDEPRESSANT, TRUTH DRUG. [From Greek *psyche* mind + *tropos* a turn, from *trepein* to turn + *-ikos* of, relating to, or resembling]

PTC *abbrev.* Phenylthiocarbamide, a crystalline compound that is tasteless to some people and intensely bitter-tasting to others, the difference being due to a recessive gene. Approximately one-third of Caucasian and Asian populations are *non-tasters* and two-thirds are *tasters*, but almost all members of African and native South American populations are *tasters*. Also called *phenylthiourea*. Formula: $C_6H_5NHCSNH_2$. Compare PROPYLTHIOURACIL (PROP).

P300 *n.* A large positive **evoked potential* that occurs approximately 300 milliseconds after the presentation of a stimulus, especially one that is unexpected, interesting, or potentially important, and that is believed to

indicate that the stimulus has been appraised. A low-amplitude P300 is a firmly established sign of schizophrenia. The P300 latency increases between 1 and 2 milliseconds per year of the adult lifespan. Also called the *P300 potential* or *P300 wave*. [From *p(ositive) 300 (milliseconds)*]

ptosis *n.* Drooping of one eyelid, partially or completely closing the eye. When the **pupil* of the eye is normal and there is only partial drooping, it is usually a sign of fatigue; if the pupil is constricted and there is only partial drooping, it may be a sign of **Horner's syndrome*; when the pupil is dilated and especially if the eye is completely closed and the eyeball is turned outwards, it may be a sign of malfunction of the **oculomotor nerve*, which travels from the brainstem directly to the eye. [From Greek *ptosis* a falling, from *piptein* to fall + *-osis* indicating a process or state]

P200 *n.* A major positive deflection in an **event-related potential* or an **average* evoked potential, occurring about 200 milliseconds after the onset of the stimulus. Some researchers have claimed that its magnitude, or the acuteness of the angle between the **N140* and the P200, correlates with **IQ*, but empirical findings are inconsistent. *Compare* *STRING LENGTH*. Also called the *P200 potential* or *P200 wave*. [From *p(ositive) 200 (milliseconds)*]

puberty *n.* The stage of development at the beginning of **adolescence* when the glands that secrete **sex* hormones mature and **secondary sexual characteristics* appear. Also called *pubescence*. **pubertal** *adj.* [From Latin *pubertas* maturity, from *puber* grown-up]

public goods dilemma *n.* A type of **social dilemma* in which members of a group choose whether or how much to contribute to something from which all group members benefit equally. In a classical (and typical) experiment, nine participants or subjects were given \$5 each, and the rules specified that if five or more of them contributed their money to a central fund, then all nine participants would receive a \$10 bonus whether or not they had contributed. If enough people contributed, the net payoff, taking into account contributions paid in, was \$10 to a contributor and \$15 to a non-contributor, but if too few contributed, the payoff was zero to a contributor and \$5 to a non-contributor. Public goods games are designed to simulate subscription payments to unions and other social dilemmas in which all

*****ebook converter DEMO Watermarks*****

members of a group benefit from actions that are costly to the individuals who make them. They are also called *free-rider problems*, and the corresponding experimental games are sometimes called *give-some* games.

puer aeternus *n.* In **analytical psychology*, an **archetype* (2) of eternal youth, viewed by Carl Gustav Jung (1875–1961) as a **neurotic* (1) component of personality, arising from an inability to come to terms with ageing. [From Latin *puer* a boy + *aeternus* eternal or everlasting]

puerperal psychosis *n.* The most severe and rarest (about two per thousand live births) of the three major postpartum mental disorders, with onset typically sudden, usually within two weeks of giving birth, and symptoms of severe terminal **insomnia*, sudden tearfulness or inappropriate laughter, **anxiety*, **depression*, **depersonalization*, rejection of the baby or **delusion* that it is deformed, cursed, or dead, **paranoid ideation* frequently implicating hospital staff or family members, and threats to kill the baby or commit **suicide*. Although widely recognized, this disorder is not listed separately in either **DSM-5* or **ICD-10*. Also called *postpartum psychosis*. Compare POSTPARTUM BLUES, POSTPARTUM DEPRESSION. [From Latin *puerperalis* of or relating to childbirth, from *puer* a boy, from *parere* to bear]

Pulfrich effect *n.* A visual illusion that is seen when a pendulum such as a length of string with a weight attached to one end is swung from side to side in a plane perpendicular to the line of vision. If it is viewed from a distance with a lens from a pair of sunglasses or a similar dark filter over one eye but with both eyes open, and with attention focused on the centre of the swing, the pendulum appears to move in an ellipse parallel to the floor, clockwise as seen from above if the dark lens is over the left eye and anticlockwise if it is covers the right eye. Any object moving across the line of vision is similarly affected, so that if the dark filter covers the left eye, objects moving from left to right on a television screen appear to recede and objects moving from right to left appear to be displaced forward. Since 1966 this effect has been exploited periodically by companies marketing expensive spectacles that are claimed to make ordinary television images three-dimensional but that consist merely of one dark and one plain lens. See also KINEPHANTOM. [Named after the German psychologist Carl Pulfrich (1858–1927) who first described it in 1922, although he was born blind in one eye]

*****ebook converter DEMO Watermarks*****

and never saw the effect himself]

pulvinar *n.* The cushion-shaped bulge at the back of the **thalamus* above the midbrain that receives projections from the auditory, somatosensory, and visual cortex, and also from the superior colliculus, and is believed to be implicated in visual attention, especially the suppression of attention to irrelevant stimuli. [From Latin *pulvinus* a cushion]

pumphead *n.* Another name for **post-operative cognitive dysfunction*, or a person suffering from post-operative cognitive dysfunction, after open heart surgery with a heart-lung machine. The term was introduced by US surgeons and first gained prominence following an article entitled 'Pumphead' in the magazine *Scientific American* in July 2003. [From *pump*, referring to the heart-lung machine, + *-head*, a combining form indicating a mental condition, as in *smackhead* a person whose mental state is affected by heroin]

punch-drunk *adj.* Manifesting the characteristic signs of some professional boxers and others who have suffered repeated blows to the head and contusions of the brain, including **clouding of consciousness*, **ataxia*, and **tremor*.

punctuated equilibrium *n.* A form of **evolution* characterized by short bursts of radical change interrupted or punctuated by long periods of stability; or a theory according to which evolution occurs in this way. [From Latin *punctuare*, *punctuatum* to prick, from *pungere*, *punctum* to puncture]

punctuationist *n.* One who believes in **punctuated equilibrium*.

punishment *n.* Any **stimulus* (1) that an organism seeks to avoid or escape. **Negative reinforcement* is not punishment but almost the reverse, namely the withdrawal of punishment. *See also* *AVOIDANCE CONDITIONING*, *ESCAPE CONDITIONING*, *LAW OF EFFECT*, *LOCUS OF CONTROL*.

pupil *n.* The dark central opening in the **iris* through which light enters the eye, its variable diameter being controlled by the *dilator pupillae* and *sphincter pupillae* muscles of the iris. *See also* *ACCOMMODATION REFLEX*,

ARGYLL ROBERTSON PUPIL, DARK ADAPTATION, DEPTH OF FIELD, GLAUCOMA, LIGHT ADAPTATION, OCULOMOTOR NERVE, PUPILLARY LIGHT REFLEX, SYMPATHETIC NERVOUS SYSTEM. **pupillary** *adj.* [From Latin *pupilla* a pupil, diminutive of *pupa* a girl or a doll, alluding to the tiny reflection in the eye]

pupillary light reflex *n.* A reflex in which light shone into one eye causes the pupils of both eyes to constrict involuntarily, protecting against damage to the retina and causing a temporary threshold shift (TTS), similar to the acoustic reflex in response to loud noise. The reflex is found even in people whose primary visual cortex is destroyed, rendering them totally blind. *Optic nerve damage results in equal pupils, neither responding to light shone into the eye on the damaged side but both responding normally to light shone into the other eye, whereas *oculomotor nerve damage results in a dilated pupil on the damaged side that does not respond to light shone into either eye. Also called the *consensual pupillary reflex*, the *consensual light reflex*, *Haab's pupillary reflex*, the *light reflex*, or the *pupillary reflex*. See also REFLEX.

pure erotomania *n.* Another name for *erotomantic delusional disorder.

pure hue *n.* A hue consisting of *monochromatic light.

pure light *n.* In the terminology introduced by the English physicist and mathematician Sir Isaac Newton (1642–1727) in his *Opticks* (1704), any light that cannot be broken down into constituent colours, thus the same as a pure hue consisting of *monochromatic light. Compare COMPOSITE LIGHT.

pure phi *n.* Another name for *phi movement.

pure tone *n.* A sound wave such as that generated by a tuning fork or oscillator whose pressure variation as a function of time is a sine wave. Also called a *simple tone*. See also FOURIER ANALYSIS, TONE (1). Compare COMPLEX TONE.

purine *n.* A white crystalline substance or any of several *bases (1) derived from it, including *adenine and *guanine, which are constituents of *DNA

and **RNA*, in which they are paired with pyrimidine bases. *Compare PYRIMIDINE*. [From *pure (uric acid)* + Greek *-ine* indicating an organic compound]

Purkinje cell *n.* A type of large efferent neuron that has dense **dendrites* forming as many as 100,000 synapses with afferent neurons, although it is not bushlike but lies flat in one plane and has an axon that breaks up into numerous branches near its end, its cell body being found in the middle layer of the **cerebellar cortex*, its action being inhibitory, and its neurotransmitter being **GABA*. Axons of Purkinje cells provide the only output from the cerebellar cortex after it has processed sensory and motor information from other parts of the nervous system. It was discovered in 1837 by the Czech-born German physiologist Johannes E(vangelista) Purkinje (Purkyně) (1787–1869). Also spelt *Purkyně cell*. Also called a *Purkinje neuron* or a *Purkyně neuron*.

Purkinje figure *n.* An image of the network of retinal blood vessels that is made visible in one's own eye if light is shone on to the eyeball at an oblique angle from a pinhole close to its surface. The best way of seeing the image is by darkening the room and holding a torch or flashlight against the outer corner of one closed eye, and then moving the torch from side to side. Also spelt *Purkyně figure*. [Named after the Czech-born German physiologist Johannes E(vangelista) Purkinje (Purkyně) (1787–1869) who discovered it]

Purkinje image *n.* A secondary **positive afterimage* occurring after the primary afterimage following exposure to a brief light stimulus, appearing in the **complementary colour* to that of the original stimulus, the primary (Hering) afterimage generally being either in the same colour as the stimulus or colourless. Depending on the intensity of the original stimulus, the Purkinje image may persist for several seconds if the gaze is held steady, but it tends to disappear as soon as the eyes are moved, though blinking may briefly restore it. Also spelt *Purkyně image*. Also called the *Purkinje afterimage*. *See also* *AFTERIMAGE*, *BIDWELL'S GHOST*. *Compare* *HERING IMAGE*, *HESS IMAGE*. [Named after the Czech-born German physiologist Johannes E(vangelista) Purkinje (Purkyně) (1787–1869) who first drew attention to it in 1823]

Purkinje–Sanson image *n.* Any of three images that can be seen reflected from the eye of a person who is looking at an illuminated object such as a flame in a dark room. The first is a bright image reflected from the convex surface of the cornea; the second is a large, dim image reflected from the convex front surface of the **crystalline lens*; and the third is a small, bright, inverted image that is reflected from the rear (posterior) surface of the lens and that enlarges with **accommodation* (1) of the eye for close viewing, because the curvature of the lens increases, such accommodation also causing the distance between the second and third images to change. Also spelt *PurkynĚ–Sanson image*. Also called a *Purkinje image* or a *Sanson image*. [So called because it was first observed in 1823 by the Czech-born German physiologist Johannes E(vangelista) Purkinje (PurkynĚ) (1787–1869) and investigated further in 1838 by the French surgeon Louis Joseph Sanson (1790–1841)]

Purkinje shift *n.* A change in peak sensitivity to light under changing illumination, from wavelengths close to 555 nanometres (green) in **photopic* (light-adapted) vision to 505 nanometres (blue–green) in **scotopic* (dark-adapted) vision, resulting from the predominance of **cone* vision in bright illumination and **rod* vision in dim illumination. Thus reds, oranges, and yellows appear relatively light in bright illumination whereas blues and greens appear relatively light in dim illumination, as can be demonstrated by finding red and blue objects that appear equally light under bright daylight illumination and then viewing them in twilight or dim illumination, where the red will appear very much darker than the blue. Also called the *Purkinje effect* or *Purkinje phenomenon*. Also spelt *PurkynĚ shift*. See also *BEZOLD–BRÜCKE PHENOMENON*. [Named after the Czech-born German physiologist Johannes E(vangelista) Purkinje (PurkynĚ) (1787–1869) who first drew attention to it in 1825 after noticing that in the dim light of early dawn, when one's eyes are usually dark adapted, red flowers look inky black]

purple hearts *n.* A street name for the barbiturate drug **phenobarbital* (phenobarbitone).

pursuit movement *n.* A **smooth following movement* of the eyes, used when tracking a moving object and sometimes accompanied by **saccades*. Also called an *ocular pursuit movement*.

*****ebook converter DEMO Watermarks*****

pursuit rotor *n.* A device for measuring a person's skill at tracking a moving target, usually consisting of an object or image moving either smoothly or irregularly and a stylus that the person being tested tries to keep on the target, the device keeping an automatic record of time on target.

push-down stack *n.* Any storage system from which items are withdrawn in reverse order to the order in which they were entered, so that the last item in is the first one out, and so on. In computing, temporary memory stores are often push-down stacks, and human ***short-term memory** operates mainly in this way. [Named after a type of spring-operated device for stacking trays in canteens]

pusher *n.* Someone or something that pushes. In informal usage, a person who sells illegal drugs, especially ***narcotics**. *See also* TRAVEL AGENT.

putamen *n.* One of the ***basal ganglia** in the ***corpus striatum**, a large reddish structure surrounding the globus pallidus on three sides in each cerebral hemisphere, consisting of the lateral part of the ***lenticular nucleus**, implicated in posture and movement control. [From Latin *putamen* clippings, from *putare* to prune]

putrid odour *n.* One of the six primary odours in ***Henning's prism** and one of the seven in the ***stereochemical theory**, resembling the odour of faeces or rotten eggs. US *putrid odor*.

p value *abbrev.* Probability value: in ***inferential statistics**, the probability of obtaining, by chance alone, results at least as extreme as those obtained; equivalently, the probability of a ***Type I error**. *See also* SIGNIFICANCE TEST.

Pygmalion effect *n.* A ***self-fulfilling prophecy** whereby people tend to behave the way others expect them to. In a famous field experiment on the Pygmalion effect in children, carried out by the German-born US psychologist Robert Rosenthal (born 1933) and the US elementary school head teacher Lenore F(rances) Jacobson (1922–2010) and published in a book entitled *Pygmalion in the Classroom* (1968), the researchers applied a standard IQ test to children in an elementary school in San Francisco at the

beginning of an academic year, selected 20 per cent (about five children per class) at random, and told their teachers that the tests suggested that these children were potential academic ‘spurters’ who could be expected to show unusual intellectual gains in the year ahead. When the children were retested at the end of academic year, the ‘spurters’ showed massive IQ gains relative to the other children, especially in the first and second grades (6–7-year-old children): 20 per cent of the ‘spurters’ gained at least 30 IQ points, and 80 per cent gained at least 10 IQ points. These gains were presumably due to subtle effects of the teachers' expectations on the way they handled the children, but the experiment has been criticized on methodological grounds. *See also* [EXPERIMENTER EXPECTANCY EFFECT](#), [GALATEA EFFECT](#), [GOLEM EFFECT](#), [LABELLING THEORY](#), [OEDIPUS EFFECT](#). [Named after George Bernard Shaw's play *Pygmalion* (1912), in which the linguist Professor Henry Higgins gives elocution lessons to a cockney flower-girl Eliza Dolittle and passes her off in high society as an upper-class lady—see also etymology of [*Pygmalionism](#)]

Pygmalionism *n.* **1.** Sexual attraction to a statue, dressmaker's dummy, or other representation of the human form. **2.** Falling in love with one's own handiwork. [Named after Pygmalion, the king of Cyprus in a Greek myth, who fell in love with his own ivory sculpture of a woman, later brought to life as Galatea]

pyknic body type *n.* A short, squat, rounded [*somatotype](#) believed by the German psychiatrist Ernst Kretschmer (1888–1964) and his followers to be prone to manic–depressive psychosis ([*bipolar disorders](#)). *See also* [KRETSCHMER CONSTITUTIONAL TYPE](#). *Compare* [ASTHENIC BODY TYPE](#), [ATHLETIC BODY TYPE](#), [DYSPLASTIC BODY TYPE](#). [From Greek *pyknos* thick]

pyramidal cell *n.* Any of the large neurons that are the principal output neurons of the [*neocortex](#), each having long [*dendrites](#) ascending towards and branching near the surface of the cortex, smaller basal dendrites near the pyramid-shaped cell body, and a long, slender [*axon](#) emerging from the base of the cell body, continuing for centimetres or in some cases more than a metre before terminating in a dense brush of branches. Most of the nerve fibres leaving the cerebral cortex are composed of the axons of pyramidal cells. Pyramidal cells are also found in the hippocampus, olfactory bulb, and elsewhere. *See also* [BETZ CELL](#). *Compare* [BIPOLAR CELL](#), [GRANULE CELL](#), [STELLATE](#)

*****ebook converter DEMO Watermarks*****

CELL. [So called because of the pyramidal shape of its soma]

pyramidal decussation *n.* The partial ***decussation** of the ***corticospinal tract** in the medulla oblongata, just above its junction with the top of the spinal cord, where the fibres of ***pyramidal cells** divide into three, with 80 per cent crossing the left–right midline of the body. [So called because it forms a pyramid-shaped cross-section of pyramidal cell axons]

pyramidal tract *n.* Another name for the ***corticospinal tract**. [So called because it contains mostly the axons of ***pyramidal cells**, and also because it forms a pyramidal structure where it splits into three strands at the ***pyramidal decussation** just above the top of the spinal cord]

pyramid of numbers *n.* The characteristic decrease in the relative numbers of animals at each successively higher level in the ***food chain** of a natural ecosystem (see **illustration**).

Pyramid of numbers. A woodland food chain.

pyridoxine *See* **VITAMIN B₆**.

pyriform cortex *See* **PIRIFORM CORTEX**.

pyrimidine *n.* A type of crystalline nitrogenous ***base (1)** or a derivative of

*****ebook converter DEMO Watermarks*****

it such as **cytosine*, **thymine*, and **uracil*, which are found in **DNA* and **RNA*, where they are paired with purine bases. *Compare PURINE*. [A variant of *pyridine*, from Greek *pyr* fire + *-ide* indicating membership of a particular group of chemical compounds + *-ine* indicating an organic compound]

pyromania *n.* A **disruptive, impulse-control, and conduct disorder* in **DSM-5* characterized by multiple episodes of deliberate and purposeful fire setting, with emotional tension before the act, followed by pleasure, gratification, or relief while committing the act or watching its aftermath, and general interest in or preoccupation with fire and matters associated with fire. *See also URETHRAL EROTISM*. [From Greek *pyr* fire + *mania* madness]

qi-gong psychotic reaction *n.* A ***culture-bound syndrome** included in CCMD-2 (the *Chinese Classification of Mental Disorders*, 2nd ed.), restricted mainly to Chinese communities in southern and eastern Asia and elsewhere, the onset invariably following participation in qi-gong, a system of meditational exercises involving deep breathing believed to promote physical and spiritual well-being, characterized by a time-limited period of ***paranoid ideation**, ***dissociation**, and ***psychotic (1)** signs and symptoms. [From Chinese *qi-gong* exercise of vital energy, from *qi* energy + *gong* skill or exercise]

Q-methodology *n.* A form of ***factor** analysis in which the correlations between individuals rather than tests are analysed. It was introduced by the US-based English psychologist William Stephenson (1902–89) in an article entitled ‘Correlating Persons Instead of Tests’ in the journal *Character and Personality* in 1935 and expounded at length in his book *The Study of Behavior: Q-Technique and its Methodology* (1953). Also called *Q-technique*. See also **Q-sort**. Compare **R-METHODOLOGY**.

Q-sort *n.* In psychometrics, a test in which the respondent classifies items into categories along a dimension such as *Agree/Disagree*, often by arranging a deck of cards showing trait-descriptive statements into a fixed number of piles, such classifications being suitable for analysis by ***Q-methodology**. It amounts to a kind of ***rating scale**. [From *q(uestionnaire) sort*]

Quaalude *n.* A proprietary name for the depressant drug ***methaqualone**. [Trademark]

quadrantic hemianopsia *n.* Loss of vision for one quadrant of the visual field, usually associated with a lesion in **optic radiations* from a lateral geniculate nucleus to the visual cortex.

quadratic model *n.* A mathematical model represented by a quadratic equation such as $Y = aX^2 + bX + c$, or by a system of quadratic equations. The relationship between the variables in a quadratic equation is a parabola when plotted on a graph. *Compare* *LINEAR MODEL*.

quadriceps reflex *n.* An informal name for the **patellar reflex*. [Named after the quadriceps muscle that extends the leg at the knee joint]

quadriplegia *n.* Paralysis of all four limbs, usually as a result of an injury to the upper part of the spine. Also called *tetraplegia*, which is a less common but more correct form because it is not a neoclassical **hybrid* (3). *Compare* *DIPLEGIA*, *HEMIPLEGIA*, *MONOPLEGIA*, *OPHTHALMOPLEGIA*, *PARAPLEGIA*, *TRIPLEGIA*. **quadriplegic** *adj.* [From Latin *quadrans* a quarter + Greek *plege* a blow + *-ia* indicating a condition or quality]

qualia *n. pl.* A philosophical term for sensory experiences that have distinctive subjective qualities but lack any meaning or external reference to the objects or events that cause them, such as the painfulness of pinpricks or the redness of red roses. The term is virtually synonymous with **sense data*. *See also* *INVERTED QUALIA*, *PHI MOVEMENT*, *SENSATION*, *SENSIBILIA*. **quale** *sing.* [From Latin *qualis* of what kind]

qualitative inheritance *n.* Inheritance of an all-or-nothing **phenotypic* characteristic through an **allele* at a single locus, as contrasted with **quantitative inheritance* of a characteristic that varies on a **continuum* from one extreme to another. *See also* *MONOGENIC INHERITANCE*. *Compare* *POLYGENIC INHERITANCE*.

qualitative research *n.* Research that focuses on non-numerical data, such as verbal protocols or reports, and that uses such techniques and approaches as **content analysis*, **conversation analysis*, **critical theory*, **deconstruction*, **discourse analysis*, **ethnomethodology*, **focus groups*,

*grounded theory, *hermeneutics (1), *interviews, *motivational research, *phenomenology, *protocol analysis, *psychoanalytic construction, *sociology of knowledge, and *Verstehen. See also NUD*IST, OPEN-ENDED QUESTION.

quantifier *n.* 1. In *logic, a symbol denoting the degree of generality of an expression, the most important being the *existential quantifier* $\exists$ and the *universal quantifier* $\forall$. $\exists x$ means approximately *there exists an x such that...*; and $\forall x$ means approximately *for every x,....* The universal quantifier is also written (x) , for example, the sentence *All students are friendly* may be written either $\forall x: Sx \rightarrow Fx$ or $(x)(Sx \rightarrow Fx)$, where *S* stands for *is a student*, *F* stands for *is friendly*, and the arrow stands for *if...then* or material implication; literally, *For every x, if x is a student, then x is friendly*. See also PREDICATE CALCULUS. 2. In linguistics, a word or phrase referring to the number or amount of anything (*all, some, a few, every, many, any*), an example in context being the first word in the sentence *All generalizations are false*.

quantitative inheritance *n.* Inheritance of a phenotypic characteristic that varies on a *continuum from one extreme to another and is determined by multiple genes, as contrasted with *qualitative inheritance of an all-or-nothing characteristic. See also POLYGENIC INHERITANCE. Compare MONOGENIC INHERITANCE.

quantized image *n.* Another name for a *block portrait. [From Latin *quantum*, neuter of *quantus* how much + *-izare* from Greek *-izein* to cause to become]

quartile *n.* In descriptive statistics, a score such that one-quarter, one-half, or three-quarters of a set of scores, arranged in order, fall below it, these being the first, second, and third quartiles respectively, symbolized by Q_1 , Q_2 , and Q_3 . The second quartile is identical to the *median. See also PARTILE. Compare DECILE, PERCENTILE.

quasi-experiment *n.* Any research method that has some of the features of an *experiment but is not strictly experimental inasmuch as the investigator either does not manipulate the *independent variable directly or

does not have full control over the ***extraneous** or nuisance variables that might influence the results. *See also* **NON-EQUIVALENT GROUPS DESIGN**, **ONE-GROUP PRETEST–POSTTEST DESIGN**, **INTERRUPTED TIME-SERIES DESIGN**. *Compare* **CORRELATIONAL STUDY**. **quasi-experimental** *adj.* [From Latin *quasi* as if]

queen bee syndrome *n.* A tendency for some individually successful women in male-dominated environments to block the advancement of junior female colleagues and to be intolerant of competition from members of their own sex. The term was coined by the Australian-born US social psychologist Graham L. Staines (born 1946) and two colleagues in an article in the magazine *Psychology Today* in 1974, in the narrower sense of a tendency of successful women to oppose the women's liberation movement, and experimental evidence for the phenomenon in its more general form was reported in an article in the *British Journal of Social Psychology* in 2004 in which it was suggested that the syndrome may contribute to the 'glass ceiling' in organizations in which individually successful senior women, strongly represented on appointment and promotion committees in the interests of equal opportunities, may be less likely than men to support female applicants for appointments and promotions. *See also* **SEXISM**, **STEREOTYPE**. [So called because a bee colony has only one reproductive queen, all other female (worker) bees being infertile and serving the queen]

Querulantenwahn *n.* Another name for ***paranoia** querulans. [German: delusion of complaining people, from *Querulant*, a complaining person, from *quer* crossways + *Wahn* delusion]

questionnaire *n.* In psychometrics, a set of questions specially designed to provide objective information about some characteristic of a respondent, such as attitudes, preferences, interests, values, or personality. Also called an *inventory*, particularly when used to measure abilities, aptitudes, or intelligence, such instruments seldom being called questionnaires. [From French *questionner* to ask questions]

quiet-biting attack *n.* The organized pattern of behaviour of a ***predator** stalking and killing its ***prey**. This type of behaviour has been elicited in animals by stimulating the ***medial** forebrain bundle of the hypothalamus. [So called because other forms of aggression are

*****ebook converter DEMO Watermarks*****

characteristically accompanied by vocalization]

quiet sleep *n.* Another name for **NREM sleep*. **QS** *abbrev.*

quinalbarbitone *n.* Another name for **secobarbital*.

quinine *n.* A very bitter-tasting crystalline **alkaloid* extracted from the bark of trees belonging to the genus *Cinchona* and used as an **analgesic* (1), antipyretic, and muscle relaxant. *See also* *OTOTOXIC*. [From Spanish *quina* cinchona bark, from Quechua *kina* bark]

quinone *See* *VITAMIN K*.

quota of affect *n.* In **psychoanalysis*, a quantity of instinctual energy that remains constant despite **displacement* and various qualitative transformations that it undergoes. It is an **economic* concept related to the **principle of constancy*. Sigmund Freud (1856–1939) defined it in an important though confused passage (because it seems to allow the quota to increase or diminish) in an article on ‘The Neuro-Psychoses of Defence’ (1894): ‘In mental functions something is to be distinguished—a quota of affect or sum of excitation—which possesses all the characteristics of a quantity (though we have no means of measuring it), which is capable of increase, diminution, displacement and discharge, and which is spread over the memory-traces of ideas somewhat as an electric charge is spread over the surface of a body’ (*Standard Edition*, III, pp. 45–61, at p. 60).

quota sample *n.* A **non-probability sample* drawn from a population so that its composition in terms of sex, age, social class, or other demographic characteristics matches the known proportions in the population. *See also* *ACCIDENTAL SAMPLE*, *CONVENIENCE SAMPLE*, *OPPORTUNITY SAMPLE*, *SELF-SELECTED SAMPLE*, *SNOWBALL SAMPLE*. *Compare* *CLUSTER SAMPLE*, *PROBABILITY SAMPLE*, *RANDOM DIGIT DIALLING*, *SIMPLE RANDOM SAMPLE*, *STRATIFIED RANDOM SAMPLE*. [From Latin *quota pars*? how large a share?]

rabbit syndrome *n.* A form of [*parkinsonism](#) affecting the lip, arising as a side-effect of prolonged [*neuroleptic \(1\)](#) medication. [So called because of its resemblance to the quivering of a rabbit's lip]

race *n.* **1.** A competitive trial of speed in running, swimming, driving, etc; more generally, any manifestation of rivalry or contest. *See also* [ARMS RACE](#). **2.** In biology, a [*taxonomic](#) group into which a [*species](#) is divided, arising from relative reproductive isolation of populations from one another owing to geographic and other barriers, containing organisms that are genetically differentiable from other members of the same species by the relative frequencies of their [*polymorphic genes](#). Thus in humans the relative percentages of the A, B, and O [*blood](#) group [*alleles](#) are 28, 6, 66 in Caucasian populations; 18, 11, and 71 in African populations; and 19, 17, and 64 in Oriental populations; and many other polymorphic genes show similar racial differences, but across all polymorphic genes, only about 6 per cent of genetic [*variance](#) among humans is due to racial differences. Also called a *microspecies*, *subspecies* or *variety*. *See also* [ETHNIC](#), [RACIALISM](#), [RACISM](#). **racial** *adj.* [From Italian *razza*, origin uncertain]

racialism *n.* [*Prejudice](#), discrimination, stereotyping, or condescension on the basis of [*race \(2\)](#), usually accompanied by a belief in the intrinsic superiority of one race over another or others or by race hatred. Also called *racism*, but distinguished from it in careful usage. *See also* [AUTHORITARIANISM](#), [MODERN RACISM](#), [STEREOTYPE](#). *Compare* [ETHNOCENTRISM](#), [RACISM](#). **racialist** *n.* **1.** One who manifests or practises racialism. *adj.* **2.** Manifesting or practising racialism. [From *racial* + Greek *-ismos* indicating a state or condition]

racial memory *n.* Another name for the **collective unconscious*. Also called the *racial unconscious*.

racism *n.* A belief that **races* (2) are inherently different from one another and that people's characteristics and capacities are determined largely by race, usually accompanied by a belief in the intrinsic superiority of one particular race over another or others. Also called *racialism*, but distinguished from it in careful usage. *See also* *AUTHORITARIANISM*, *MODERN RACISM*, *STEREOTYPE*. *Compare* *ABLEISM*, *AGEISM*, *ETHNOCENTRISM*, *FATTISM*, *HETEROSEXISM*, *SEXISM*, *SPECIESISM*. **racist** *n.* 1. A person with opinions or attitudes that are characterized by racism. *adj.* 2. Of, relating to, or manifesting racism. [From *race* + Greek *-ismos* indicating a state or condition]

radical *adj.* 1. Relating to, consisting of, or going to the root or fundament; necessitating, entailing, or favouring fundamental social, economic, or political change. *n.* 2. A group of atoms that is unstable in the free state but when bound together in a molecule behaves as a single unit, such as the **acetyl* group —COCH₃. *See also* *FREE RADICAL*. [From Latin *radix* a root + *-icalis* of, relating to, or resembling]

radical constructivism *See* *CONSTRUCTIVISM*.

radioisotope scan *n.* A method of examining the brain by passing a Geiger counter over the cranium after the intravenous injection of a radioisotope, used to detect tumours, vascular disturbances, cerebral atrophy, and other abnormalities.

railway illusion *n.* Another name for the **Ponzo illusion*.

ramp movement *n.* A slow, deliberate, sustained bodily movement thought to be controlled by the **basal ganglia*. Also called a *smooth movement*. *Compare* *BALLISTIC MOVEMENT*. [From French *ramper* to creep or clamber]

random digit dialling *n.* A technique used by some public opinion polling organizations to draw a **probability* sample of telephone subscribers

*****ebook converter DEMO Watermarks*****

within a telephone exchange by dialling the last few digits randomly. A variation of this technique is ***directory plus one sampling**. US *random digit dialing*. See also **CLUSTER SAMPLE**, **SIMPLE RANDOM SAMPLE**, **STRATIFIED RANDOM SAMPLE**. Compare **ACCIDENTAL SAMPLE**, **CONVENIENCE SAMPLE**, **NON-PROBABILITY SAMPLE**, **OPPORTUNITY SAMPLE**, **QUOTA SAMPLE**, **SELF-SELECTED SAMPLE**, **SNOWBALL SAMPLE**. **RDD** abbrev.

random-dot kinematogram *n.* Two or more patterns of random dots presented in sequence, each having an area or shape within it that has no visible border but is identical in both or all the patterns and is displaced a short distance from one pattern to the next. If viewed singly or in slow succession, the patterns appear random and the displaced area remains totally invisible, but if viewed in rapid succession, with interstimulus intervals between approximately 10 and 100 milliseconds for displacements of 5 to 40 minutes of arc (sixtieths of a degree) of ***visual angle**, the displaced area stands out from the background pattern of dots with an ***illusory contour** and appears to move as a block. In some displays the area of identical dots changes slightly in outline, though not in the relative positions of its dots, from one frame to the next, and in one popular example it depicts a Dalmatian dog walking in a spotty environment. See also **APPARENT MOVEMENT**, **VISUAL ILLUSION**. Compare **RANDOM-DOT STEREOGRAM**, **TERNUS PHENOMENON**. [From Greek *kinema*, *kinematos* motion + *gramme* a line]

random-dot stereogram *n.* A type of ***anaglyph** for studying binocular depth perception invented by the Hungarian-born US radar engineer and psychologist Bela Julesz (1928–2003) at Bell Telephone Laboratories in 1960, consisting of two random arrays of dots that when viewed stereoscopically, one array being viewed by each eye, appears to contain a form such as a triangle or square lying in a plane either in front or behind the rest of the dots, bounded by an ***illusory contour**. It is constructed by generating two arrays of randomly placed dots, identical except for a clearly defined region that is slightly shifted sideways in one of the arrays, and it is usually presented for viewing by printing one of the arrays in red and the other in green or cyan (blue–green), with a slight horizontal displacement so that the unshifted dots do not fall exactly on top of one another, and it is viewed with spectacles having one red and one green or cyan lens. Also called a *Julesz stereogram*. See also **CYCLOPEAN PERCEPTION**, **STEREOPSIS**, **VISUAL**

ILLUSION. Compare **RANDOM-DOT KINEMATOGRAM**. [From Greek *stereos* solid + *gramme* a line]

random drift *n.* Another name for ***genetic drift**.

randomization *n.* A technique of particular importance in ***experimental design**, introduced by the English statistician and geneticist Ronald Aylmer Fisher (1890–1962) in an article in the *Journal of the Ministry of Agriculture* in 1926, in which experimental subjects are assigned to ***treatment conditions** strictly at random in order to control for the influence of ***extraneous variables** and to enable ***inferential statistics** to be used to determine the significance of any effects that are then observed. The control of extraneous variables through random assignment to treatment groups can be demonstrated by choosing a page from a telephone directory, assigning all the entries on it to two groups by tossing a coin, and then comparing the two groups for the number of surnames containing the letter *p*, or the number of telephone numbers ending in 6, or the number of addresses in a particular sector of the area covered by the directory, or any other characteristic of the entries whatsoever: in each case the two groups will turn out to be roughly similar, especially if the groups are large. See also **RANDOMIZED CONTROLLED TRIAL**, **TIME SAMPLING DIARY**. [From Old French *randon* random, from *randir* to gallop + *-izare* from Greek *-izein* to cause to become + Latin *-ation* indicating a process or condition]

randomization test *n.* In statistics, a ***distribution-free** approach to ***significance** testing that is carried out either by forming all possible permutations of all possible scores, or by selecting a random sample of all possible permutations of all possible scores, and then counting the proportion that are at least as extreme as the observed score, either in terms of raw scores or a test statistic, such as the ***t test** value, derived from the raw scores. It is similar to ***resampling statistics** but differs from it in using all possible permutations of scores, or a random sample of these, rather than restricting the permutations to the actual scores obtained in the study. The prototypical randomization test is ***Fisher's exact test**. See also **MONTE CARLO METHOD**.

randomized blocks design *n.* A research design in which research participants or subjects are assigned to blocks according to a pretest, the

*****ebook converter DEMO Watermarks*****

members of each block being roughly matched on a variable assumed to be related to the [*dependent variable](#), and each block containing as many members as there are treatment conditions, and then the members of each block are randomly assigned to treatment conditions. *See also* [LATIN SQUARE](#).

randomized controlled trial *n.* A research design used for testing the effectiveness of a drug, or any other type of treatment, in which research participants are assigned randomly to treatment and control or [*placebo \(1\)](#) groups and the differences in outcomes are compared. The idea of [*randomization](#) as a method of control was introduced by the English statistician and geneticist Ronald Aylmer Fisher (1890–1962) in an article in the *Journal of the Ministry of Agriculture* in 1926, and the first randomized controlled trial was designed by the English medical statistician Sir Austin Bradford Hill (1897–1991) and carried out in 1948 by the Medical Research Council of the UK to study the therapeutic efficacy of the antibiotic drug streptomycin. Hill gave a full account of this historic drug trial in an article in the journal *Controlled Clinical Trials* in 1990. Also called a *randomized clinical trial*. *See also* [DOUBLE-BLIND STUDY](#), [RANDOMIZED DOUBLE-BLIND EXPERIMENT](#), [SINGLE-BLIND STUDY](#). **RCT** *abbrev.*

randomized double-blind experiment *n.* A type of [*double-blind study](#), often used in conducting drug trials and trials of other forms of treatment, in which participants or subjects are randomly assigned to [*treatment conditions](#), usually an [*experimental group](#) and a [*control group](#), and neither they nor the experimenter knows, until the data have been collected, which groups they have been assigned to. *See also* [RANDOMIZED CONTROLLED TRIAL](#).

randomized response *n.* A technique designed to reduce or eliminate evasive [*response](#) bias in [*survey research](#) on sensitive issues by preserving respondent confidentiality through randomization. For example, an investigator might instruct the respondents as follows: Toss a coin privately and then answer *Yes* if *either* your coin fell heads *or* you have smoked cannabis, otherwise answer *No*. With a sample size of 1,000, we would expect 500 *Yes* replies if none of the respondents had smoked cannabis; additional *Yes* responses would suggest that some respondents whose coins fell tails also replied *Yes*, and the proportion who had smoked cannabis could

*****ebook converter DEMO Watermarks*****

be estimated from the results without identifying the individuals concerned. If 80 answered Yes, then we might assume that approximately 80 of the 500 whose coins fell tails answered Yes, and we could therefore estimate the proportion of the population who have smoked cannabis to be $80/500 = 16$ per cent, and this conclusion could be reached without having identified any individual cannabis smokers. The technique was first proposed by the US economist Stanley Leon Warner (1928–92) in an article in the *Journal of the American Statistical Association* in 1965. See also [NON-REACTIVE MEASURE](#), [REACTIVITY](#).

random lottery incentive system *n.* A method of rewarding experimental participants or subjects for taking part in a research study by using a chance device. For example, participants may be rewarded with points or tokens on the understanding that one in ten of them, selected at random, will be paid at a specified rate for the points that they accumulate. This technique is supposed to save money while retaining a real financial incentive for the participants.

random sample *n.* A [*probability](#) sample drawn from a [*population](#) in such a way that every member of the population is equally likely to be selected. Also called, especially in the context of [*survey research](#), a *simple random sample*.

range *n.* In descriptive statistics, a crude measure of the degree of dispersion, variability, or scatter in a group of scores, defined as the difference between the highest and lowest score in the group. Compare [INTERQUARTILE RANGE](#), [PROBABLE ERROR](#), [SEMI-INTERQUARTILE RANGE](#), [STANDARD DEVIATION](#), [VARIANCE](#).

range of accommodation *n.* The distance between the [*near point](#) and the [*far point](#) of the eye, the limits within which [*accommodation \(1\)](#) is able to adjust the crystalline lens so that an image is sharply focused on the retina.

rank *n.* Position or status within a social organization. In statistics and measurement theory, an ordinal number (1, 2, 3,...) often used in place of measurements made on an [*ordinal scale](#) to represent the order of magnitude

*****ebook converter DEMO Watermarks*****

of the scores. If two or more raw scores are equal, then they are both assigned a rank that is the mean of the ranks they would have had if the raw scores had been slightly different. Many ***non-parametric statistical** procedures work with ranks. [Old French *ranc* a row or tier]

rank correlation *n.* A shortened name for ***Spearman rank correlation coefficient**.

Rankian *adj.* Of or relating to the Austrian ***psychoanalyst** Otto Rank (1884–1939) or his writings and doctrines. See **WILL THERAPY**.

Ranschburg inhibition *n.* The difficulty of recalling lists of similar items relative to clearly differentiated items; thus a list of ***nonsense syllables** such as *BEX, DOV, DEX, BOV, DEV* takes longer to learn and tends to result in more errors on recall than *DEG, VOK, NUX, ZAJ, KIF*, or a list of words such as *big, immense, large, great, vast* is similarly harder than *cold, red, quiet, clever, hungry*. A special case of this phenomenon is the ***repetition effect**. Also called the *Ranschburg effect*, *Ranschburg phenomenon*, *Ranschburgsches Phänomen*, or *Ranschburgsches phenomenon*, though the latter mixture of two languages is a barbarism that is avoided in careful usage. See also **PROACTIVE INTERFERENCE**, **RETROACTIVE INTERFERENCE**. Compare **VON RESTORFF EFFECT**. [Named after the Hungarian psychiatrist Paul Ranschburg (1870–1945) who reported it in 1901]

Ranvier's node *n.* Any of the spaces that occur at regular intervals along the ***myelin** sheath of a nerve fibre, where the ***axon** is exposed. Also called a *node of Ranvier*. See also **SALTATION (1)**. [Named after the French histologist Louis-Antoine Ranvier (1835–1922) who studied them]

raphe nuclei *n. pl.* A series of neuron clusters resembling stitches connecting the two halves of the ***medulla oblongata**. They release ***serotonin** and may be implicated in ***slow-wave sleep**. Also called the *raphe system*, and sometimes spelt *raphé nuclei* or *raphé system*, probably in the mistaken belief that the word is of French origin. **raphe nucleus** *sing.* [From Greek *rhaphe* a seam, from *rhaptein* to sew together]

rapid eye movement *n.* Any of the quick, jerky, synchronized
*****ebook converter DEMO Watermarks*****

rotations of the eyeballs behind closed lids that occur throughout ***REM sleep** and are associated with dreaming. **REM** *abbrev.*

rapid eye movement sleep behaviour disorder *n.* A ***parasomnia** in ***DSM-5** characterized by repeated arousal and vocalization or complex behaviour during sleep, these activities occurring during ***REM sleep**, more than 90 minutes after falling asleep and usually in the latter part of a sleep period, often involving acting out dreams. A person who is awakened from such an episode is normally fully alert and not disoriented or confused. *See also* **REM BEHAVIOUR DISORDER**. *Compare* **NON-RAPID EYE MOVEMENT SLEEP AROUSAL DISORDER**. US *rapid eye movement sleep behavior disorder*.

rapidly adapting *adj.* Of or relating to a ***afferent** neurons from ***sensory** receptors in the ***skin** that respond only to the onset and offset of stimulation and not to sustained stimulation. *See also* **TRANSIENT RESPONDER**. *Compare* **SLOWLY ADAPTING**. **RA** *abbrev.*

rapport *n.* A sympathetic or harmonious relationship or state of mutual understanding. The word was introduced into psychology by the Viennese physician Franz Anton Mesmer (1734–1815), and the French psychologist and neurologist Pierre Janet (1859–1947) confined its meaning specifically to the relationship between a hypnotist and a hypnotized subject; then Sigmund Freud (1856–1939) eventually widened its meaning and described it as the ***prototype (2)** of the ***transference**. [From French *rapporter* to bring back, from *re-* again + *aporter* to carry to, from Latin *apportare* to bring to, from *ad* to + *portare* to bring or carry]

Rasch scale *n.* In psychometrics, a simple application of ***item response theory** based on the assumption that the probability of a particular response to a test item depends on two parameters that can be estimated independently: the extent to which the item elicits a latent trait, and the status of the respondent on that latent trait, the latter being constant across test items. The ***British Ability Scales** were among the first to be constructed according to Rasch scales. [Named after the Danish psychometrician Georg Rasch (1901–80), who expounded this approach in his book *Probabilistic Models for Some Intelligence and Attainment Tests* (1960)]

*****ebook converter DEMO Watermarks*****

rate-dependency effect *n.* Another name for the **initial values law*, as it applies to the effects of drugs on behaviour.

rating scale *n.* In psychometrics, any device for quantifying a respondent's subjective judgement or response to a stimulus. Some rating scales consist of a row of unlabelled boxes or lines on which the respondent marks a chosen point, whereas others provide the respondent with sets of alternatives labelled with numbers or words. In all of these cases, the end-points of the scale are generally anchored with labels such as *Strongly Disagree* and *Strongly Agree*. See also *BIPOLAR RATING SCALE*, *GRAPHIC RATING SCALE*, *NUMERICAL RATING SCALE*, *Q-SORT*, *REPERTORY GRID TEST*, *RESPONSE CATEGORY*, *SEMANTIC DIFFERENTIAL*, *VERBAL RATING SCALE*.

ratio IQ *n.* The original but now obsolete conception of **IQ*, introduced in 1912 by the German psychologist (Louis) William Stern (1871–1938), as a ratio of **mental age (MA)* to **chronological age (CA)*. Although Stern's original quotient was this MA/CA, in 1916 the US psychologist Lewis Madison Terman (1877–1956) modified it to $(MA/CA) \times 100$, to express mental age as a percentage of chronological age and to eliminate awkward decimals. Since the publication of *The Measurement of Intelligence* in 1944 by the Romanian-born US psychologist David Wechsler (1896–1981), the standard definition of IQ has been the purely statistical **deviation IQ*.

ratiomorphic *adj.* Of or relating to psychological processes that appear **rational* but are inaccessible to consciousness, especially the computational processes involved in perception. The word was coined by the Hungarian-born US psychologist Egon Brunswik (1903–55). See also *BRUNSWIKIAN*.
ratiomorphism *n.* [From Latin *ratio* reason + Greek *morphe* form]

rational *adj.* **Thinking* or behaving reasonably or logically. Rational decisions or choices are those that are in the best interests of the agent who makes them, relative to the information available to the agent at the time of acting; or more specifically, rational decisions or choices are those that maximize **expected utility*. In addition, rational **beliefs* are those that are internally consistent; rational preferences are those that are **transitive*; rational probability judgements are those that obey **Kolmogorov's axioms*; and rational **inferences* or arguments are those that obey the rules of **logic*.

*****ebook converter DEMO Watermarks*****

See also [BOUNDED RATIONALITY](#), [DOMINANT ALTERNATIVE/STRATEGY](#), [NASH EQUILIBRIUM](#), [RATIONAL CHOICE THEORY](#), [RATIONALISM \(1, 2, 3\)](#), [REASON](#), [SURE-THING PRINCIPLE](#), [TRANSITIVE PREFERENCES](#). **rationality** *n.* The state or quality of being rational. Compare [NEGATIVE CAPABILITY](#). [From Latin *rationalis* rational, from *ratio*, -onis reason or reckoning, from *reri*, *ratus* to think]

rational choice theory *n.* A theory of [*decision making](#) according to which, when faced with several options or possible courses of action, a decision maker chooses an option that is believed to offer the best outcome from that agent's own point of view. The fundamental assumption is that agents are [*rational](#) in the sense of maximizing [*expected utility](#), but this is often interpreted as a [*normative \(1\)](#) assumption rather than one that accurately describes human behaviour. Many writers use the term synonymously with [*decision theory](#). The theory has been particularly influential in economics and in branches of psychology closely associated with economics. See also [EXPECTED UTILITY THEORY](#), [INTRANSITIVE PREFERENCES](#), [MONEY PUMP](#), [PASCAL'S WAGER](#). Compare [BEHAVIOURAL DECISION THEORY](#), [PSYCHOLOGICAL DECISION THEORY](#).

rational emotive behaviour therapy *n.* A form of [*psychotherapy](#) or [*cognitive](#) therapy developed by the US psychologist Albert Ellis (1913–2007) in 1955, based on the assumption that psychological problems often arise from people's interpretations of events in their lives rather than the events themselves, and that irrational interpretations (as when people who are rejected in love irrationally infer that they are intrinsically worthless and unlovable) cause psychological problems; the therapy involves challenging irrational belief systems in an extremely directive manner by explicit confrontation, suggestion, argument, and various specialized procedures. US *rational emotive behavior therapy*. See also [ABC \(1\)](#), [COGNITIVE RESTRUCTURING](#), [RATIONAL EMOTIVE THERAPY](#). **REBT** *abbrev.*

rational emotive therapy *n.* The term used by the US psychologist Albert Ellis (1913–2007) for a new form of [*psychotherapy](#) that he developed in 1955 and that from 1993 he began calling [*rational](#) emotive behaviour therapy. **RET** *abbrev.*

rationalism *n.* 1. The doctrine associated especially with the French

*****ebook converter DEMO Watermarks*****

philosopher René Descartes (1596–1650), the Dutch philosopher Baruch Spinoza (1632–77), and the German philosopher and mathematician Gottfried Wilhelm von Leibniz (1646–1716) that it is possible to obtain knowledge by **reason* alone, that there is only one valid system of reasoning and it is deductive in character, and that everything is explicable in principle by this form of reasoning. *See also* [A PRIORI](#), [HUME'S FORK](#), [NATIVISM](#). *Compare* [EMPIRICISM](#). **2.** The more general view that everything is explicable in principle by one system of reasoning. **3.** A general commitment to **reason* as opposed to faith, religious belief, prejudice, tradition, or any other source of belief that is without foundation in reason. **rationalist** *n.* One who believes in or practises rationalism (1, 2, 3). **rationalistic** *adj.* [From Latin *rationalis* of or relating to reason, from *ratio* reason]

rationality, bounded *See* [BOUNDED RATIONALITY](#).

rationalization *n.* The act of justifying discreditable actions after the event, or a justification or excuse put forward in this way. In **psychoanalysis*, a **defence mechanism* in which a false but reassuring or self-serving explanation is contrived to explain behaviour that in reality arises from a repressed wish. The term was first used in the narrower psychoanalytic sense in 1908 by the Welsh psychoanalyst Ernest Jones (1879–1958) in an article in the *Journal of Abnormal Psychology* entitled 'Rationalisation in Everyday Life'. **rationalize** *vb.*

rational type *n.* One of the basic personality types in **analytical psychology*. *See* [FUNCTION TYPE](#).

ratio scale *n.* A scale of measurement in which differences between values can be quantified in absolute terms and a fixed zero point is defined, as for example in measurements of length in centimetres or age in years. In a ratio scale, equal differences between scores represent equal differences in the **attribute* being measured, and a zero score represents complete absence of the attribute. It is only when measurement reaches the level of a ratio scale that it is meaningful to describe a score as twice the value of another score, for example. *See also* [MEASUREMENT LEVEL](#), [SCALE \(1\)](#). *Compare* [ABSOLUTE SCALE](#), [INTERVAL SCALE](#), [LOG-INTERVAL SCALE](#), [NOMINAL SCALE](#), [ORDINAL SCALE](#). [From Latin *ratio* a reckoning]

*****ebook converter DEMO Watermarks*****

Rat Man *n.* The nickname used in the literature of [*psychoanalysis](#) to refer to an early patient of Sigmund Freud (1856–1939). The Rat Man was tormented by fantasies of rats gnawing at his father's anus and that of a woman to whom he was attracted. Freud's case study, published in 1909, entitled 'Notes upon a Case of Obsessional Neurosis' (*Standard Edition*, X, pp. 155–320), is a classic text on the psychoanalytic theory of [*obsessive-compulsive disorder](#). *See also* [UNDOING](#).

rausch *n.* A state of diminished consciousness characteristic of light general [*anaesthesia](#), often defined in anaesthesiology as the point at which a patient fails to respond to questions. [From German *Rausch* intoxication or ecstasy]

Rauwolfia *n.* A genus of tropical trees and shrubs including the south-east Asian species *Rauwolfia serpentina* from the powdered roots of which [*reserpine](#) is derived. [Named by the French botanist and monk Charles Plumier (1646–1704), after the German Botanist Leonhard Rauwolf (1535–96) who had travelled to Africa and Asia to study such plants]

raven paradox *n.* Another name for [*Hempel's paradox](#).

Raven's Progressive Matrices *n.* A non-verbal [*intelligence](#) test requiring inductive reasoning about abstract geometric patterns, first published in 1938 and revised several times since then, designed to cover a very wide range of mental ability and to be usable with subjects irrespective of age, sex, nationality, or education. The respondent is presented with 60 abstract geometric patterns, and in each case tries to select from several alternatives the one that fits in a missing part of the pattern. Some psychologists believe that it provides the purest available measure of general intelligence, uncontaminated by cultural and educational influences, but there is evidence to suggest that it is not entirely [*culture-fair](#). Also called the *Progressive Matrices test*. *See also* [CATTELL CULTURE-FAIR TEST](#), [MILL HILL VOCABULARY SCALE](#). **RPM** *abbrev.* [Named after the English psychologist John C(arlyle) Raven (1902–70), who developed it in 1938]

raw primal sketch *See* [PRIMAL SKETCH](#).

raw score *n.* In statistics and measurement theory, a numerical result of an empirical investigation in the form in which it was recorded. *See also* DATA, SCORING FORMULA, TRANSFORMATION. *Compare* DERIVED SCORE.

Rayleigh equation *n.* An index of a person's colour vision given by the proportion of light from the red and green parts of the visible spectrum that need to be mixed to match a standard yellow. Usually 670 nanometres (spectral red) is mixed with 535 nm (spectral green) until it matches 589 nm (spectral yellow). Also called the *Rayleigh match*. *See also* ADDITIVE PRIMARY, ANOMALOSCOPE, COLOUR-BLINDNESS, COLOUR EQUATION, PRIMARY COLOUR (1), TRISTIMULUS VALUES. [Named after the English physicist Lord (John William Strutt) Rayleigh (1842–1919) who introduced it in 1881]

reactance *n.* 1. A psychological state resulting from the elimination or threatened elimination of an option, causing that option to appear more attractive. For example, if a child who initially has the possibility of playing with either of two toys is forbidden to play with one of them, then the forbidden toy may suddenly seem more attractive to the child. According to reactance theory, a person who is subjected to excessive *persuasion that is experienced as a threat to freedom of choice may respond by strengthening the targeted attitude rather than changing it, and a person with a nagging spouse may deliberately avoid doing what the spouse continually demands. The concept was introduced in 1966 by the US psychologist Jack W(illiams) Brehm (1928–2009) in a book entitled *A Theory of Psychological Reactance*. *See* COGNITIVE DISSONANCE. 2. In engineering, opposition to the flow of alternating current, measured in ohms, resulting from the presence of an inductor or capacitor in an electrical circuit, or opposition to acoustic or mechanical vibration, usually resulting from inertia or stiffness of the vibrating object or medium. [From Latin *reagere* to react, from *agere* to do + *-antia* indicating an action, state, condition, or quality]

reaction formation *n.* In *psychoanalysis, a *defence mechanism whereby a person replaces a repressed thought, feeling, or behavioural act with one that is diametrically opposed to it, as when a shy person behaves in an exhibitionist manner or a repressed homosexual denounces homosexuality. According to the Austrian psychoanalyst Otto Fenichel (1898–1946), it is a form of permanent *countercathexis: ‘The person who has built up reaction-
*****ebook converter DEMO Watermarks*****

formations does not develop certain defence mechanisms for use when an instinctual danger threatens; he has changed his personality structure as if the danger were continually present, so that he may be ready whenever the danger occurs' (*The Psychoanalytic Theory of Neuroses*, 1945, p. 151).

reaction latency *n.* In **Hullian learning theory*, the time elapsing between a **stimulus (1)* and a **response*. *st_R* abbrev.

reaction threshold *n.* In **Hullian learning theory*, the strength of an organism's momentary reaction potential that must be reached for it to respond to a **stimulus (1)*. *sL_R* abbrev.

reaction time *n.* The time elapsing between the onset of a **stimulus (1)* and a **response* to it, sometimes broken down into **physiological time* plus **central reaction time*. **Simple reaction time* applies when there is only one possible stimulus requiring only one type of response; **choice reaction time* (also called *complex reaction time*) when there are two or more possible stimuli requiring different responses; and **discrimination* reaction time when the response depends on the detection of a difference in an objectively measurable perceptual dimension such as brightness, length, or weight. Also, especially in relation to animal behaviour, called *latency*, *latent time*, or *response latency*. See also *FITTS' LAW*, *HICK'S LAW*, *LIBET'S DELAY*, *PERSONAL EQUATION*, *PHYSIOLOGICAL TIME*, *READINESS POTENTIAL*, *SUBTRACTION METHOD*. **RT** abbrev.

reactive attachment disorder *n.* In **DSM-5*, a **trauma- and stressor-related disorder* of infancy or early childhood (beginning before age 5 years) characterized by a persistent pattern of emotional withdrawal from carers, manifested by rarely seeking comfort when distressed and responding minimally when comforted, and more generally by a lack of social and emotional responsiveness to others, limited positive **affect*, and episodes of labile affect in interactions with adult carers, together with evidence of pathogenic care, assumed to be responsible for the disturbed social relating, in which the child has experienced either neglect or persistent lack of adult care, repeated changes of carers with limited opportunity to form stable attachments, or rearing in institutions with insufficient numbers of carers or

other circumstances of severely limited opportunities for forming attachments to carers. *See also* [ATTACHMENT THEORY](#), [TRAUMA- AND STRESSOR-RELATED DISORDERS](#). *Compare* [AUTISM SPECTRUM DISORDER](#), [DISINHIBITED SOCIAL ENGAGEMENT DISORDER](#), [INTELLECTUAL DISABILITY](#).

reactive depression *n.* A form of [*depression](#) that arises as a consequence of some upsetting event or experience. Also called *exogenous depression*. *Compare* [ENDOGENOUS DEPRESSION](#).

reactive synaptogenesis *n.* The spontaneous formation of new [*synapses](#) (1) in reaction to axon terminal degeneration at nearby receptor sites. [From Greek *synapsis* contact or junction, from *syn* together + *haptēin* to fasten + *genesis* birth]

reactivity *n.* The property of being responsive to stimuli, or (in relation to a mental disorder) of being precipitated by an external cause, notably with reference to [*reactive depression](#). In psychometrics, the property of some psychological measures of yielding scores that are influenced by the participants' or subjects' knowledge that their behaviour is being observed or measured. *See* [NON-REACTIVE MEASURE](#). *See also* [DEMAND CHARACTERISTICS](#).

readability formulas *See* [FLESCH INDICES](#).

readiness potential *n.* A negative [*event-related potential](#), across wide areas of both [*frontal lobes](#), the [*motor cortex](#), and the [*parietal lobes](#) of the [*cerebral](#) cortex, gradually increasing for approximately a second to two seconds before a person performs a voluntary action at a time of his or her own choosing. The phenomenon, revealed by averaging the [*EEG](#) traces across a number of voluntary actions, was discovered in 1964 by the German neurologist H(ans) H(elmut) Kornhuber (1928–2009) and his postgraduate student Lüder Deecke (born 1938) and published in the journal *Pflügers Archiv (European Journal of Physiology)* briefly in 1964 and at length in 1965. It is usually interpreted as an electrophysiological sign of planning, preparation, and initiation of voluntary action, and it has been replicated with a variety of bodily actions, including flexing a finger or wrist, moving a foot, and vocalizing a syllable. It suggests that voluntary decision processes occupy more than a second, which contrasts with the much shorter [*reaction](#)

*****ebook converter DEMO Watermarks*****

time for automatic responses to stimuli. According to research by the US neurophysiologist Benjamin Libet (1916–2007) published in the journal *Behavioral and Brain Sciences* in 1985, conscious decisions lag 350 to 400 milliseconds behind the onset of the associated readiness potentials, suggesting that spontaneous voluntary action begins unconsciously and apparently undermining the conventional interpretation of free will. *See also* **LIBET'S DELAY**. Compare **CONTINGENT NEGATIVE VARIATION**. **RP** or **BP** abbrev. [Translated from the German *Bereitschaftspotential*, the term introduced by Kornhuber and Deecke]

reading by sound *n.* Another name for ***surface dyslexia**.

reading disorder *n.* A ***specific learning disorder** characterized by a level of reading ability (accuracy, speed, and comprehension) substantially below what is expected for the child's age, intelligence, and education, the reading difficulty interfering substantially with scholastic or academic achievement or everyday life and not being attributable to neurological or sensory impairment, ***intellectual disability**, or environmental deprivation. Also called *legasthenia*, *reading disability*, *specific developmental dyslexia*, *specific reading disorder*. *See also* **DYSLEXIA**, **HYPERLEXIA**, **SPECIFIC SPELLING DISORDER**.

reading ease score *n.* One of the ***Flesch indices** of the readability of text, defined by the formula $RE = 206.835 - (1.015 \times \text{average number of words per sentence}) - (84.6 \times \text{average number of syllables per word})$. In practice, reading ease scores almost always lie between zero and 100. A reading ease score of zero indicates that the text is practically unreadable, 40 that it is difficult, 65 that it is standard, 85 that it is easy, and 95 that it is very easy. Reading ease scores have been found to correlate highly with ratings of readability and with measures of comprehension and retention. *See also* **HUMAN INTEREST SCORE**.

reading span *n.* The number of words that can be apprehended in a single ***fixation** (1) while reading. Most adults have an average reading span of about three.

reafference *n.* Changes in ***proximal** stimuli resulting from self-produced

*****ebook converter DEMO Watermarks*****

movements rather than any movements or changes in the ***distal** stimuli, including especially the changes in visual stimulation resulting from head and eye movements. **reafferent** *adj.* [From Latin *re-* back again + *aferre* to carry to, from *ad* to + *ferre* to carry]

realistic anxiety *n.* In ***psychoanalysis**, any ***anxiety** resulting from an external danger that poses a real threat, in contrast to an internally generated anxiety. *Compare* **NEUROTIC ANXIETY**.

realistic group conflict theory *n.* The notion that group conflict and hostility are caused chiefly by competition for resources and power. The theory was first proposed by the US-based Turkish psychologist Muzafer Sherif (1906–88) and several colleagues in the ***Robbers Cave experiment**. **RGCT** *abbrev.*

reality-ego *n.* In ***psychoanalysis**, one of the two major aspects of the ***ego**, based on the ***reality principle**, differentiated by Sigmund Freud (1856–1939) from the ***pleasure-ego**, based on the ***pleasure principle**. In his article on ‘Formulations on the Two Principles of Mental Functioning’ (1911), he summed up the distinction as follows: ‘Just as the pleasure-ego can do nothing but *wish*, work for a yield of pleasure, and avoid unpleasure, so the reality-ego need do nothing but strive for what is *useful* and guard itself against damage’ (*Standard Edition*, XII, pp. 218–26, at p. 223).

reality monitoring *n.* The act or process of discriminating between genuine memories that are acquired through perception from external reality and apparent memories that are generated internally by imagination. It tends to break down in ***schizophrenia**, ***delusional disorder**, ***Alzheimer's disease**, and other mental disorders characterized by ***hallucinations**, ***delusions**, and ***dementia**, and it is temporarily disrupted by intoxication with some types of drugs, especially ***hallucinogens**. Research into ***constructive memory** has shown that the sources of many memories are neither purely external nor purely internal, and the distinction between external and internal memory sources is therefore considered relative rather than absolute. Reality monitoring is a form of ***metacognition** that was named in 1981 by the US psychologists Marcia K. Johnson (born 1943) and Carol L. Raye (born 1946), who were also the first to study it systematically. The term is widely used in

*****ebook converter DEMO Watermarks*****

cognitive psychology and is closely related to [*reality testing](#) in clinical psychology. *See also* [DÉJÀ VU](#), [EYEWITNESS MISINFORMATION EFFECT](#), [FALSE MEMORY](#), [PARAMNESIA \(1\)](#), [PIAGET KIDNAPPING MEMORY](#), [RECOVERED MEMORY](#), [SOURCE MEMORY](#).

reality principle *n.* In [*psychoanalysis](#), the chief governing principle of the [*ego](#), exercising control over behaviour to meet the conditions imposed by external reality, thereby acting as a moderating influence on the [*pleasure principle](#). The Irish dramatist George Bernard Shaw (1856–1950) expressed its essence with remarkable clarity and brevity in his play *Man and Superman: A Comedy and a Philosophy* (1901–3), in the discussion about the Life Force near the end of Act III, when the Devil asks Don Juan what the use is of knowing oneself, and Don Juan replies: ‘Why, to be able to choose the line of greatest advantage instead of yielding in the direction of the least resistance’. The reality principle involves the conversion of [*free energy](#) into [*bound energy](#). Sigmund Freud (1856–1939) gave a full account of this aspect of his theory in 1915 in an article on ‘Instincts and their Vicissitudes’ (*Standard Edition*, XIV, pp. 117–40). *See also* [REALITY-EGO](#), [REALITY TESTING](#).

reality, psychical *See* [PSYCHICAL REALITY](#).

reality testing *n.* Objective differentiation between the external world and one's inner imaginative world, loss of which in a [*mental disorder](#) tends to indicate lack of [*insight \(3\)](#) and is often taken to be indicative of [*psychosis \(1\)](#). The term is used widely in clinical psychology and is closely related to [*reality monitoring](#) in cognitive psychology. The concept was introduced by the Austrian neurologist Sigmund Freud (1856–1939) in his article on ‘Formulations on the Two Principles of Mental Functioning’ (1911, *Standard Edition*, XII, pp. 218–26).

reason *n.* The faculty of [*rational](#) thought; rational grounds for a belief, or a [*premise](#) of an argument supporting a belief; a rational motive or cause for an action or a choice; sanity or soundness of mind. [From Old French *reisun* reason, from Latin *ratio* reckoning, from *rerī* to think]

reasoned action, theory of *See* [THEORY OF REASONED ACTION](#).

reasoning *n.* Cognitive processing directed at finding solutions to problems by applying formal rules of ***logic** or some other ***rational** procedure. See **CONDITIONAL REASONING**, **COUNTERFACTUAL REASONING**, **DEDUCTION**, **DEDUCTIVE REASONING**, **DEFAULT REASONING**, **DEONTIC REASONING**, **EPISTEMIC REASONING**, **INDUCTION (1, 2)**, **INFERENCE**, **LOGIC**, **LOGICAL ANALYSIS**, **MODAL LOGIC**, **NON-MONOTONIC REASONING**, **SYLLOGISM**. See also **MENTAL MODEL**, **PREMISE**, **RATIONAL**, **RATIONALISM (1, 2)**. Compare **PROBLEM SOLVING**.

rebirthing *n.* A technique of ***psychotherapy** based on and similar to ***primal therapy**, but concentrating specifically on reliving and coming to terms with one's birth pains and involving total body immersion in warm water.

rebound effect *n.* A pattern of events, opposite to those produced by a drug or some other special treatment, that occur when the drug or treatment is abruptly withdrawn, typical examples being rebound insomnia following sudden withdrawal from a ***hypnotic (2)** drug and ***REM rebound** following the cessation of a period of REM deprivation. See also **DELIRIUM TREMENS**.

rebound REM *n.* Another name for ***REM rebound**.

rebus *n.* A representation of a word or sentence by a combination of ***pictographs**, ***logographs**, or other symbols in the form of a puzzle. A typical example is h@b& to represent the word *hatband*. **rebuses** *pl.* [French *rébus*, from Latin *rebus* by things]

recall *n.* The act or process of retrieving information from memory spontaneously, either without ***cues (3)** in the case of *free recall* or with cues in the case of *cued recall*. It involves reproduction of the remembered information, in contrast to ***recognition**, which involves identification of a match between the remembered information and newly presented information, recognition generally being easier than recall and producing higher memory scores in formal tests. See also **ENCODING SPECIFICITY**, **MEMORY**, **MNEMONIC**, **SERIAL RECALL**, **STATE-DEPENDENT MEMORY**.

recapitulationism *n.* The doctrine that the development of an organism

from conception to maturity repeats the same sequence of stages as have occurred during the evolution of its **species* or **race* (2). Also called *palingenesis* or *recapitulation theory*. [From Latin *recapitulare* to reinstate headings in a document]

Received Pronunciation *n.* The standard, regionally neutral, prestige **accent* (1) of British English, sometimes (misleadingly) called BBC English. **RP** *abbrev.*

receiver operating characteristic *n.* In **signal* detection theory, a plot of the proportion of **false alarms* (2) on the horizontal axis against the proportion of **hits* on the vertical axis (see *illustration*), the diagonal from bottom left (0, 0) to top right (1, 1) corresponding to a **d prime* of zero, and the curve obtained from a particular experiment always describing an arc above this diagonal, its precise form depending on the value of *d prime*, which in turn depends on the **signal-to-noise ratio* and the observer's sensitivity to the signal, different points on the curve representing variations in the observer's attitude towards the relative importance of **misses* and false alarms. *See also* MEMORY OPERATING CHARACTERISTIC. **ROC** *abbrev.*

Receiver operating characteristic. The observer at A is concerned to avoid misses and is willing to risk many false alarms, and at B is concerned to avoid false alarms and is willing to risk many misses; the observer at C is equally concerned about misses and false alarms.

recency effect *n.* In **serial learning (1)*, enhanced memory for the last items in a series of items that have been learned. *See also* [SERIAL POSITION EFFECT](#). *Compare* [PRIMACY EFFECT \(1\)](#).

recency law *n.* The principle according to which the more recently information was learned the better it tends to be remembered.

receptive aphasia *n.* Another name for Wernicke's aphasia. *See* [APHASIA](#).

receptive field *n.* An area of the retina or any other receptor surface that when stimulated increases or decreases the propensity of a neuron at a higher level in the sensory system to discharge a nerve impulse, the receptor area thus being the receptive field of that neuron. The term is sometimes applied in the same way to the neurons in the **sensory* projection areas of receptors. A *classical receptive field* is one within which stimulation invariably excites the neuron or invariably inhibits the neuron; a *non-classical receptive field* is an area that surrounds or is adjacent to a classical receptive field and within which stimulation cannot influence the neuron directly but can modulate the firing of neurons in the associated classical receptive field. A receptive field is sometimes defined in terms of an external area of the perceptual field that stimulates a specified neuron rather than in terms of an internal area of the receptor surface. *See also* AUDITORY RECEPTIVE FIELD, CENTRE-SURROUND RECEPTIVE FIELD, COMPLEX CELL, DOUBLE-OPPONENT RECEPTIVE FIELD, END-STOPPED RECEPTIVE FIELD, HYPERCOMPLEX CELL, SIMPLE CELL. *Compare* PERCEPTUAL FIELD, VISUAL FIELD.

receptive orientation *n.* In **neo-Freudian* theory, a term used by the German-born US psychoanalyst Erich Fromm (1900–80) to denote a passive-dependent character type who leans on authority for knowledge and help, and on people in general for support, usually accompanied by a chronic inability to say no to requests and an inordinate fondness for food and drink. *Compare* EXPLOITATIVE ORIENTATION, HOARDING ORIENTATION, MARKETING ORIENTATION, PRODUCTIVE ORIENTATION.

receptor *n.* 1. An abbreviated name for a **sensory* receptor. 2. An abbreviated name for a **neuroreceptor*. [From Latin *recipere*, *receptum* to receive, from *re-* back + *capere*, *ceptum* to take]

receptor blocker *n.* Another name for a **competitive antagonist*.

receptor potential *n.* Another name for **generator potential*.

receptor site *n.* Another name for a **neuroreceptor*.

recessive gene *n.* A **gene* that is inherited from one parent and that

produces its characteristic ***phenotype** only in a homozygous organism, that is, only when the corresponding ***allele** inherited from the other parent is the same. Also (more accurately but less commonly) called a *recessive allele*. See also **COMPLEMENTATION**. Compare **DOMINANT GENE**.

reciprocal altruism *n.* A form of ***altruism** or helping behaviour whose performance or continuation is conditional on the recipient behaving altruistically or helpfully in return. The concept was introduced by the US biologist Robert L. Trivers (born 1943) in an article in the *Quarterly Review of Biology* in 1971, where he used the example of cleaner-fish, some 50 species of which are known to feed on parasites attached to the bodies, including the insides of the mouths, of other, larger species of fish, which reciprocate by refraining from eating the cleaner-fish. Trivers explained the basic idea as follows: Suppose a swimmer with cramp has 1/2 chance of drowning unless a passer-by jumps into the water to help. If this entails a 1/20 chance of both the swimmer and passer-by drowning, then, by volunteering the help, the passer-by who expects the good turn to be reciprocated by the swimmer in the future trades a 1/10 chance of drowning (two episodes, each with a 1/20 chance) for a 1/2 chance of drowning, so the altruism pays off in the end. He suggested that many psychological characteristics, such as guilt, gratitude, and sympathy, have been shaped by natural selection of the ability to detect and avoid individuals who take advantage of reciprocally altruistic relationships by cheating. See also **PRISONER'S DILEMMA GAME**, **TIT FOR TAT STRATEGY**.

reciprocal inhibition *n.* A technique of ***behaviour** therapy used especially to treat ***phobias** by repeatedly evoking a response that is physiologically incompatible with anxiety, such as deep muscular relaxation, simultaneously with the anxiety-provoking ***phobic stimulus**, usually imagined rather than actually present. A specialized application of this technique, with a hierarchy of increasingly anxiety-provoking imaginary situations involving the phobic stimulus, is called ***systematic desensitization**.

recoding test *n.* Another name for a ***coding test**.

recognition *n.* The act or process of perceiving or identifying information

*****ebook converter DEMO Watermarks*****

as matching or being the same as information that has been remembered. It is often contrasted with ***recall**, which involves reproduction of remembered information without ***cues** (3), and it is generally easier than recall, producing higher memory scores in formal tests. *See also* **MEMORY**, **MEMORY OPERATING CHARACTERISTIC**, **STERNBERG TASK**. **recognize** *vb.* [From Latin *recognoscere* to know again, from *re-* again + *cognoscere* to know, from *com-* together + *noscere* to know]

recognition heuristic *n.* A ***heuristic** used when making judgements, on the basis of limited relevant knowledge, as to which of two alternatives is higher on some criterion such as size or monetary value. If one of the alternatives is recognized and the other is not, the heuristic involves simply judging the recognized alternative to be higher. For example, if a person with limited knowledge of mountains is presented with pairs of mountain names and is asked which is taller in each pair, and if the person recognizes only about half the names, then choosing the recognized mountain whenever only one is recognized will yield a high proportion of right answers. This works when there is a strong correlation between recognizability and the criterion being judged. The heuristic was introduced in 1999 by the US psychologist Daniel G(ray) Goldstein (born 1969) and the German psychologist Gerd Gigerenzer (born 1947) in a book by Gigerenzer and several co-authors entitled *Simple Heuristics That Make Us Smart* and in 2002 in an article in the journal *Psychological Review* that was under editorial review when the book was published. *See also* **LESS-IS-MORE EFFECT**.

recombinant DNA *n.* A form of ***genetic engineering** in which genetic material is produced by combining ***DNA** extracted from different sources, often combining ***genes** from a human or animal with those from a bacterium, using ***restriction enzymes** to cut DNA chains and ***DNA** ligase to unite strands that have been cut. Not to be confused with ***DNA** recombination. *See also* **ANNEALING (2)**, **HETERODUPLEX DNA**, **HYBRIDIZATION**.

recombination *n.* Another name for ***DNA** recombination, not to be confused with ***recombinant DNA**.

reconstructive memory *n.* An active process whereby various strategies are used during the process of memory ***retrieval** to rebuild

*****ebook converter DEMO Watermarks*****

information from memory, filling in missing elements while remembering. It was first differentiated from ***reproductive memory** in 1932 by the English psychologist Sir Frederic Charles Bartlett (1886–1969), who studied it with the technique of ***successive reproduction**. *See also* CONSTRUCTIVISM, DEFERRED ACTION, FALSE MEMORY, WAR OF THE GHOSTS. *Compare* CONSTRUCTIVE MEMORY.

recovered memory *n.* A memory, usually for a traumatic event or experience, such as being sexually abused as a child, retrieved after having been forgotten or repressed, often for many years. Unless it is verified, what appears to be a recovered memory may in fact be a ***false memory**. *See also* DEFERRED ACTION, FALSE MEMORY SYNDROME, HYPNOTHERAPY, PARAMNESIA (1), PIAGET KIDNAPPING MEMORY. *Compare* EYEWITNESS MISINFORMATION EFFECT.

recruitment *n.* **1.** The process or practice of enlisting people, especially for military service or employment. **2.** A symptom of certain forms of hearing disorder in which there is a greater than normal increase in loudness with increasing stimulus intensity, resulting in a distressing exaggeration of loud sounds, while soft sounds may be comfortably audible. Also called *loudness recruitment*. **3.** An increase in the number of neurons firing as a stimulus is prolonged. [From French *recroître* to reinforce, from Latin *recrescere* to grow again, from *re-* again + *crescere* to grow]

rectus muscle *n.* A straight muscle, especially one of the ***extra-ocular muscles** attached externally to each eyeball along its front-to-back axis: the *superior rectus*, *medial rectus* (also called *internal rectus*), *lateral rectus* (also called *external rectus*), or *inferior rectus*. Together with the two ***oblique muscles**, the rectus muscles control eye movements, the lateral and medial recti moving the visual axis from side to side, and the superior and inferior recti moving the axis up and down. *See also* ABDUCENS NERVE, DIPLOPIA. [From Latin *rectus* straight]

red blood cell *n.* Another name for an ***erythrocyte**. Also called a *red blood corpuscle*.

red devils *n.* A street name for ***secobarbital** (quinalbarbitone) or ***Seconal**.

red-green cell *n.* A neuron that is located in the visual system and is excited by red light and inhibited by green light or vice versa. Such **opponent cells* are not found in the retina, where the **trichromatic theory* applies, but at higher levels in the visual system. *See also* BLUE-YELLOW CELL. *Compare* CONE.

red-green colour-blindness *n.* Another name for **daltonism*. US *red-green color-blindness*.

redintegration *n.* The restoration of a complete mental state when only a single element of it is experienced. A classic literary example, often quoted as an illustration of the power of the chemical senses to reawaken memories from the distant past, occurs at the end of the 'Overture' to the vast novel *À la Recherche du Temps Perdu* (Remembrance of Things Past) by the French novelist Marcel Proust (1871–1922), where the taste of a madeleine cake soaked in lime tea evokes vivid memories of childhood: 'I had recognized the taste of the crumb of madeleine soaked in her concoction of lime-flowers which my aunt used to give to me.... Immediately the old grey house upon the street, where her room was, rose up like the scenery of a theatre to attach itself to the little pavilion, opening on to the garden, which had been built out behind it for my parents', and so on for seven volumes. *See also* FLASHBACK (2), STATE-DEPENDENT MEMORY. [From Latin *re-* again + *integrare* to make whole, from *integer* whole]

red nucleus *n.* A large **nucleus* (2) in the front of the **tegmentum* of the midbrain in each hemisphere, receiving inputs from the motor cortex and the cerebellum and sending outputs to the inferior olivary nucleus on the same side and also to the cerebellum, the reticular formation, and the thalamus. It is involved in movement control in distal muscles, including those of the hands and feet. *See also* RUBROSPINAL TRACT. [So called because of its reddish appearance, which results from its high iron content]

Red Queen hypothesis *n.* The proposition that any evolutionary advance by one species is ipso facto detrimental to other species in the same **ecosystem*, so that species are involved in a competitive evolutionary race in which they must continually evolve merely to survive and maintain their positions. The term was introduced by the US evolutionary biologist Leigh
*****ebook converter DEMO Watermarks*****

(Maiorana) Van Valen (1935–2010) in an article in the journal *Evolutionary Theory* in 1973. [Alluding to the passage in Chapter 2 of Lewis Carroll's *Through the Looking Glass* in which Alice first finds herself on a chessboard and the Red Queen says: ‘Now, *here*, you see, it takes all the running *you* can do, to stay in the same place. If you want to get somewhere else, you must run at least twice as fast as that!’]

reduced reaction time *n.* Another name for **central reaction time*.

reductional division *n.* Another name for **meiosis (1)*.

reductionism *n.* An attempt to provide a complete explanation of a phenomenon in terms of events or processes occurring at a lower or more basic level. Thus a psychological phenomenon may be reduced to neurophysiological processes, which in turn are correlated in detail with biochemical processes, and these may be similarly reduced to chemical processes, and the chemical processes to physical processes. Reductionism usually entails a belief that the lower or more basic processes in some sense explain the higher; but critics argue that such correlations cannot amount to a complete explanation any more than a specification of the electronic or electrical processes taking place in a computer could explain the computations that it performs. **reductionist** or **reductionistic** *adj.*

reduction screen *n.* A visual barrier perforated by a pinhole through which an observer can view a scene while eliminating several important depth cues, namely monocular (movement) **parallax*, **ocular convergence*, and **stereopsis*. Also called an *artificial pupil*. Compare VOID MODE.

reductive interpretation *n.* In **analytical psychology*, a term used dismissively by Carl Gustav Jung (1875–1961) to characterize **interpretation* in classical **psychoanalysis*, in which the doctrine of **psychic* determinism encourages analysts to explain everything causally in terms of unconscious instinctual processes. According to Jung, on the contrary, ‘No psychological fact can ever be explained in terms of causality alone; as a living phenomenon, it is always indissolubly bound up with the continuity of the vital process, so that it is not only something evolved but also continually evolving and creative’ (*Collected Works*, 6, paragraph 717).

*****ebook converter DEMO Watermarks*****

reduplicative paramnesia *n.* A disorder of [*memory](#) in which people may believe that familiar objects such as buildings are not the ones they know but merely resemble them. *Compare* [CAPGRAS SYNDROME](#), [DOPPELGÄNGER](#).

reefer *n.* An obsolescent street name for a hand-rolled cigarette containing [*cannabis](#). [From *reef* the part of a sail gathered in when there is high wind, alluding to the resemblance of a cannabis cigarette to a rolled-up sail]

re-evaluation counselling *n.* Another name for [*co-counselling](#). US *re-evaluation counseling*. **RC** abbrev.

reference, delusion (ideas) of *See* [DELUSION OF REFERENCE](#), [IDEAS OF REFERENCE](#).

reference group *n.* Any group that an individual takes as a standard in adopting opinions, attitudes, or patterns of behaviour or in self-judgement of social standing. The term was introduced in 1942 by the US sociologist Herbert H(iram) Hyman (1918–85). The US psychologist Harold H(arding) Kelley (1921–2003) later distinguished between *normative reference groups*, which set standards that individuals use as positive or negative models, and *comparative reference groups*, which are used by individuals to judge their own income, status, education, and so on. *See also* [ANTICIPATORY SOCIALIZATION](#), [NEGATIVE REFERENCE GROUP](#), [POSITIVE REFERENCE GROUP](#), [RELATIVE DEPRIVATION](#).

referred pain *n.* Pain felt at a site in the body some distance from a [*lesion](#) that gives rise to it, well-known examples being [*angina](#), which originates from coronary artery disease but may be felt in the left arm, shoulder, or jaw, and pain in the right shoulder often felt by a person with disease of the [*gall bladder](#). It arises only from stimulation of deep-lying [*pain](#) receptors in viscera, joints, and muscles, and never from pain receptors in the skin. Also called *telalgia*. *See also* [PAIN](#), [SYNAESTHESIA \(2\)](#).

reflectance *n.* The degree to which a surface reflects light, sound, or any other form of radiant energy. Radiation striking a surface that is not reflected

is either absorbed, depending on the *absorbance* of the surface, or transmitted, depending on its *transmittance*, which is the reciprocal of its *opacity*, the degree to which it reflects or absorbs incident light. *See also* [LUMINANCE](#). [From Latin *reflectere* to turn back, from *re-* again + *flectere* to bend]

reflected appraisal *n.* An evaluation of oneself inferred from the reactions of others during social interaction. Also called *reflected self-appraisal*. [From Latin *reflectere* to turn back, from *re-* again + *flectere* to bend]

reflecting back *n.* In client-centred therapy or counselling, a process whereby the therapist or counsellor puts into words and feeds back, without **interpretation* (2) or judgement, the emotional content of the client's words and behaviour. The therapist might say, for example, 'You are angry because I am not taking your side against your husband'. Also called *reflection of feeling*.

reflection-impulsivity *n.* A **cognitive* style, first identified in 1958 by the US psychologist Jerome Kagan (born 1929), characterized by either *reflection* or *reflectivity*, a tendency to consider and deliberate over alternative solutions to problems, or *impulsivity*, a tendency to respond spontaneously without deliberation, especially in situations of uncertainty. It is usually measured by analysing patterns of response latencies and errors in simple tasks, a reflective person generally producing relatively few errors but long response times, and an impulsive person more errors but shorter response times. *See also* [MATCHING FAMILIAR FIGURES TEST](#). Also called *conceptual tempo*.

reflex *n.* 1. An immediate involuntary stereotyped **response* to a **stimulus* (1), such as blinking both eyes when something touches the cornea of either eye. In spite of being involuntary, many reflexes are effected by voluntary (striated) muscles, but some (such as the axon reflex) do not involve voluntary muscles. Also called a *reflex action* or a *reflex response*. *See* [ACCOMMODATION REFLEX](#), [ACHILLES TENDON REFLEX](#), [ACOUSTIC REFLEX](#), [AUDIO-OCULOGYRIC REFLEX](#), [AXON REFLEX](#), [BABINSKI REFLEX](#), [BICEPS REFLEX](#), [BLINK REFLEX](#), [CILARY REFLEX](#), [CORNEAL REFLEX](#), [DEEP TENDON REFLEX](#), [FLEXION REFLEX](#), [GAG REFLEX](#), [GRASP](#)

*****ebook converter DEMO Watermarks*****

REFLEX, MORO REFLEX, PATELLAR REFLEX, PUPILLARY LIGHT REFLEX, ROOTING REFLEX, SPINAL REFLEX, STARTLE REFLEX, STRETCH REFLEX, TRICEPS REFLEX, VESTIBULO-OCULAR REFLEX. *See also* CONDITIONED REFLEX, LOOMING, REFLEX ARC, UNCONDITIONED REFLEX. *adj.* 2. Of, relating to, or resembling a reflex (1). [From Latin *reflexus* bent back, from *reflectere* to bend back, from *flectare* to bend]

reflex arc *n.* A simple model of a neural pathway underlying a **reflex*, regarded by some psychologists as the basic element of behaviour: **stimulus* (1) → **sensory* receptor → **afferent* nerve → **interneuron(s)* → **efferent* nerve → **effector* → **response*. According to this model, a reflex carries an impulse from a sensory receptor to the spinal cord, where it connects either directly or via one or more interneurons with an efferent neuron that transmits the impulse to an appropriate muscle, gland, or other effector organ. The mechanism of the **axon* reflex does not conform to this pattern. *See also* CONDITIONED RESPONSE, MONOSYNAPTIC REFLEX, POLYSYNAPTIC REFLEX, UNCONDITIONED RESPONSE. *Compare* TOTE.

reflexology *n.* 1. A form of **psychotherapy* involving massage of the soles of the feet to relieve tension by stimulating nerve function and blood flow. 2. The doctrine, associated especially with Pavlovian **classical conditioning*, that all or almost all behaviour can be interpreted in terms of **reflexes*.

refraction *n.* A deflection in the direction of propagation of a light wave, sound wave, or other wave, caused by passing from one medium of transmission to another in which it is propagated at a different velocity, the degree of refraction depending on the relative **refractive* indices of the two media, the angle of incidence to the second medium, and the wavelength of the radiation. This phenomenon explains the working of a **lens*, including the **crystalline lens* of the eye, and the optical defect of chromatic aberration. *See also* ABERRATION (3), REFRACTIVE INDEX. **refract** *vb.* [From Latin *refractus* broken up, from *refringere* to break up, from *re-* again + *frangere* to break + *-ion* indicating an action, process, or state]

refractive index *n.* A measure of the degree of **refraction* of light or other radiation at the interface of two media, equal to the ratio of the sine of

*****ebook converter DEMO Watermarks*****

the angle of incidence to the sine of the angle of refraction, which in turn is equal to the ratio of the wave propagation speed in the first medium to the wave propagation speed in the second. *See also* [DIOPTRE](#).

refractory period *n.* **1.** A variable period of time following [*orgasm](#) during which males lack sexual desire and are incapable of achieving erection of the penis. *See also* [COOLIDGE EFFECT](#). **2.** A period up to approximately 2 milliseconds after an [*action potential](#) (the firing of a neuron) before the neuron recovers its capacity to fire again (the [*absolute refractory period](#)) or the subsequent period of up to 10 milliseconds during which its propensity to fire again is diminished (the [*relative refractory period](#)). **3.** A period following a response to a stimulus during which reaction time to a further stimulus is increased. Also called a *refractory phase* or, in sense 3, a *psychological refractory period* or *PRP*. [From Latin *refractus* broken, from *frangere* to break]

regeneration *n.* The process whereby a damaged [*axon](#) of a sensory or motor neuron in the peripheral nervous system grows a new connection to the organ, tissue, or cell that it previously innervated. In the central nervous system, damaged neurons do not always regenerate.

regenerative sprouting *n.* The growth of offshoots or sprouts from a severed axon initiating a process of [*regeneration](#).

regional cerebral blood flow *n.* Blood flow in localized areas of the brain during specific mental states or activities, recorded by a non-invasive [*brain](#) imaging technique such as a [*PET scan](#) or a [*SPECT scan](#), usually after introducing a radioactive substance, or by [*MRI](#). **rCBF** *abbrev.*

register *n.* **1.** In computer technology, a specialized memory location. **2.** A speech style associated with a particular topic or class of social interactions, such as legal [*jargon](#) (1), the [*argot](#) of a particular group, or [*slang](#). *See also* [VOCAL REGISTER](#). **3.** The anatomically determined range of a human voice. **4.** Another name for a [*sensory](#) register.

regression *n.* **1.** A reversion to an earlier, more immature mode of thinking, feeling, or behaving. **2.** In [*psychoanalysis](#), a [*defence mechanism](#)
*****ebook converter DEMO Watermarks*****

whereby a person reverts to a form of behaviour, thinking, or ***object-relationship** characteristic of an earlier stage of development in order to avoid or reduce ***anxiety**. *Libidinal regression* is a retreat to an earlier ***libidinal stage**, and tends to occur in response to conflict if there has been an earlier ***fixation** (2); *ego regression* is a return to earlier modes of mental functioning, as when an adult behaves in a childlike manner under stress. The concept was introduced by Sigmund Freud (1856–1939) in 1900 in his book *The Interpretation of Dreams* (Standard Edition, IV-V, at pp. 533–48). See also **REGRESSION IN THE SERVICE OF THE EGO**. **3.** In statistics, a technique for analysing the association between one or more ***independent variables** and a ***dependent variable**. See **MULTIPLE REGRESSION**, **REGRESSION ANALYSIS**, **REGRESSION TOWARDS THE MEAN**. **4.** A backward glance while reading a line of text. [From Latin *regressus* a stepping back + *-ion* indicating an action, process, or state]

regression analysis *n.* In statistics, the analysis of the relationship between a ***predictor variable** (or ***independent variable**) and a ***dependent variable**, usually expressed as a ***linear model** in which the value of the dependent variable is equal to a weighted value of the independent variable plus a constant. It was originally put forward in a primitive form by the English explorer, amateur scientist, and psychologist Sir Francis Galton (1822–1911) at a meeting of the Royal Institution in London in 1877. When more than one predictor variable is involved, it is called ***multiple regression**. Also called *linear regression*. See also **CROSS-VALIDATION** (2).

regression fallacy *n.* An erroneous interpretation of ***regression** towards the mean as being caused by something other than chance. A frequently quoted example reported in 1973 by the Israeli-American psychologists Daniel Kahneman (born 1934) and Amos Tversky (1937–96) comes from the experience of flying instructors. Experienced instructors noticed that praise given to a trainee pilot for an exceptionally smooth landing was usually followed by a rougher landing on the following attempt, and harsh criticism for an unusually rough landing was usually followed by a smoother landing on the following attempt, and the instructors therefore came to believe that praise was not merely ineffective but counter-productive and that punishment was highly effective, whereas in reality an unusually smooth or rough landing is likely to be followed by a more average one because of

regression towards the mean. The fallacy is usually explained by the use in judgements of this kind of the **representativeness heuristic*. Compare *NON-REGRESSIVENESS BIAS*.

regression in the service of the ego *n.* A term introduced into **ego* psychology by the US-based German psychologist Ernst Kris (1901–57) to denote the use of **regression* (2) as a means of facilitating creativity.

regression towards the mean *n.* In statistics, the tendency for the value of a variable predicted probabilistically and with random error to be closer to its mean than predicted. When a **predictor variable* is used to predict the value of a **dependent variable* with which it is imperfectly correlated, and then the actual value of the dependent variable is observed and compared with its predicted value, the observed value turns out most often to be somewhere between the predicted value and the mean. To clarify this phenomenon, consider the limiting case of a totally unreliable predictor variable that has a zero correlation with the dependent variable. Suppose a fair coin is tossed ten times, and the number of heads (the predictor variable) is used to predict the number of heads in the following ten tosses (the dependent variable). In this case there is *complete* regression to the mean, the expected value of the dependent variable being *equal* to its mean, namely five heads. The higher the correlation between the predictor variable and the dependent variable, the less the regression towards the mean, but unless the correlation is perfectly reliable, the expected value of the dependent variable is always somewhere between its predicted value and its mean. One manifestation of this phenomenon is the fact that when values fluctuate randomly around a mean value, an extreme score is relatively improbable, so that if such a score is observed, then the following observation is likely to be a less extreme score. A familiar instance of regression towards the mean is **filial regression*. US *regression toward the mean*. See also *NON-REGRESSIVENESS BIAS*, *ONE-GROUP PRETEST–POSTTEST DESIGN*, *REGRESSION FALLACY*. Compare *OVERDOMINANCE*. [From Latin *regressus* a stepping back + Old French *moien*, from Latin *medius* middle]

regulator *n.* A person who regulates or controls, or anything that regulates or controls, especially (in social psychology) a **gesture* (1) that accompanies speech and helps to coordinate turn-taking, including raising a hand in the air

*****ebook converter DEMO Watermarks*****

to indicate that one has not finished speaking, and establishing **eye* contact at the beginning and end of a speaking turn. *See also* [KINESICS](#).

regulator gene *n.* A gene that controls the expression of a **structural gene* by directing the synthesis of a **gene* regulator that binds to a **gene* operator and affects the synthesis of the structural gene's protein product. *See* [ACTIVATOR GENE](#), [REPRESSOR GENE](#). *See also* [OPERON](#). *Compare* [STRUCTURAL GENE](#).

rehabilitation *n.* The process of helping a person who has been ill, disabled, hospitalized, or imprisoned to re-adapt to society or find employment; more generally, the process of restoring the status or reputation of a person or thing. *See also* [HALFWAY HOUSE](#). **rehabilitate** *vb.* [From Latin *rehabilitare* to restore, from *re-* again + *habilitas* skill + *-ation* indicating a process or condition]

rehearsal buffer *n.* Another name for a **phonological buffer store*.

rehearse *vb.* **1.** To repeat or go over something, usually in order to commit it to memory or to retain it in memory. **2.** To recall or enumerate items of information repeatedly in order to retain them in **short-term memory*. Such repetition is called *maintenance rehearsal* when it is simple repetition and *elaborative rehearsal* when deeper processing is involved. *See also* [PHONOLOGICAL LOOP](#). **3.** To practise a speech or a musical or dramatic act in preparation for a performance of it. **rehearsal** *n.* [From Old French *rehercier* to harrow again, from *re-* again + *hercer* to harrow, from Latin *hirpex*, *hirpici* a rake or harrow]

Reichian therapy *n.* Another name for **orgone therapy*. [Named after the Austrian (later US-based) psychiatrist Wilhelm Reich (1897–1957), who introduced it in 1942 in his book *The Function of the Orgasm*, not a translation of *Die Funktion des Orgasmus* (1927), despite its similar title.]

reify *vb.* To treat an abstract concept as something concrete, as when a child asks what colour sadness is. *See also* [CATEGORY MISTAKE](#). **reification** *n.* The act or process of reifying. [From Latin *res* a thing, on the model of the English word *deify*]

reinforcement *n.* 1. In **operant* conditioning, any **stimulus (1)* that, if it is presented soon after a **response*, increases the relative frequency with which that response is emitted in the future; also the process whereby a response is strengthened in this way. See also CUMULATIVE RECORD, DIFFERENTIAL REINFORCEMENT, LAW OF EFFECT, NEGATIVE REINFORCEMENT, REINFORCEMENT SCHEDULE, SKINNER BOX, SOCIAL LEARNING. 2. In **classical conditioning*, an **unconditioned stimulus* that, if paired repeatedly with a **conditioned stimulus*, causes the conditioned stimulus to elicit a **conditioned response*. **reinforce** *vb.* To provide reinforcement (1, 2). **reinforcer** *n.* A **stimulus (1)* that provides reinforcement (1, 2).

reinforcement schedule *n.* In **operant* conditioning, a particular arrangement of the contingency of **reinforcement (1)*, relating an organism's responses to the frequency and timing of the reinforcement. In *continuous reinforcement*, the organism is rewarded after every response, whereas in *partial reinforcement* or *intermittent reinforcement* the organism is rewarded after a certain amount of time has elapsed or a certain number of responses have been made. The most important *simple reinforcement schedules* are the **fixed-interval schedule*, **fixed-ratio schedule*, **variable-interval schedule*, and **variable-ratio schedule*. See also COMPOUND REINFORCEMENT SCHEDULE, DIFFERENTIAL REINFORCEMENT OF HIGH RESPONSE RATES, DIFFERENTIAL REINFORCEMENT OF LOW RESPONSE RATES, DIFFERENTIAL REINFORCEMENT OF OTHER RESPONSES, DIFFERENTIAL REINFORCEMENT OF PACED RESPONSES.

reinforcing selection *n.* Pressures of **natural selection* operating at two or more levels (individual, family, population) in such a way that certain genes are favoured at all levels and their spread through the population is accelerated. Compare COUNTERACTING SELECTION.

Reissner's membrane *n.* A membrane separating the vestibular and cochlear canals of the inner ear. [Named after the German anatomist Ernst Reissner (1824–78) who discovered it and published his finding in 1851]

Reiz *n.* Stimulus. This causes confusion in English-speaking countries where *R* is an abbreviation for *response*. **R** *abbrev.* [From German *Reiz* stimulus]

Reiz limen *n.* Absolute threshold. **RL** *abbrev.* [From German *Reiz* stimulus + Latin *limen* a threshold]

rejection-then-retreat technique *n.* Another name for the *door-in-the-face technique.

related scores t test *n.* In *inferential statistics, a version of the **t* test used for comparing means from two statistically related samples, such as two sets of scores taken from a single group of research participants or subjects. Also called a *paired samples t test*. Compare INDEPENDENT SAMPLES T TEST.

relationship, coefficient of See COEFFICIENT OF RELATIONSHIP.

relative deprivation *n.* The discrepancy that one perceives between what one has and what one could or should have, in contradistinction to absolute deprivation of the bare necessities for living. *Egoistic relative deprivation* arises from unfavourable comparisons between one's individual circumstances and those of a comparative *reference group, and it tends to generate personal dissatisfaction and unhappiness; *fraternal relative deprivation* arises from unfavourable comparisons between the circumstances of one's group (social class, racial group, occupational group, and so on) and a reference group, and it tends to generate protest behaviour, rebellion, and in extreme cases revolution. The concept was introduced by the US sociologist Samuel A(ndrew) Stouffer (1900–60) and several co-authors in their study of *The American Soldier* (1949), where it was reported that army units with the highest rates of promotion also had the highest levels of dissatisfaction among those not promoted. The US sociologist Robert K(ing) Merton (1910–2003) developed the idea further in his book *Social Theory and Social Structure* (1957), arguing that high rates of social mobility raised hopes and expectations and encouraged over-optimistic social comparisons. The British sociologist Walter Garrison (Garry) Runciman (born 1934), in his book *Relative Deprivation and Social Justice* (1966), provided further evidence that workers' feelings of deprivation and class consciousness tend to be relative rather than absolute. Subsequent researchers have generally corroborated and extended these basic ideas and findings. See also EQUITY THEORY, SOCIAL COMPARISON.

relative error *n.* In **psychophysics*, the **absolute error* divided by the true value of a stimulus.

relative pitch *n.* The ability to recognize the **pitch* of a **tone* (1), or to produce a tone at its correct pitch, by referring it to a tone of known pitch. Thus a person with relative pitch who is presented with a C and told that it is a C can recognize another tone as an F or can hum an F. *Compare* *ABSOLUTE PITCH*.

relative refractory period *n.* A **refractory period* (2), lasting up to 10 milliseconds, immediately after the **absolute refractory period*, during which a neuron will fire only in response to a very strong stimulus, well above the normal threshold strength. This allows frequency of neuron firing to be used by the nervous system to signal stimulus strength in spite of the **all-or-none law*.

relative size *n.* The **angular size* of an object as compared with that of another; specifically, one of the monocular cues of visual **depth perception*, useful only with objects that are familiar or of known size, objects with relatively large angular sizes being perceived as closer than objects with relatively small angular sizes.

relaxation technique *n.* 1. Any method or procedure designed to induce relaxation. See *ABAISSEMENT DU NIVEAU MENTAL*, *AUTOGENIC TRAINING*, *BASIC-ID*, *BIOFEEDBACK*, *HYPNOSIS*, *MINDFULNESS*, *RECIPROCAL INHIBITION*, *TRANSCENDENTAL MEDITATION*, *PROGRESSIVE RELAXATION*, *PSYCHOPROPHYLAXIS*, *SYSTEMATIC DESENSITIZATION*. 2. In **connectionism* (1) and **parallel distributed processing*, the use of iterated propagation of signals through a network of connected units until they are all responding as consistently as possible to signals received from one another and no further adjustments in connections and firing rates can lead to further improvements. If some connections between units are excitatory and others are inhibitory, then a single signal propagated through the network will cause some of the units to increase their strength of firing in response to excitatory input from other units, and will cause other units to decrease their strength of firing because of inhibitory input, but the resulting pattern will not necessarily be stable or settled, because a second signal propagated through the network will in most cases
*****ebook converter DEMO Watermarks*****

result in further changes, but after a number of iterations the system will usually settle down to an equilibrium state. *Compare* [ANNEALING \(1\)](#).

relaxation therapy *n.* Another name for [*progressive relaxation](#).

relaxin *n.* A polypeptide hormone that is secreted by the corpus luteum of a pregnant woman and that relaxes the pelvic ligaments, allowing the pelvis to dilate during childbirth.

relay cell *n.* Another name for an [*interneuron](#). Also called a *relay neuron*.

releaser *n.* In ethology, a [*sign](#) stimulus that is contained in a structure, crest, colouring pattern, call, or scent and that evokes an immediate innate response or [*fixed-action pattern](#), having evolved specifically as a signal to communicate with [*conspecifics \(1\)](#). Not all sign stimuli are releasers: the speckling pattern on some birds' eggs is a sign stimulus for incubation behaviour, but it is believed to have evolved as camouflage. *See also* [INNATE RELEASING MECHANISM](#), [VACUUM ACTIVITY](#).

releasing hormone *n.* Any of several [*peptide](#) hormones secreted by the hypothalamus and transmitted to the anterior pituitary via the hypothalamic–hypophyseal portal system, where it stimulates the release of a [*trophic hormone](#). *See* [CORTICOTROPHIN-RELEASING HORMONE](#), [GROWTH HORMONE RELEASING HORMONE](#), [LUTEINIZING — HORMONE RELEASING HORMONE](#), [THYROTROPHIN-RELEASING HORMONE](#). Also called a *releasing factor*.

reliability *n.* The quality of being trustworthy or dependable. In psychometrics, the [*internal consistency](#) and [*stability](#) with which a measuring instrument performs its function, corresponding roughly to the everyday concept of accuracy. *See* [CRONBACH'S ALPHA](#), [EQUIVALENT-FORM RELIABILITY](#), [KUDER–RICHARDSON COEFFICIENT](#), [SPLIT-HALF RELIABILITY](#), [TEST–RETEST RELIABILITY](#). *See also* [CLASSICAL TEST THEORY](#), [GENERALIZABILITY THEORY](#). *Compare* [VALIDITY](#). [From Old French *relier* to rely, from Latin *religare* to tie back + *-abilitas* capacity, from *habilis* able]

reliability coefficient *n.* In psychometrics, a ***correlation** coefficient or other numerical index of the ***reliability** of a test or measure.

REM atonia *abbrev.* An inhibition of skeletal muscles (but not ***extra-ocular muscles**) during ***REM sleep**, manifested as complete ***atonia**, that is governed by a small inhibitory centre in the pons called the ***subcoerulear nucleus** and by the ***magnocellular nucleus** in the medulla oblongata to which it is connected, and that prevents spinal nerves from activating skeletal muscles and thereby stops dreams from being acted out by the sleeper. The only observable bodily movements in a person in REM sleep, apart from breathing and rapid eye movements, are occasional twitches of the extremities, except in people with ***REM behaviour disorder**. The French physiologist Michel Jouvet (born 1925) discovered the mechanism in 1965 by performing experiments on cats in which he used a heated wire to destroy a small volume of the subcoerulear nucleus or of the magnocellular nucleus to which it is linked. This caused the cats to move about during REM sleep, stand up, twitch their whiskers, hiss, paw the air, and make movements typical of stalking and attacking prey—a phenomenon called *REM sleep without atonia*. See also **NARCOLEPSY**, **SLEEP PARALYSIS**. Compare **RAPID EYE MOVEMENT SLEEP BEHAVIOUR DISORDER**. [From *rapid eye movement* + *atonia*, from Greek *a-* without + *tonos* tension or tone + *-ia* indicating a condition or quality]

REM behaviour disorder *abbrev.* A condition in which ***REM atonia** does not function during episodes of dreaming. People with this disorder thrash violently about, leap out of bed, and sometimes attack bed-partners during REM sleep. It is assumed to be due to a lesion in the ***subcoerulear nucleus** or the ***magnocellular nucleus**. US *REM behavior disorder*. See **RAPID EYE MOVEMENT SLEEP BEHAVIOUR DISORDER**. **RBD** *abbrev.*

remember *n.* To maintain in or recall to consciousness something previously experienced or learned, or to retain information. See **MEMORY**. [From Latin *re-* again + *memor* mindful]

reminiscence *n.* 1. The act or process of recalling or recounting a past experience; the event recalled or recounted, or something that reminds one of a past experience. See also **ANAMNESIS (1)**. 2. In ***cognitive** psychology, an
*****ebook converter DEMO Watermarks*****

improvement in memory for material or performance of a task some time after learning it, compared to the level of performance immediately after learning, especially when the learning was carried out by **massed practice*. The concept was introduced in 1913 by the Welsh schoolteacher Philip Boswood Ballard (1865–1950), who reported that schoolchildren who memorized passages of poetry and were tested repeatedly for periods up to a week could often recall lines on later tests that they could not recall on earlier tests. Ballard contrasted this phenomenon with **obliviscence*. Reminiscence of some items of information can be offset by forgetting of others, so that the overall performance may not improve over time; however, under some conditions there may be an overall gain in performance over successive tests, in which case the phenomenon is called **hypermnnesia*. See also *SUCCESSIVE REPRODUCTION*. **reminiscent** *adj.* [From Latin *reminisci* to call to mind, from *re-* again + *mens* mind]

remote viewing *n.* A conjectural **paranormal* phenomenon involving **extra-sensory perception* of distant objects or events, especially of large environmental features such as lakes or prominent buildings. Also called *clairvoyance*.

REM rebound *abbrev.* The tendency for a person or animal deprived of **REM sleep* to spend an increased proportion of sleeping time in REM sleep during immediately succeeding sleeping periods. In research into this phenomenon, the person or animal is awakened whenever a period of REM begins and then allowed to go back to sleep, carefully curtailing the amount of REM sleep but not the total amount of sleep. Also called *rebound REM*. See also *REBOUND EFFECT*.

REM sleep *abbrev.* Rapid-eye-movement sleep, a stage of sleep occurring in progressively lengthening episodes roughly every 90 minutes throughout the night in human adults and occupying about 20 per cent of sleeping time, strongly associated with vivid **dreams (1)*, and characterized by **rapid eye movements*, **theta waves*, absence of **delta waves*, penile erections in males, and **REM atonia* of the skeletal muscles preventing dreams being acted out. REM sleep does not occur in reptiles but has been found in birds and almost all mammals, including dogs and cats (whose eyelids can be lifted gently to reveal darting eyes during REM episodes) and also in bats, moles, and

*****ebook converter DEMO Watermarks*****

whales, but not in the Australian spiny anteater or echidna of the genus *Tachyglossus*, which is exceptional in this regard. Also called *active sleep*, *desynchronized (D) sleep* or *paradoxical sleep*. See also REM REBOUND, SLEEP. Compare NREM SLEEP.

renifleur *n.* A person with *osphresiolagnia; one given to recurrent sexually arousing fantasies, sexual urges, or behaviour involving smells. [French *renifleur* a sniffer]

renin *n.* A hormone secreted by the kidneys in response to signals from *baroreceptors and *blood-flow receptors, indicating falling blood pressure or blood flow or a rise in the concentration of *vasopressin in the blood. Its secretion causes the synthesis of *angiotensin II, which leads to the constriction of blood vessels, compensating for the lowered blood pressure, and angiotensin II also precipitates the release of *aldosterone, leading to decreased sodium excretion in urine, therefore increased whole-body sodium and the stimulation of the *subfornical organ, which tends to initiate drinking. [From Latin *renes* kidneys, from *ren* a kidney]

Renshaw cell *n.* A type of spinal *motor neuron that releases glycine as a neurotransmitter, inhibiting the activity of *alpha motor neurons and preventing their repeated firing. See also GAMMA MOTOR NEURON. [Named after the US neurologist Birdsey Renshaw (1911–48) who first reported its discovery in the *Journal of Neurophysiology* in 1946]

reparation *n.* The act or process of repairing, compensating, or making amends. In *Kleinian analysis, a mechanism associated with depressive anxiety and feelings of guilt whereby one repairs the damage done by destructive fantasies to an *instinctual object, enabling the *depressive position to be overcome. [From Latin *reparare* to mend, from *parare* to prepare]

repeated-measures analysis of variance *n.* A form of *analysis of variance that is used to analyse the difference between three or more means when the sets of scores are not independent, data that require this type of analysis most often arising in *within-subjects designs when several measurements of a variable are taken from a single group of individuals at

*****ebook converter DEMO Watermarks*****

different times. *[Multifactorial analysis](#) of variance may involve repeated measures on one or more of its independent variables.

repeated reproduction See [SUCCESSIVE REPRODUCTION](#).

Repertory Grid Test *n.* A test designed to reveal the respondent's ways of construing the world according to *[personal construct theory](#). The respondent is presented with three elements from the domain of interest (people, events, or objects) and is asked to indicate in what way any two of the elements are similar to each other and different from the third. For example, if the three elements are *my father*, *my boss*, and *my husband*, then the respondent may reply that *my father* and *my boss* are both unfriendly and in that way different from *my husband*, thereby eliciting the personal construct *friendly–unfriendly* among the respondent's ways of construing people. Then the respondent answers the same question with regard to a second group of three elements, and so on, until all the respondent's important constructs in the relevant domain have been elicited, whereupon a grid is constructed, with elements running across the top, elicited constructs down the side, and each cell marked with a tick if the construct applies to the element, a cross if it does not apply, or unmarked if the respondent has not used the construct to judge the element. After the repertory grid has been drawn up, the constructs may be presented as *[rating scales](#) on which the respondent rates each of the elements on each of the constructs. What is unusual about this test is that it is tailored to the individual respondent's way of construing or interpreting the world. The earliest form of the test was first described by its inventor, the US psychologist George A(lexander) Kelly (1905–67), in his book *The Psychology of Personal Constructs* (1955, Vol. 1, pp. 219–66). See also [GRID ANALYSIS](#), [ROLE CONSTRUCT REPERTORY TEST](#). **Rep test** *abbrev.* [From *repertory* an entire stock of things available, from Latin *repertorium* a storehouse, from *reperire* to obtain, from *re-* again + *parere* to bring forth]

repetition compulsion *n.* In *[psychoanalysis](#), a type of *[compulsion](#) characterized by a tendency to place oneself in dangerous or distressing situations that repeat similar experiences from the past. Sigmund Freud (1856–1939) introduced it in 1914 in an article on ‘Remembering, Repeating and Working-Through’ (*Standard Edition*, XII, pp. 147–56) and discussed it

*****ebook converter DEMO Watermarks*****

at length in his book *Beyond the Pleasure Principle* (1920). In analysis, the ***transference** often contains elements that involve recreations of past conflicts with parents and other family members. Also called a *compulsion to repeat*. See also **FATE NEUROSIS**.

repetition effect *n.* In ***serial recall** of a string of letters, numbers, or other items, the phenomenon of generally superior performance when none of the items occurs more than once than when some items are repeated. It is a special case of ***Ranschburg inhibition**.

repetitive DNA *n.* Any segment of ***DNA** containing stuttering duplications of a sequence of base pairs that may be from tens to hundreds of base pairs long. Most repetitive DNA does not code for proteins but consists of ***introns** or ***junk** DNA with no apparent function, and because it tends to be highly variable and individually distinctive, it is useful in ***DNA** fingerprinting. Also called a *VNTR locus*. See also **CENTROMERE**.

replication *n.* **1.** The reproduction of exact copies of complex ***DNA** or other molecules such as occurs during the growth of living tissue. **2.** The repetition of an experiment or other research procedure to check the ***external validity** of the results.

representability *n.* In ***psychoanalysis**, an aspect of ***dreamwork** denoting the quality of ideas that have been transformed so as to be capable of representation by visual images. Sigmund Freud (1856–1939) discussed considerations of representability in 1900 in his book *The Interpretation of Dreams* (*Standard Edition*, IV-V, at pp. 539–49).

representation *n.* **1.** Anything that corresponds to something else in certain specified ways, or that serves as an ***image** (1, 2, 3) of it. **2.** More specifically a formal system for making explicit a certain class of information together with a specification of how the system achieves this, typical examples being representations of the natural numbers by systems of Arabic numerals (1, 2, 3, 4,...), Roman numerals (I, II, III, IV,...), or binary digits (1, 10, 11, 100,...), each system having its own explicit rules for constructing an integer of any desired size. ***Computational theories** of vision seek to construct representations of visual information.

*****ebook converter DEMO Watermarks*****

representational momentum *n.* After perceiving a static pictorial image of a moving object, such as a photograph of a person jumping off a wall, a tendency for subsequent recall of the image to be extrapolated forward in time, as though the movement implied in the image had continued further along its course. Respondents who are later asked to pick out the original image from a sequence of images of the scene at different points in time are more likely to err by selecting one slightly later in time than one slightly earlier. The phenomenon was first reported by the US psychologist Jennifer J. Freyd (born 1957) in an article in the journal *Perception and Psychophysics* in 1983. See also [CONSTRUCTIVE MEMORY](#), [SCHEMA](#). **RM** abbrev. [From Latin *repraesentare* to exhibit, from *re-* again + *praesentare* to present + *momentum* movement or impetus, from *movere* to move]

representativeness heuristic *n.* A cognitive [*heuristic](#) through which people estimate the probability that *A* belongs to (or originates from) a particular class *B* by judging the degree to which *A* is representative or typical of *B*. It can lead to errors of judgement because it ignores [*prior probabilities](#) (1) and can thus cause people to commit the [*base-rate fallacy](#), and if it is used to estimate the probability of obtaining a particular value in a sample drawn from a known population, then it is insensitive to information about the sample size and may therefore cause people to commit the [*sample size fallacy](#). See also [CONJUNCTION FALLACY](#), [NON-REGRESSIVENESS BIAS](#), [REGRESSION FALLACY](#).

repressed gene *n.* A [*gene](#) that has been inactivated by a [*gene](#) repressor.

repression *n.* In [*psychoanalysis](#), a [*defence mechanism](#) whereby unacceptable thoughts, feelings, or wishes are banished from [*consciousness](#). In an article entitled 'Repression' in 1915, Sigmund Freud (1856–1939) gave the following brief and frequently quoted definition: '*The essence of repression lies simply in turning something away, and keeping it at a distance, from the conscious*' (Standard Edition, XIV, pp. 146–58, at p. 147, italics in original). In [*primal repression](#), wishes emanating from the [*id](#) are blocked from reaching consciousness; in [*primary repression](#), anxiety-arousing information already in consciousness is removed and blocked from returning; and in [*secondary repression](#) conscious material that is reminiscent

*****ebook converter DEMO Watermarks*****

of repressed material is also removed from consciousness. The term (German *Verdrängung*) was introduced in its psychological sense in 1806 by the German philosopher and psychologist Johann Friedrich Herbart (1776–1841) (*Samtliche Werke*, V, p. 19) and repeated in 1824 in his book *Psychologie als Wissenschaft* (Psychology as Science), and it has not been established whether Freud knew of this work when he began using the term in 1894. See also [COUNTERCATHESIS](#). Compare [FORECLOSURE](#), [SUPPRESSION](#) (with which this concept is often confused). **repress** *vb.* **repressed** *adj.*

repression–sensitization scale *n.* A personality questionnaire designed to measure a respondent's characteristic mode of reacting to threatening stimuli or ideas, typical *repressors* tending to react by blocking, denial, and repression, that is, by putting threatening ideas out of their minds, and *sensitizers* tending to react by approaching, facilitating, and increasing vigilance, that is, by confronting the threatening stimuli directly. It was developed by the US psychologist Donn Byrne (born 1931), on the basis of items taken from the [*MMPI](#), and published in the *Journal of Personality* in 1961. **R–S scale** *abbrev.*

repressor gene *n.* A [*regulator](#) gene that synthesizes a [*gene](#) repressor capable of binding to a [*gene](#) operator and preventing the expression of a [*structural gene](#) by suppressing the synthesis of its protein product. Compare [ACTIVATOR GENE](#).

reproducibility *n.* In a [*Guttman scale](#), the degree to which the items can be arranged in a hierarchy such that a respondent's agreement to an item implies agreement to all items below it in the hierarchy, deviations from this pattern being counted as errors. It is often abbreviated to *Rep* and defined as $Rep = 1 - (\text{number of errors})/(\text{total number of responses})$, a Guttman scale being considered satisfactory if it has been administered to a large group of respondents and its reproducibility is at least .90, implying that the scale is reasonably unidimensional, measuring mainly one major variable. See also [UNIDIMENSIONALITY](#). **Rep** *abbrev.*

reproduction method *n.* Another name for the [*method of average error](#).

reproductive interference *n.* Impairment of the reproduction of learned material caused by the learning of other material. See [PROACTIVE INTERFERENCE](#), [RETROACTIVE INTERFERENCE](#).

reproductive memory *n.* Accurate retrieval of information from memory, without significant alteration. The English psychologist Sir Frederic Charles Bartlett (1886–1969) first differentiated it from [*reconstructive memory](#) in 1932.

Rep test See [REPERTORY GRID TEST](#).

resampling statistics *n.* A general approach to statistical analysis in which, given a set of scores, new data are generated by repeated random sampling with replacement from the existing scores (the bootstrapping technique) or by using a data-generating mechanism such as a computer's random number generator (the [*Monte Carlo method](#) or simulation technique), and the results of the new samples are then examined. Thus if 7/10 patients given a drug and 2/10 given a [*placebo \(1\)](#) improved, a researcher could randomly select 10 balls with replacement from an urn containing 9 white balls (representing the improved patients) and 11 black balls (representing the unimproved patients) and count the proportion of these samples containing 7 or more white balls; if the proportion is less than 5 per cent, then the observed result is statistically significant. The procedure would normally be performed using a computer rather than a physical urn and balls. It is similar to [*randomization](#) statistics but differs from it in using the observed scores rather than all possible scores that could be generated. See also [MONTE CARLO METHOD](#).

research hypothesis *n.* Another name for an [*alternative hypothesis](#).

reserpine *n.* An [*alkaloid](#) extracted from the roots of the south-east Asian plant [*Rauwolfia serpentina](#), used for the treatment of hypertension and as a sedative and tranquillizer. It has a broad spectrum of pharmacological actions, including especially the progressive depletion of the neurotransmitters [*noradrenalin](#) (norepinephrine), [*dopamine](#), and [*serotonin](#) from synaptic vesicles in the central nervous system, and it tends to cause

severe depression. [From German *Reserpin* an irregular blend of Latin *Rauwolfia* and *serpentina*]

residual *n.* **1.** In statistics, especially in **regression* analysis and **analysis of variance* (ANOVA), short for residual variance, that part of the variance in the dependent variable unaccounted for by the independent variables and thus attributed to chance variation. **2.** The difference between a score and its expected value according to a theoretical model. [From Latin *residuus* remaining over, from *residere* to stay behind + *-alis* of or relating to]

residual schizophrenia *n.* A form of **schizophrenia* without **positive* symptoms, that is, without **delusions*, **hallucinations*, **disorganized speech*, **disorganized thinking*, or **catatonia*, but with evidence of **negative* symptoms such as **affective flattening*, **alogia*, or **avolition*.

resinous odour *n.* One of the six primary odours in **Henning's prism*, resembling the odour of resin or turpentine. US *resinous odor*.

resistance *n.* The process of striving against, opposing, or withstanding something. In **psychoanalysis*, the tendency to strive against the transition of **repressed* thoughts, feelings, or wishes from the **unconscious* (2) to **consciousness*, especially an attempt to prevent this happening while undergoing psychoanalysis. The **interpretation* (2) of resistance is an important aspect of psychoanalytic technique. Sigmund Freud (1856–1939) discussed a number of forms of resistance in *Studies on Hysteria* (1895, *Standard Edition*, II, at pp. 278–87) and in *Inhibitions, Symptoms and Anxiety* (1926, *Standard Edition*, XX, pp. 77–175, at pp. 158–60). In an article on ‘A Difficulty in the Path of Psycho-Analysis’ in 1917, he interpreted hostility to his work as further evidence of resistance (*Standard Edition*, XVII, pp. 137–44). When it occurs during psychoanalysis, it is also called *transference resistance*. See also *NEGATIVE THERAPEUTIC REACTION*, *WORKING THROUGH*.

resistance stage *n.* The second stage of the **general adaptation syndrome* to **stress* (1), during which the body copes actively with a stressor by mechanisms such as sending **leucocytes* to the site of an injury or infection. See also *ALARM REACTION*, *EXHAUSTION STAGE*.

resolution phase *n.* The fourth phase of the *sexual response cycle, occurring after the *orgasmic phase.

resonance theory *n.* Another name for the *place theory of pitch perception. Also called *resonance place theory*.

resource dilemma *n.* A type of *social dilemma in which players harvest resources (usually tokens representing money) from a common resource pool of known size, and after each trial the pool is replenished at a predetermined rate. Players are free to choose, within limits, how much to take from the pool, and it is in each player's individual self-interest to take as much as possible, but if everyone behaves greedily, then the pool is exhausted and every player suffers. One popular type of resource dilemma is the *commons dilemma. The resource dilemma research paradigm provides a useful model of everyday social dilemmas involving conservation of natural resources. It is also called a *resource management dilemma* or a *resource conservation dilemma*, and the corresponding experimental games are sometimes called *take-some* games.

resource-holding potential *n.* A measure of an animal's capacity to win a fight against an opponent, assuming that both adopt the same behavioural strategy. It is often equivalent simply to the animal's *escalated fighting ability, which in turn derives from its strength, size, and experience, but it is sometimes affected by other factors, as when a male insect in possession of a female has greater chances of winning, even against a stronger opponent, because it is easier to hold on to something than to wrest it from the grip of an opponent. Also called *resource-holding power* or *relative holding power*. **RHP** *abbrev.* [Coined in 1974 by the British biologist Geoffrey Alan Parker (born 1944)]

respiration *n.* Breathing, or more generally any process by which an organism generates usable energy, usually in the form of molecules of *ATP, from the oxidative metabolism of food. *See also* KREBS CYCLE. [From Latin *respirare* to breathe + *-ation* indicating a process or condition]

respondent conditioning *n.* Another name for *operant conditioning.

response *n.* Any physical or psychological reaction of an organism to a **stimulus* (1). It may include a behavioural, muscular, glandular, or neurophysiological reaction caused by stimulation of a **sensory* receptor, and in the **behaviourism* of the US psychologist Burrhus F. Skinner (1904–90) and his followers, it also includes a purely mental reaction. See also *CONDITIONED RESPONSE*, *DISCRIMINATIVE RESPONSE*, *FIGHT-OR-FLIGHT RESPONSE*, *FIXED-ACTION PATTERN*, *REACTION TIME*, *REFLEX* (1), *UNCONDITIONED RESPONSE*. **R** *abbrev.* [From Latin *respondere* to reply, from *re-* back + *spondere* to promise]

response amplitude *n.* In **Hullian learning theory*, the magnitude or intensity of an organism's response to a **stimulus* (1). **A** *abbrev.*

response bias *n.* In psychometrics, any systematic tendency of a respondent to choose a particular response category in a multiple-choice questionnaire for an extraneous reason, unrelated to the variable that the response is supposed to indicate but related to the content or meaning of the question. A typical example is **social desirability response set*. See also *LIE SCALE*, *RESPONSE SET* (2). Compare *RESPONSE STYLE*.

response category *n.* One of the alternatives from which a respondent must select in responding to a **closed question*. For example, in the questionnaire item *I enjoy working with numbers* (YES, NO), the response categories are YES and NO. See also *MULTIPLE-CHOICE*, *NUMERICAL RATING SCALE*, *VERBAL RATING SCALE*. Compare *FREE RESPONSE*, *GRAPHIC RATING SCALE*, *OPEN-ENDED QUESTION*.

response competition *n.* A condition in which a **stimulus* (1) activates more than one **response* in an organism, so that the responses vie with one another for dominance. For example, a person performing a difficult task in front of an audience may need to concentrate on the task but may also wish to concentrate on aspects of **self-presentation* and may therefore experience response competition, leading to an **audience effect*.

response latency *n.* The interval of time elapsing between a **stimulus* (1) and a **response*, a term used in preference to **reaction time* when

referring to animal behaviour. Also called *latency* or *latent time*.

response set *n.* 1. A bias disposing an organism to respond in a particular way to a stimulus, especially if the organism is concentrating on the **response* rather than the **stimulus* (1). Compare STIMULUS SET (1, 2). 2. In psychometrics, a type of **response* bias such as **acquiescence response set* or **social desirability response set* in which a respondent replies to items in a multiple-choice questionnaire by choosing or avoiding certain response categories for reasons related to the content of the items or questions, such as **self-presentation* or **impression management*. Compare RESPONSE STYLE.

response style *n.* In psychometrics, any consistent tendency on the part of a respondent to choose a particular response category in a multiple-choice questionnaire irrespective of the content of the question or item, as in **acquiescence response set* or **position preference*, rather than a tendency to choose a particular type of response determined by the content of the item or question, as in **social desirability response set*. See also RESPONSE SET (2). Compare RESPONSE BIAS.

rest-activity cycle See BASIC REST—ACTIVITY CYCLE.

resting potential *n.* The voltage difference of about -70 millivolts (mV) across the cell membrane of a neuron (negative on the inside) maintained by the **sodium* pump when it is not transmitting a nerve impulse. Given that it occurs across the very thin membrane of a tiny cell, it equates to about 10,000 volts per millimetre. It represents stored energy, and its momentary reversal when the nerve is stimulated constitutes the firing of the neuron. Also called *equilibrium potential* or *resting membrane potential*. See also DEPOLARIZATION, REFRACTORY PERIOD (2), SODIUM CHANNEL. Compare ACTION POTENTIAL.

resting tremor *n.* A form of **tremor* characterized by fine, quick quavering movements that tend to disappear during purposeful movements, this type of tremor being characteristic of **parkinsonism*. Also called *passive tremor*. See also POSTURAL TREMOR. Compare INTENTION TREMOR.

restless legs syndrome *n.* A condition classified by **DSM-5* as a
*****ebook converter DEMO Watermarks*****

***parasomnia** involving discomfort in the legs and an urge to keep moving them, especially at night, worsening during periods of inactivity and relieved by movement. **RLS** *abbrev.*

Restorff effect *See* **VON RESTORFF EFFECT**.

Restoril *n.* A proprietary name for the benzodiazepine drug ***temazepam**.
[Trademark]

restricted affect *See* **AFFECT**.

restricted choice principle *See* **PRINCIPLE OF RESTRICTED CHOICE**.

restricted code *n.* A concept introduced by the English sociologist Basil Bernstein (1924–2000) to denote an informal use of language, linked to immediate situations (context bound), with a reduced semantic and syntactic range, supposedly characteristic of lower-working-class speakers, in contrast to middle-class speakers who have access to both a restricted and an ***elaborated code**. The theory is often reduced to the proposition that, owing to differences in the linguistic resources available to them, middle-class people are capable of abstract reasoning, whereas lower-working-class people are not; but Bernstein argued vigorously against this interpretation. Bernstein first drew attention to social class differences in language in an article in the *British Journal of Sociology* in 1958, and he developed the concept further in two articles in the journal *Language and Speech* in 1962 and in numerous subsequent publications.

restriction analysis *n.* Another name for ***restriction mapping**.

restriction enzyme *n.* Any of a number of ***enzymes** that are produced by bacteria and are used to cut DNA in ***genetic engineering**, ***genetic fingerprinting**, and ***gene** mapping. Each restriction enzyme cuts DNA at a different point defined by a different palindromic sequence of bases. Also called a *restriction endonuclease*. *See also* **RESTRICTION MAPPING**. *Compare* **DNA LIGASE**. **restriction fragment** *n.* A section of DNA cut by a restriction enzyme.

restriction mapping *n.* Determination of the distinctive features of a segment of **DNA* by treating it with different **restriction enzymes* to produce restriction fragments of different lengths, which are then separated and sized by **electrophoresis* to produce a map of the segment with distances between restriction sites measured in base pairs (bp) or thousands of base pairs (kbp). Used in **genetic fingerprinting* and research. Also called *restriction analysis*.

retardation, mental *See* INTELLECTUAL DISABILITY.

retardation, psychomotor *See* PSYCHOMOTOR RETARDATION.

retarded depression *n.* A form of **depression* occurring during the depressive phase of a **bipolar disorder*.

rete mirabile *n.* A network of fine blood vessels in the base of the brain within which the temperature of arterial blood is lowered before entering the brain. [From Latin *rete* a net + *mirabile* wonderful]

retention hysteria *n.* In **psychoanalysis*, one of three types of **hysteria* distinguished in 1895 by the Austrian physician Josef Breuer (1842–1925) and Sigmund Freud (1856–1939) in *Studies on Hysteria* (*Standard Edition*, II, at pp. 169–73), supposedly characterized by emotions that have not undergone **abreaction* and are therefore retained, Freud's case of Rosalia H (pp. 169–73) being the classic example. After 1895 Freud came to believe that all hysteria is defence hysteria, and he abandoned the tripartite distinction. *Compare* DEFENCE HYSTERIA, HYPNOID HYSTERIA.

reticular activating system *n.* An abbreviated name for the **ascending reticular activating system*. **RAS** *abbrev.*

reticular formation *n.* A small, thick bundle of ascending and descending axons running through the length of the brainstem, interwoven with nerve cells having predominantly horizontal and evenly spaced dendrites producing a netlike pattern, responsible for controlling breathing, heartbeat, blood pressure, swallowing, urination, movements of the face, eyes, and

tongue, sleep and wakefulness, and other vital functions. Also called the *brainstem reticular formation (BSRF)*. See also [ASCENDING RETICULAR ACTIVATING SYSTEM](#), [DESCENDING RETICULAR FORMATION](#), [NEUROPIL](#). **RF** abbrev. [From Latin *reticulum* a little net, diminutive of *rete* a net, alluding to its appearance]

reticular nucleus *n.* Any of the clusters of nerve cell bodies belonging to the [*reticular formation](#) and situated in the pons or the medulla oblongata.

reticular nucleus of the thalamus *n.* A network of nerve cell bodies surrounding the front and sides of the [*thalamus](#), receiving impulses ascending to and descending from the cerebral cortex and inhibiting neurons in the thalamus.

retina *n.* A platelike structure, a quarter of a millimetre thick, at the back of each eye, technically part of the brain, responsible for converting light into nerve impulses, arranged in three principal layers separated by two thin strata of synaptic connections called [*plexiform layers](#) (see [illustration](#)). The outer layer nearest the [*pigment](#) epithelium has an array of 126 million photoreceptors ([*rods](#) and [*cones](#)), the middle layer contains [*bipolar](#) cells that receive inputs from photoreceptors immediately in front of them, and the inner layer facing the [*crystalline lens](#) contains [*ganglion](#) cells, interlaced with [*horizontal cells](#) and [*amacrine](#) cells, and receives inputs from retinal [*bipolar](#) cells. This arrangement of layers is found in all vertebrates and is unexpected, because light has to pass through a forest of neurons before reaching the photoreceptors, and because fibres from ganglion cells have to burrow back through the layers of the retina to feed into the optic nerve, thereby creating the [*blind spot \(1\)](#). This seems so illogical that diagrams appearing in textbooks sometimes incorrectly show light entering from the outer layer where the photoreceptors are located, and various arguments have been put forward to explain why the layers have to be arranged back to front, but such arguments are beside the point because, quite independently of vertebrates, squids and octopuses have evolved eyes that are very similar to those of vertebrates but have retinal layers arranged the other way round, avoiding the drawbacks mentioned above. See also [COLOUR ZONE](#), [DUPLEXITY THEORY](#), [FOVEA](#), [INNER NUCLEAR LAYER](#), [INNER PLEXIFORM LAYER](#), [INTERPLEXIFORM CELL](#), [MACULA LUTEA](#), [OUTER NUCLEAR LAYER](#), [OUTER PLEXIFORM LAYER](#). **retinas** or

*****ebook converter DEMO Watermarks*****

retinae *pl.* **retinopathy** *n.* Disorder of the retina. *See also* [SOLAR RETINOPATHY](#).
[Probably from Latin *rete* a net]

Retina. Basic structure (light enters from the bottom of the diagram).

retinal *adj.* **1.** Of or relating to the retina. *n.* **2.** Another name for [*retinene](#).

retinal cone *See* [CONE](#).

retinal disparity *n.* Another name for [*binocular](#) disparity.

retinal expansion *n.* Another name for [*looming](#).

retinal ganglion cell *See* [GANGLION CELL](#).

*****ebook converter DEMO Watermarks*****

retinal image *n.* The inverted image of the *visual field that is focused on to the *retina by the crystalline lens of the eye.

retinal painting *n.* An explanation of *anorthoscopic perception in terms of a hypothetical process by which the extended image of a figure viewed through a moving slit is gradually spread over the retina and imprinted on to it part by part, resulting in a retinal imprint of the whole figure whose form is then perceived. This hypothesis was championed by the German physiologist, physicist, and mathematician Hermann Ludwig Ferdinand von Helmholtz (1821–94) and other 19th-century researchers, but it was subsequently discredited by studies of eye movements that occur during anorthoscopic perception and that would disrupt the process.

retinal rivalry *n.* Another name for *binocular rivalry.

retinene *n.* A form of *retinol that combines with the protein *opsin to form *rhodopsin, the visual purple pigment. Also called *retinal*. [From *retin(a)* + *-ene* indicating an unsaturated compound with double bonds, from Greek *-ene* a feminine name suffix]

retinex theory *n.* A theory of colour vision according to which the visual system includes three separate eye–brain systems called *retinexes*, each with a peak sensitivity to long-wave light (560 nanometres), medium-wave light (530 nm), or short-wave light (430 nm) and inhibitory effects on the other systems, operating to assign a colour to each spot in the visual field according to the ratio, for each of the three retinexes, of light reflected from that spot to the average of the light reflected from its surround, the resulting triplet of ratios uniquely defining the colour at each spot. The theory, which was put forward by the US physicist Edwin H(erbert) Land (1909–91), inventor of the Polaroid Land camera and president of the Polaroid Corporation, in the *Journal of the Optical Society of America* in 1971, accounts for the *Land effect and for *colour constancy, because relative rather than absolute wavelengths determine perceived colour, the perceived colour of an object remaining constant as long as the reflectance ratios are unchanged, even if the total amount of light of any given wavelength varies markedly, and this explains why colour constancy is disrupted and some colours cannot be perceived at all when surfaces are viewed in *void mode. [Coined by its
*****ebook converter DEMO Watermarks*****]

inventor from *retin(a)* + (*cort*)*ex*]

retinitis pigmentosa *n.* Any of a group of disorders, often hereditary, characterized by bilateral degeneration of the retinas, with onset in childhood, often manifested initially as night blindness or reduction in visual field, leading to **blindness* in middle age. [From *retin(a)* + *-itis* indicating an inflammation + Latin *pigmentum* paint, alluding to the reddish pigmentation of the retina associated with the disease]

retinol *n.* A fat-soluble vitamin necessary for **scotopic* vision, formed by **hydrolysis* of beta-carotene, found in carrots and other yellow and green vegetables, butter, eggs, and fish oil. Also called *vitamin A*. *See also* RETINENE, VITAMIN. [From Greek *rhetine* resin + English *-ol* denoting a compound containing a hydroxyl group, from (*alcoh*)*ol*]

retinotopic map *n.* An inverted **topographic map* of the object or scene being viewed with the eyes, with neighbouring cells having **receptive fields* close together, in the **lateral* geniculate nucleus or in the **primary visual cortex* where the neurons are stacked vertically in **ocular-dominance columns* and **orientation columns*. [Probably from Latin *rete* a net + Greek *topos* a place + *-ikos* of, relating to, or resembling]

retrieval *n.* The act or process of retrieving anything, especially (in psychology) the act or process of recovering **encoded* information from **storage* in **memory* and bringing it into **consciousness*. **retrieve** *vb.*

retrieval-based learning *n.* A learning strategy based on repeated **retrieval* or **recall* of the material being learnt. In an article in the journal *Psychological Science* in 2006, the US psychologists Henry L(ederer) Roediger III (born 1947) and Jeffrey D. Karpicke (born 1980) reported an experiment in which they compared three different learning strategies spread over four study periods. One group of students spent all four periods studying text material, reading it repeatedly (SSSS); a second group studied the text in three periods and then spent the fourth period trying to recall it, writing down as many ideas from the text as they could remember (SSSR); and a third group studied the text during the first period and then spent the remaining three periods recalling it (SRRR). Later testing showed that recall was best in

*****ebook converter DEMO Watermarks*****

the SRRR (retrieval-based learning) group and worst in the SSSS (study-based learning) group, although a poll of student opinion showed that most students expected the reverse pattern. [The term *retrieval-based learning* was first used in an article by Jeffrey D. Karpicke in the journal *Current Directions in Psychological Science* in 2012, although the learning strategy itself is older.]

retrieval-induced forgetting *n.* A failure to remember an item of information as a result of recalling related information. The standard experimental demonstration of this phenomenon involves **paired-associate learning* of word pairs such as *animal-cat*, *animal-dog*, and *fruit-banana*, followed by a retrieval-practice phase in which recall is cued by category and initial letter, such as *animal-d_____*. In the retrieval-practice phase, some previously learnt animal pairs (*animal-dog*) are recalled but others (*animal-cat*) are not, and none from the fruit category are recalled. Finally, cued recall is tested for all pairs: *animal-c_____*, *animal-d_____*, *fruit-b_____*, and so on. Numerous experiments have confirmed that recall of *cat* is significantly impaired, relative to recall of *banana*, although neither was included in the retrieval-practice phase, because inhibition is required to overcome interference during retrieval, and recall of some animal paired associates can induce forgetting of other animal paired associates. Similar retrieval-induced forgetting has been shown to occur with visual images, faces, autobiographical memories, eyewitness memories, odours, motor actions, and native-language words when retrieving foreign-language equivalents. The phenomenon was first reported and named in an article by the US psychologists Michael C(hristopher) Anderson (born 1964), Robert A. Bjork (born 1938), and Elizabeth L(igon) Bjork (born 1941) in the *Journal of Experimental Psychology: Learning, Memory, and Cognition* in 1994, although a closely related phenomenon, on immediate-memory tests, was first reported by the Estonian-born Canadian psychologist Endel Tulving (born 1927) and Tannis Y(vonne) Arbib (born 1936) in an article in the *Journal of Experimental Psychology* in 1966. **RIF** abbrev.

retroactive association *n.* Another name for a **backward association*.

retroactive facilitation *n.* Facilitation or improvement in the learning

*****ebook converter DEMO Watermarks*****

or performance of a task caused by **positive transfer* from training on a different task occurring later in time.

retroactive inhibition *n.* Another name for **retroactive interference*.

retroactive interference *n.* Impairment of memory for previously learnt information, or performance of a previously learnt task, caused by subsequent learning of similar information or a similar task. Also called *retroactive inhibition*. See also *RANSCHBURG INHIBITION*, *SKAGGS–ROBINSON PARADOX*. Compare *PROACTIVE INTERFERENCE*. **RI** *abbrev.*

retroflex *adj.* Of or relating to speech sounds articulated with the tip of the tongue curled back towards the front part of the hard palate behind the **alveolar* ridge, as in the *r* sounds in North American English and some **rhotic* varieties of British English, especially the south-west of England. See also *PLACE OF ARTICULATION*. [From Latin *retroflexus* bent back, from *retro-* back + *flectere* to bend]

retrograde amnesia *n.* Loss of memory for events or experiences before a traumatic event or incident that causes the amnesia. The memories are generally recovered gradually over time, starting with early memories, and the traumatic event itself is often, though not always, recalled eventually. See also *GLOBAL AMNESIA*, *NEXT-IN-LINE EFFECT*, *TRANSIENT GLOBAL AMNESIA*. Compare *ANTEROGRADE AMNESIA*. [From Latin *retro* behind + *gradus* a step]

retrograde transport *n.* The movement of worn-out components of neurons along **microtubules* from **axons* and **dendrites* back to the cell body or soma for degradation by **lysosomes*. Compare *ANTEROGRADE TRANSPORT*. [From Latin *retro* backwards + *gradi* to go]

retrospective falsification *n.* Unconscious alteration or distortion of memories to make them satisfy present wishes or needs. [From Latin *retro* backwards + *specere, spectrum* to look]

retrospective study *n.* A type of research investigation in which participants with a particular disorder or characteristic are recruited and their

past histories are examined in an effort to discover the relevant causal factor(s). The findings of such an investigation carry less persuasive force than those of a **prospective study*, partly because they rely on the fallible memories of the participants, which may be influenced by their own theories about the causative factors.

retrovirus *n.* Any of a group of viruses, notably **HIV*, whose genetic code is carried in **RNA* rather than **DNA* and is transcribed by **reverse transcriptase* into DNA, thereby reversing the normal direction in which it was once thought that genetic information invariably flows. *See also* *CENTRAL DOGMA*. **retroviral** *adj.* [From *re(verse) tr(anscriptase) + virus*]

Rett's disorder *n.* A **neurodevelopmental disorder* found only in girls, characterized by the appearance, between 5 months and 4 years of age, of accelerated head growth and **psychomotor* retardation, replacement of purposeful hand movements with stereotyped **gestures* (1) such as hand-wringing, poorly coordinated gait, withdrawal from social interaction, and impairment in speech and language comprehension. [Named after the German-born Austrian paediatrician Andreas Rett (1924–97) who first described the disorder in 1965]

return of the repressed *n.* In **psychoanalysis*, the reappearance in **dreams* (1), **symptoms*, or **parapraxes* of material that has been subject to **repression*. *See also* *CHOICE OF NEUROSIS*, *COMPROMISE FORMATION*.

reuptake *n.* The reabsorption by a **presynaptic* neuron of a **neurotransmitter* substance recently released from its terminal **bouton*, thereby halting the **action potential* in the **postsynaptic* cell.

revealed preference *n.* A preference inferred from observations of a decision maker's actual choices. The notion was introduced in a posthumous article by the English philosopher, mathematician, and economist Frank (Plumpton) Ramsey (1903–30), published in 1931, and was later popularized by the US economist Paul Anthony Samuelson (1915–2009). It underlies the modern form **utility* theory introduced in 1947 by the Hungarian-born US mathematician John von Neumann (1903–57) and the German-born US economist Oskar Morgenstern (1902–77). Consider a woman facing a

*****ebook converter DEMO Watermarks*****

decision involving several alternatives. We may assign a value of 0 to her least preferred alternative *L* and 1 to her most preferred alternative *M*. Then, to determine her degree of preference for another alternative *X* we may find a gamble involving *L* and *M* that she considers equally as attractive as *X*. For example, she may turn out to be indifferent between *X* for certain and roll of a die resulting in *L* if one spot comes up and *M* if any other number of spots come up, in which case the utility of *X* according to revealed preference is 5/6 or .83 on the scale from 0 to 1. A strong interpretation of revealed preference holds that it is meaningless to assert that a decision maker's choice of *X* rather than *Y* can be explained by a preference for *X* over *Y*, because the choice literally determines the preference, and hence decision makers choose according to their preferences by definition. However, the strong interpretation leads to difficulties in interpreting inconsistent preferences such as those induced by the **Allais paradox* or **modified Ellsberg paradox*. See also ANCHORING AND ADJUSTMENT, EXPECTED UTILITY THEORY, SUBJECTIVE UTILITY.

reverberating circuit *n.* A **cell* assembly that continues to respond after the original stimulus that excited it has ceased, providing a neural basis for **short-term memory*, according to a hypothesis of the Canadian psychologist Donald O(lding) Hebb (1904–85). Also called a *reverberatory circuit*. See also PHASE SEQUENCE.

reversal *n.* 1. The act or process of turning round. In **psychoanalysis*, a **defence mechanism* whereby an **instinctual aim* changes into its opposite, usually from an active to a passive form, as when **sexual sadism* turns to **sexual masochism* or **voyeurism* to **exhibitionism* (1). Also called *reversal into the opposite*. 2. Another name for a **reversal error* in reading or writing.

reversal error *n.* An error of reading or writing in which a letter, group of letters, or word is read or written backwards, as when a *d* is read or written as a *b* or the word *bed* is read or written as *deb*. Also called simply a *reversal*.

reversal into the opposite See REVERSAL (1).

reversal learning *n.* Another name for **habit* reversal.

reverse anorexia nervosa *n.* Another name for **muscle* dysmorphia.

*****ebook converter DEMO Watermarks*****

See also [BIGOREXIA](#). Compare [ANOREXIA NERVOSA](#).

reverse tolerance *n.* Another name for [*sensitization](#).

reverse transcriptase *n.* An enzyme present in [*retroviruses](#) that transcribes information from [*RNA](#) into [*DNA](#), thereby reversing the usual direction of transcription of genetic information from DNA to RNA. Compare [RNA POLYMERASE](#).

reversible figure *n.* Another name for an [*ambiguous figure](#).

reversible goblet *n.* An [*ambiguous figure](#) introduced in 1915 by the Danish psychologist Edgar Rubin (1886–1951), a classic demonstration of [*figure–ground reversal](#), its appearance alternating between a goblet and a pair of facial profiles in silhouette (see [illustration](#)). Also called the *face–goblet illusion* or *Rubin's figure*.

Reversible goblet. It can be seen as a white goblet or a pair of black facial profiles.

reversible perspective See [PERSPECTIVE REVERSAL](#).

reversion *n.* A turning back, reverse, or recurrence. In genetics, the restoration of a [*mutant \(2\)](#) phenotype to the normal form by a further mutation of the same gene. Also called a *back mutation*. [From Latin *re-* back + *vertere* to turn + *-ion* indicating an action, process, or state]

rewrite rule *n.* A rule in [*generative grammar](#) of the form $A \rightarrow X$, where *A* represents a syntactic category such as a sentence or a noun phrase and *X* a sequence of syntactic categories. The rule expresses an instruction to replace *A* by *X*. For example, a sentence (S) can be rewritten as a noun phrase ([NP](#))

plus a verb phrase (VP): $S \rightarrow NP + VP$; and the verb phrase can be rewritten as a verb (V) plus a noun phrase (NP): $VP \rightarrow V + NP$. Also called a *phrase-structure rule*. See also PHRASE MARKER.

rhathymia *n.* A *personality trait discovered through *factor analysis, associated with light-heartedness and freedom from worry; hence, the state or condition of being optimistic and carefree. The term was introduced by the US psychologist J(oy) P(aul) Guilford (1897–1987) and a co-author in an article in the *Journal of Psychology* in 1936. [From Greek *rhathymia* freedom from care]

rhetoric *n.* 1. The art of persuasive, influential, or entertaining speech or oratory, or the study of effective language use. See also ATTITUDE CHANGE, PERSUASION. 2. Bombastic or mannered speech or writing, or language that seems impressive but lacks true meaning (*the Chinese claims are mere rhetoric*). **rhetorical** *adj.* [From Greek *rhetor* a teacher of rhetoric + *-ikos* of, relating to, or resembling]

rhetorical question *n.* A question asked for dramatic effect and not requiring an answer.

rheumatic chorea *n.* Another name for *Sydenham's chorea.

rhinencephalon *n.* The olfactory lobe in the *forebrain of each cerebral hemisphere containing the *olfactory bulb, *olfactory tract, and *olfactory cortex, concerned largely with the sense of smell, but in humans also with *emotions. The meaning is sometimes restricted to the olfactory cortex alone and is sometimes taken to be nearly synonymous with the limbic system, which was once believed to be devoted to olfaction. [From Greek *rhis*, *rhinos* the nose + *enkephalos* the brain, from *en* in + *kephale* the head]

rhinotillexomania *n.* Compulsive nose-picking. See also COMPULSION. [From Greek *rhis*, *rhinos* the nose + *tillein* to pull + *ex* out + *mania* madness]

rhodopsin *n.* The *visual pigment found in *rods in the retina, with peak sensitivity to light of approximately 505 nanometres in the blue–green part of

the visible spectrum. Also called *visual purple*, not because it is sensitive to light in the purple part of the spectrum, but on the contrary because it reflects blue and red light and therefore looks purple. *See also* [NYCTALOPIA](#), [OPSIN](#), [OPTOGRAM](#), [RETINENE](#). *Compare* [CONE PIGMENT](#). [From Greek *rhodon* a rose + *opsis* sight, from *ops* and eye]

rhombencephalon *n.* A technical name for the [*hindbrain](#), especially in a developing embryo. *Compare* [MESENCEPHALON](#), [PROSENCEPHALON](#). [From Greek *rhombos* a rhombus (alluding to the shape of the fourth ventricle that it contains) + *enkephalos* the brain, from *en* in + *kephale* the head]

rho, Spearman's *See* [SPEARMAN RANK CORRELATION COEFFICIENT](#).

rhotic *adj.* Denoting an [*accent \(1\)](#) or [*dialect](#) in which an *r* following a vowel (as in the words *car* and *cart*) is pronounced. In [*Received Pronunciation](#) *r* is pronounced only before a vowel and never before a consonant or a pause; but rhotic pronunciation is found in most varieties of English in the United States and Canada, Ireland, Scotland, and parts of England including the area to the south and west of London. **rhotacism** *n.* Defective or non-standard pronunciation of *r*. [From the name of the Greek letter *rho*, corresponding to the roman *r* + *-itikos* resembling or marked by]

rhyming method *n.* A memory aid based on rhymes. *See* [MNEMONIC](#).

rhyming slang *n.* A form of [*slang](#) characteristic of the [*cockney](#) dialect of the East End of London, in which a word is replaced by another word or phrase that rhymes with it, for example, *apples and pears* meaning stairs, *Jimmy Riddle* meaning piddle, *dicky-bird* meaning word, and *boat race* meaning face. In practice, the rhyming part is often dropped, originally to hide the meaning from the uninitiated, so that (for example) *apples* means stairs and *Jimmy* means piddle. Some of the shortened forms have become common words, including the familiar *loaf* (from *loaf of bread*) and the surprisingly offensive *berk* (from *Berkshire hunt*).

rhythm *n.* An ordered arrangement of stressed and unstressed or long and short sounds in speech or music, or any analogous regularly occurring sequence of events, including a [*biological rhythm](#). **rhythmic** or **rhythmical**

*****ebook converter DEMO Watermarks*****

adj. [From Greek *rhythmos* a measure or measured motion, from *rhein* to flow]

riboflavin *See* VITAMIN B₂.

ribonucleic acid *See* RNA. [From *ribo(se)* + *nucleic acid*]

ribose *n.* A sugar that occurs in *RNA. *See also* DEOXYRIBOSE. [Changed from *arabinose* a sugar found in cedar and pine gum]

ribosome *n.* Any of the tiny particles that are found in abundance in the *cytoplasm of a cell, some being attached to the *endoplasmic reticulum, and that contain *RNA and *protein and are the construction sites where proteins are synthesized according to information carried to them by *messenger RNA. [From *ribo(nucleic acid)* + Greek *soma* a body]

Ribot's law *n.* The principle that, during *retrograde amnesia, the oldest memories are most resistant to disruption or impairment. *Compare* JACKSON'S PRINCIPLE. [Named after the French psychologist Théodule Armand Ribot (1839–1916), who formulated it]

Ricco's law *n.* In *psychophysics, a law relating the *absolute threshold or *difference threshold for visual brightness to the intensity of the stimulus and the area of the retina that is stimulated, usually expressed as $A \times I = k$, where A is the area of the retina stimulated, I is the intensity of the stimulus, and k is a constant. It is valid for small retinal areas centred on the fovea, corresponding to stimuli subtending *visual angles up to about 6 minutes of arc (1/10 of a degree). *Compare* PIPER'S LAW. [Named after the Italian astronomer Annibale Ricco (1844–1919) who formulated it]

Ringelmann effect *n.* Another name for *social loafing. [Named after the French agricultural engineer Maximilien (Max) Ringelmann (1861–1931) who first investigated the phenomenon in 1882–7]

risk *n.* **1.** Danger or hazard; or a situation or factor involving danger or hazard, or one likely to cause loss or injury. **2.** A situation in which an action

will result in an outcome that is not known with certainty, but the set of possible outcomes and their associated probabilities are known or can be estimated. For example, betting on the outcome of the roll of a die involves risk inasmuch as the particular outcome is not known in advance, but the possible outcomes {1, 2, 3, 4, 5, 6} and their associated probabilities (1/6 each) are known. The US economist Frank Hyneman Knight (1885–1972) was the first to distinguish between risk and ***uncertainty (2)** in his book *Risk, Uncertainty, and Profit* (1921), and the distinction is maintained in careful usage, but many writers use the terms interchangeably. *See also* [COMMON RATIO EFFECT](#), [ELLSBERG PARADOX](#), [INSUFFICIENT REASON](#), [MODIFIED ELLSBERG PARADOX](#). **risky** *adj.* [From French *risque* risk, from Italian *risco* risk, from Greek *rhiza* a cliff]

risk aversion *n.* A widespread characteristic of human preferences, first discussed in 1738 by the Swiss mathematician and physicist Daniel Bernoulli (1700–82), according to which most people tend to value gains involving ***risk (2)** less than certain gains of equivalent monetary expectation. A typical example is a choice between a sure gain of 50 units (Swiss francs, dollars, pounds sterling, or any other units) and a gamble involving a 50 per cent probability of winning 100 units and a 50 per cent probability of winning nothing. The two prospects are of equivalent monetary expected value, but most people prefer the sure gain to the gamble, which they typically value equally to a sure gain of about 35 units. *See also* [ALLAIS PARADOX](#), [CERTAINTY EFFECT](#), [ELLSBERG PARADOX](#), [FRAMING EFFECT](#), [MODIFIED ELLSBERG PARADOX](#), [PROSPECT THEORY](#), [ST PETERSBURG PARADOX](#). *Compare* [RISK SEEKING](#). **risk-averse** *adj.*

risk seeking *n.* A tendency among human decision makers to prefer losses involving risk (2) to sure-thing losses of equivalent monetary expectation. Experiments have shown that human decision makers typically prefer a gamble involving a 50 per cent probability of losing 100 units (such as dollars or pounds) to a sure loss of 50 units, although these two prospects are of equivalent monetary expectation; in fact, people typically value a 50 per cent probability of losing 100 units equally to a sure loss of about 40 units. *See also* [FRAMING EFFECT](#), [PROSPECT THEORY](#). *Compare* [RISK AVERSION](#). **risk-seeking** *adj.*

risky shift *n.* In decisions involving risk, a tendency for involvement or participation in a group to cause the individual opinions of the group members to change in the direction of greater risk, causing group decisions to be generally riskier than the average of the individual decisions of the participating group members. It was discovered independently in 1957 by the US psychologist Robert Charles Ziller (born 1924) and in 1961 by a US graduate student James (Arthur Finch) Stoner (born 1935), who used quite different methods and who both expected the opposite effect. The finding has been replicated many times and holds true for most decisions involving risk, although dilemmas have been found that reliably produce cautious shifts. It is explained partly by a **social comparison* effect, based on a cultural tendency for people to admire riskiness rather than caution in most circumstances, as a result of which most people like to consider themselves at least as willing to take risks as their peers, but during group discussion some group members discover that others are riskier than themselves, and they therefore alter their opinions in a risky direction to restore their self-images, causing a risky shift in the group decision. A second explanatory mechanism is the *persuasive argumentation* effect, which arises from the same cultural tendency to admire riskiness rather than caution, causing group members to be more willing to voice pro-risk than procaution persuasive arguments during the group discussion, resulting in more persuasive arguments in a risky than a cautious direction. Social comparison and persuasive argumentation effects can also explain cautious shifts, and some authorities believe that they can also explain the more general **group polarization* phenomenon. Also called a *choice shift*.

risperidone *n.* A drug belonging to the group of **atypical antipsychotics* that acts as a **serotonin* and a **dopamine* antagonist and is used in the treatment of **schizophrenia* with fewer **neuroleptic-induced* side-effects than are associated with conventional neuroleptic drugs. Also called *Risperdal* (trademark).

risus sardonicus *n.* A spasm of the facial muscles resulting in a permanent contorted grin, most frequently caused by tetanus. [From Latin *risus* a laugh + *sardonicus* sardonic or scornful]

Ritalin *n.* A proprietary name for the stimulant drug **methylphenidate*.

*****ebook converter DEMO Watermarks*****

[Trademark]

ritualized fighting *n.* Another name for **conventional fighting*.

r–K continuum *n.* A dimension along which **natural selection* is claimed by some **sociobiologists* to vary according to ecological conditions, from **r-selection* at one extreme to **K-selection* at the other. *See also* CONTINUUM.

R-methodology *n.* Regular **factor* analysis, in which correlations between tests are analysed. Also called *R-technique*. *Compare* Q-METHODOLOGY. [Arbitrary symbol, presumably chosen because it follows Q in the alphabet]

RNA *abbrev.* Ribonucleic acid, a type of **nucleic acid* present in all living cells, playing an important part in the synthesis of **proteins* within the cells' **ribosomes*. Hydrolysis of RNA yields the bases **adenine*, **guanine*, **cytosine*, and **uracil*, together with ribose and phosphoric acid (see *illustration* overleaf). *See also* AMP, CODON, COMPLEMENTARY BASE PAIRING, DOUBLE HELIX, GENE EXPRESSION, NITROGENOUS BASE, NUCLEOTIDE, POLYMERASE CHAIN REACTION, RNA POLYMERASE. *Compare* MESSENGER RNA, TRANSFER RNA.

disorder or other form of **impulse-control disorder*. Compare ROID RAGE.

Robbers Cave experiment *n.* A **field* experiment on conflict and cooperation carried out by the US-based Turkish psychologist Muzafer Sherif (1906–88) and several colleagues in the summer of 1954 and published in books entitled *The Robbers Cave Experiment: Intergroup Conflict and Cooperation* (1961) and *In Common Predicament: Social Psychology of Intergroup Conflict and Cooperation* (1966). Two groups of white, middle-class eleven-year-old boys, arbitrarily named Rattlers and Eagles by the experimenters and each initially unaware of the other group's existence, spent the first week of a three-week summer holiday hiking, swimming, boating, and camping. After they had established separate group identities, they were brought together to compete at football, treasure hunts, tug-of-war, and other events, the winners receiving trophies and medals. Almost immediately, Rattlers and Eagles became hostile and antagonistic towards each other: flags were burned, cabins ransacked, and a food fight escalated into a near-riot in the mess hall. The experimenters restored peace by contriving situations in which members of the two groups had to cooperate to achieve superordinate goals. For example, the camp truck was made to break down at a spot where members of both groups were needed to pull it up a steep hill. At the end of the third week, the two groups were so friendly that they chose to travel home on the same bus. See also REALISTIC GROUP CONFLICT THEORY, SOCIAL IDENTITY THEORY. Compare JIGSAW CLASSROOM. [Named after Robbers Cave State Park in Oklahoma, where the experiment took place]

rocks *n.* A street name for **crack* cocaine. [Referring to its appearance]

rod *n.* One of the two major classes of **photoreceptors* at the back of the **retina*, absent from the **fovea*, long and cylindrical in shape, with an outer segment at its back end containing photosensitive membranes arranged like an orderly stack of discs studded with light-absorbing pigment molecules of **rhodopsin* and a synaptic ending at the other end transmitting nerve impulses to **bipolar* cells and **horizontal cells* in the retina. A rod is totally unresponsive to colour; it mediates **scotopic* vision, functioning only in dim light, and is extremely sensitive, being capable of excitation by a single **photon*. The human retina contains some 120 million rods, far outnumbering the 6 million retinal cones. See also DARK ADAPTATION, PHOTOCHROMATIC

*****ebook converter DEMO Watermarks*****

INTERVAL. *Compare* CONE.

rod-and-frame test *n.* A test of *field dependence–independence in which the respondent, seated in a completely darkened room, attempts to adjust a luminous rod to a vertical position within a tilted luminous frame. Field-dependent people are more strongly influenced by the frame and less able to discount it in judging the upright. *Compare* TILTING-ROOM TEST. **RFT** *abbrev.*

rod pigment *n.* Rhodopsin.

Rogarian *adj.* Of, relating to, or resembling the *client-centred therapy of the US psychologist Carl Rogers (1902–87).

Rohypnol *n.* A proprietary name for *flunitrazepam, a benzodiazepine drug approximately ten times as potent as Valium, that when taken orally induces within 15 minutes slight nausea, dizziness, and a form of drowsiness and immobility resembling mild general anaesthesia lasting from two to eight hours. It is used in the treatment of insomnia, and it is sometimes called the *date rape drug* on account of having been implicated in a number of incidents of rape and sexual assault: it is tasteless, odourless, and colourless and can easily be used to spike a potential rape victim's drink without her knowledge; all traces of it disappear from the bloodstream within 36 hours; and people who take it with alcohol generally experience amnesia lasting at least 12 hours. It is sometimes taken as a street drug, and its most common street name is *roofies*. [Trademark]

roid rage *n.* Heightened aggression or a *tantrum arising as a side-effect of *anabolic steroid ingestion. It is distinguished from *road rage, which may or may not be associated with steroid use. The term first appeared in an article in the *San Diego Union-Tribune* in 1987. *See also* IMPULSE-CONTROL DISORDERS, INTERMITTENT EXPLOSIVE DISORDER. [A shortened form of *steroid*]

rok-joo *See* KORO.

Rolandic fissure *n.* Another name for the *central sulcus. Also written

Rolando's fissure. [Named after the Italian anatomist Luigi Rolando (1773–1831)]

Role Construct Repertory Test *n.* Another name for the **Repertory Grid Test* when the elements presented to the respondent are role titles such as *A teacher you liked*, *Your mother*, *A neighbour with whom you get along well*, and so on. Its inventor, the US psychologist George A(lexander) Kelly (1905–67), listed 24 role titles, including the three quoted here, in the original publication of the test in his book *The Psychology of Personal Constructs* (1955, Vol. 1, pp. 221–2).

rolfing *n.* A technique of **psychotherapy* based on body manipulation and **massage*, using fingers, knuckles, and elbows, designed to correct postural faults and to realign the body vertically and symmetrically. Also written *Rolfing*. See also *BODY THERAPIES*. [Named after the US biochemist Ida P. Rolf (1896–1979) who invented and promoted it from the 1970s]

romantic love *n.* A type of love characterized by erotic passion and intimacy but lacking commitment. See *LOVE*.

romantic love scale *n.* A questionnaire designed to measure romantic **love*, defined in terms of three components labelled affiliative/dependent needs (needing to be with the loved person), predispositions to help (willingness to make sacrifices for the loved person), and exclusivity (desire to be intimately involved with the loved person to the exclusion of others), the scale being specifically designed to distinguish romantic love from liking, which is measured by the **liking scale*. Both scales were constructed by the US psychologist Zick Rubin (born 1944) and published in the *Journal of Personality and Social Psychology* in 1970.

Romberg's sign *n.* Swaying or falling over when standing upright with eyes shut and feet together; a sign of **sensory ataxia* or **locomotor ataxia*. [Named after the German pathologist and neurologist Moritz Heinrich Romberg (1795–1873) who gave the first clinical description of **locomotor ataxia* (tabes dorsalis)]

roofies *n.* A street name for the benzodiazepine drug **Rohypnol*, the date
*****ebook converter DEMO Watermarks*****

rape drug.

rooting reflex *n.* A reflex in which a newborn infant responds to being touched or stroked on the cheek by turning its head towards the stimulated side and making sucking movements. The reflex usually disappears at around 3 or 4 months of age but can persist until 12 months. [From Old English *wrotan* to burrow with the snout, from *wrot* a snout]

root language *n.* Another name for an [*isolating language](#).

rootwork *n.* A [*culture-bound syndrome](#) found in the Caribbean and among African American and Latino communities in the southern United States, where it is generally attributed to witchcraft, sorcery, or hexing, characterized by [*anxiety](#), gastrointestinal complaints such as nausea, vomiting, and diarrhoea, weakness, dizziness, and fear of being poisoned or killed, the symptoms generally persisting unless the spell is removed by a healer called a *root doctor*. Also called *mal puesto* or *brujería* in Spanish-speaking communities. Compare [VOODOO DEATH](#). [From Old English *rot* a root, from Old Norse *rot* a root]

Rorschach test *n.* A [*projective test](#) consisting of ten symmetric ink blots varying in shape and colour. The respondent examines each one in turn and interprets it by saying what it looks like. The test is designed to yield information about unconscious mental processes. It was developed in 1911 and published in 1921 in a book entitled *Psychodiagnostik* (Psychodiagnostics) by the Swiss psychiatrist Hermann Rorschach (1884–1922). Rorschach was not the first to experiment with the interpretation of ink blots, his most famous forerunner having been the Italian polymath Leonardo da Vinci (1452–1519). See also [HOLTZMAN INKBLOT TECHNIQUE](#).

Rosencrantz and Guildenstern effect *n.* A type of [*approach–avoidance conflict](#) and entrapment experienced by a person who is kept waiting while attempting to achieve a particular goal, as when a person waiting at a bus stop faces the choice of waiting or walking but as time passes feels increasingly unwilling to leave the bus stop because of the increasing likelihood that a bus will arrive. In such situations, time is simultaneously an investment that increases the likelihood of goal attainment and an expense

*****ebook converter DEMO Watermarks*****

that increases the likelihood of failing to attain the goal, and as time passes, the conflict increases. [Named after the following passage in the play *Rosencrantz and Guildenstern are Dead* (1967) by the Czechoslovakian-born British playwright Tom Stoppard (born 1937): 'We've travelled too far, and our momentum has taken over; we move idly towards eternity, without possibility of reprieve or hope of explanation.']

Rosenthal effect *n.* Another name for the **experimenter expectancy effect*. [Named after the German-born US psychologist Robert Rosenthal (born 1933) who pioneered research on it]

Rosenzweig Picture-Frustration Study *n.* A **projective test*, designed to measure characteristic modes of responding to frustration, in which the respondent is presented with 24 cartoon drawings, each depicting one person saying something frustrating to the other, the second person being shown with a blank speech bubble. The respondent's task is to fill in each of the 24 blank speech bubbles with the first response that comes to mind, and from the responses the direction of aggression (directed inwards, directed outwards, or repressed) and type of aggression, including obstacle-dominance (frustrating objects stand out), ego-defence (the respondent's ego predominates to protect itself), and need-persistence (the respondent pursues goals despite frustration) are scored. In addition, a group conformity rating is provided, indicating how closely the responses resemble the most common responses or population norms. **RPFS** *abbrev.* [Named after the US psychologist Saul Rosenzweig (1907–2004) who published early accounts of research using the test in the *Journal of Experimental Psychology* in 1943 and the *Journal of Personality* in 1945 and adult and child versions of the test itself in 1948]

Ross–Jones test *n.* A test for excess of globulin in the **cerebrospinal fluid*. Cerebrospinal fluid is floated on a solution of ammonium sulphate, and globulin forms a greyish-white ring at the junction of the two liquids, the width of the ring providing an index of excess of globulin. [Named after the Scottish pathologist Hugh Campbell Ross (1875–1926) and the Welsh psychoanalyst Ernest Jones (1879–1958) who introduced it]

rostral *adj.* Of, relating to, or situated towards the **anterior* end or side of a

*****ebook converter DEMO Watermarks*****

body, organ, or part; or, in the human brain, towards the top, as if humans walked on all fours like other animals. *Compare* CAUDAL. [From Latin *rostrum* a beak]

rostrum *n.* 1. Any beak or beak-shaped structure, such as the rostrum of the *corpus callosum, the front tip below the genu. 2. A platform for public speaking, named after the *rostrum* of the Roman forum, which was festooned with beaks plundered from the bows of captured ships. [From Latin *rostrum* a beak]

rotating circles illusion *n.* Another name for the *Pinna–Brelstaff illusion.

rotating head illusion *n.* A visual illusion in which a two-dimensional painting or photograph of a head (or of any three-dimensional object) appears to rotate in the same direction as a viewer who moves in front of it from one side to the other. The illusion results from the fact that if the head were three-dimensional, then the viewer, moving from side to side, would see it first from one side, then from the front, then finally from the other side, as if the head were rotating in the opposite direction, and the head would appear stationary, therefore with a two-dimensional painting or photograph, the absence of any apparent contrary rotation causes the head to appear to rotate in the same direction as the viewer, and the sitter's *gaze seems to follow the viewer around. Also called the *portrait illusion*. *Compare* HOLLOW-FACE ILLUSION.

rotation *n.* Application of any of several statistical techniques in *factor analysis for making a factor solution easier to interpret by rotating the axes of the factor loadings to achieve a simple or meaningful structure. *See* SIMPLE STRUCTURE.

rotation, mental *See* MENTAL ROTATION.

rote learning *n.* Memorization through repetition and reproduction without attention to meaning. In psychology, the term is applied especially to the learning of inherently meaningless information such as *nonsense syllables. [Perhaps from Latin *rota* a wheel]

*****ebook converter DEMO Watermarks*****

rote memory *n.* Mechanical memory based on [*rote learning](#).

Rotter Incomplete Sentences Blank *n.* A [*sentence completion test](#) designed to measure psychological adjustment, available in three forms (high school, college, and adult), each consisting of 40 truncated sentences, such as *I hate...*; *The best...*; and *Most girls...*. It is scored for conflict, positive responses, and neutral responses, from which an overall adjustment score is calculated. **RISB** *abbrev.* [Named after the US psychologist Julian B(ernard) Rotter (1916–2014) who published the earliest version of it in the journal *American Psychologist* in 1946 and, with two colleagues, issued a revised version commercially in 1992]

rough endoplasmic reticulum *See* [ENDOPLASMIC RETICULUM](#). **RER** *abbrev.*

round dance *n.* One of two patterns of movement, first described by the Austrian zoologist Karl von Frisch (1886–1982) in a series of publications from 1924 to 1955, through which a female honey-bee communicates to other members of her hive the direction and distance of a source of nectar or sometimes a new nesting site less than a certain distance away—less than about 5–80 metres away, depending on the bee species or subspecies—the more elaborate and specific [*waggle dance](#) being reserved for targets further away. In the round dance, the bee moves in circles on a (usually) vertical surface of the honeycomb, alternating clockwise and anticlockwise, the liveliness and length of her dance indicating how rich the food source is (see [illustration](#)). Also called a *circling dance*. [Translated from von Frisch's German *Rundtanz* literally round dance, from *rund* round + *Tanz* a dance]

Round dance

round window *n.* An opening in the wall of the middle ear leading to the cochlea, covered by a membrane, functioning to reduce pressure caused by vibration of the ***oval window**. Also called the *cochlear window*, *fenestra cochleae* or *fenestra rotunda*. [So called because of its circular shape]

r-selection *n.* A form of ***natural selection** that is typical of organisms in relatively unstable, variable, and unpredictable ecological conditions in which rapid population growth is crucial, and that is characterized by fast development, small size, early reproduction, perfunctory parental care, limited learning capacity, and generally opportunistic behaviour. *See also R-K CONTINUUM. Compare K-SELECTION. r-selected* *adj.* Selected for superiority in environments favouring *r*-selection.

R squared *n.* In statistics, the square of the ***multiple correlation coefficient**. *See COEFFICIENT OF DETERMINATION. Symbol:* R^2 .

rubber hand phenomenon *n.* A **cognitive illusion* that is induced when a person holds one hand out of sight while an artificial hand is positioned where the person's own hand might be, and both the artificial hand and the real hand are simultaneously stroked with a paintbrush or similar object. The artificial hand begins to be experienced as the person's own hand after about 10 seconds, on average, and this effect is accompanied by electrical activity in the premotor area of the **motor cortex*. The phenomenon was first reported by the US psychiatrists Matthew M. Botvinick (born 1967) and Jonathan D. Cohen (born 1955) in the journal *Nature* in 1998, and the brain activity associated with this body-ownership illusion was first described in an article in the journal *Science* by the Swedish neuroscientist H. Henrik Ehrsson (born 1972) and colleagues in 2004. *See also* PHANTOM LIMB. *Compare* ALIEN HAND SIGN, ANARCHIC HAND.

Rubin's figure *n.* Another name for the **reversible goblet*. [Named after the Danish psychologist Edgar Rubin (1886–1951) who introduced it in 1915]

rubrospinal tract *n.* A bundle of efferent nerve fibres connecting the **red nucleus* to the **spinal cord*. [From Latin *ruber* red + English *spinal*]

Ruffini corpuscle *n.* An oval-shaped sensory nerve ending in subcutaneous tissue of hairy **skin* and near fingernails, similar in structure to a **Golgi tendon organ*, sensitive to drag or shearing stress. Also called a *Ruffini ending*. *Compare* FREE NERVE ENDING, MEISSNER'S CORPUSCLE, MERKEL CELL, PACINIAN CORPUSCLE. [Named after the Italian histologist Angelo Ruffini (1864–1929) who discovered it and published his findings in 1892]

rule of abstinence *See* ABSTINENCE RULE.

rumination disorder *n.* An **eating disorder* in **DSM-5* characterized by a persistent pattern of repeated regurgitation, chewing, and swallowing or spitting out of partly digested food, without apparent nausea, retching, or disgust, the behaviour not occurring as a result of **anorexia nervosa*, **bulimia nervosa* or a gastrointestinal or other medical condition. [From Latin *ruminare* to chew the cud, from *rumen* the gullet]

rumour *n.* An unverified story or report circulating in a community, usually by word of mouth. It tends to focus on people or events about which there is interest or concern but not much concrete evidence, and as it is propagated, it undergoes the same processes of **assimilation* (5), **levelling* (1), and **sharpening* as are found in other forms of **serial reproduction*. US *rumor*. See also MEME, RUMOUR INTENSITY FORMULA, SMALL WORLD PHENOMENON, URBAN LEGEND. [From Latin *rumor* noise]

rumour intensity formula *n.* A proposition formulated by the US psychologists Gordon W(illard) Allport (1897–1967) and the Russian-born Leo (Joseph) Postman (1918–2004) in their book *The Psychology of Rumor* (1947) that the strength of a **rumour* depends on its importance multiplied by the difficulty of falsifying it. US *rumor intensity formula*.

Rumpelstiltskin phenomenon *n.* The tendency for the naming of something to create the impression of imparting an understanding of it. It applies, for example, to the naming of mental disorders: a person who tells implausible lies may be said to be suffering from **pseudologia fantastica*, but that term is nothing more than a name for implausible lying, and any impression that it imparts an understanding of the phenomenon is a **cognitive illusion*. [Named after Rumpelstiltskin in a famous fairy tale, called Rumpelstilzchen in the German version collected by the brothers Grimm, a strange dwarf who exerts a baleful influence over a miller's daughter until she eventually gains power over him by learning his name]

run *n.* The act or process of running, or a journey, trip, or spell. In statistics, any succession of observations of one specified type in an ordered sequence of observations, preceded and followed by observations of a different type or by no observations at all. For example, a succession of heads in a sequence of coin tosses is a run, and so is a succession of failures in a sequence of trials of a treatment. See also RUNS TEST.

runs test *n.* In statistics, a test of the randomness of an ordered sequence of binary or dichotomous observations, in which the number of **runs* expected on the basis of chance is calculated and compared with the observed number of runs. Also called the *Wald–Wolfowitz runs test*.

Russell's paradox *n.* The most famous [*paradox](#) of [*set](#) theory. Some sets are members of themselves and others are not: for example, the set of all sets is a member of itself, because it is a set, whereas the set of all penguins is not, because it is not a penguin. Now consider the set of all sets that are not members of themselves; is it a member of itself or is it not? If it is a member of itself, then it is not a member of itself, because it is one of those that are not members of themselves; and if it is not a member of itself, then it is a member of itself. It was discovered in 1901 by the Welsh philosopher Bertrand (Arthur William) Russell (1872–1970), and it undermined the attempt by the German logician and mathematician Friedrich Ludwig Gottlob Frege (1848–1925) to derive the whole of arithmetic from logic via set theory. When the second volume of Frege's monumental *Grundgesetze der Arithmetik* was in press, he received a letter from Russell describing the paradox; he replied that ‘arithmetic totters’ and was forced to add an appendix to the book explaining why the ambitious project had to be abandoned. Russell's paradox is closely related to the [*barber's paradox](#).

saccade *n.* A rapid ***ballistic movement** of the eyes, lasting 20 to 100 milliseconds, as they jump from one fixation point to the next when reading or tracking a moving object or image. A ***microsaccade** is a small saccade occurring as part of ***physiological nystagmus** during visual fixation of a stationary object. *See also* **AUTOKINETIC EFFECT**, **CHANGE BLINDNESS**, **EYE-TRACKING**, **FEEDFORWARD**, **VISUAL SUPPRESSION**. *Compare* **SMOOTH EYE MOVEMENT**. **saccadic** *adj.* [French *saccade* a jerk, from Old French *saquer* to pull]

saccadic suppression *n.* Another name for ***visual suppression**.

saccul *n.* A small sac, especially the smaller of the two sections of the ***membranous labyrinth** of the inner ear that functions as an ***otolith** receptor in the ***vestibular system**. **saccular** *adj.* *Compare* **UTRICLE**. [From Latin *sacculus* a little sac, diminutive of *saccus* a sack]

sad horse disease *See* **BORNA DISEASE VIRUS**.

sadism *n.* Another name for ***sexual sadism**. The term is also used loosely to denote extreme cruelty not motivated by sexual desire. *See also* **ORAL SADISTIC PHASE**. **sadistic** *adj.* [Named after the French writer Count Donatien François de Sade (1740–1814), also known as the Marquis de Sade, who described it in his novels, notably *Les 120 Journées de Sodome* (1785, *The 120 Days of Sodom*) and *Juliette* (1796)]

sadistic–anal stage *n.* Another name for the ***anal sadistic stage**. *See* **ANAL STAGE**.

sadistic–oral phase See ORAL SADISTIC PHASE.

sadomasochism *n.* A generic name for *sexual sadism and *sexual masochism, alluding to the fact that they are often combined in the same person. **sadomasochistic** *adj.* **SM** *abbrev.*

sagittal plane *n.* The vertical plane dividing the body, the brain, or any other organ into left and right parts, the *midsagittal plane* (also called the *median plane*) dividing the structure along its midline. (see illustration at *coronal plane). Compare CORONAL PLANE, TRANSVERSE PLANE. [From Latin *sagitta* an arrow]

sagittal section *n.* A cutting through a *sagittal plane. The midsagittal section (also called the *median section*) of the brain passes through the *longitudinal fissure and exposes the *medial surfaces of the cerebral hemispheres. Compare CORONAL SECTION, HORIZONTAL SECTION, TRANSVERSE SECTION.

sagittal suture *n.* The serrated line along the middle of the top of the skull where the left and right *parietal bones join together.

Saint John's wort See ST JOHN'S WORT.

Saint Vitus' dance *n.* A disorder of the motor nerves leading to jerky, *choreiform movements of the limbs and face; also an obsolete name for *Sydenham's chorea. [So called because of an early confusion with *tarantism in pilgrims to the shrine of St Vitus at Ulm]

saka See UFUFUNYANE.

salience *n.* 1. The protruding or jutting-out property of a physical structure; hence figuratively the prominence, conspicuousness, or striking quality of a *stimulus (1). 2. In relation to animal behaviour, leaping. **salient** *adj.* [From Latin *saliens* leaping, from *salire* to leap]

salivary gland *n.* Any of the *exocrine glands that secrete saliva into the

*****ebook converter DEMO Watermarks*****

oral or mouth cavity. Human salivary glands include the parotid glands in front and below each ear, the sublingual gland below the tongue, and the submaxillary glands below each side of the jaw.

saltation *n.* 1. The manner in which a nerve impulse is propagated along a **myelinated* nerve fibre in a sequence of jumps from one **node* of Ranvier to the next, greatly increasing its speed of propagation. Also called *saltatory conduction*. 2. A sudden variation in the structure or behaviour of an organism, species, or subspecies resulting from genetic **mutation*. 3. Another name for **sensory* saltation. [From Latin *saltus* a leap, from *saltare* to dance + *-ation* indicating a process or condition]

salty *n.* One of the primary tastes in **Henning's tetrahedron*, the characteristic taste of sodium chloride or table salt.

sample *n.* In research methods and statistics, a number of individuals selected from a **population* to test hypotheses about the population or to derive estimates of its **parameters*. See ACCIDENTAL SAMPLE, CLUSTER SAMPLE, CONVENIENCE SAMPLE, HOLD-OUT SAMPLE, NON-PROBABILITY SAMPLE, OPPORTUNITY SAMPLE, PROBABILITY SAMPLE, QUOTA SAMPLE, RANDOM DIGIT DIALLING, SELF-SELECTED SAMPLE, SIMPLE RANDOM SAMPLE, SNOWBALL SAMPLE, STRATIFIED RANDOM SAMPLE. [From Latin *exemplum* an example]

sample size fallacy *n.* A failure to take account of sample size when estimating the probability of obtaining a particular value in a sample drawn from a known population. Research into the fallacy was first reported by the Israeli-American psychologists Daniel Kahneman (born 1934) and Amos Tversky (1937–96) in an article in the journal *Cognitive Psychology* in 1972 describing an experiment in which participants were asked to estimate the probability of a group of people having an average height over 6 feet. The participants produced almost identical estimates for group sizes of 10, 100, and 1,000, whereas in reality the probability of an unusually high sample average, relative to the population average, is much greater in a small sample than in a large one. The fallacy is explained by the use of the **representativeness heuristic*, which is insensitive to sample size. The most common form of the fallacy is the tendency to assume that small samples should be representative of their parent populations, the **gambler's fallacy*

*****ebook converter DEMO Watermarks*****

being a special case of this phenomenon. Compare [BASE-RATE FALLACY](#).

sampling frame *n.* A list of members of a [*population](#) from which members of a [*sample](#) are selected, especially when a [*simple random sample](#) (SRS) is drawn.

Sander parallelogram *n.* A visual illusion in which the long diagonal of a parallelogram appears much longer than that of a smaller parallelogram contiguous to it, one of the large parallelogram's short sides forming one of the long sides of the smaller parallelogram and the two long diagonals being of equal length (see [illustration](#)). Also called the *parallelogram illusion*. [Named after the German Gestalt psychologist Friedrich Sander (1889–1971) by one of his students, who published it in 1926, although it had already been published by the US lighting engineer and psychologist Matthew Luckiesh (1883–1967) in his book *Visual Illusions: Their Causes, Characteristics and Applications* (1922, p. 58) and should arguably be called the Luckiesh illusion]

Sander parallelogram. The distances AX and AY are equal.

sangue dormido *n.* A [*culture-bound syndrome](#) largely confined to Portuguese-speaking Cape Verde islanders and emigrant Cape Verde communities in other parts of the world, the symptoms of which may include muscle and joint pain, numbness, trem-bling, paralysis, convulsions, stroke, blindness, heart attack, and (among pregnant women) miscarriage. [From Spanish *sangue* blood, from Latin *sanguis* blood + Spanish *dormido* sleeping,

from Latin *dormire* to sleep]

Sanson image *n.* Another name for a **Purkinje–Sanson image*. [So called because it was investigated in 1838 by the French surgeon Louis Joseph Sanson (1790–1841), having been first observed in 1825 by the Czech-born German physiologist Johannes E(vangelista) Purkinje (1787–1869)]

sapid *adj.* Tastable; in non-technical discourse also tasty or pleasant-tasting. [From Latin *sapidus* tastable, from *sapere* to taste]

Sapir–Whorf hypothesis *n.* The two-pronged theory that language determines the way people perceive the world and think, rather than the other way round (see *LINGUISTIC DETERMINISM*), and that people who speak different languages perceive reality differently and think differently, because categories and distinctions encoded in one language are not necessarily available in another (see *LINGUISTIC RELATIVITY*). Also called the *Whorfian hypothesis*. See also *POLYONYMY*. [Named after the US anthropologist Edward Sapir (1884–1939) and the US fire prevention officer and linguist Benjamin Lee Whorf (1897–1943) who formulated it in the 1920s]

sapphism *n.* A less common name for **lesbianism*. **sapphic** *adj.* [Named after the lyric poet Sappho (born about 650 BC) who lived on the Greek island of Lesbos and expressed love for women in many of her poems]

sarcomere *n.* Any of the transverse segments of **striped muscle* tissue, situated between two **Z-discs*, that comprise an integrated contractile unit. [From Greek *sarx*, *sarcos* flesh + *meros* a part]

sarin *n.* The **organophosphate*, **anticholinesterase*, **nerve* gas isopropyl methylphosphonofluoridate. Formula: $C_4H_{10}FPO_2$. [German, origin unknown]

Saroten *n.* A proprietary name for the tricyclic antidepressant drug **amitriptyline*. [Trademark]

SAS *abbrev.* Statistical Analysis System, a suite of statistical computer programs often used by psychologists, distributed by SAS Inc. of Cary, North Carolina, USA. *Compare* [BMDP](#), [SPSS](#), [SYSTAT](#).

satellite cell *n.* A type of [*neuroglial](#) cell that forms round a damaged cell. [From Latin *satelles* an attendant]

satiety centre *n.* One of the two structures of the [*appestat](#), situated in each side of the [*ventromedial hypothalamus](#), stimulation of which inhibits eating and destruction increases eating. US *satiety center*. *Compare* [FEEDING CENTRE](#).

satisficing *n.* A decision making procedure or cognitive [*heuristic](#) that entails searching through the available options just long enough to find one that reaches a preset threshold of acceptability, first suggested by the US political scientist and decision theorist Herbert A(lexander) Simon (1916–2001) in his book *Models of Man: Social and Rational* (1957), to explain the behaviour of human decision makers with [*bounded rationality](#) in circumstances in which an optimal solution cannot be determined, often because a thorough examination of all available options would be required but would be infeasible or would consume too much time and energy. Thus a newly married couple looking for a house to buy may accept the first one they find that satisfies certain minimal requirements of price, location, number of rooms, and local amenities; human chess players also usually adopt satisficing moves because it is impossible to analyse all available moves in a typical chess position; and firms often seek satisfactory rather than optimum levels of profits and growth. *See also* [PSYCHOLOGICAL DECISION THEORY](#). **satisfice** *vb.* **satisficer** *n.* One who satisfices. [A blend of *satis(factory)* and *(suf)ficing*, because it involves the choice of options that are satisfactory or that suffice]

saturation *n.* 1. The amount of [*chroma](#) in a colour as a proportion of all the colour, both [*chromatic \(1\)](#) and [*achromatic \(1\)](#), the admixture of grey causing the colour to appear *desaturated*. It is one of the three major dimensions of colour, the other two being [*hue](#) and [*lightness](#). The [*Munsell](#) chroma scale of saturation ranges from grey (zero) to the most saturated level (14). *See also* [CHROMATICITY](#), [MUNSELL COLOUR SYSTEM](#). 2. In [*log-linear](#) *****ebook converter DEMO Watermarks*****

analysis, the state of a model that contains all main effects and interactions and in which observed and expected frequencies are therefore equal. **3.** More generally, the state or quality of being soaked or imbued with something to the fullest extent possible. [From Latin *saturare*, -*atum* to soak, from *satur* full or sated, from *satis* enough + -*ation* indicating a process or condition]

satyriasis *n.* A psychological condition of men characterized by uncontrollable sexual desire and an inability to have lasting sexual relationships. Referred to non-technically as *Don Juanism*. Compare **NYMPHOMANIA**. [From Greek *satyros* one of the Greek gods of the woodlands who chase the nymphs]

savant *n.* **1.** A person of great wisdom or learning. **2.** Another name for an ***idiot savant**. [From French *savant* wise or knowledgeable]

savings, method of See **METHOD OF SAVINGS**.

saxitoxin *n.* A ***neurotoxin** that is produced by plankton in reddish discoloured sea water and that selectively blocks ***sodium** channels in neurons, disabling their ability to generate nerve impulses, used as a neurotoxin in experimental neurophysiology. See also **NEUROTOXIN**. **STX** *abbrev.* [Named after *Saxi(domus) (gigantus)* an Alaskan clam that feeds on it and from which it is isolated + *toxin* poison, from Greek *toxikon* arrow-poison, from *toxon* a bow]

Sayre's law *n.* Another name for ***Issawi's law of social motion**. [Named after the US political scientist Wallace Stanley Sayre (1905–72) who formulated it but did not publish it]

scala *n.* Any of the three fluid-filled chambers separated by membranes that run through the length of the ***cochlea** of the inner ear. See **SCALA MEDIA**, **SCALA TYMPANI**, **SCALA VESTIBULI**. **scalae** *pl.* [From Latin *scala* a ladder or staircase, alluding to the cochlea's resemblance to a spiral staircase]

scala media *n.* A ***cochlear** chamber bounded by the ***organ of Corti** and ***Reissner's membrane** and containing ***endolymph**.

scala tympani *n.* A *cochlear chamber lying below the *basilar membrane and containing *perilymph.

scala vestibuli *n.* A *cochlear chamber situated on the opposite side of Reissner's membrane to the *organ of Corti and containing perilymph.

scale *n.* **1.** In statistics and measurement theory, a rule governing the relationship between numerical scores and the magnitudes of the *attributes or quantities being measured. *See also* ABSOLUTE SCALE, INTERVAL SCALE, LOG-INTERVAL SCALE, MEASUREMENT LEVEL, NOMINAL SCALE, ORDINAL SCALE, RATIO SCALE. **2.** A test or measuring instrument for implementing a scale (1). **scaling** *n.* The development or construction of scales (1, 2), often by aggregating or ordering responses of individuals. [From Latin *scala* a ladder, from *scandere* to climb]

scalogram analysis *n.* The method used to construct a *Guttman scale.

SCAN *abbrev.* Schedules for Clinical Assessment in Neuropsychiatry, a set of instruments and manuals for assessing, measuring, and accurately classifying the *signs (1) and *symptoms of adult mental disorders, with the objective of facilitating valid comparisons across research investigations, published by the World Health Organization in 1994. Its major components are the *Present State Examination (PSE), an *Item Group Checklist (IGC), a *Clinical History Schedule (CHS), and *Catego, a computer software package for processing SCAN data.

scanning speech *n.* Abnormal speech characterized by staccato articulation, with words clipped and broken into detached syllables with pauses between them, caused by neuromuscular disorder.

scatter *n.* In descriptive statistics, the degree of dispersion or variability in a set of scores, usually indexed by the *variance or *standard deviation. *See also* INTERQUARTILE RANGE, PROBABLE ERROR, RANGE, SEMI-INTERQUARTILE RANGE.

scatterplot *n.* In statistics, a graph of the relationship between two variables consisting of unconnected points representing individuals or cases,

with the horizontal axis usually representing the individuals' scores on one variable and the vertical axis the scores on the other variable. A scatterplot is often useful when the **correlation* between two variables is being investigated. Also called a *scatter diagram* or a *scattergram*.

schedule of reinforcement See REINFORCEMENT SCHEDULE.

Scheffé test *n.* In statistics, a method of **multiple comparisons* that can be used for making not only pairwise comparisons but all possible linear combinations of group means. For pairwise comparisons of means it tends to be conservative, inasmuch as it requires larger differences between means for significance than some other methods. Compare BONFERRONI CORRECTION, DUNCAN'S MULTIPLE RANGE TEST, LEAST-SIGNIFICANT DIFFERENCE TEST, NEWMAN-KEULS TEST, TUKEY-HSD TEST. [Named after the US mathematician Henry Scheffé (1907–77) who developed it in 1959]

schema *n.* A plan, diagram, or outline, especially a mental representation of some aspect of experience, based on prior experience and memory, structured in such a way as to facilitate (and sometimes to distort) perception, cognition, the drawing of inferences, or the interpretation of new information in terms of existing knowledge. The term was first used in a psychological sense by the English neurologist Sir Henry Head (1861–1940), who restricted its meaning to a person's internal **body image*, and it was given its modern meaning by the English psychologist Sir Frederic Charles Bartlett (1886–1969) in his book *Remembering: A Study in Experimental and Social psychology* (1932, p. 199) to account for the observation that errors in the recall of stories tend to make them more conventional, which Bartlett attributed to the **assimilation* (5) of the stories to pre-existing schemata. The concept of a **frame* (2), introduced in 1975 by the US cognitive scientist Marvin (Lee) Minsky (born 1927), is essentially a schema formalized in **artificial intelligence*. A **script* (3) is a schema of an event sequence. See also CAUSAL SCHEMA, CONSTRUCTIVISM, PERCEPTUAL SCHEMA, SCHEME, SELF-SCHEMA, WAR OF THE GHOSTS. Compare MENTAL MODEL, PROTOTYPE (2). **schemata** or **schemas** *pl.* [From Greek *schema* a form, from *echein* to have]

scheme *n.* In the writings of the Swiss psychologist Jean Piaget (1896–1980), a concept almost synonymous with **schema* but restricted to

*****ebook converter DEMO Watermarks*****

conscious cognitive representations and plans.

schizoaffective disorder *n.* A *mental disorder* in *DSM-5* characterized by a *major depressive episode*, a *manic episode*, or a *mixed episode*, together with the symptoms of *schizophrenia*.

schizoid personality *n.* A concept introduced in 1963 by the Scottish psychoanalyst W. Ronald D. Fairbairn (1889–1964) to denote a type of person who may be outwardly successful but is solitary, withdrawn, and unable to relate to people, and even when interacting gives nothing to the other person. Fairbairn linked this to a failure of the person's mother to treat the child as real or to love it for its own sake. *See also* SCHIZOID PERSONALITY DISORDER.

schizoid personality disorder *n.* A *personality disorder* in *DSM-5* characterized by a pervasive detachment from social relationships and a restricted range of emotional expression, indicated by such signs and symptoms as a lack of desire for or enjoyment of close relationships; almost exclusive choice of solitary pursuits; little or no interest in having sexual relationships; enjoyment of few activities; lack of close friends or confidants other than immediate family members; apparent indifference to praise and criticism; and emotional coldness, detachment, and *affective flattening*. *See also* SCHIZOID PERSONALITY. *Compare* ASPERGER'S DISORDER, AVOIDANT PERSONALITY DISORDER, SCHIZOPHRENIA, SCHIZOTYPAL (PERSONALITY) DISORDER.

schizophrenia *n.* A major *mental disorder*, formerly called *dementia praecox*, characterized by *positive symptoms* such as *delusions*, *hallucinations*, *disorganized speech*, *disorganized thinking*, grossly disorganized behaviour, or *catatonia*; *negative symptoms* such as *affective flattening*, *alogia*, or *avolition*; and marked deterioration in work, social relations, or self-care. Associated features include inappropriate *affect*, *anhedonia*, *dysphoric mood*, lack of *insight* (3), *depersonalization*, and *derealization*. To meet the diagnostic criteria of *DSM-5*, at least two major symptoms must be present. Because of its etymology (see below), schizophrenia is often confused with multiple personality disorder or split personality (*dissociative identity disorder*), but the Swiss psychiatrist Eugen Bleuler (1857–1939), who coined the term,

*****ebook converter DEMO Watermarks*****

meant it to refer to the splitting up or disintegrating of the mental functions rather than the cleaving in two of the mind. On page 5 of his book *Dementia praecox oder Gruppe der Schizophrenien* (1911, p. 8 of the English translation *Dementia Praecox or the Group of Schizophrenias*, 1950), he explained: ‘I call dementia praecox “schizophrenia” because...the “splitting” of the different psychic functions is one of its most important characteristics’. See also BORNA DISEASE VIRUS, CATATONIC SCHIZOPHRENIA, DELUSIONAL DISORDER, DISORGANIZED SCHIZOPHRENIA, DOUBLE BIND, PARANOID SCHIZOPHRENIA, p50, p300, REALITY MONITORING, REALITY TESTING, RESIDUAL SCHIZOPHRENIA, SCHIZOAFFECTIVE DISORDER, SCHIZOPHRENIA SCALE, UNDIFFERENTIATED SCHIZOPHRENIA. Compare SCHIZOID PERSONALITY, SCHIZOPHRENIFORM DISORDER, SCHIZOTYPAL (PERSONALITY) DISORDER. [From Greek *schizein* to split + *phren* mind, originally midriff, the supposed seat of the soul + *-ia* indicating a condition or quality]

schizophrenia scale *n.* Any scale designed to measure schizophrenia, including the schizophrenia scale of the *MMPI.

schizophrenia spectrum and other psychotic disorders *n.* An umbrella term introduced in *DSM-5 to encompass disorders associated with *hallucinations, *delusions, *disorganized speech, *negative symptoms, and grossly abnormal body movements. The disorders in this category are *schizotypal (personality) disorder, *delusional disorder, *brief psychotic disorder, *schizophreniform disorder, *schizophrenia, *schizoaffective disorder, *substance/medication-induced psychotic disorder, *psychotic disorder due to another medical condition, and *catatonia.

schizophreniform disorder *n.* A *mental disorder in *DSM-5 with the same features as *schizophrenia, but lasting for only a short time, usually more than one month but less than six months. [From *schizophreni(a)* + *form*, from Latin *forma* a form]

schizophrenogenic *adj.* Tending to cause schizophrenia. The word has been used especially to describe mothers or parents who create *double binds for their children.

schizotypal (personality) disorder *n.* A *personality disorder in *DSM-5 characterized by behavioural eccentricities and anomalies of
*****ebook converter DEMO Watermarks*****

cognition and affect that resemble those of **schizophrenia*, notably marked discomfort with, and reduced capacity for, close personal relationships together with cognitive or perceptual distortions and eccentric behaviour, beginning by early childhood, indicated by such signs and symptoms as **ideas of reference* (but not **delusions* of reference); odd beliefs or magical thinking (such as superstitions and beliefs in telepathy or clairvoyance); unusual perceptual experiences; strange speech and thinking; **paranoid* ideation; inappropriate **affect* or **affective flattening*; eccentric or peculiar appearance or behaviour; absence of close friends; and excessive social anxiety that does not decline with intimacy. *See also* COGNITIVE SLIPPAGE, SCHIZOTYPY. *Compare* SCHIZOID PERSONALITY DISORDER, SCHIZOPHRENIA.

schizotypy *n.* A mental disorder believed to be closely related to **schizophrenia*, first described and named by the Hungarian-born US psychiatrist and psychoanalyst Sandor Rado (1890–1972) in an article in the *American Journal of Psychiatry* in 1953, characterized by the following signs and symptoms: **anhedonia*, a distorted body **schema*, a deficit of **motivation*, and inability to organize goal-oriented activities. In an influential article by the US psychologist Paul Everett Meehl (1920–2003) in the journal *American Psychologist* in 1962, the definition was extended to include **cognitive* slippage, **social anxiety disorder*, and **ambivalence*. The corresponding disorder in **DSM-5* is called **schizotypal (personality) disorder*. [From Greek *schizein* to split + *phren* mind, originally midriff, the supposed seat of the soul + *typos* a mark]

Scholastic Aptitude Test *See* SCHOLASTIC ASSESSMENT TEST.

Scholastic Assessment Test *n.* The most widely used test for selecting candidates for admission to colleges and universities in the US. Its subtests include verbal and mathematical aptitude tests and an achievement test in each academic subject. It was introduced in schools in 1926 and was originally called the *Scholastic Aptitude Test*, but the Educational Testing Service changed its name in 1994 in response to criticisms of its accuracy at predicting academic performance. *Compare* AMERICAN COLLEGE TESTING PROGRAM, GRADUATE RECORDS EXAMINATION. **SAT** *abbrev.*

school psychology *n.* The name given in the US to the field of **applied*

*****ebook converter DEMO Watermarks*****

psychology that in the UK is called **educational psychology*. The work of school psychologists involves the diagnosis and treatment of educational, emotional, and behavioural problems in children of all ages up to the late teens.

Schreber case *n.* A virtuosic **case study* in **psychoanalysis* by Sigmund Freud (1856–1939), entitled ‘Psycho-Analytic Notes on an Autobiographical Account of a Case of Paranoia (Dementia Paranoides)’ (1911, *Standard Edition*, XII, pp. 9–82), based on the memoirs of the German magistrate Daniel Paul Schreber (1842–1911). Freud sought to explain why the particular **delusions* found in paranoia (now called **delusional disorder*) are delusions of jealousy, **erotomania* (1), persecution, and grandeur, rather than any others, and he concluded that the following unconscious homosexual wish-fantasy underlies paranoia in a man: *I (a man) love him (a man)*. Homosexuality being socially taboo, the man with paranoia distorts the wish-fantasy into a more acceptable form. First, he may alter the grammatical subject of the wish-fantasy by **projection* (1), yielding *It is not I, but she (my sexual partner), who loves him*, and delusions of jealousy arise. Second, he may alter the object of the sentence by **displacement*: *I don't love a man, because I love women*. This is still unacceptable to a Victorian married man, so it is distorted further by projection into *Women love me*, and delusions of erotomania arise. Third, the verb may be altered by **reversal* (1): *I do not love a man, I hate men*, and this may be changed by projection into the more acceptable form *Men hate me*, yielding delusions of persecution. Finally, he may deny the whole sentence: *I don't love a man, because I love no one*; but for **economic* reasons **object libido* cannot simply disappear but is diverted into **ego* libido, so this is equivalent to *I love no one but myself*, yielding delusions of grandeur. If the person with paranoia is female, then the whole chain of argument applies with the gender terms reversed. The reason for the particular group of delusions found in paranoia was thus explained by Freud. See also LATENT HOMOSEXUALITY, PSYCHOANALYTIC CONSTRUCTION.

Schröder staircase *n.* An **ambiguous figure* appearing as a staircase viewed either from above or below, a classic illustration of **perspective reversal* (see *illustration*). Also spelt *Schroeder staircase*. Often confused with the **staircase illusion*. [Named after the German bacteriologist and psychologist Heinrich Georg Friedrich Schröder (1810–85) who first

published it in 1858]

Schröder staircase. The perspective alternates spontaneously between views of a staircase as seen from above and from below.

schwa *n.* The neutral and central mid **vowel* (see also the diagram accompanying that entry) that occurs in the words *the* and *fern*, at the beginning of *about*, and at the end of *sofa*, and the symbol in the **International Phonetic Alphabet (IPA)* that represents it, namely an inverted *e*. Statistically, it is the most frequently occurring English vowel (over ten per cent of all vowel sounds), yet it has no corresponding single letter in the standard alphabet. See also *CENTRAL VOWEL*, *FORMANT*, *MID VOWEL*. [From Hebrew *shewa* a mark indicating the absence of a vowel sound]

Schwann cell *n.* A type of large **neuroglial* cell responsible for forming the **myelin* sheath around nerves in the **peripheral nervous system*. See also *NEUROLEMMA*. Compare *OLIGODENDROCYTE*. [Named after the German physiologist Theodor Schwann (1810–82) who studied it]

scientific method *n.* Another (less precise) name for the hypothetico-deductive method.

scientific revolution *n.* According to the US historian and philosopher of science Thomas S(amuel) Kuhn (1922–96) in *The Structure of Scientific Revolutions* (1962), a period in which competing **paradigms* (1) vie with one another in a scientific discipline, in a manner analogous to **Darwinian evolution*, until a new paradigm replaces the old by a process of **survival of the fittest*, and a **paradigm* shift thus occurs. See also *KUHNIAN*, *NORMAL SCIENCE*.

sclera *n.* The tough inelastic opaque white membrane that forms the outer covering of the eyeball, apart from one-sixth of the area that is covered by the transparent **cornea*. It maintains the eyeball's shape and forms attachments to the **extra-ocular muscles*. [From Greek *skleros* hard]

sclerosis *n.* Hardening of tissue resulting from inflammation, deposits of fat or of **amyloid plaques*, infiltration of connective tissue fibres, or other causes. See also *AMYOTROPHIC LATERAL SCLEROSIS*, *ARTERIOSCLEROSIS*, *ARTERIOSCLEROTIC DEMENTIA*, *ATHEROSCLEROSIS*, *CEREBRAL ARTERIOSCLEROSIS*, *GLIOSIS*, *MULTIPLE SCLEROSIS*. **sclerotic** *adj.* [From Greek *skleros* hard + *-osis* indicating a process or state]

scopolamine *n.* A colourless, viscous, liquid **alkaloid* that is found in **henbane* and other plants and that acts pharmacologically to inhibit muscarinic acetylcholine activity by competing with acetylcholine for receptor sites, having the effect of a central nervous system **depressant* that crosses the blood–brain barrier and produces sedation and amnesia, used as an adjunct to analgesics in surgery and obstetrics and as a preventative of motion sickness. Also called *hyoscine*. Formula: $C_{17}H_{21}NO_4$. See also *METHYL SCOPOLAMINE*, *TRUTH DRUG*. Compare *ATROPINE*. [From Latin *Scopolia*

the belladonna genus of plants, named after the Italian naturalist Giovanni Scopolli (1723–88) + *amine*]

scopophilia *n.* A **paraphilia* characterized by recurrent, intense sexual fantasies, urges, or behaviour involving looking at naked bodies or other arousing stimuli. Also written *scoptophilia*. *See also* [VOYEURISM](#). [From Greek *skopeein* to watch + *philos* loving, from *phileein* to love + *-ia* indicating a condition or quality]

scoring formula *n.* In psychometrics, a mathematical rule by which **raw scores* are converted to test scores. According to the simplest scoring formula, the test score is simply the sum of the item scores; other scoring formulas involve combining raw scores in various ways other than simple addition, weighting different items of subtests differently, correcting for guessing or for failing to respond to certain items, and so on. *See also* [CONFIGURAL SCORING RULE](#).

scotoma *n.* A blind spot or area of absent or diminished vision, usually resulting from a lesion in the **retina* or **optic nerve*, from viewing the sun directly (called *solar retinopathy* or an *eclipse scotoma*, because it often arises from a person trying to watch an eclipse of the sun), or from squinting. Temporary scotomas often arise as **auras* heralding **epileptic seizures* or **migraine* headaches. *See also* [BLIND SPOT](#), [FILLING-IN](#), [MODAL COMPLETION](#), [TROXLER EFFECT](#). **scotomas** or **scotomata** *pl.* [From Greek *skotoma* dizziness, from *skotos* darkness + *-oma* indicating an abnormality]

scotopic *adj.* Of, relating to, or governed by the **rod*-mediated visual system that functions when the eyes are dark-adapted for dim illumination or night vision, functioning only outside the **fovea* and having peak sensitivity at a wavelength of 505 nanometres (blue–green light) but responding to light across the entire visible spectrum, having only one type of photoreceptor and therefore being completely colour-blind though significantly more sensitive than the **photopic* system except for wavelengths above 650 nanometres (in the red region of the spectrum), where the sensitivities of the two systems are similar. *See also* [ARAGO PHENOMENON](#), [DARK ADAPTATION](#), [DUPLEXITY FUNCTION](#), [FIELD ADAPTATION](#), [LIGHT ADAPTATION](#), [NYCTALOPIA](#), [PHOTOCHROMATIC INTERVAL](#), [PURKINJE SHIFT](#), [RETINOL](#), [SCOTOPIC LUMINOSITY CURVE](#), [STILES-CRAWFORD EFFECT](#).

*****ebook converter DEMO Watermarks*****

Compare MESOPIC, PHOTOPIC. **scotopia** *n.* scotopic vision. Also called *night vision* or *twilight vision*. Compare PHOTOPIC. [From Greek *skotos* darkness + *ops* an eye + *-ikos* of, relating to, or resembling]

scotopic luminosity curve *n.* A *luminosity curve depicting the intensity of light that is required at each point in the *visible spectrum for the colours to appear equally bright in dim light, under *scotopic vision mediated by *rods. Compare PHOTOPIC LUMINOSITY CURVE.

scream therapy See PRIMAL THERAPY.

screening test *n.* In psychometrics, a test designed to eliminate a significant proportion of respondents as a preliminary step to a process of *diagnosis or a *selection test.

screen memory *n.* In *psychoanalysis, an innocuous and non-threatening memory of a childhood experience, noteworthy for its sharpness in relation to the insignificance of its content, that signifies an unconscious memory of a significant and threatening kind. Sigmund Freud (1856–1939) introduced the concept in 1899 in an article entitled ‘Screen Memories’ (*Standard Edition*, III, pp. 303–22). Also called a *cover memory*. Compare BLOCKING MEMORY.

script *n.* 1. Handwriting in contradistinction to type or printed text. 2. Any written text. 3. A *schema of an event sequence, such as paying at the checkout of a supermarket, incorporating assumptions about the characteristic actors, objects, and actions in a prototypical instance of the schema. This usage was introduced in 1977 by the US linguist and cognitive scientist Roger C. Schank (born 1946) and the US psychologist Robert P(aul) Abelson (1928–2005) in their book *Scripts, Plans, Goals and Understanding*. See also CONCEPTUAL DEPENDENCY THEORY, FRAME (3), MEMORY ORGANIZATION PACKET. [From Latin *scribere*, *scriptum* to write]

Scripture's blocks *n.* An *ambiguous figure that can be perceived either as three cubes or as five cubes depending on how the perspective cues are interpreted (see *illustration*). See also PERSPECTIVE REVERSAL. [Named after the US-born German/British psychologist Edward Wheeler Scripture (1864–
*****ebook converter DEMO Watermarks*****]

1945) who published it in 1895]

Scripture's blocks. A is identical to B but inverted, as can be confirmed by inverting the page. If one of the groups is seen as three blocks, then the other will be seen as five, and whenever one of the images appears to flip over, so does the other.

SDAT *abbrev.* Senile dementia of the Alzheimer type; a disorder similar to **Alzheimer's disease* but with onset after 65 years of age. *See also* [SENILE DEMENTIA](#).

Seashore Measures of Musical Talent *n.* A set of measures devised by the Swedish-born US psychologist Carl E(mil) Seashore (1866–1949) and discussed in his book *The Psychology of Musical Talent* (1919). They involve controlled procedures for measuring the respondent's ability to discriminate pitch, loudness, tempo, timbre, and rhythm. Also called the *Seashore Tests of Musical Ability*, but Seashore himself deliberately avoided the word *tests* and preferred *measures*, which he thought better captured their character as standardized laboratory procedures.

seasonal affective disorder *n.* A **mood disorder* characterized by recurrent **major depressive episodes* that tend to occur during the winter months, thought to be related to the reduction in hours of daylight. Also called *seasonal mood disorder*. *See also* [PHOTOTHERAPY](#). **SAD** *abbrev.*

secobarbital *n.* A short-acting **barbiturate* drug and central nervous system **depressant*, used as a sedative and hypnotic and sometimes taken as a street drug. Also called *quinalbarbitone* or *Seconal* (trademark). Street names include *pink lady*, *red devils*. Formula $C_{12}H_{18}N_2O_3$. [From *seco-* indicating a chemical compound with an open ring + *barbit(uric) acid* + *-al*

indicating a pharmaceutical product]

Seconal *n.* A proprietary name for the barbiturate drug *secobarbital (quinalbarbitone). [Trademark]

secondary advantage *n.* Another name for *secondary gain.

secondary colour *n.* A colour resulting from the mixture of two *primary colours (1). US *secondary color*. Also called a *binary colour*. See also METAMER.

secondary drive See DRIVE.

secondary elaboration *n.* Another name for *secondary revision.

secondary gain *n.* Any benefit that a person receives as an indirect result of having a disorder, such benefits taking the form of monetary compensation, disability benefits, personal services and attention, or escape from work or onerous responsibilities. Sigmund Freud (1856–1939) drew the distinction between *primary gain and secondary gain in 1916–17 in his book *Introductory Lectures on Psycho-Analysis* (Standard Edition, XV–XVI, at pp. 381–5). Also called *advantage by illness*, *epinosic gain*, *gain from illness*, *secondary advantage*.

secondary identification *n.* In *psychoanalysis, *identification (2) occurring after the establishment of an *object-relationship. See PRIMARY IDENTIFICATION.

secondary immune response See IMMUNE RESPONSE.

secondary impotence See IMPOTENCE (2).

secondary memory *n.* Another name for *long-term memory. Compare PRIMARY MEMORY.

secondary narcissism *n.* In *psychoanalysis, a form of *narcissism in

which **libido* is withdrawn from external **instinctual objects* and turned back on the **ego*. *See also* EGO LIBIDO, OBJECT LIBIDO. *Compare* PRIMARY NARCISSISM.

secondary prevention *n.* Measures taken to limit the spread of an existing disorder. *Compare* PRIMARY PREVENTION, TERTIARY PREVENTION.

secondary process *n.* In **psychoanalysis*, a conscious, rational mode of mental functioning, based on the **reality principle*, involving **bound energy*. Sigmund Freud (1856–1939) developed the concept at the beginning of his psychological work and expounded it at length in Chapter VII of his book *The Interpretation of Dreams* (1900, *Standard Edition*, IV–V). *See also* BINDING. *Compare* PRIMARY PROCESS.

secondary projection area *n.* Any area of the cerebral cortex that receives projections from a **primary projection area*. *Compare* TERTIARY PROJECTION AREA.

secondary quality *See* PRIMARY QUALITY.

secondary reinforcement *n.* In **operant* conditioning, **reinforcement* by means of a **stimulus* (7) that has acquired reinforcing properties by having been paired with a **reinforcer*. For example, if a bell is sounded repeatedly before an animal is fed, then the bell becomes a secondary reinforcer that can be used to reinforce a particular response, such as pressing a lever. Secondary reinforcement is especially useful in **shaping* (1), because it is often difficult to time primary reinforcers such as food sufficiently precisely. The counterpart of secondary reinforcement in **classical conditioning* is **higher-order conditioning*. **secondary reinforcer** *n.* A **stimulus* (7) that has become a **reinforcer* through secondary reinforcement.

secondary repression *n.* In **psychoanalysis*, a form of **repression* in which conscious material that is reminiscent of repressed material is removed from consciousness. *Compare* PRIMAL REPRESSION, PRIMARY REPRESSION.

secondary revision *n.* In **psychoanalysis*, one of the forms of **dreamwork* in which the contents of a dream are rearranged to present a more consistent and comprehensible narrative. Also called *secondary elaboration*.

secondary sexual characteristic *n.* Any of the **attributes* that distinguish the sexes, apart from differences in their reproductive organs and **gametes*, and that develop during **puberty* under the influence of **sex* hormones. Among the most prominent are facial hair and deep voices in men, and wide hips and breasts in women. Compare PRIMARY SEXUAL CHARACTERISTIC.

secondary somatosensory area See SOMATOSENSORY CORTEX.

second censorship See CENSORSHIP.

second messenger *n.* Any chemical substance, notably **cyclic AMP*, that is synthesized within the **cytoplasm* of a cell in response to stimulation by a nerve impulse from a neuron and that has the effect of changing the electrical potential across the **cell* membrane of the cell in which it is operating. [So called because it acts as a neurotransmitter after being activated by a different neurotransmitter or hormone]

second-order approximation to language See APPROXIMATION TO LANGUAGE.

secretory phase *n.* Another name for the **luteal phase* of the **oestrous cycle* or **menstrual cycle*. [So called because of the secretion of progesterone from the corpus luteum during this phase, although hormones are also secreted during the other phases]

sedative *adj. n.* (Of or relating to) a drug or agent that has a calming or soothing effect without a strong hypnotic (sleep-inducing) effect, especially certain of the **benzodiazepine* drugs acting via the **GABA* receptor complex, a **propanediol* drug, or **buspirone*. See also SEDATIVE-HYPNOTIC; SEDATIVE-, HYPNOTIC-, OR ANXIOLYTIC-RELATED DISORDERS. [From Latin *sedatus*

stilled, from *sedare* to still, related to *sedere* to sit + *-ivus* indicating a tendency, inclination, or quality]

sedative–hypnotic *n.* Any of a number of central nervous system **depressant* drugs that are used mainly for their calming and sleep-inducing effects, among the most commonly prescribed being the **barbiturates*, certain of the **benzodiazepines*, the **propanediols*, **chloral hydrate*, **GHB*, **glutethimide*, **paraldehyde*, and **temazepam*. See also SEDATIVE-, HYPNOTIC-, OR ANXIOLYTIC-RELATED DISORDERS.

sedative-, hypnotic-, or anxiolytic-related disorders *n.* A class of **substance-related and addictive disorders* in **DSM-5* induced by consuming **sedatives*, **hypnotics*, and **anxiolytic* or anti-anxiety drugs. These drugs, all of which are central nervous system depressants, include the **benzodiazepines*, **carbamates*, and **barbiturates*, comprising all sleeping medications and all anti-anxiety drugs apart from the non-benzodiazepine anxiolytics. DSM-5 distinguishes between sedative-, hypnotic-, or anxiolytic use disorder, intoxication, and withdrawal. See SUBSTANCE ABUSE, SUBSTANCE DEPENDENCE, SUBSTANCE-INDUCED DISORDERS, SUBSTANCE USE DISORDERS.

seduction theory *n.* In **psychoanalysis*, a theory propounded by Sigmund Freud (1856–1939) from 1895 to 1897, and then abandoned, according to which **neuroses* were attributed to **repressed* memories of sexual seduction in childhood. But in 1897 he ceased to believe that the fantasies were based in reality and propounded a theory of **psychical reality* to deal with the problem. In his article ‘On the History of the Psycho-Analytic Movement’ (1914), he wrote: ‘If hysterical subjects trace back their symptoms to traumas that are fictitious, then the new fact which emerges is precisely that they create such scenes in *phantasy*, and this psychical reality requires to be taken into account alongside practical reality’ (*Standard Edition*, XIV, pp. 7–66, at pp. 17–18).

segregation of alleles *n.* The law of segregation of alleles, the first of **Mendel’s laws*, stating that every **somatic* cell of an organism carries a pair of hereditary units (now identified as **alleles*) for each **character* (2), and that at **meiosis* (1) the pairs separate so that each **gamete* carries only one unit from each pair. Also called the *law of segregation*. See also INDEPENDENT

*****ebook converter DEMO Watermarks*****

ASSORTMENT.

seizure *n.* A sudden attack of a disorder, especially a **convulsion*. *See also* AGENESIS OF THE CORPUS CALLOSUM, AUDIOGENIC SEIZURE, PSEUDOSEIZURE, PSYCHOMOTOR SEIZURE. [From Old French *saisir* to take possession of, from Latin *sacire* to appropriate]

selection *n.* 1. The act or process of choosing, or the item(s) chosen. 2. The natural and artificial processes whereby certain organisms or their characteristics or **genotypes* are reproduced and perpetuated in a population in preference to others. *See* NATURAL SELECTION. *See also* APOSTATIC SELECTION, CANALIZING SELECTION, COUNTERACTING SELECTION, DIRECTIONAL SELECTION, DISRUPTIVE SELECTION, FREQUENCY-DEPENDENT SELECTION, GROUP SELECTION, KIN SELECTION, *K*-SELECTION, REINFORCING SELECTION, *R*-SELECTION, SELECTION PRESSURE, SELECTIVE BREEDING, SEXUAL SELECTION, STABILIZING SELECTION. [From Latin *seligere*, *selectum* to sort, from *se-* apart + *legere* to choose + *-ion* indicating an action, process, or state]

selection pressure *n.* Any environmental feature, such as shortage of food, presence of predators, or competition from **conspecifics* (1), that drives **natural selection*.

selection test *n.* In psychometrics, any test used to choose among candidates for jobs or positions, for promotion, for places on training courses, and so on.

selective advantage *n.* Any characteristic or **trait* that gives an organism or a **genotype* greater chances of surviving and reproducing than the available alternatives.

selective attention *n.* Focusing concentration on a single stimulus or class of stimuli to the exclusion of others. The US psychologist William James (1842–1910) famously pointed out in his *Principles of Psychology* (1890) that this ability must be acquired: ‘The baby, assailed by the eyes, ears, nose, skin and entrails all at once, feels it all as one great blooming, buzzing confusion’ (p. 488). *See* ATTENUATION THEORY, BOTTLENECK THEORY, COCKTAIL PARTY PHENOMENON, FILTER THEORY, FLANKER COMPATIBILITY EFFECT, *****ebook converter DEMO Watermarks*****

KAMIN BLOCKING.

selective breeding *n.* The artificial mating of organisms with particular **genotypes* in order to enhance or suppress certain hereditary characteristics.

selective exposure *n.* The tendency for people to expose themselves to mass media messages that reinforce their pre-existing attitudes. For example, people tend to read newspapers whose editorial opinions are close to their own.

selective mutism *n.* An **anxiety disorder* in **DSM-5* whose essential feature is a persistent failure to speak in certain social situations in which speaking is expected, such as at school or among peers, despite a proven ability to speak in other situations. To satisfy the diagnostic criteria, the behaviour must interfere with educational or occupational achievement or with social interaction and must not be attributable to a lack of knowledge or facility with the language required in the specified situations, or to embarrassment about a communication disorder such as stuttering. Also called *elective mutism*. [From Latin *mutus* dumb]

selective serotonin reuptake inhibitor *n.* A class of **antidepressant* drugs that have a specific blocking action on the reuptake of **serotonin* at **synapses (1)* in the central nervous system, allowing ambient concentrations of this neurotransmitter to increase. Side-effects include sexual dysfunction in approximately half of the people who take them. See CITALOPRAM (Cipramil), CLOMIPRAMINE (Anafranil), FLUOXETINE (Prozac), FLUVOXAMINE (Luvox), PAROXETINE (Paxil), SERTRALINE (Zoloft), ST JOHN'S WORT. Compare MONOAMINE OXIDASE INHIBITOR (MAOI), TETRACYCLIC ANTIDEPRESSANT, TRICYCLIC ANTIDEPRESSANT. **SSRI** *abbrev.*

self *n.* A person's distinctive individuality, identity, essential nature, or collection of personal characteristics. See also COHESIVE SELF, GRANDIOSE SELF, IDEAL SELF, I-SELF, ME-SELF, NUCLEAR SELF, PHENOMENAL SELF, SELF-ACTUALIZATION, SELF-DETERMINATION THEORY, SELF-PSYCHOLOGY, TRUE SELF, VIRTUAL SELF. [From Old English *seolf*, cognate with Old High German *selb*]

self-actualization *n.* A term introduced by the German psychiatrist Kurt
*****ebook converter DEMO Watermarks*****

Goldstein (1878–1965) to denote the motive to realize one's latent potential, understand oneself, and establish oneself as a whole person. In the theory of ***personality** of the US psychologist Abraham Maslow (1908–70), set out in his book *Toward a Psychology of Being* (1962), it represents the highest level of psychological development. The Swiss psychologist Carl Gustav Jung (1875–1961) used the word to define his concept of ***individuation** (*Collected Works*, 7, paragraph 266). *See also* **NEED-HIERARCHY THEORY**, **PEAK EXPERIENCE**. *Compare* **ACTUALIZATION**. **self-actualize** *vb*.

self-analysis *n*. The systematic application to oneself of the techniques of ***psychoanalysis**, apart from the analysis of the ***transference**.

self-confidence *n*. Belief or assurance in oneself, trusting one's abilities, judgements, or decisions, either in general or in relation to a specific situation or activity. Also called *self-assurance*. *See also* **HARD-EASY EFFECT**, **OVERCONFIDENCE EFFECT**, **UNREALISTIC OPTIMISM**. **self-confident** *adj*. [From Old English *seolf* self + Latin *confidens* confident, from *con* with + *fides* faith]

self-defeating personality disorder *n*. A controversial ***personality disorder**, not listed in ***ICD-10** or ***DSM-5** (though listed in an appendix of DSM-III-R), characterized by habitual or recurrent behaviour that leads to failure and invites rejection. Also (misleadingly, since no sexual arousal is implied) called *masochistic personality*.

self-defeating prophecy *n*. A prediction that becomes false as a consequence of having been made. A frequently cited example is the ***unexpected hanging paradox**, but the prediction in that paradox is not actually self-defeating, although it appears to be. A more natural and less paradoxical example is the following: a doctor may discover that a particular patient has a strong genetic predisposition to breast cancer and may predict that she will develop the disease; but the patient may respond to the prediction by having a double mastectomy, eliminating the possibility of developing breast cancer. Also called a *self-defeating prediction*. *See also* **OEDIPUS EFFECT**. *Compare* **SELF-FULFILLING PROPHECY**.

self-determination theory *n*. A theory of human motivation according to which people have three basic psychological needs, for
*****ebook converter DEMO Watermarks*****

autonomy, competence, and relatedness, and are intrinsically motivated, for example, to initiate positive health-related behaviours, when these needs are fulfilled. The theory emerged from research carried out in the 1970s by the US psychologist Edward L. Deci (born 1942) and others, but it was not formally proposed until the 1980s and fully developed by Deci and the US psychologist Richard M. Ryan (born 1953) in an article in the journal *Psychological Inquiry* in 2000. **SDT** abbrev.

Self-Directed Search test See [HOLLAND CODES](#).

self-efficacy *n.* Ability to achieve desired results. Perceived self-efficacy includes beliefs about one's ability or competence to bring about intended results. The concept became widely known in the 1980s and 1990s, largely through the influence of the Canadian-born US psychologist Albert Bandura (born 1925), culminating in his book *Self-Efficacy: The Exercise of Control* (1997). See also [CORE SELF-EVALUATION](#), [SOCIAL COGNITIVE THEORY](#). [From English *self* + Latin *efficax* efficient or effective, from *efficere* to accomplish, from *facere* to do]

self-esteem *n.* One's attitude towards oneself or one's opinion or evaluation of oneself, which may be positive (favourable or high), neutral, or negative (unfavourable or low). Also called *self-evaluation*. See also [CORE SELF-EVALUATION](#), [EGO INVOLVEMENT](#), [POSITIVITY BIAS \(1\)](#), [SELF-IMAGE](#).

self-estrangement *n.* A feeling of [*depersonalization](#) and detachment from one's natural self, especially as a result of immersion in complex industrial culture.

self-evaluation *n.* Another name for [*self-esteem](#).

self-fulfilling prophecy *n.* A prediction that becomes true as a consequence of having been made. For example, if the president of a large company predicts a fall in the company's share price, then the prediction is likely to bring about a fall in the share price irrespective of any other factors, because investors will be more inclined to sell their shares. The best-known self-fulfilling prophecy effects in psychology are the [*experimenter expectancy effect](#) and the [*Pygmalion effect](#). Also called a *self-fulfilling*

*****ebook converter DEMO Watermarks*****

prediction. See also LABELLING THEORY, NOCEBO EFFECT, OEDIPUS EFFECT, PLACEBO EFFECT. *Compare* SELF-DEFEATING PROPHECY.

self-handicapping *n.* Imposing an obstacle to one's successful performance in a particular situation in order to provide an excuse for failure (usually in a person of low self-esteem) or to increase the credit that one can take for success (usually in a person of high self-esteem). Typical examples are going out with friends rather than staying at home and studying the night before an important examination, or becoming intoxicated with alcohol before a date or a potential sexual encounter. It occurs most often when a person is uncertain of success in an **ego-involving* endeavour. The concept was introduced in an article in the journal *Personality and Social Psychology Bulletin* in 1978 by the US psychologists Edward Ellsworth Jones (1926–93) and Steven (Charles) Berglas (born 1949).

self-hypnosis *n.* Self-induced **hypnosis*. Also called *autohypnosis*.

self-image *n.* The idea or conception that one has of oneself in general. *See also* GUIDING FICTION, SELF-ESTEEM, SELF-PERCEPTION THEORY, SELF-SCHEMA.

selfish *adj.* Characterized by self-interest or promotion of one's own interests without regard to the welfare of others. More specifically in social psychology and sociobiology, of or relating to forms of behaviour that benefit an individual in terms of direct advantage or chances of survival and reproduction at some cost to another individual or individuals. *See also* SELFISH GENE. *Compare* ALTRUISM.

selfish gene *n.* A way of describing any **gene*, drawing attention to the fact that it is the fundamental unit of competition in the process of evolution by **natural selection*, increasing in relative frequency in the gene pool by having **phenotypic* effects that give it greater chances of survival and replication than its **alleles*. *See also* EXTENDED PHENOTYPE. [Coined in 1976 by the British ethologist Richard Dawkins (born 1941) in the title of his book *The Selfish Gene*]

self-monitoring *n.* Observation and control of **expressive behaviour* and **self-presentation*. High self-monitors regulate their expressive self-
*****ebook converter DEMO Watermarks*****

presentation and are highly responsive to social and interpersonal cues to situationally appropriate behaviour, whereas low self-monitors lack these abilities or motivations. The concept was introduced in an article in the *Journal of Personality and Social Psychology* in 1974 by the US-based Canadian social psychologist Mark Snyder (born 1947).

Self-Monitoring Scale *n.* A questionnaire comprising 25 true/false items designed to measure **self-monitoring*. It was introduced in 1974 by the US-based Canadian social psychologist Mark Snyder (born 1947).

self-object *n.* In **self-psychology*, one's subjective experience of another person who sustains one's self within a social relationship, evoking and reinforcing one's sense of selfhood. The element *object* refers to an **instinctual object*, not to an inanimate thing. Also written *selfobject*.

self-perception theory *n.* A theory according to which people infer their own **attitudes* (1), **opinions*, and other internal states partly by observing their overt behaviour and the circumstances in which that behaviour occurs. A canonical example is of a man who is asked whether he likes brown bread and who replies, 'I must like it; I'm always eating it.' According to the theory, **introspection* is a poor guide to one's internal states, because internal cues are weak and ambiguous, and a person is therefore in essentially the same position as an outside observer, who necessarily relies on outward behaviour in interpreting another's internal states. The theory has been used to provide an alternative interpretation of **cognitive* dissonance effects. It was introduced in two influential articles by the US psychologist Daryl J. Bem (born 1938) in the *Journal of Experimental Social Psychology* in 1965 and in *Psychological Review* in 1967. It is sometimes regarded as a **behaviourist* type of **attribution* theory.

self-presentation *n.* The conscious or unconscious control of the impression that one creates in social interactions or situations. It is one of the important forms of **impression management*, namely management of one's own impression on others through role playing. The phenomenon is encapsulated in Shakespeare's famous observation in *As You Like It*: 'All the world's a stage, / And all the men and women merely players: / They have their exits and their entrances; / And one man in his time plays many parts'

*****ebook converter DEMO Watermarks*****

(II.vii.139–42). It was popularized by the Canadian-born US sociologist Erving Goffman (1922–82) in his influential book *The Presentation of Self in Everyday Life* (1959). See also [INGRATIATION](#), [SELF-MONITORING](#), [SOCIAL CONSTRUCTIONIST PSYCHOLOGY](#).

self-preservation instinct *n.* In [*psychoanalysis](#), another name for an [*ego](#) instinct, as distinct from a [*sexual instinct](#) or [*libido](#), the prototypical example of a self-preservation instinct being [*hunger \(1\)](#). The following key passage occurs in an article entitled ‘The Psycho-Analytic View of Psychogenic Disturbance of Vision’ (1910) by Sigmund Freud (1856–1939): ‘From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual—the ego instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as “hunger” or “love”’ (*Standard Edition*, XI, pp. 211–18, at pp. 214–15). Ten years later he began to change his mind on the point made in the last sentence of the quotation—see [THANATOS](#).

self-psychology *n.* A version of [*psychoanalysis](#), put forward by the Austrian-born US psychoanalyst Heinz Kohut (1913–81) in his books *The Analysis of the Self* (1971) and *The Restoration of the Self* (1977), and in his edited volumes *The Search for the Self* (1978) and *How Does Psychoanalysis Cure?* (1984), placing emphasis on the self and the experience of selfhood, the constituent sectors of the self being the *pole of goals and ambitions*, the *pole of ideals and standards*, and the *arc of tension* between the two poles functioning to activate basic talents and skills. Kohut distinguished between the *virtual self* (an image of the neonate’s self in the mind of a parent), the *nuclear self* (the initial organization of the self that emerges in the second year of life), the *cohesive self* (a coherent structure representing the normally functioning self), and the *grandiose self* (a normal exhibitionistic and self-centred self in early infancy). See also [GRANDIOSE SELF](#), [NARCISSISM](#), [NARCISSISTIC PERSONALITY DISORDER](#), [SELF](#), [SELF-OBJECT](#).

self-report *adj.* In psychometrics, of, relating to, or comprising a questionnaire, inventory, check list, or other measuring instrument in which the respondent rather than the test administrator selects and records the

*****ebook converter DEMO Watermarks*****

responses.

self-schema *n.* Any mental structure representing knowledge about oneself on a particular dimension or in a particular domain. A person who has a well-developed ***self-image** in a particular area—for example, a person with a strong self-image of being truthful—is said to be *self-schematic* on that dimension, and such a person is likely to form self-judgements more rapidly and more confidently about information relevant to the self-schema than is a person who is not self-schematic in that area. *See also* [COGNITIVE THERAPY](#), [DEPRESSIVE REALISM](#), [SCHEMA](#).

self-selected sample *n.* A type of ***convenience sample** comprising research participants or subjects who have volunteered to participate, often in response to an advertisement calling for people with certain characteristics to come forward. *Compare* [ACCIDENTAL SAMPLE](#), [CLUSTER SAMPLE](#), [NON-PROBABILITY SAMPLE](#), [OPPORTUNITY SAMPLE](#), [PROBABILITY SAMPLE](#), [QUOTA SAMPLE](#), [RANDOM DIGIT DIALING](#), [SIMPLE RANDOM SAMPLE](#), [SNOWBALL SAMPLE](#), [STRATIFIED RANDOM SAMPLE](#).

self-serving bias *n.* An ***attribution** bias that leads people to ascribe their own successes to internal personal factors, such as ability, and their failures to external situational causes, such as bad luck. *See also* [ATTRIBUTION THEORY](#), [KELLEY'S CUBE](#), [LAKE WOBEGON EFFECT](#).

sella turcica *n.* A saddle-shaped depression enclosing the ***pituitary gland** in the middle of the sphenoid bone at the base of the skull. Also called the *Turkish saddle*. [From Latin *sella* a saddle + *turcica* Turkish]

semantic *adj.* Of or relating to meaning in linguistics and philosophy. [From Greek *semantikos* significant, from *sema* a sign + *-ikos* of, relating to, or resembling]

semantic coding *n.* Remembering a word or verbal expression by storing its meaning rather than its sound or the physical movements required to articulate it. *Compare* [ACOUSTIC CODING](#), [ARTICULATORY CODING](#).

semantic component *n.* Another name for a ***semantic feature**.

semantic confusion *n.* Misperceiving or misremembering a word as one that has a similar meaning, as when *lamp* is perceived or recalled as *light*. Compare [ACOUSTIC CONFUSION](#).

semantic differential *n.* A device for measuring the [*affective](#) or [*connotative](#) meaning of words, also widely used for measuring attitudes towards other concepts and objects. It consists of a variable number of seven-point bipolar [*rating scales](#), such as

good -- -- -- -- -- *bad*
active -- -- -- -- -- *passive*
strong -- -- -- -- -- *weak*

on which respondents rate the items under investigation. According to [*factor analysis](#), there are three underlying dimensions of affective or connotative meaning, exemplified by the three core scales shown above, labelled evaluation, activity, and potency, respectively. Scores ranging from −3 at the negative end of each scale to +3 at the positive end are usually assigned. To illustrate how it works, research in the US has shown that average ratings of the word *nurse* tend to be towards the *good*, *active*, and *weak* poles, whereas the word *policeman* tends to be rated towards the *good*, *active*, and *strong* poles. The particular adjective pairs used depend on the items being evaluated: *active* versus *passive* could be included among the scales used to measure the activity dimension if the items being rated were political parties, for example, but this might be less appropriate if the items were types of food. The technique was developed by the US psychologist Charles E(gerton) Osgood (1916–91) and published in 1952 in the journal *Psychological Bulletin*, and it became popular with researchers after it was expounded in detail in the book *The Measurement of Meaning* (1957) by Osgood, his US colleague G(eorge) J(ohn) Suci (1925–1998), and the Canadian-born US psychologist Percy (Hyman) Tannenbaum (1927–2009). See also [CONGRUITY THEORY](#). **SD** *abbrev.*

semantic encoding See [SEMANTIC MEMORY](#).

semantic feature *n.* An element of a word's [*denotation](#) or denotative meaning. For example, *young*, *male*, and *human* are semantic features of the

word *boy*. Also called a *semantic component*.

semantic-feature hypothesis *n.* The proposition that the order of appearance of words in the course of a child's language acquisition are governed by the type and complexity of the **semantic* features that they contain. **SFH** *abbrev.*

semantic generalization *n.* A form of **stimulus* generalization in which a learned **response* to a particular **stimulus* (1) comes to be elicited by another stimulus that resembles it not in its stimulus properties but in its meaning, as when a learned response to the word *shoe*, or to an image of a shoe, comes to be elicited by the word *lace*, or by the image of a shoelace.

semantic memory *n.* A type of **long-term memory* for factual information about the world, excluding personal episodes in one's life, typical examples being knowledge of the dates of the Second World War, the chemical formula for water, and the Spanish word for a book. The concept was introduced in 1972 by the Estonian-born Canadian psychologist Endel Tulving (born 1927), who distinguished it from **episodic memory* and **procedural memory*. *See also* **GENERIC KNOWLEDGE**. [From Greek *semantikos* significant, from *sema* a sign + *-ikos* of, relating to, or resembling, so called because it is necessary for the use of language]

semantic priming *See* **PRIMING** (1).

semantics *n.* The branch of **linguistics* devoted to the study of meaning, including **concept* formation, changes in meaning, and the relationship between linguistic expressions and their meanings. *See also* **CASE GRAMMAR**, **COMPONENTIAL THEORY**, **PROTOTYPE THEORY**.

semantic satiation *n.* A peculiar sense of loss of meaning that occurs when a word is recited slowly 15 or 20 times in succession. *Compare* **VERBAL TRANSFORMATION EFFECT**.

semicircular canal *n.* Any of the three looped, fluid-filled ducts, set at right-angles to one another as if lying in the x, y, and z planes of a three-

dimensional graph, forming part of the **vestibular system* within the **membranous labyrinth* of the inner ear and being partly responsible for the sense of balance and spatial orientation through its responses to angular acceleration, the angle of rotation of the head determining which one, two, or three of the canals in each ear are affected. Each canal has a bulge (**ampulla*) on its crest-shaped inner surface in which are embedded **hair cells* that project into a gelatinous membrane (the **cupula*) where a fluid (**endolymph*) within the canal acts as an inertial mass resisting angular acceleration, displacing the cupula and hair cells backwards relative to the direction of movement and causing adjoining neurons to send nerve impulses to the brainstem and cerebellum. *See also* *AUBERT EFFECT*, *BÁRÁNY TEST*, *OTOLITH*.

semi-interquartile range *n.* In descriptive statistics, half the **interquartile range*, sometimes used as an index of variability.

semiology *n.* The study of signs and signals, especially of spoken and written language, and their relationships to the objects, concepts, and ideas to which they refer. *Compare* *SEMIOTICS*. [From Greek *semeion* a sign + *logos* word, discourse, or reason]

semiorder *n.* A term introduced in 1956 by the US mathematical psychologist Robert Duncan Luce (1925–2012) to denote an ordering, such as a preference ordering, in which an element x is ranked above another element y only if it exceeds y by a certain specified threshold value ϵ , and x ties with y if the absolute difference between them falls below ϵ . *See also* *LEXICOGRAPHIC SEMIORDER*.

semiotics *n.* The study of patterned human communication in all its modes, including touch, facial expression, gestures, and the spoken and written signs and symbols of human languages. *See also* *KINESICS*, *NON-VERBAL COMMUNICATION*. *Compare* *SEMIOLOGY*. [From Greek *semeiotikos* of or relating to signs, from *semeion* a sign + *-ikos* of, relating to, or resembling]

semipermeable membrane *n.* A **membrane* that is partly but not fully permeable, especially one through which a solvent but not its solute or dissolved substance can diffuse. *See also* *CELL MEMBRANE*.

semitone *n.* A musical interval corresponding to a frequency ratio of approximately 17:18, the difference in pitch between adjacent keys on a piano, equal to one-twelfth of an **octave*, the smallest difference in pitch normally used in Western music. *See also* *TONE (2)*.

semitone paradox *n.* A phenomenon in the perception of musical tones that are ambiguous as regards the **octaves* to which they belong, each tone being composed of equal **sinusoidal* waves from octaves spanning the auditory range. Using ambiguous tones of this kind, if two tones such as D and G are presented simultaneously, followed by C# and G#, which differ from the first pair by a **semitone* down and up, then the sequence is clearly perceived as either converging or diverging in contrary motion, although the stimulus tones lack the information required to determine pitch: if the D is below the G, then it is divergent motion, but if the D is above the G, then it is convergent motion, and there is no way of knowing whether the D is below or above the G. It is a surprising phenomenon rather than a true **paradox*. *See also* *AUDITORY ILLUSION*. *Compare* *MELODIC PARADOX*, *TRITONE PARADOX*.

semivowel *n.* A speech sound articulated like a **vowel* but functioning like a **consonant* because it is non-syllabic. In English, there are two semivowels, both of which are **approximants*, namely the initial **phonemes* in the words *wet* and *yet*. *See also* *MANNER OF ARTICULATION*.

senescence *n.* The process of growing old and the physical and psychological changes that characterize this process. [From Latin *senescere* to grow old, from *senex* old]

senile dementia *n.* Any chronic, progressive form of **dementia* starting in old age (usually taken to mean from 65 years of age) with no clear physical cause, most commonly due to a late-onset form of **Alzheimer's disease*, **vascular* or **multi-infarct dementia*, dementia resulting from **HIV* infection, head trauma, **Parkinson's disease*, **Huntington's disease*, **Pick's disease*, **Creutzfeldt–Jakob disease*, or substance-induced persisting dementia resulting from **alcohol*, **inhalants*, **sedatives*, **hypnotics*, or **anxiolytics*. *See also* *SDAT*. [From Latin *senilis* old, from *senex* an old man]

senile plaque *n.* Another name for an ***amyloid plaque**.

sensate focus *n.* A technique used in ***sex** therapy, consisting of a structured programme of non-genital tactile stimulation, stroking, and pleasuring, with a strict prohibition of intercourse or genital contact. It was introduced by the US gynaecologist and sexologist William Howell Masters (1915–2001) and Virginia E(shelman) Johnson (1925–2013) in a series of publications including their influential books *Human Sexual Response* (1966) and *On Sex and Loving* (1986).

sensation *n.* A subjective experience or feeling that results from stimulation of a ***sense** organ, or the capacity to experience through the senses, conventionally distinguished in psychology from ***perception**, in which sensory experience is not merely experienced as such but is interpreted with reference to its presumed external stimulus, this distinction having first been made in 1785 by Thomas Reid (1710–96), founder of the Scottish school of psychological philosophy. *See also* **AFTERSENSATION**, **QUALIA**, **SENSE (1)**, **SENSE DATA**, **SENSIBILIA**. [From Latin *sensatio* sensation, from *sensus* felt, from *sentire* to feel + *-ation* indicating a process or condition]

sensation level *n.* The absolute intensity of a sound measured in ***decibels** relative to the ***absolute threshold** of the listener. Thus a sensation level of 40 dB indicates a sound 40 dB more intense than the faintest sound of the same frequency that the listener can hear. *Compare* **SOUND PRESSURE LEVEL**. **SL** *abbrev.*

sensation seeking *n.* A personality ***trait** associated with a preference for intense sensory stimulation, strong, novel, and varied experiences, and in many cases risk taking. The concept was introduced by the US psychologist Marvin Zuckerman (born 1928), who defined it in his book *Behavioural Expressions and Biosocial Bases of Sensation Seeking* (1994) as ‘a trait defined by the seeking of varied, novel, complex and intense sensations and experiences, and the willingness to take physical, social, legal and financial risks for the sake of such experience’ (p. 27). Zuckerman developed a sensation-seeking scale (**SSS**), originally published in collaboration with three colleagues in the *Journal of Consulting Psychology* in 1964. The scale has four subscales: thrill and adventure seeking (indicated by agreement with
*****ebook converter DEMO Watermarks*****

questionnaire items such as *I often wish I could be a mountain climber*); disinhibition (*I like wild ‘uninhibited’ parties*); experience seeking (*People should dress in individual ways even if the effects are sometimes strange*); and boredom susceptibility (*I can’t stand watching a movie that I’ve seen before*). Men score significantly higher on this and other measures of sensation seeking than women. See also [SOCIOSEXUALITY](#).

sensation type *n.* Another name for a [*sensing type](#).

sense *n.* **1.** Any of the faculties by which one experiences the external world or the internal state of one’s body. In about 350 BC the Greek philosopher Aristotle (384–322 BC) distinguished between five senses, namely vision, hearing, smell, taste, and touch, but he recognized that touch includes more than one sense, and there are now known to be separate touch receptors for heat, cold, pain, and various forms of pressure, and also sensory receptors that respond to mechanical stimulation in the [*vestibular system](#) and that supply information about balance, orientation, and movement, and in some species [*electroreceptors](#) for detecting electrical discharges, a [*magnetic sense](#) that responds to the Earth’s magnetic field, or [*infra-red](#) vision. See also [SENSATION](#), [SENSE ORGAN](#), [SENSORY MODALITY](#). **2.** Moral discernment (*a sense of right and wrong*). **3.** Practical intelligence (*common sense*). **4.** Reason or purpose (*this doesn’t make sense*). **5.** The specific meaning of a word (*in what sense do you mean you are sorry?*). **6.** The mathematical property of being positive or negative. *vb.* **7.** To experience something through intuition or extra-sensory perception (*I sensed that something was going to happen*). [From Latin *sensus* felt, from *sentire* to feel]

sense data *n. pl.* A philosophical term for [*sensations](#) detached from their meaning and from any reference to the stimuli that give rise to them, the raw experiences given through the senses of sight, hearing touch, smell, and taste. See also [QUALIA](#), [SENSIBILIA](#). **sense datum** *sing.* [From *sense* + Latin *data* things given, from *dare* to give]

sense modality See [SENSORY MODALITY](#).

sense organ *n.* An anatomic structure specialized for detecting [*stimuli](#)

*****ebook converter DEMO Watermarks*****

(3) and converting them into nerve impulses that are transmitted to the central nervous system, its sensory components being **sensory* receptors. *See also* EAR, EYE, NOSE, SKIN, TONGUE, VESTIBULAR SYSTEM.

sense ratio method *n.* A **psychophysical* method in which an observer is presented with two **standard stimuli* *A* and *B* that differ on some perceptible dimension and is then presented with a different pair of stimuli *C* and *D* and is asked to adjust *D* so that it stands in the same relation of magnitude to *C* as *B* does to *A*.

sensibilia *n. pl.* A philosophical term for potential **sense* data or **qualia* that are not necessarily sensed by any organism and that can therefore exist independently of sensation. **sensibile** *sing.* [From Latin *sensibilia* things that can be sensed, from *sensibilis* capable of being sensed, from *sentire* to sense or feel]

sensing type *n.* One of the subsidiary personality types in **analytical psychology*. *See* FUNCTION TYPE.

sensitivity training group *n.* Another name for a **T-group*.

sensitization *n.* In **addiction* or drug **dependence* (2), an increase in responsiveness to a drug resulting from repeated use of it, or a tendency to require smaller and smaller dosages of a drug to achieve a desired effect. Also called *reverse tolerance*. *Compare* TOLERANCE (3), which is more common. *See also* SUBSTANCE DEPENDENCE.

sensitization–repression scale *See* REPRESSION–SENSITIZATION SCALE.

sensorimotor *adj.* Of, relating to, or involving both sensory and motor functions or the nerves governing them. Also spelt *sensory-motor*.

sensorimotor cortex *n.* A generic name for both the **somatosensory cortex* and the **motor cortex*, separated by the **central sulcus*.

sensorimotor rhythm *n.* An **EEG* rhythm of 12–14 hertz that is

generated in the ***sensorimotor** cortex. It was discovered in 1965 by the US neurobiologist M(aurice) Barry Stermann (born 1935) in an experiment on cats and is known to be associated with behavioural stillness and mental alertness. *See also* BIOFEEDBACK. **SMR** *abbrev.*

sensorimotor stage *n.* According to the theory of cognitive development of the Swiss psychologist Jean Piaget (1896–1980), the first stage of cognitive development, from birth to approximately 2 years of age, when the infant gradually adapts motor behaviour to sensory input to serve its motivational goals, increasing the number and complexity of its sensory and motor abilities. *Compare* CONCRETE OPERATIONS, FORMAL OPERATIONS, PRE-OPERATIONAL STAGE.

sensorineural deafness *n.* Any form of ***deafness** in which sound is conducted normally through the external and middle ears but hearing loss occurs as a result of disease or damage in the ***cochlea** or the neural pathway from it to the brain. Its most common forms are ***presbycusis** (high-frequency hearing loss in old people resulting from deterioration of the ***organ of Corti**), occupational deafness caused by exposure to noise at work, ***ototoxic** deafness following excessive intake of drugs such as ***quinine** or ***aspirin**, infectious deafness from mumps or congenital rubella (German measles) leading to destruction of the cochlea, and a tumour on a nerve supplying the ***vestibular system**. Also called *nerve deafness*. *See also* DECIBEL. *Compare* CENTRAL AUDITORY PROCESSING DISORDER, CONDUCTIVE DEAFNESS. [From Latin *sensorius* of the senses, from *sensus* felt, from *sentire* to feel + Greek *neuron* a nerve + *-al* from *-alis* of or relating to]

sensorium *n.* Any area of the brain responsible for receiving and analysing information from the ***sense** organs; also the apparatus of perception considered as a whole. [From Latin *sensorius* of the senses, from *sensus* felt, from *sentire* to sense]

sensory *adj.* Of or relating to ***sensation** or the ***senses** (1). [From Latin *sensorius* of the senses, from *sensus* felt, from *sentire* to sense]

sensory acuity *n.* The sharpness or keenness of a sense organ or sensory system. *See also* ACUITY.

*****ebook converter DEMO Watermarks*****

sensory adaptation See ADAPTATION (2).

sensory aphasia *n.* Another name for Wernicke's aphasia. See APHASIA.

sensory apraxia *n.* Another name for *ideational apraxia. See APRAXIA.

sensory ataxia *n.* Any form of *ataxia caused by an impairment of sensation, usually *proprioception.

sensory conflict theory *n.* A proposed explanation for *motion sickness according to which *passive movement creates a mismatch between information relating to orientation and movement supplied by the visual and the vestibular systems, and it is this mismatch that induces feelings of nausea.

sensory cortex *n.* Any area of the *cerebral cortex receiving information from a *sense organ. See AUDITORY CORTEX, OLFACTORY CORTEX, SOMATOSENSORY CORTEX, VISUAL CORTEX.

sensory decision theory *n.* Another name for *signal detection theory. SDT *abbrev.*

sensory deprivation *n.* The state of being cut off from almost all sensory stimulation from the external environment, sometimes used as a technique of *brainwashing. The earliest experiments, reported in the mid 1950s, involved volunteers lying in small, soundproof cubicles, sometimes immersed in water held at body temperature, wearing translucent goggles that transmitted diffuse light, to prevent form perception, and cotton gloves with cardboard cuffs to restrict tactile sensations. The volunteers remained in sensory deprivation typically for 2–4 days almost continuously (apart from brief periods for eating and visiting the toilet) during which time their thinking usually became undirected and was often replaced by fantasies and hallucinations, many of the volunteers becoming unable to distinguish sleep from waking, and some found the experience intensely unpleasant.

sensory homunculus *n.* Another name for the *somatosensory homunculus.

sensory information store *n.* Another name for a **sensory* register. **SIS** *abbrev.*

sensory memory *n.* A very short-term memory store for information being processed by the sense organs. The most frequently investigated sensory registers are the **iconic store* and the **echoic store*, though the existence of an echoic store has not been convincingly established. It should not be confused with **perceptual memory*. *See also* LEVELS OF PROCESSING, SENSORY REGISTER. *Compare* LONG-TERM MEMORY, SHORT-TERM MEMORY.

sensory modality *n.* Any of the relatively independent sensory systems such as vision, hearing, smell, taste, and touch, the traditional five senses originally identified in about 350 BC by the Greek philosopher Aristotle (384–322BC), who recognized that touch includes different senses within itself. In 1904 the Austrian physiologist Max von Frey (1852–1932) identified the four component sensations of touch as heat, cold, pain, and pressure, pressure now being known to include sensations of texture and vibration. The sensory systems associated with the **vestibular system*, **kinaesthesia*, **proprioception*, and the **magnetic sense* are also sometimes regarded as sensory modalities. Also called a *modality* or a *sense* or a *communication channel*. *See also* CROSS-MODAL MATCHING, CROSS-MODAL TRANSFER, EGOCENTRE, MODALITY EFFECT, MOLYNEUX'S QUESTION, SYNAESTHESIA (1).

sensory-motor *See* SENSORIMOTOR.

sensory neglect *n.* Any condition in which a well-defined class of sensory information is processed normally by **sensory* receptors but is persistently ignored or not responded to. It usually arises from a **neurological disorder*, and its most common form is **spatial neglect*.

sensory nerve *n.* Any **nerve* that carries information from a **sensory* receptor to the central nervous system. *See* COCHLEAR NERVE, FACIAL NERVE, GLOSSOPALATINE NERVE, GLOSSOPHARYNGEAL NERVE, OLFACTORY NERVE, OPTIC NERVE, TRIGEMINAL NERVE, VAGUS NERVE, VESTIBULOCOCHLEAR NERVE.

sensory neuron *n.* A **neuron* belonging to a **sensory* receptor or a

*sensory nerve (see [illustration](#)).

Sensory neuron

sensory preconditioning *n.* Learning of an association between two stimuli that are presented together or in close succession without [*reinforcement](#) (2), the learned association becoming apparent when a response is conditioned to one of the stimuli and is found to be elicited by the other.

sensory projection area *n.* Any area of the cerebral cortex to which information is transmitted by afferent fibres from [*sensory](#) receptors. Also called a *projection area*. See also [HOMUNCULUS](#).

sensory receptor *n.* An anatomical structure composed of [*sensory](#) nerve endings adapted to respond to specific [*stimuli](#) (1) and to convert them into nerve impulses that are transmitted to other parts of the [*nervous](#) system, the forms of energy to which they respond being light, kinetic energy, temperature, chemical reactions, in some species of fish electrical discharges, in some snakes infrared radiation, and in some birds and other species the Earth's magnetic field. See [AUDITORY RECEPTOR](#), [COLD SPOT](#), [CONE](#), [ELECTRORECEPTOR](#), [FREE NERVE ENDING](#), [GOLGI TENDON ORGAN](#), [GUSTATORY RECEPTOR](#), [HAIR CELL](#), [INFRA-RED VISION](#), [MAGNETIC SENSE](#), [MECHANORECEPTOR](#), [MEISSNER'S CORPUSCLE](#), [MERKEL CELL](#), [MUSCLE SPINDLE](#), [NOCIRECEPTOR](#), [OLFACTORY RECEPTOR](#), [OSMORECEPTOR](#) (1, 2), [OTOLITH](#), [PACINIAN CORPUSCLE](#), [PAIN RECEPTOR](#), [PHOTORECEPTOR](#), [PRESSURE RECEPTOR](#), [ROD](#), [RUFFINI CORPUSCLE](#), [SACCULE](#), [TACTILE RECEPTOR](#), [TASTE BUD](#), [TEMPERATURE RECEPTOR](#), [TOUCH RECEPTOR](#), [UTRICLE](#), [WARM SPOT](#). See also [CHEMORECEPTOR](#), [CONTACT RECEPTOR](#), [CUTANEOUS SENSE](#), [DISTANCE RECEPTOR](#), [EXTEROCEPTOR](#), [INTEROCEPTOR](#), [PROXIMORECEPTOR](#),

*****ebook converter DEMO Watermarks*****

RECEPTIVE FIELD, SENSE ORGAN, SOMATIC RECEPTOR, TELERECEPTOR, TRANSDUCER. Also called a *receptor*. [From *sensory* + *receptor*, from Latin *recipere*, *receptum* to receive, from *re-* back + *capere*, *ceptum* to take]

sensory register *n.* Any of the subsystems of **sensory* memory such as the **iconic store* for vision and the **echoic store* for hearing, generally assumed to exist separately for each sensory modality. Also called a *sensory information store (SIS)*, *sensory store*, or *register*.

sensory relay nucleus *n.* Any of the **nuclei* (2) in the **thalamus* to which some or all of the information from sensory receptors apart from olfactory receptors is sent before being transmitted to specialized sensory areas of the cerebral cortex.

sensory saltation *n.* A tactile illusion, discovered in 1972 by the US psychologist Frank A(rthur) Geldard (1904–84), that occurs if the forearm or other area of the body is given a light tap, then a second and third tap are delivered in quick succession (about one-tenth of a second apart), the second tap in the same spot as the first and the third a few centimetres away. The effect is that the second tap is felt very distinctly to have occurred at a point somewhere between the first and the third taps. Saltatory areas within which the phenomenon occurs differ in size and shape in different parts of the body, but they never cross the **midsagittal plane* of the body, and within these areas saltation is experienced even if the area of skin between the taps is anaesthetized, showing that the illusion arises not in the skin but at a higher level of the sensory system. Also called *cutaneous rabbit illusion*, *saltation*. [From Latin *saltus* a leap, from *saltare* to dance + *-ation* indicating a process or condition]

sensory store *n.* Another name for a **sensory* register.

sensory summation *n.* A generic name for **spatial summation* and **temporal summation*.

sensory suppression *n.* The partial or complete blocking by a stimulus of sensory experience of a different stimulus. See BINOCULAR RIVALRY, MASKING, MIXTURE SUPPRESSION, TASTE suppression. See also AMBLYOPIA EX
*****ebook converter DEMO Watermarks*****

ANOPSIA, CHESHIRE CAT EFFECT, HOLE-IN-THE-HAND ILLUSION.

sensory transduction *n.* The conversion by a ***sensory** receptor of any of a number of different forms of energy into nerve impulses or ***action potentials**. Touch receptors supply kinetic energy; photoreceptors, light; auditory receptors, sound; temperature receptors, heat; olfactory and taste receptors, energy from chemical reactions; and electroreceptors in some species of fish, electrical energy. *See also* **TRANSDUCER**. [From *sensory* + Latin *transducere* to lead across, from *trans* across + *ducere*, *ductum* to lead + *-ion* indicating an action, process, or state]

sentence completion test *n.* A type of ***projective test** in which the respondent is presented with the first few words of a series of sentences and is asked to fill in the missing words. Typical items are *My greatest fear is...*; *I only wish I had....* One of the most carefully constructed versions is the ***Rotter Incomplete Sentences Blank**. The technique was first used in 1897 by the German psychologist Hermann von Ebbinghaus (1850–1909) as an intelligence test. Also called an *incomplete sentences test*.

sentence functor *n.* In ***logic**, a string of words and sentence variables (usually represented by Greek letters) such that if the sentence variables are replaced by declarative sentences, then the whole becomes a declarative sentence with the inserted sentences as constituents. A typical example is: *Many people have said that ϕ , but it is a lie that ψ* . Replacing the sentence variables, this might become *Many people have said that fruit is nourishing, but it is a lie that Hitler loved animals*. *See also* **TRUTH FUNCTOR**, **TRUTH TABLE**. [From Latin *functio* a function, from *fungi* to perform]

sentient *adj.* Capable of ***sensation**; conscious or aware. **sentient being** *n.* Any ***organism** that is sentient or capable of feeling. [From Latin *sentiens* feeling, from *sentire* to feel]

separable attribute *n.* An ***attribute** that is not inherent in a ***phenomenon**, inasmuch as the phenomenon can occur or exist without the attribute. For example, ***frequency (1)** is a separable attribute of sound, because ***noise (1)** is sound without frequency, whereas ***amplitude** is not a separable attribute of sound, because without amplitude there can be no

*****ebook converter DEMO Watermarks*****

sound wave and therefore no sound. In the visual modality, **saturation (1)* is a separable attribute of colour, but **lightness* is not. *See also* SEPARABLE STIMULUS DIMENSION. *Compare* INTEGRAL ATTRIBUTE.

separable stimulus dimension *n.* A **separable* attribute of any measurable aspect of a **stimulus (1)*. *Compare* INTEGRAL STIMULUS DIMENSION.

separate variance estimates *n.* In statistics, separate estimates of **variances* of two or more populations, used when the population variances cannot be assumed to be equal for testing the null hypothesis that their means are equal. *Compare* POOLED VARIANCE ESTIMATE.

separation anxiety *n.* The normal fear or apprehension of infants when separated from their mothers or other major attachment figures, or when approached by strangers, usually most clearly evident between 6 and 10 months of age or, in later life, similar apprehension about separation from familiar physical or social environments. *See also* SEPARATION ANXIETY DISORDER.

separation anxiety disorder *n.* An **anxiety disorder* in **DSM-5* characterized by developmentally inappropriate and excessive **separation anxiety* relating to separation from home or from major attachment figures. Symptoms, which to satisfy the diagnostic criteria must persist for at least 4 weeks and must cause clinically significant distress or social, academic, or occupational problems, may include unrealistic fear of losing major attachment figures or of harm befalling them, refusal to attend school, refusal to sleep alone, repeated nightmares about separation, and complaints of somatic symptoms such as headaches, nausea, or vomiting when separation is threatened. *See also* ANACLOTIC DEPRESSION, HOSPITALISM.

septal *adj.* Of, relating to, or situated in the **septum pellucidum*.

septal rage *n.* Intense **dysphoria*, hyperexcitability, and anger resulting from a lesion in the **septum pellucidum*. Also called *sham rage*.

septum pellucidum *n.* A thin, double partition extending down from

the lower surface of the corpus callosum to the fornix and adjacent structures, separating the lateral ventricles of the brain and enclosing an area above the third ventricle. It is part of the ***limbic system** and one of the most important of the ***pleasure centres** of the brain, electrical stimulation of this area producing intensely agreeable sensations of well-being in humans. Experimental rats with access to levers to control the output of electrodes implanted semi-permanently in their septal areas self-stimulate themselves for long periods to the virtual exclusion of food, sex, and sleep, whereas ablation of the area leads to ***septal** rage. Also spelt *septum pelucidum*. Also called the *septum*, *septal area*, *septal nucleus*, *septal region*, or *septum lucidum*. **septa pellucida** *pl.* [From Latin *saeptum* a fence or enclosure, from *saepire* to fence or enclose + *pellucidus* transparent, from *per* through + *lucere* to shine]

sequence completion *n.* Another name for ***number-completion tests**.

serial anticipation method *n.* A technique for studying verbal learning in which on each trial the learner is provided with a stimulus word and attempts to provide the next word in the list, or, in the case of ***paired-associate learning**, the second member of a pair, and after each response the learner is shown the correct word. Also called the *anticipation method*.

serial learning *n.* **1.** Any task that involves learning lists of items and recalling them in the same serial order in which they were presented. *See also* SERIAL ANTICIPATION METHOD. **2.** A generic term for any form of ***discrimination learning** in which the set of stimuli is replaced with a new and unfamiliar set. *See* GENERALIZED ODDITY PROBLEM, HABIT REVERSAL, NON-REVERSAL SHIFT.

serial position effect *n.* In ***serial learning (1)**, a tendency for the items near the beginning and end of the series to be recalled best, and those in the middle worst, producing a U-shaped *serial position curve* of recall as a function of serial position. It includes the ***primacy effect (1)** and the ***recency effect**. Also called the *edge effect* or *end effect*. *See also* TIP-OF-THE-TONGUE PHENOMENON.

serial processing *n.* Computational processing in which steps are executed one at a time in a fixed sequence. This is the way in which ordinary

*****ebook converter DEMO Watermarks*****

computers function, but the brain is believed to use [*parallel processing](#). See also [CASCADE PROCESSING](#), [CONNECTIONISM](#), [DISCRETE PROCESSING](#), [NEURAL NETWORK](#), [PARALLEL DISTRIBUTED PROCESSING](#). [From Latin *serialis* of or relating to a series, from *series* a row, from *serere* to link + *-alis* of or relating to]

serial recall *n.* Retrieval from memory of a number of items of information in the order in which they were originally presented, in contradistinction to [*free recall](#). See also [RANSCHBURG INHIBITION](#), [RECALL](#), [REPETITION EFFECT](#), [SERIAL ANTICIPATION METHOD](#).

serial reproduction *n.* A technique for studying memory in a social context, popularized by the English psychologist Sir Frederic Charles Bartlett (1886–1969) in his book *Remembering: A Study in Experimental and Social Psychology* (1932, chapters 7–8) and usually attributed to him, but in fact introduced by the US psychologist Ernest Norton Henderson (1869–1967) in an article in the journal *Psychological Review* in 1903, surprisingly not cited by Bartlett. It involves a person reading a short story (typically about 100 words long) and recounting it from memory to a second person, who then recounts it from memory to a third, and so on in the manner of the children's game of Chinese whispers, the phenomena of [*assimilation](#) (5), [*levelling](#) (1), and [*sharpening](#) becoming obvious after about eight transmissions. The technique has been used as a laboratory model of [*rumour](#) transmission. In some studies, the original stimulus is a drawing that is serially reproduced from memory by each of the participants or subjects in turn. See also [WAR OF THE GHOSTS](#). Compare [SUCCESSIVE REPRODUCTION](#).

series completion *n.* Another name for [*number-completion tests](#).

Serlect *n.* A proprietary name for the atypical antipsychotic drug [*sertindole](#). [Trademark]

Seropram *n.* A proprietary name for the antidepressant drug [*citalopram](#). [Trademark]

serotonergic *adj.* Releasing [*serotonin](#); also activated by or responding to serotonin, this extended usage being widespread but consistently rejected by the English physiologist Sir Henry Hallet Dale (1875–1968), who coined
*****ebook converter DEMO Watermarks*****

the suffix *-ergic*, and by many other authorities. The term applies especially to nerve fibres such as those of the **raphe nuclei* of the medulla oblongata, the **area postrema*, and the **locus coeruleus* that use serotonin as a **neurotransmitter* and that project to the cerebral cortex, limbic system, thalamus, and cerebellum. Compare ADRENERGIC, CHOLINERGIC, DOPAMINERGIC, GABAERGIC, NORADRENERGIC. [From *serotonin* + Greek *ergon* work + *-ikos* of, relating to, or resembling]

serotonin *n.* A **biogenic amine* that is a powerful **vasoconstrictor* and one of the major neurotransmitter substances in the central nervous system, originating mainly in **raphe nuclei* of the brainstem, the **area postrema*, and **locus coeruleus*, and that is involved in arousal, attention, NREM sleep, and, above all, mood—depression and suicide often being associated with low serotonin levels. It is synthesized in the brain from its precursor **5-hydroxytryptophan* (obtained from dietary **tryptophan*), an amino acid that, unlike serotonin itself, is able to cross the **blood–brain barrier*, and it generates the metabolite 5-hydroxyindoleacetic acid. Formula: $\text{HOC}_8\text{H}_5\text{NCH}_2\text{CH}_2\text{NH}_2$. Also called *5-hydroxytryptamine* or *5-HT*. See also PARACHLOROPHENYLALANINE, PROZAC, SELECTIVE SEROTONIN REUPTAKE INHIBITOR, SEROTONERGIC, TRICYCLIC ANTIDEPRESSANT, TRYPTOPHAN HYDROXYLASE. [From *serum* the liquid portion of blood, from Latin *serum* whey + Greek *tonos* tone, so called because of its constricting effect on blood vessels]

Seroxat *n.* A proprietary name for the antidepressant drug **paroxetine*. [Trademark]

sertindole *n.* An **atypical antipsychotic* drug, used in the treatment of **schizophrenia* and other **psychotic (1)* disorders. Also called *Serlect* (trademark).

sertraline *n.* An antidepressant drug belonging to the group of **selective serotonin reuptake inhibitors (SSRIs)*. Also called *Zoloft* (trademark).

set *n.* 1. A collection of objects or elements that have something in common or that are treated as a unit. See also SET THEORY, VENN DIAGRAM. 2. A temporary readiness to perceive, think, or act in a particular way, usually as a

result of experimental instructions or an experimental manipulation, hence *perceptual set*, *cognitive set*, *behavioural set*, *motor set*. Also called a *mental set*, formerly called an *Einstellung*. See also [AUFGABE](#), [FUNCTIONAL FIXEDNESS](#), [WATER-JAR PROBLEM](#).

set point *n.* A natural state to which a dynamically stable system tends to return if perturbed, such as normal body temperature of 37°C, or the weight to which a person's body tends to revert after loss or gain from unusual or special circumstances or activities such as temporary illness, dieting, or overeating. See also [APPESTAT](#), [HOMEOSTASIS](#).

set theory *n.* A mathematical theory originated by the Russian-born German mathematician Georg Cantor (1845–1918) between 1874 and 1897 to deal with collections of objects, called **sets* (1). A set is usually represented by an upper-case letter or by a pair of curly brackets enclosing all of its members; thus the set of all additive primary colours is the set $C = \{\text{red, green, blue}\}$; the set of natural numbers is $N = \{1, 2, 3, \dots\}$; and the set of female US presidents is $F = \emptyset$, which is called the *empty set* or *null set*. See also [BARBER PARADOX](#), [BOOLEAN](#), [FUZZY SET](#), [RUSSELL'S PARADOX](#).

severe mental retardation *n.* An obsolescent term for a level of **intellectual disability* associated with **IQ* approximately between 20 and 35 (in adults, **mental age* from 3 to under 6 years). Also called *severe mental subnormality*.

severe myoclonic epilepsy of infancy *n.* An alternative name for **Dravet syndrome*. **SMEI** abbrev.

sex *n.* **1.** Either of the categories of male and female or the sum total of biological **attributes* on which this distinction is based within a species. Compare [GENDER](#) (1). *adj.* **2.** Of or relating to sex, especially sex (1), as in the phrase *sex differences* or *sex discrimination*, but also sex (3) as in *sex industry*. **3.** Short for sexual intercourse or any of the activities distinctively associated with it. **sexual** *adj.* Of or relating to sex, especially sex (3), as in the phrase *sexual abuse*, but also sex (1) as in *secondary sexual characteristics*. [From Latin *sexus* sex, perhaps from *secare* to divide]

sex cell *n.* Another name for a **gamete*.

sex chromosome *n.* A **chromosome* that determines the sex of a human or other organism. See *X CHROMOSOME*, *Y CHROMOSOME*. Compare *AUTOSOME*.

sex difference *n.* Any of the myriad psychological characteristics that differentiate reliably between women and men or girls and boys, such as the significant superiority of women, on average, at tasks involving decoding non-verbal communication, as in the **PONS*, or the significant superiority of men, on average, at **mental rotation*. See also *ANDROGYNY*, *FEAR OF SUCCESS*.

sex hormone *n.* Any **hormone* such as **progesterone*, **oestrogen* (or **oestradiol*), **oestrone*, **Müllerian inhibiting substance*, **testosterone*, or **androsterone* that is produced by the gonads (ovaries or testes) and controls the development of primary and/or secondary sexual characteristics.

sex-influenced trait *n.* A phenotypic characteristic or **trait* such as male pattern baldness that is expressed differently in males and females, usually because its expression depends on androgens or oestrogens, and that is controlled by a single gene that is dominant in males but recessive in females, so that, for example, men who inherit the gene from either parent lose hair as they age, whereas women do so only if they inherit it from both parents and are thus homozygotes. Also called a *sex-limited trait*. Compare *SEX-LINKED*.

sexism *n.* A belief in the intrinsic superiority of one sex over the other, often accompanied by **prejudice*, discrimination, or **stereotyping* on the basis of sex. See also *QUEEN BEE SYNDROME*. Compare *ABLEISM*, *AGEISM*, *ETHNOCENTRISM*, *FATTISM*, *HETEROSEXISM*, *RACISM*, *SPECIESISM*. **sexist** *n.* 1. One who manifests or practises sexism. *adj.* 2. Of or relating to sexism. [Coined from *sex* following the model of *racism*]

sex-limited trait *n.* Another name for a **sex-influenced trait*.

sex-linked *adj.* Of or relating to a gene located on a **sex* chromosome or

a characteristic or ***trait** inherited along with one's sex through being determined by such a gene. The best known examples in humans are haemophilia and various forms of colour-blindness, which are determined by genes located on the X chromosome, carried by females but expressed mostly by males, because the smaller Y chromosome has no homologous alleles to bring about ***complementation**. See also **HOLANDRIC**, **HOLOGYNIC**, **HORNER'S LAW**, **X-LINKED**, **Y-LINKED**. Compare **SEX-INFLUENCED TRAIT**.

sex pheromone *n.* A ***pheromone** that is released by an animal and that induces a sexual response in members of the same species, such as the volatile sexual attractants released by female insects that can attract males from great distances. See also **CATNIP**. [From sex + Greek *pherein* to bear + *horman* to stimulate]

sexsomnia *n.* A ***parasomnia**, named by the Canadian-based South African psychiatrist Colin M. Shapiro (born 1952) and two co-authors in the title of an article in the *Canadian Journal of Psychiatry* in 2003, involving sexual behaviour initiated by a person who is asleep, sometimes with a willing partner but sometimes causing injury to self or others. It is believed to be related to ***sleepwalking** but distinct from it, especially because of the relatively higher level of ***arousal** typical of sexsomnia. [A blend of sex and (para)somnia]

sex therapy *n.* Any form of therapy, including ***psychotherapy** and ***sensate focus**, offered to people with ***sexual dysfunctions**. Also called *sexual therapy*.

sexual abuse *n.* The subjection of a child or other vulnerable person to sexual activity liable to cause physical or psychological damage. See also **CHILD SEXUAL ABUSE**, **ELDER ABUSE**.

sexual anomaly *n.* Another name for a ***paraphilia**.

sexual arousal disorder *n.* Another name for ***male hypoactive sexual desire disorder** and ***female sexual interest/arousal disorder**. See also **PERSISTENT SEXUAL AROUSAL SYNDROME**.

sexual aversion disorder *n.* A [*sexual dysfunction](#) characterized by persistent or recurrent extreme antipathy to and active avoidance of genital contact with a sexual partner, generally accompanied by anxiety, fear, or disgust at the thought of sexual activity, causing significant distress or problems of interpersonal interaction. [From Latin *aversus* turned away or hostile, from *avertere* to turn from, from *vertere* to turn]

sexual desire disorder *n.* Another name for [*male hypoactive sexual desire disorder](#) and [*female sexual interest/arousal disorder](#).

sexual deviation *n.* Another name for a [*paraphilia](#).

sexual dimorphism *n.* The property of some species, including humans, of having differences between males and females in shape, size, or morphology. *See also* [DIMORPHIC](#). **sexually dimorphic** *adj.* [From *sexual* + Greek *dis* twice + *morphe* a form or shape + *-ismos* indicating a state or condition]

sexual disorder *See* [SEXUAL DYSFUNCTIONS](#).

sexual dysfunctions *n.* A category of [*mental disorders](#) in [*DSM-5](#) involving disturbances in the [*sexual response cycle](#) or pain associated with sexual intercourse. *See* [DELAYED EJACULATION](#), [ERECTILE DISORDER](#), [FEMALE ORGASMIC DISORDER](#), [FEMALE SEXUAL INTEREST/AROUSAL DISORDER](#), [GENITO-PELVIC PAIN/PENETRATION DISORDER](#), [MALE HYPOACTIVE SEXUAL DESIRE DISORDER](#), [PREMATURE \(EARLY\) EJACULATION](#). *See also* [DYSPAREUNIA](#), [PERSISTENT SEXUAL AROUSAL SYNDROME](#), [SEXUAL AVERSION DISORDER](#), [VAGINISMUS](#).

sexual harassment *n.* Persistent unwelcome sexual remarks, looks, or advances, especially from a senior colleague in the workplace. *See also* [STALKING](#).

sexual instinct *n.* In [*psychoanalysis](#), one of the two classes of [*instincts](#) (3) or [*drives](#) in the early classification of Sigmund Freud (1856–1939), the other being the [*ego](#) instincts of self-preservation. In Freud's theory, the form of energy driving the sexual instinct is [*libido](#), and it drives

a far wider range of activity than is ordinarily understood by sexual behaviour. In his later classification, first introduced in 1920, he distinguished between ***Eros** (the life instincts, including the sexual instinct) and ***Thanatos** (the death instinct). Also called the *sex instinct*, *sexual drive*, or *sex drive*.

sexual involution *n.* The decline in sexual desire and activity manifested by some people of both sexes after the ***menopause** or in middle life. [From Latin *involutum* rolled up, from *involvere* to roll up + *-ion* indicating an action, process, or state]

sexual latency See **LATENCY PERIOD**.

sexual masochism *n.* A ***paraphilia** characterized by recurrent, intense sexual fantasies, urges, or behaviour involving submission to pain, humiliation, bondage, or some other form of physical or psychological suffering. Also called simply *masochism*, a term introduced by the German neurologist and sexologist Richard von Krafft-Ebing (1840–1902) in his book *Psychopathia Sexualis* (1886). See also **FUSION OF INSTINCTS**, **HYPOXYPHILIA**, **SEXUAL MASOCHISM DISORDER**. Compare **SEXUAL SADISM**. [Named after the Austrian historian and novelist Leopold von Sacher-Masoch (1836–95) who wrote about it, notably in his novel *Venus im Pelz* (1870), translated into English as *Venus in Furs* (1902), in which the heroine Wanda subjects the narrator to sexually stimulating suffering]

sexual masochism disorder *n.* A ***paraphilic disorder** in ***DSM-5** characterized by intense, recurrent sexual arousal from the physical or mental suffering of another person, or associated fantasies or urges over a period of at least six months. To meet the diagnostic criteria, the individual must either have acted out this behaviour with a non-consenting person, or the fantasies or urges must have caused clinically significant distress or impairment in social, occupational, or other areas of life. See also **SEXUAL MASOCHISM**.

sexual orientation *n.* Another name for ***sexual preference**. See also **EGO-DYSTONIC SEXUAL ORIENTATION**. [From Latin *sexualis* of or relating to sex + *oriens*, *orientis* rising, alluding to the rising sun, used to find one's bearings + *-ation* indicating a process or condition]

*****ebook converter DEMO Watermarks*****

sexual pain disorder *n.* A non-technical name for [*dyspareunia](#).

sexual perversion *n.* An obsolescent term, often considered offensive nowadays, for a [*paraphilia](#).

sexual preference *n.* The predominant predilection or inclination that defines a person as a [*heterosexual \(1\)](#), [*homosexual \(1\)](#), or [*bisexual \(1\)](#). Also called *sexual orientation*. See also [HETEROSEXISM](#).

sexual preference disorder *n.* Another name for a [*paraphilia](#).

sexual reproduction *n.* Biological reproduction involving the fusion of male and female [*gametes](#). Compare [ASEXUAL REPRODUCTION](#), [PARTHENOGENESIS](#).

sexual response cycle *n.* The cycle of phases associated with sexual activity, classified and labelled differently by different researchers, but roughly as follows: appetitive phase (sexual desire, fantasy, and appetite for sexual activity); arousal phase (sexual excitement accompanied in the male by tumescence and erection of the penis and in the female by vasocongestion in the pelvis, lubrication and expansion of the vagina, and swelling of the external genitalia); orgasmic phase (male climax and ejaculation, female climax); resolution phase (muscular relaxation, feelings of well-being, and detumescence of the male penis); refractory period (lack of sexual desire and incapacity of males to achieve erection of the penis for a time).

sexual sadism *n.* A [*paraphilia](#) characterized by recurrent, intense sexual fantasies, urges, or behaviour involving the subjection of another person to pain, humiliation, bondage, or some other form of physical or psychological suffering. Also called *sadism*, a term introduced by the German neurologist and sexologist Richard von Krafft-Ebing (1840–1902) in his book *Psychopathia Sexualis* (1886). See also [FUSION OF INSTINCTS](#), [SEXUAL SADISM DISORDER](#). Compare [SEXUAL MASOCHISM](#). [Named after the French writer Count Donatien François de Sade (1740–1814), also known as the Marquis de Sade, who described it in his novels, notably *Les 120 Journées de Sodome* (1785, *The 120 Days of Sodom*) and *Juliette* (1796)]

sexual sadism disorder *n.* A [*paraphilic disorder](#) in [*DSM-5](#) characterized by recurrent and intense sexual arousal from fantasies, urges, or behaviour involving the physical or psychological suffering of another person. To meet the diagnostic criteria, the individual must either have acted out these fantasies or urges with a non-consenting person, or the fantasies or urges must cause the individual clinically significant distress or problems in social, occupational, or other areas of life. *See also* [SEXUAL SADISM](#).

sexual selection *n.* A form of [*natural selection](#) operating through the differential success of individuals of different genotypes in acquiring mates. It works largely through mate choices that are made by members of the opposite sex and that are based on perceptible characteristics such as size, plumage, or behaviour. *See also* [BATEMAN'S PRINCIPLES](#), [PARENTAL INVESTMENT](#).

sexual therapy *See* [SEX THERAPY](#).

sfumato *n.* One of the monocular cues of visual [*depth perception](#) based on the fact that the outlines of distant objects tend to appear slightly blurred because of diffusion by atmospheric dust, smoke, and vapour particles. This term was first used in relation to painting and drawing, in which the effect is achieved by smoothly blending different regions of colour or tone. [*Aerial perspective](#) is partly explained by sfumato. *See also* [HYBRID IMAGE](#). [From Italian *sfumato* shaded off, from *sfumare* to shade off, Latin *ex* out + *fumare* to smoke]

shading *n.* The depiction of highlights and shadows in visual art, the effect of light and shade; more specifically, another name for [*chiaroscuro](#), one of the monocular cues of visual [*depth perception](#).

shadow *n.* **1.** A dark shape cast on a surface by an object blocking rays of light; more generally, an area of relative darkness. **2.** In [*analytical psychology](#), the negative side of a person's personality, comprising all personal and collective elements that do not fit in with the person's self-perception and that are therefore denied overt expression but exist in the unconscious as an [*archetype](#) (2). It is so called because it is the dark side of one's personality and is interpreted as a shadow cast by the [*ego](#). Carl Gustav

Jung (1875–1961) described the shadow in a key passage as ‘that hidden, repressed, for the most part inferior and guilt-laden personality whose ultimate ramifications reach back into the realm of our animal ancestors and so comprise the whole historical aspect of the unconscious’ (*Collected Works*, 9, part 2, paragraph 422).

shadowing *n.* Repeating out loud words as they are being heard, used in experiments on **dichotic* listening to prevent **rehearsal (1)* of words presented simultaneously to the other ear.

shaking palsy *n.* The name that the English surgeon James Parkinson (1755–1824) originally gave to the disorder that is now invariably called **Parkinson's disease*.

shallow living *n.* In the **neo-Freudian* theory of the German-born US psychoanalyst Karen Horney (1885–1952), a **neurotic (1)* method of dealing with a conflict by immersion in trivial though distracting activities.

sham rage *n.* Unfocused anger or fury in response to any strong stimulus, originally observed in decorticate animals (animals whose cerebral cortex has been removed) and animals in which the pathway between the hypothalamus and pituitary gland has been damaged. It is known to result from more specific lesions, notably ablation of the **septum pellucidum* (in which case it is called septal rage) or the **ventromedial hypothalamus*, which is responsible for controlling anger and aggression. It has been observed in humans who have suffered extensive cortical damage from prolonged hypoglycaemia or carbon monoxide poisoning. [So called because it is not triggered by a normal external instigator of anger, such as frustration]

shape constancy *n.* A form of **perceptual constancy* in which a familiar object tends to retain its perceived shape despite radical changes in the pattern of retinal stimulation resulting from differences in its orientation. Thus a dinner plate looks the same shape whether the **proximal* stimulus image that it casts on the retina is a circle, an ellipse, or (if it is viewed from the edge) roughly a straight line. Also called *form constancy*. *See also* PERSPECTIVE ILLUSION, SHAPE–SLANT INVARIANCE, TEMPLATE MATCHING.

shape–slant invariance *n.* A hypothesis, seemingly obvious yet contradicted by experimental evidence, that impressions of the shape and of the slant or orientation of an object are mutually dependent, so that misperceptions of shape should produce misperceptions of slant and vice versa. Also called *shape–tilt invariance*. See also [SHAPE CONSTANCY](#). Compare [SIZE–DISTANCE INVARIANCE](#).

shaping *n.* **1.** A technique of [*operant](#) conditioning that involves gradually building up a desired pattern of behaviour by selectively [*reinforcing](#) (1) closer and closer approximations to it, beginning with existing elements of the subject's behavioural repertoire, until the required responses are learned. It can be used to train animals more effectively than any other known method, and is sometimes used as a technique of [*behaviour](#) therapy to treat mental disorders and psychological problems in human beings. See also [SECONDARY REINFORCEMENT](#). Compare [AUTOSHAPING](#). **2.** More generally, moulding something into a particular form.

shared psychotic disorder *n.* A [*mental disorder](#) in which a person develops a [*delusion](#) that is similar in content to that of a closely associated person with a pre-established delusion. Also called *folie à deux*, *induced delusional disorder*, *shared paranoid disorder*. Compare [SCHIZOPHRENIA](#).

sharpening *n.* The magnification or exaggeration of certain salient details in perception or memory, and also in [*serial reproduction](#) and [*rumour](#) transmission. See also [WEAPON FOCUS](#). Compare [ASSIMILATION](#) (5), [LEVELLING](#) (1).

Sheldon's constitutional psychology *n.* A theory, especially that of the US psychologist William H(erbert) Sheldon (1899–1977), postulating that [*personality](#) is dependent on physique or [*somatotype](#). See [ECTOMORPH](#), [ENDOMORPH](#), [MESOMORPH](#). Compare [KRETSCHMER CONSTITUTIONAL TYPE](#).

shell shock *n.* A term introduced by the English psychologist Charles Samuel Myers (1873–1946), in an article in the medical journal *The Lancet* in 1915, to denote what came to be called [*post-traumatic stress disorder](#). It resulted from traumatic experiences during military actions and was

attributed at that time to noise and concussion associated with exploding shells. Also called *combat fatigue*.

shenjing shuairuo *n.* A **culture-bound syndrome* included in CCMD-2 (the *Chinese Classification of Mental Disorders*, 2nd ed.), found mainly among Chinese communities in southern and eastern Asia, characterized by **fatigue* (1), dizziness, headaches, joint and muscle pain, loss of concentration, gastrointestinal complaints, **sexual dysfunctions*, assorted **dyssomnias*, and **amnesia*. It is sometimes interpreted in Western cultures as an **anxiety disorder* or a **mood disorder*. [Chinese term for **neurasthenia*, from *shenjing* a nerve + *shuairuo* weak]

shen-k'uei *n.* A **culture-bound syndrome* found mainly among men in Thailand and in ethnic Chinese communities in southern and eastern Asia, characterized by **anxiety* and **panic attacks* accompanied by somatic symptoms such as **insomnia*, **sexual dysfunctions*, dizziness, backache, and **fatigue* (1), the symptoms often being attributed to loss of semen brought about by excessive sexual intercourse, masturbation, nocturnal emissions (wet dreams), and the passing of whitish urine believed to contain semen. Spelt *shenkui* in Chinese-speaking communities. *Compare* DHAT. [From Thai or Chinese *shen* spirit + *k'uei* or *kui* deficit or wastage]

shifted checkerboard figure *n.* Another name for the **Münsterberg illusion*.

shin-byung *n.* A **culture-bound syndrome* restricted mainly to Korea and Korean communities living elsewhere, characterized by **anxiety*, **dissociation*, **insomnia*, **anorexia*, dizziness, and **fatigue* (1), together with somatic symptoms such as gastrointestinal complaints and general **asthenia*, the symptoms generally being attributed to possession by the spirits of dead ancestors. [From Korean *shin* spirit + *byung* possession]

shinkei-shitsu *n.* Another name for **taijin kyofusho*. [From Japanese *shinkei-shitsu* nervous temperament, from *shinkei* a nerve + *shitsu* constitution or nature]

shock *n.* 1. Any sudden and unexpected experience of extreme surprise,
*****ebook converter DEMO Watermarks*****

horror, or outrage; any violent impact or jarring. **2.** In medical discourse, another name for **traumatic shock*.

shock therapy *n.* Another name for **electroconvulsive therapy*. Also called *shock treatment*.

shoe anaesthesia *n.* A condition analogous to **glove anaesthesia* occurring in the foot. US *shoe anesthesia*.

shook yong *See* KORO.

shorthand *n.* Any method of writing quickly, using special symbols or abbreviations. *See also* BRACHYGRAPHY (short writing), STENOGRAPHY (narrow writing), and TACHYGRAPHY (quick writing).

short-sightedness *n.* A non-technical name for **myopia*.

short-term memory *n.* A memory system capable of holding a limited amount of information for brief periods, up to a maximum of about 20 or 30 seconds, although it can be renewed indefinitely if the information within it is **rehearsed* (2). Its capacity is about seven items or **chunks* of information according to evidence first reviewed in an influential article by the US psychologist George A(rmitage) Miller (1920–2012) in the journal *Psychological Review* in 1956. Without short-term memory, language would be incomprehensible, because to understand a sentence a listener or reader has to remember its beginning at least until its end. Also called *immediate memory*. *See also* CHUNKING, CORSI BLOCKS, DYNAMIC MEMORY SPAN, LEVELS OF PROCESSING, MAGICAL NUMBER SEVEN, MAINTENANCE REHEARSAL, PHONOLOGICAL LOOP, PUSH-DOWN STACK, REVERBERATING CIRCUIT, SPAN OF APPREHENSION, WORKING MEMORY. *Compare* LONG-TERM MEMORY, SENSORY MEMORY. **STM** *abbrev.*

short-term store *n.* Another name for **short-term memory*. **STS** *abbrev.*

SHRDLU *n.* A famous **artificial intelligence* program devised in 1968–70 by the computer scientist Terry (Allen) Winograd (born 1946) to carry out

instructions in a *block world*—a table with blocks of various shapes and colours scattered over it. On the basis of images from a video camera scanning the scene, the program works out the arrangement of blocks, some of which may be lying on top of others, responds to questions in English about the situation, replies to these questions in English, understands requests in English to manipulate the blocks, carries out such requests with a robotic arm, and describes in English its actions and the reasons behind them. [Named after the printer's code ETAOIN SHRDLU used to indicate typographical errors, representing the twelve most frequent letters in English in descending order]

shrink *n.* A colloquial term for a **psychiatrist* or a **psychoanalyst*. [A contraction of *headshrinker*]

sibling *n.* **1.** A brother or sister. *See also* *SIBLING RIVALRY*. **2.** Any member of one's sib, a sib being a group of kinspeople descended from a single ancestor. [From Old English *sibb* relationship, from *gesibb* related + *-ling* denoting a person associated with the group specified]

sibling rivalry *n.* Rivalry or competition between brothers, sisters, or brothers and sisters.

sibling rivalry disorder *n.* Abnormally intense negative feeling towards an immediately later-born sibling, manifested in **regression* (1), **tantrums*, **dysphoria*, **dyssomnia*, and oppositional, defiant, or attention-seeking behaviour towards one or both parents.

side-effect *n.* Any secondary or incidental effect of a drug or other treatment, especially an unwanted effect in addition to the intended reaction. Also called an *adverse drug effect* or an *adverse drug reaction*.

Sidman avoidance conditioning *n.* A type of **avoidance conditioning* in which the organism receives an aversive stimulus (such as an electric shock) at regular fixed intervals, without any warning signal, unless it performs an avoidance response (such as jumping over a barrier), and each avoidance response resets the timer to zero. Also called *free operant avoidance conditioning*. [Named after the US psychologist Murray Sidman]
*****ebook converter DEMO Watermarks*****

(born 1923) who popularized it in the early 1960s]

sight method *n.* Another name for the **whole-word method*.

sight vocabulary *n.* The set of words that a person can recognize as wholes without decomposing them into their elements.

sigma score *n.* Another name for a **standard score*. [Named after *sigma* (σ), the eighteenth letter of the Greek alphabet, the lower-case form of which is often used to symbolize it]

sigmatism *n.* 1. Abnormal or defective pronunciation of /s/, as in lisping. 2. The repetitive use of the letter s for poetical effect. [From the name of the Greek letter *sigma*, corresponding to the roman s]

sign *n.* 1. An objective indication of a disorder observed by an examiner rather than reported by the afflicted person. *See also* *HARD SIGN*, *SCAN*, *SOFT SIGN*, *SYNDROME*. *Compare* *SYMPTOM*. 2. More generally, any signal, gesture, mark, emblem, or token with an identifiable meaning. [From Latin *signum* a mark]

signal *n.* Any verbal or non-verbal pattern of sounds, signs, gestures, or other events transmitted through a communication channel and capable of conveying information; more generally any non-random component of a **time series*. *See also* *RECEIVER OPERATING CHARACTERISTIC*, *SIGNAL DETECTION THEORY*, *SIGNAL-TO-NOISE RATIO*. *Compare* *NOISE (2)*. [From Latin *signum* a sign]

signal anxiety *n.* In **psychoanalysis*, **anxiety* activated by the **ego* in response to external danger. The concept was introduced by Sigmund Freud (1856–1939) in his book *Inhibitions, Symptoms and Anxiety* (1926, *Standard Edition*, XX, pp. 77–175, at pp. 80–3, 92–4). *Compare* *PRIMARY ANXIETY*. [So called because this form of anxiety is a signal of danger]

signal detection theory *n.* A **psychophysical* theory of the detectability of stimuli developed in 1952–4 by a number of US researchers

led by John A(rthur) Swets (born 1928), based on the assumptions that there is a normal probability distribution N of activation of the sensory system by *noise (2) generated externally or by internal random neural activity in the absence of any *signal, that there is a different normal probability distribution (SN) of activation by signal plus noise, and that the difference between the means (or equivalently the separation between the peaks) of the SN and N distributions, divided by the *standard deviation of the N distribution, is an index of detectability called d prime or d' that can be estimated experimentally from the relative frequencies of correct detections of the signal when it is present (*hits*) and incorrect detections of the signal when it is absent (*false alarms*), the performance of an observer usually being depicted by means of a *receiver operating characteristic (ROC). According to the theory, an observer sets a criterion level of sensory activation below which the signal is reported as absent and above which it is reported as present, but if the two probability distributions overlap, then stimuli below the criterion must include not only instances of noise (*correct rejections*) but also instances of signal (*misses*), and stimuli above the threshold must include not only instances of signal (*hits*) but also instances of noise (*false alarms*). Also called *sensory decision theory*. See also IDEAL OBSERVER, LIKELIHOOD RATIO (2), MEMORY OPERATING CHARACTERISTIC, PSYCHOMETRIC FUNCTION, SIGNAL-TO-NOISE RATIO, TWO-ALTERNATIVE FORCED-CHOICE TASK. SDT abbrev.

signal-to-noise ratio *n.* The ratio of *signal strength to *noise (2) strength in a communication channel or *time series. See also RECEIVER OPERATING CHARACTERISTIC.

significance See STATISTICAL SIGNIFICANCE.

significance test *n.* In *inferential statistics, any test designed to determine whether an *alternative hypothesis achieved the required level of *statistical significance to justify being accepted in preference to the *null hypothesis. In a classical null hypothesis significance test, the null hypothesis is provisionally assumed to be true, and a calculation is then made of the probability of obtaining a result as extreme as the one actually obtained. If the probability is sufficiently small (by convention this significance level is often set at $p < .05$), the investigator is justified in rejecting the null hypothesis and

*****ebook converter DEMO Watermarks*****

therefore also in accepting its logical negation, namely the alternative hypothesis. The term ‘tests of significance’ was introduced by the English statistician and geneticist Ronald Aylmer Fisher (1890–1962) in 1925, on page 43 of his book *Statistical Methods for Research Workers*. Also called a *statistical test*.

significant other *n.* A term used by the US psychiatrist Harry Stack Sullivan (1892–1949) in his book *Conceptions of Modern Psychiatry* (1947) to denote the most influential person—usually the mother—in a child’s world. It is used colloquially to denote a person with whom someone is sexually or romantically involved.

sign language *n.* Any system of communication based on hand signals, especially one used by deaf people. There are many such systems, including **American Sign Language* and **British Sign Language*, and like **natural languages* they tend to be mutually unintelligible. *See also* *CHEROLOGY*, *DACTYLOLOGY*, *MAKATON*.

sign stimulus *n.* In ethology, a **feature (1)* of a complex **stimulus (1)* that triggers a specific response or **fixed-action pattern*. A classic example is the redness of the belly of a male stickleback fish in breeding condition, which elicits aggressive attacks from other male sticklebacks, whereas other features of the stimulus, such as its shape, size, and manner of movement, have little effect on the responses. Similarly, the tactile sensation of prodding by a male stickleback at the base of the tail of a female in the right condition elicits egg-laying, whereas other features of the stimulus, including its colouring, are irrelevant to this response. The Dutch-born British ethologist Niko Tinbergen (1907–88), who first identified sign stimuli in 1951, reported that even a red mail van passing outside the window of his laboratory elicited aggressive **display (1)* from his male sticklebacks, and even prodding with a glass rod at the base of a female’s tail elicited egg-laying. Many sign stimuli, though not all, are **releasers*. *See also* *SUPERNORMAL STIMULUS*, *VACUUM ACTIVITY*. **sign stimuli** *pl.*

sign test *n.* In statistics, a **distribution-free test* applied to two related samples to test the **null hypothesis* that the two variables are distributed similarly. Differences between corresponding scores on the two variables are

*****ebook converter DEMO Watermarks*****

classified as either positive, negative, or tied, and if the two variables are similarly distributed, the numbers of positive and negative differences will not be significantly different.

sildenafil citrate *n.* The chemical name of the drug **Viagra*, used for treating **erectile disorder*.

silent mutation *n.* Any **mutation* that has no effect on the phenotype, either because the altered **codon* happens to specify the same amino acid as the original one (see *CODON FAMILY*), or because it occurs in an **intron* that has no genetic function. [So called because it is not expressed]

silent receptors *n.* **Neuroreceptors* to which substances bind without producing any apparent physiological response.

silhouette illusion See *SPINNING DANCER ILLUSION*.

silok See *LATAH*.

similarities test *n.* A type of **intelligence* test item or subtest in which the respondent tries to explain in what way things are similar or alike. A typical example is: *In what way are fear and happiness similar or the same?* The answer is that they are both emotions.

similarity-attraction hypothesis See *ATTITUDE SIMILARITY HYPOTHESIS*.

similarity grouping law *n.* One of the four original **grouping laws* of **Gestalt* psychology, formulated in 1923 by the German psychologist Max Wertheimer (1880–1943) to explain the organization of parts into wholes by the visual system. According to the law, elements that are similar tend to be grouped perceptually, so that (for example) the array OOxx tends to be perceived as two pairs. Also called *equality grouping law*. See also *COMMON FATE*, *COMMON REGION*, *CONNECTEDNESS GROUPING LAW*, *PRÄGNANZ*. Compare *CLOSURE GROUPING LAW*, *GOOD CONTINUATION*, *PROXIMITY GROUPING LAW*.

similarity law *n.* In the doctrine of [*associationism](#), a law introduced by the English philosopher John Stuart Mill (1806–73) according to which mental elements that are similar tend to become associated. *See also* [GROUPING LAW](#). *Compare* [CONTIGUITY LAW](#), [FREQUENCY LAW](#).

similarity paradox *n.* Another name for the [*Skaggs–Robinson paradox](#).

simile *n.* A [*figure of speech](#) in which something is explicitly compared to something that it resembles, usually with one of the prepositions *like* or *as*, a typical example being ‘Love is like the measles; we all have to go through it’—Jerome K(lapka) Jerome (1859–1927), *Idle Thoughts of an Idle Fellow* (1889). *Compare* [METAPHOR](#). [From Latin *simile* something similar, from *similis* like]

Simon effect *n.* The tendency for [*choice reaction time](#) to be shorter and responses more accurate when [*stimulus \(1\)](#) and [*response](#) occur in the same relative location, even if location is irrelevant to the task. Thus, if respondents are instructed to press a left-hand button whenever a cross appears on a screen and a right-hand button whenever a circle appears, then reactions are generally faster and more accurate on congruent trials on which crosses appear on the left of the screen and circles appear on the right than on incongruent trials, suggesting that location information cannot be ignored in decision making, even if it is irrelevant. In Simon’s original experiments, participants moved a lever left or right in response to stimuli presented to their left or right ears. *Compare* [STROOP EFFECT](#). [Named after the US psychologist J(ennings) Richard Simon (born 1929), who first reported the effect in articles in the *Journal of Experimental Psychology* in 1968 and 1969]

simple cell *n.* A type of neuron in the [*primary visual cortex](#) (Area V1) that responds maximally to a stationary bar (slit) or straight edge with a particular orientation or slant and position on the [*retina](#) and that divides the [*receptive field](#) into excitatory and inhibitory regions: excitation within a bar and inhibition outside it, excitation outside a bar and inhibition inside it, or excitation on one side of an edge and inhibition on the other side. *See also* [BAR DETECTOR](#), [EDGE DETECTOR](#), [END-STOPPED RECEPTIVE FIELD](#), [FEATURE DETECTOR](#),
*****ebook converter DEMO Watermarks*****

ORIENTATION-SPECIFIC CELL. *Compare* COMPLEX CELL, HYPERCOMPLEX CELL.

simple deteriorative disorder *n.* A condition (included in the *ICD-10 classification but not in *DSM-5) characterized by progressive decline in occupational or academic functioning; gradual appearance and exacerbation of *negative symptoms such as *affective flattening, *alogia, and *avolition; poor interpersonal skills; and social isolation and withdrawal. *Compare* SCHIZOAFFECTIVE DISORDER, SCHIZOID PERSONALITY DISORDER, SCHIZOPHRENIFORM DISORDER, SCHIZOTYPAL (PERSONALITY) DISORDER. [So called because of the absence of prominent *catatonic, *hebephrenic, or *paranoid symptoms]

simple line graph *See* LINE GRAPH.

simple phobia *n.* Another name for *specific phobia.

simple random sample *n.* A *probability sample drawn from a *population in such a way that every member of the population is equally likely to be selected. Also called a *random sample*. *See also* CLUSTER SAMPLE, RANDOM DIGIT DIALING, STRATIFIED RANDOM SAMPLE. *Compare* ACCIDENTAL SAMPLE, CONVENIENCE SAMPLE, NON-PROBABILITY SAMPLE, OPPORTUNITY SAMPLE, QUOTA SAMPLE, SELF-SELECTED SAMPLE, SNOWBALL SAMPLE. **SRS** *abbrev.*

simple reaction time *n.* *Reaction time in a situation in which there is only one possible stimulus requiring only one type of response. *Compare* CHOICE REACTION TIME, DISCRIMINATION REACTION TIME.

simple receptive field *n.* The *receptive field of a *simple cell.

simple reinforcement schedule *n.* A *reinforcement schedule that does not incorporate two or more different schedules. Also called a *simple schedule*. *Compare* COMPOUND REINFORCEMENT SCHEDULE.

simple schizophrenia *n.* Another name for *simple deteriorative disorder.

simple structure *n.* In *factor analysis, a method of *rotation advocated

by the US psychologist Louis Leon Thurstone (1887–1955) in which as many factor loadings as possible are zero and none is negative.

simple tone *n.* Another name for a **pure tone*.

simplicity principle *n.* Another name for the **precision law* of Gestalt psychology.

Simpson's paradox *n.* A statistical **paradox* in which two sets of data, considered separately, each support a certain conclusion, but together support the opposite conclusion. Suppose that a drug trial is run, and drug A is effective in 10 out of 100 patients (10 per cent), whereas drug B is effective in 200 out of 1,000 (20 per cent). Then a second trial is run, and in this case drug A is effective in 400 out of 1,000 patients (40 per cent), whereas drug B is effective in 60 out of 100 patients (60 per cent). Clearly, drug B is superior in each of the two trials, yet if the data are combined, then drug A is superior: drug A is effective in 410 out of 1,100 (37 per cent), whereas drug B is effective in 260 out of 1,100 (24 per cent). [Named after the British mathematician Edward Hugh Simpson (born 1927) who published it in 1951]

simulation heuristic *n.* A **heuristic* whereby people make predictions, assess the probabilities of events, carry out **counterfactual reasoning*, or make judgements of causality through an operation resembling the running of a simulation model. The ease with which the mental model reaches a particular state may help a decision maker to judge the propensity of the actual situation to reach that outcome. The Israeli-American psychologists Daniel Kahneman (born 1934) and Amos Tversky (1937–96), who introduced the heuristic in a lecture in 1979 and published it as a book chapter in 1982, provided empirical evidence that people use it to predict the behaviour of others in certain circumstances and to answer questions involving counterfactual propositions by mentally undoing events that have occurred and then running mental simulations of the events with the corresponding input values of the model altered. For example, when provided with a **vignette* describing two men who were delayed by half an hour in a traffic jam on the way to the airport so that both missed flights on which they were booked, one of them by half an hour and the second by only five minutes (because his flight had been delayed for 25 minutes), 96 per cent of a

*****ebook converter DEMO Watermarks*****

sample of students thought that the second man would be more upset. Kahneman and Tversky argued that this difference could not be attributed to disappointment, because both had expected to miss their flights, and that the true explanation was that the vignette invited the use of the simulation heuristic, in which it would be easier to imagine minor alterations that would have enabled the second man to arrive in time for his flight. The heuristic is often interpreted as a form of [*availability heuristic](#).

simultanagnosia *n.* Impaired ability to perceive more than one object or image at the same time, hence an inability to comprehend a whole picture even when its constituent elements can be recognized, often occurring as a symptom of [*Bálint's syndrome](#) or a lesion in the [*left](#) temporal lobe. See also [AGNOSIA](#), [MOTION-INDUCED BLINDNESS](#), [NAVON FIGURE](#). [From *simultan(eous)* + *agnosia*]

simultaneous contrast *n.* The tendency for a sensation such as lightness, colour, or warmth to induce the opposite sensation in a stimulus with which it is juxtaposed. See [COLOUR CONTRAST](#), [CONTRAST \(2\)](#), [LIGHTNESS CONTRAST](#), [WARMTH CONTRAST](#). Compare [SUCCESSIVE CONTRAST](#).

simultaneous masking *n.* A form of [*masking](#) that occurs when the perception of a stimulus, called the *test stimulus*, is reduced or eliminated by the simultaneous presentation of a second stimulus, called the *masking stimulus*. See also [AUDITORY MASKING](#), [VISUAL MASKING](#). Compare [BACKWARD MASKING](#), [FORWARD MASKING](#).

simultaneous matching to sample See [MATCHING TO SAMPLE](#).

single-blind study *n.* A research design in which the research participants or subjects do not know until after the data have been collected, but the experimenter does know, which experimental treatment has been applied to which subjects. This type of design is often used in drug trials involving the comparison of a drug and a [*placebo \(1\)](#), to avoid contamination of the results from biases and preconceptions on the part of the subjects. See also [RANDOMIZED CONTROLLED TRIAL](#). Compare [DOUBLE-BLIND STUDY](#), [OPEN STUDY](#).

single-case design *n.* Another name for a **case study*.

single-frame task *n.* A **visual search* task in which all stimuli are presented together. *Compare* MULTIFRAME TASK.

single-linkage clustering *n.* In statistics, any technique of **cluster analysis* in which the distance between two clusters is defined as the distance between their two closest members. Also called the *nearest neighbour method*.

single photon emission computed tomography *See* SPECT SCAN.

single stimuli method *See* METHOD OF SINGLE STIMULI.

single-synapse reflex *n.* Another name for a **monosynaptic reflex*.

sinusoidal *adj.* Varying according to the regular undulating sine curve $y = \sin x$. [From Latin *sinus* a curve or bay + *-oid* indicating likeness or resemblance, from Greek *eidos* shape or form + *-al* from Latin *-alis* of or relating to]

sinusoidal grating *n.* A grating in which the **luminance* of the image undulates at a regular **spatial frequency* along an axis, increasing and decreasing according to the sine curve $y = \sin x$.

sitology *n.* The study of food, nutrition, and diet. [From Greek *sitos* grain or food + *logos* word, discourse, or reason]

situationist critique *n.* A critique of the concept of **personality*, initiated by the Austrian-born US psychologist Walter Mischel (born 1930) in his book *Personality and Assessment* (1968), based on evidence apparently contradicting the fundamental assumption of all personality theories, namely that people display more or less consistent patterns of behaviour across situations. Mischel drew attention to the low correlations between personality test scores and behaviour in everyday situations and concluded that behaviour

can be more reliably predicted from past behaviour than from personality test scores. According to the strong form of the situationist critique, behaviour is merely predictive of itself, and theories of personality are futile. *See also* [INTERACTIONISM \(2\)](#).

six degrees of separation *See* [SMALL WORLD PHENOMENON](#).

6-hydroxydopamine *n.* A [*neurotoxin](#) that is closely related to [*dopamine](#) and is readily taken into dopaminergic and noradrenergic neurons via their normal reuptake mechanism, whereupon it destroys the neuron terminals, causing the organism to lose the ability to perform simple actions to obtain rewards. **6-OHDA** *abbrev.*

16PF *abbrev.* The Sixteen Personality Factor Questionnaire, a popular personality scale that consists of 185 questions, such as ‘I get frustrated when people take too long to explain something’, each having three response categories—usually *true ? false*—and that yields scores on sixteen primary factors: Warmth, Reasoning, Emotional Stability, Dominance, Liveliness, Rule-consciousness, Social Boldness, Sensitivity, Vigilance, Abstractedness, Privateness, Apprehension, Openness to Change, Self-reliance, Perfectionism, and Tension. Scores on the primary factors can be combined to yield scores on five global factors: Extraversion, Anxiety, Tough-mindedness, Independence, and Self-control, and in addition an Impression Management (lie) score can be calculated. The questionnaire was constructed by the English-born US psychologist Raymond B(ernard) Cattell (1905–98) and first described in an article in the *Journal of Clinical Psychology* in 1956. The sixteen primary factors were derived by successive reduction, using [*factor](#) analysis, of the 17,953 trait names, 4,505 with distinct meanings, located by the US psychologists Gordon W(illard) Allport (1897–1967) and Henry S(ebastian) Odbert (1909–95) in an exhaustive dictionary search in 1936. Also called the *Cattell 16PF*. *See also* [LANGUAGE PERSONALITY SPHERE](#), [TRAIT](#).

size constancy *n.* A form of [*perceptual constancy](#) in which an object tends to retain its perceived size despite changes in its [*angular size](#) or the size of the image that it casts on the retina. Thus a football looks the same size whether its [*proximal](#) stimulus image covers a large area of the retina

*****ebook converter DEMO Watermarks*****

when it is viewed close up or a tiny area when it is viewed from a distance.

size–distance invariance *n.* A hypothesis that the perceived size s and the perceived distance d of an object are associated in such a way that their ratio is a constant, so that $s/d = k$, implying that any misperception of size implies a misperception of distance and vice versa. This relation breaks down in the **moon illusion*. Compare *SHAPE–SLANT INVARIANCE*.

size–weight illusion *n.* A powerful **cognitive illusion* that causes approximately 98 per cent of people to judge an object to be heavier than another object of the same weight but much larger size when the two are lifted by hand. In a simple home demonstration of the illusion, pieces of lead or other heavy material may be placed in two different-sized containers and surrounded by sand to prevent them from moving about and from being visible if the containers are transparent, and the weights of the containers may be adjusted until they are identical, whereupon the smaller container will feel much heavier than the larger one. In a classic experiment on this illusion, 100 US military officers judged a smaller object to be on average two and a half times as heavy as one that was the same weight but twice the size in each dimension. The illusion was first reported in 1889 by the German psychologists Georg Elias Müller (1850–1934) and Friedrich Schumann (1863–1940). It is sometimes classified as a **tactile illusion*. Also called *Charpentier’s illusion*.

skag *n.* A street name for **heroin*.

Skaggs–Robinson paradox *n.* A surprising fact about the rate at which learning and subsequent recall are affected by the degree of similarity of the material to be learnt in two tasks carried out in close succession. On the one hand, the more similar the material to be learnt in the two tasks, the slower the rate of learning and the worse the subsequent recall, because similarity increases **proactive interference* and **retroactive interference*; but on the other hand, the rate of learning and the amount of recall are highest when the material in the two tasks is identical, because proactive and retroactive interference cease to operate and each task functions as practice for the other. Also called the *similarity paradox*. [Named after the US psychologists Ernest Burton Skaggs (1892–1970) and Edward Stevens

*****ebook converter DEMO Watermarks*****

Robinson (1893–1937) who discussed it in articles in the journal *Psychological Monographs* in 1925 and 1920 respectively]

skeletal muscle *n.* The [*striped muscle](#) tissue that is used for voluntary movements of the limbs and other body parts, including the external muscles of the eyes. [So called because most of them move parts of the skeleton]

sketchpad, visuospatial See [VISUOSPATIAL SKETCHPAD](#).

skewness *n.* In statistics, an index of the degree to which a distribution is asymmetric around its mean. The [*normal distribution](#) is symmetric and thus has zero skewness, whereas a distribution whose right tail is more prominent than its left tail is positively skewed or skewed to the right, and one whose left tail is comparatively prominent is negatively skewed or skewed to the left. In a positively skewed distribution the mean is larger than the median and the median is larger than the mode, and in a negatively skewed distribution these inequalities are reversed, the order of the parameters often being used as a test for skewness. Skewness is used along with the [*kurtosis](#) to assess whether a variable is normally distributed.

skill *n.* Expertise or accomplishment in any field; specifically, any complex, organized pattern of behaviour acquired through training and practice, including cognitive skills such as mathematics or chess, perceptual skills such as radar monitoring, motor skills such as juggling, and social skills such as non-verbal communication. Research into skills can be traced at least as far back as 1820, when the German astronomer Friedrich Wilhelm Bessel (1784–1846) studied the accuracy of difficult astronomical observations requiring judgements of duration (see [PERSONAL EQUATION](#)). In the latter half of the 19th and the early decades of the 20th century investigations continued into how people learn Morse code, typing, and other skills, and research gained considerable momentum during the Second World War with the development of radar, advanced military aircraft, and sophisticated weapon systems, which presented human operators with difficult problems of learning and performance. Since the 1970s, research on skills has been further stimulated by the rise of sport psychology and increased concern about skilled aspects of social interaction. See also [MIRROR NEURON](#), [MOTOR SKILLS DISORDER](#), [PERCEPTUAL–MOTOR SKILL](#), [SOCIAL SKILL](#), [SOCIAL SKILLS TRAINING](#), [SPECIFIC](#)

*****ebook converter DEMO Watermarks*****

DISORDER OF ARITHMETIC SKILLS, TEN THOUSAND HOUR RULE. [From Old Norse *skil* distinction, from *skilja* to separate]

skin *n.* The tough, flexible, cutaneous **membrane* that covers most of the outer surface of the body and that functions as the body's largest **sense* organ, occupying a total surface area in a human adult of approximately 1.67 square metres (18 square feet) and being composed of two layers, the outer **epidermis* and the inner **dermis* (see *illustration*). See also COLD SPOT, CUTANEOUS SENSE, ECTODERM, EPICRITIC, EXOCRINE GLAND, FORMICATION, FREE NERVE ENDING, GALVANIC SKIN RESPONSE, GOOSE PIMPLES, HISTAMINE, MECHANORECEPTOR, MEISSNER'S CORPUSCLE, MELATONIN, MERKEL CELL, PACINIAN CORPUSCLE, PAIN RECEPTOR, PALLAESTHESIA, PARADOXICAL COLD, PARADOXICAL HEAT, PARADOXICAL WARMTH, PARAESTHESIA, PELLAGRA, PHYSIOLOGICAL ZERO, PRESSURE-SENSITIVE SPOT, RAPIDLY ADAPTING, RUFFINI CORPUSCLE, SENSORY SALTATION, SKIN CONDUCTANCE RESPONSE, SLOWLY ADAPTING, SUBSTANCE P, SWEAT GLAND, TEMPERATURE RECEPTOR, TOUCH, TOUCH RECEPTOR, TWO-POINT THRESHOLD, URBACH-WIETHE DISORDER, WARM SPOT.

Skin. The structure of mammalian skin.

skin conductance response *n.* A measure of change in the conductivity of the **skin* to a weak electric current. It is usually measured in mhos (*mho* being *ohm* spelt backwards), because it is the reverse of the **galvanic skin response* in which change in the electrical resistance of the skin is measured in conventional units of ohms. **SCR** *abbrev.*

Skinner box *n.* A compartment containing a lever, key, or other manipulable device that a rat, pigeon, or other animal can operate in order to receive food delivered from a storage magazine to a hopper, or occasionally to avoid electric shocks delivered through the floor of the compartment. It was invented by the US psychologist Burrhus F(rederic) Skinner (1904–90) while he was a postgraduate student at Harvard University in 1929, and it is often attached to a **cumulative recorder* to study **operant* conditioning. See also [MAGAZINE TRAINING](#), [REINFORCEMENT \(1\)](#).

*****ebook converter DEMO Watermarks*****

Skinner crib *n.* Another name for an [*air crib](#).

Skinnerian conditioning *n.* Another name for [*operant conditioning](#). [Named after the US psychologist Burrhus F. Skinner (1904–90) who introduced the procedure in his PhD dissertation in 1931]

skin-picking disorder *See* [EXCORIATION DISORDER](#).

skin-pop *vb.* In drug-culture slang, to inject a drug subcutaneously (below the skin) or intramuscularly (into muscle tissue) rather than intravenously (into a vein). Also called *skinning*. *Compare* [MAINLINE](#).

skin sense *n.* Another name for a [*cutaneous sense](#).

skin shrink *n.* A colloquial term for a [*psychodermatologist](#). [Alluding to the colloquial term *headshrinker* for a psychiatrist]

skunk *n.* A street name for a potent form of [*cannabis](#), a cross-breed of *Cannabis sativa* and *C. indica*, usually grown indoors, either under special lights or in greenhouse conditions using hydroponic methods (without soil, in nutrient-enriched water). Compared with ordinary herbal cannabis, in which the [*psychotropic](#) ingredient delta-9-tetrahydrocannabinol (THC) ranges from 2 to 4 per cent, the concentration in skunk is usually between 10 and 15 per cent and is sometimes even higher. [From New England Algonquian *squunck*, a North American polecat that emits an offensive odour when threatened, alluding to the strong smell of burning skunk cannabis]

slang *n.* An informal, non-standard variety of a language, or the [*jargon](#) (1) of an occupational or social group. *See also* [BACK SLANG](#), [REGISTER](#) (2), [RHYMING SLANG](#). *Compare* [ARGOT](#).

sleep *n.* A periodic state of muscular relaxation, reduced metabolic rate, and suspended consciousness in which a person is largely unresponsive to events in the environment. Five stages of sleep can be distinguished by psychophysiological measurements, namely [*REM sleep](#) and four separate stages of [*NREM sleep](#), called stages I, II, III, and IV NREM sleep

respectively. *See also* BASAL FOREBRAIN, BASIC REST–ACTIVITY CYCLE, CIRCADIAN RHYTHM, DELTA SLEEP-INDUCING PEPTIDE, DELTA WAVE, DREAM (1), DYSSOMNIAS, HYPNAGOGIC IMAGE, HYPNOPOMPIC IMAGE, K COMPLEX, LOCUS COERULEUS, MAGNOCELLULAR NUCLEUS, MELATONIN, NUCLEUS GIGANTOCELLULARIS, PARADOXICAL SLEEP, PARASOMNIAS, PGO SPIKE, PINEAL GLAND, POLYSOMNOGRAPHY, PSEUDOINSOMNIA, REM ATONIA, REM REBOUND, SLEEP SPINDLE, SLEEP–WAKE CYCLE, SLEEPWALKING, SLOW-WAVE SLEEP, SUBCOERULEAR NUCLEUS.

sleep apnoea *n.* A *breathing-related sleep disorder characterized by recurrent episodes of breathing cessation during sleep, leading to *hypersomnia during the daytime. US *sleep apnea*. *See also* CENTRAL SLEEP APNOEA, OBSTRUCTIVE SLEEP APNOEA HYPOPNOEA. *Compare* CENTRAL ALVEOLAR HYPOVENTILATION SYNDROME. [From Greek *apnoia* cessation of breathing, from *a-* without + *pnein* to breathe]

sleep disorders *n.* A category of *mental disorders prominently associated with disturbances of *sleep patterns. They are subdivided into the *dyssomnias, involving disturbances in the amount, quality, and timing of sleep, and the *parasomnias, characterized by behavioural and physiological abnormalities associated with sleep, although there is overlap between these categories.

sleeper effect *n.* The tendency for the recipients of a persuasive message from a source of low *credibility to show increased *attitude change a few days or weeks after exposure to the message, either relative to recipients of the same message attributed to a source of high credibility (the *relative sleeper effect*) or relative to the amount of attitude change occurring immediately after exposure to the message (the *absolute sleeper effect*). The effect was first reported by the US psychologists Carl I(vor) Hovland (1912–61) and Walter Weiss (born 1925) in the journal *Public Opinion Quarterly* in 1951.

sleeping beauty syndrome *n.* Another name for *Kleine–Levin syndrome. [Alluding to the hypersomnia that characterizes the disorder]

sleep-onset insomnia *n.* Difficulty falling asleep, also called *initial insomnia*. *See* INSOMNIA.

*****ebook converter DEMO Watermarks*****

sleep paralysis *n.* A condition in which ***REM atonia** is experienced in the waking state. Such episodes typically occur immediately after waking or shortly before falling asleep. They are often frightening and may be accompanied by ***out-of-body experiences**. See also **NARCOLEPSY**. Compare **REM BEHAVIOUR DISORDER**.

sleep-related hypoventilation *n.* A ***breathing-related sleep disorder** in ***DSM-5** characterized by ***hypoventilation** during sleep with elevated levels of carbon dioxide in the blood. [From Greek *hypo* under + Latin *ventilare* to ventilate, from *ventus* a wind]

sleep spindle *n.* An ***EEG** wave form that occurs periodically in brief (approximately 1-second) bursts with a frequency of 12–15 hertz during light Stage II ***NREM sleep**. [So called because of the resemblance of its trace to a spindle, tapering at both ends]

sleep terrors *n.* In ***DSM-5**, a ***non-rapid eye movement sleep arousal disorder** characterized by repeated awakening from sleep, usually during the first part of the night and with a scream or cry, in a state of intense fear, confused, disoriented, and without any vivid recall of a dream, unresponsive to being comforted, and with amnesia for the episode the following morning. Also called *night terrors* or *pavor nocturnus* or, if occurring during the day, *pavor diurnus*. Compare **NIGHTMARE DISORDER**.

sleep–wake cycle *n.* The ***circadian rhythm** of sleep and wakefulness that persists even when environmental cues as to the passage of time are removed, although in those circumstances it usually has a period slightly longer than 24 hours.

sleep–wake disorders *n.* An umbrella term introduced in ***DSM-5** to cover a large number of disorders related to the ***sleep–wake cycle**. See **BREATHING-RELATED SLEEP DISORDERS**, **CIRCADIAN RHYTHM SLEEP–WAKE DISORDERS**, **HYPERSOMNOLENCE DISORDER**, **INSOMNIA DISORDER**, **NARCOLEPSY**, **PARASOMNIAS**.

sleep–wake schedule disorders *n.* Another name for ***circadian rhythm sleep–wake disorders**.

sleepwalking *n.* In *DSM-5, a *non-rapid eye movement sleep arousal disorder associated with Stages III and IV *NREM sleep, usually during the first third of the night, in which the sleeper manifests complex motor activity, including rising from bed and walking about with a blank facial expression, and is unresponsive and difficult to awaken, with amnesia for the episode the following morning. Also called *noctambulation* or *somnambulism*. See also NON-RAPID EYE MOVEMENT SLEEP AROUSAL DISORDER, SEXSOMNIA.

sleepy sickness *n.* A colloquial name for *encephalitis lethargica.

slimmers' disease *n.* A popular name for *anorexia nervosa, misleading because slimmers do not necessarily have it and it is not caused by slimming.

slip of action See ACTION SLIP. See also PARAPRAXIS.

slip of memory *n.* A minor error of recall, including an instance of *paramnesia (2). Also called a *lapsus memoriae*. See also PARAPRAXIS.

slip of the pen *n.* A mistaken piece of writing when something else was intended. Also called a *lapsus calami*. See also PARAPRAXIS.

slip of the tongue *n.* A mistaken utterance when something else was intended. Also called a *lapsus linguae*. See also MOSES ILLUSION, PARAPRAXIS, YOLK PHENOMENON.

slowly adapting *adj.* Of or relating to *afferent neurons from *sensory receptors in the *skin that respond constantly to sustained stimulation. See also SUSTAINED RESPONDER. Compare RAPIDLY ADAPTING. **SA** abbrev.

slow oxidative fibre *n.* Another name for a *slow-twitch fibre. US *slow oxidative fiber*. **SO fibre** abbrev. [So called because it reacts relatively slowly and is adapted for oxidative or aerobic metabolism]

slow-twitch fibre *n.* A dark-coloured *striped muscle fibre, especially in muscles involved in standing and walking, that responds more slowly and

is less prone to fatigue but capable of less powerful contractions than **fast-twitch fibre*. US *slow-twitch fiber*. Also called a *slow oxidative fibre* or *SO fibre*.

slow-wave sleep *n.* Another name for Stages III and IV of **NREM sleep*, characterized by high-amplitude (150 microvolts), low-frequency (1–3 hertz) EEG waves called **delta waves*. See also *DELTA SLEEP-INDUCING PEPTIDE*. *SWS* *abbrev.*

smack *n.* A common street name for **heroin*. [From Yiddish *schmeck* heroin]

small calorie See *CALORIE*.

small intestine *n.* The section of the **alimentary* canal between the **stomach* and the **large intestine*.

small-sample fallacy *n.* Another name for the **sample* size fallacy.

small world phenomenon *n.* The finding that two people *A* and *B*, chosen at random, tend to be connected by a surprisingly short acquaintanceship chain, *A* knowing someone who knows someone...who knows *B*. This helps to explain how **rumours* and other **memes* diffuse rapidly through populations. The US psychologist Stanley Milgram (1933–84) determined the typical length of the acquaintanceship chain within the US by providing over 200 participants with the name, address, and occupation of a distant target person and requesting them to send a document folder to someone with whom they were on first-name terms who would be most likely to know the target person. Each recipient along the chain received similar instructions, and the process continued until the folder reached the target person or the chain was broken. Milgram's results, published in the magazine *Psychology Today* in 1967, showed that, among the 29 per cent of cases in which the folder reached the target person, the median number of intermediaries was five, and the number of steps from the starting person to the target person was therefore six, suggesting that the US is a small world in which there are typically six degrees of separation between people. Milgram also carried out a cross-racial replication of the study, published in the

*****ebook converter DEMO Watermarks*****

Journal of Personality and Social Psychology in 1970, with similar results. The phenomenon inspired a play by the US playwright John Guare (born 1938) entitled *Six Degrees of Separation* (1992), and a film with the same title, released in 1993. [The term was introduced into the social sciences by the US political scientist Ithiel de Sola Pool (1917–84) and the Austrian-born US mathematician Manfred Kochen (1928–89) in an article on social networks written in 1958 but not published until 1978 in the journal *Social Networks*]

smart drug *n.* A non-technical name for any drug believed to have **nootropic* effects or to enhance **cognitive* ability or performance. Also called a *cognitive enhancer*. See *CAFFEINE*, *CREB*, *DEPRENYL*, *GINKGO*, *GINSENG*, *MEM 1414*, *PHENYTOIN*, *VASOPRESSIN*. See also *PERFORMANCE ENHANCER*.

smell *n.* One of the five classical **senses* (1), mediated by **olfactory receptors* in the nose. The **olfactory bulb* receives impulses from the **olfactory receptors* and transmits them via the **olfactory nerves* directly to the **olfactory cortex* and the **amygdala*, this sensory pathway being unique in bypassing the **thalamus* entirely. Perhaps for that reason, smell is more effective than any other sense in reawakening memories from the distant past, especially the emotions associated with past experiences, although the literary passage most often cited in support of this phenomenon, quoted under **redintegration*, clearly refers to taste rather than smell. See *OLFACTION*.

smell prism *n.* Another name for **Henning's prism*.

smell square *n.* Another name for the **Crocker–Henderson system*.

smile See *DISPLAY RULE*, *DUCHENNE SMILE*, *FAST*, *HYBRID IMAGE*.

smooth endoplasmic reticulum See *ENDOPLASMIC RETICULUM*. *SER* *abbrev.*

smooth eye movement *n.* An eye movement that is slow, steady, and controlled by feedback, in contrast to a **saccade*. See also *COMPENSATORY EYE MOVEMENT*, *OCULAR CONVERGENCE*, *OCULAR DIVERGENCE*, *SMOOTH FOLLOWING*

MOVEMENT.

smooth following movement *n.* A *smooth eye movement occurring only when tracking a moving object and keeping the gaze fixated on the target. *See also* PURSUIT MOVEMENT.

smooth movement *n.* Another name for a *ramp movement.

smooth muscle *n.* Involuntary muscle tissue, capable of slow, rhythmic contractions, such as is found in the muscles that control the walls of blood vessels, the erection of hair cells, the iris, and all internal organs except the heart. *Compare* CARDIAC MUSCLE, STRIPED MUSCLE. [So called because it does not have the transversely striped appearance of voluntary muscle and cardiac muscle]

Snellen fraction *n.* An index of visual *acuity based on the familiar *Snellen chart* used by optometrists and opticians, on which are printed upper-case letters arranged in size from the largest at the top to the smallest at the bottom. The person being tested normally stands 20 feet or 6 metres from the chart and reads as many letters as possible starting at the top, and a score is assigned in the form of the ratio or fraction d/d_n , where d is the viewer's distance from the chart and d_n is the distance at which a viewer with normal visual acuity could read the smallest letters that the person being tested can read. On this scale 20/20 vision is normal by definition, and 20/200 vision is a criterion of blindness originally introduced by the American Foundation for the Blind, indicating that the smallest letters read by the person being tested from 20 feet could be read from 200 feet by a viewer with normal (20/20) visual acuity, which means that the letters are approximately ten times as tall as the letters that a viewer with normal visual acuity could read. Normal visual acuity is usually defined as a *minimum separable of one minute of arc or 1/60 of a degree of *visual angle. [Named after the Dutch ophthalmologist Hermann Snellen (1834–1908) who devised it]

snow *n.* A street name for *cocaine.

snowball sample *n.* A *non-probability sample obtained by recruiting

*****ebook converter DEMO Watermarks*****

one or more individuals who each recruit one or more individuals, and so on, in the manner of pyramid selling. Although it is sometimes used informally merely for convenience, it is also uniquely effective for accessing 'hidden' groups scattered sparsely in large populations but linked by social networks, such as drug users, prostitutes, professional criminals, or paedophiles. Its first prominent implementation was in a study of leadership dynamics among gang members, carried out by the US sociologist William Foote Whyte (1914–2000) and published in his book *Street Corner Society* (1943). Compare ACCIDENTAL SAMPLE, CLUSTER SAMPLE, CONVENIENCE SAMPLE, OPPORTUNITY SAMPLE, PROBABILITY SAMPLE, QUOTA SAMPLE, RANDOM DIGIT DIALLING, SELF-SELECTED SAMPLE, SIMPLE RANDOM SAMPLE, STRATIFIED RANDOM SAMPLE.

snurp *n.* A small complex of *RNA and protein that helps to clear meaningless *introns from genetic material in cells by splicing *messenger RNA. [From *snRNP* an abbreviation of small nuclear ribonucleoprotein]

sociabilizer *n.* A drug such as *ecstasy (2) or *GHB that stimulates or enhances natural sociability. See also EMPATHOGEN.

social age *n.* A child's performance on a test of social maturity, such as the *Vineland Social Maturity Scale, expressed as the average age of children who achieved the same level of performance in a standardization sample. The concept is based on that of *mental age. Compare CHRONOLOGICAL AGE. SA *abbrev.*

social anthropology *n.* The branch of anthropology devoted to the study of social and cultural phenomena such as religious beliefs, kinship systems, and political and economic structures, especially (though not exclusively) in non-literate societies. Compare CULTURAL ANTHROPOLOGY, PHYSICAL ANTHROPOLOGY.

social anxiety disorder *n.* An *anxiety disorder in *DSM-5 characterized by a *phobia of scrutiny by others or of being the focus of attention in social situations involving strangers. Exposure to such social situations either generates anxiety about behaving in an embarrassing or humiliating way, or triggers a *panic attack, but the reaction is out of
*****ebook converter DEMO Watermarks*****

proportion to the actual threat posed by the social situation, and the avoidance behaviour or anxious anticipation interferes significantly with everyday life, occupational or academic performance, or social relationships. *See also* [HIKIKOMORI](#), [PAROXETINE](#). *Compare* [AGORAPHOBIA](#), [AUTISM SPECTRUM DISORDER](#), [GENERALIZED ANXIETY DISORDER](#), [PANIC DISORDER](#), [SEPARATION ANXIETY DISORDER](#), [SPECIFIC PHOBIA](#).

social categorization *n.* The assignment of people to social categories on the basis of skin colour, clothing, speech style, or other signs or indications of group membership, and the consequent **stereotyping* of group members according to the supposedly typical characteristics of members of those categories. *See* [SOCIAL IDENTITY THEORY](#). *See also* [MINIMAL GROUP SITUATION](#), [STIGMATIZE](#).

social class *n.* Another name for **class* (1).

social cognition *n.* The cognitive activity that accompanies and mediates social behaviour, including the acquisition of information about the social environment, the organization and transformation of this information in memory, and its effects on social behaviour. It includes **impression formation*, **person perception*, **attribution*, and **social categorization*. *See also* [MIRROR NEURON](#).

social cognitive neuroscience *n.* An interdisciplinary research field devoted to the understanding of behaviour and experience at three levels of analysis: the social level, including both motivational and social factors; the cognitive level, focusing on information-processing mechanisms influencing social-level phenomena; and the neural level, concerned with brain mechanisms underlying cognitive-level processes. This approach typically involves **brain* imaging and **neuropsychological* methods to test **social psychological* phenomena, with **cognitive* psychology bridging the neural and the social. It became widely recognized as an independent field of research in 2001, after a conference at the University of California, Los Angeles, organized by the US psychologist Matthew D. Lieberman (born 1970) and others, and the first wave of research in the field was reviewed in an article in the journal *American Psychologist* later in the same year by the US psychologists Kevin N. Ochsner (born 1969) and Matthew Lieberman.

*****ebook converter DEMO Watermarks*****

The term first appeared in print in 2000 in two simultaneous publications: an article by Matthew Lieberman and a book chapter by Kevin Ochsner. Compare [SOCIAL NEUROSCIENCE](#).

social cognitive theory *n.* An approach to [*social learning](#), incorporating findings from research into [*learning \(1\)](#), [*memory](#), and [*social cognition](#), and focusing on people's thoughts and how they affect social behaviour. It was introduced by the Canadian-born US psychologist Albert Bandura (born 1925) in his book *Social Foundations of Thought and Action: A Social Cognitive Theory* (1986), as a successor to [*social learning](#) theory. See also [SELF-EFFICACY](#). **SCT** abbrev.

social comparison *n.* The process whereby people reduce uncertainty about their beliefs, abilities, and emotions by comparing themselves with others, especially when objective criteria of evaluation are not readily available. The concept was introduced by the US psychologist Leon Festinger (1919–89) in an article in the journal *Human Relations* in 1954. See also [RELATIVE DEPRIVATION](#), [RISKY SHIFT](#).

social compliance See [COMPLIANCE](#).

social constructionist psychology *n.* An approach to [*social psychology](#) that seeks to study the ways in which people and groups create and institutionalize social phenomena by constructing their perceived reality. Socially constructed reality is interpreted as a continuous, dynamic process, with reality emerging from people's interpretations. This approach became influential in psychology after the US psychologist Kenneth J(ay) Gergen (born 1934) published a controversial article entitled 'Social Psychology as History' in the *Journal of Personality and Social Psychology* in 1973. Gergen argued that social psychology produces knowledge that alters the very phenomena that it studies and that although its methods are scientific in character, its theories are primarily reflections of contemporary history. Social constructionist psychology arose from the dramaturgical approach to [*self-presentation](#) of the Canadian-born US sociologist Erving Goffman (1922–82) in his influential book *The Presentation of Self in Everyday Life* (1959) and the social [*constructivism](#) introduced by the Austrian-born US sociologist Peter Ludwig Berger (born 1929) and the Slovene-born US

*****ebook converter DEMO Watermarks*****

sociologist Thomas Luckmann (born 1927) in their influential book *The Social Construction of Reality* (1966). See also [NARRATIVE PSYCHOLOGY](#).

social constructivism See [CONSTRUCTIVISM](#).

social contagion *n.* The spread of ideas, attitudes, or behaviour patterns in a group through imitation and [*conformity](#). Also called *behavioural contagion*.

social desirability response set *n.* A predisposition or readiness to respond to items of a multiple-choice questionnaire with responses calculated to present oneself in a favourable light according to perceived social norms and values. See also [RESPONSE SET \(2\)](#).

social dilemma *n.* An interactive decision in which individual interests are at odds with collective interests, the pursuit of individual self-interest by every decision maker leaving everyone worse off than if each had acted cooperatively. In empirical studies, social dilemmas are presented in one of three general forms, called [*N-person Prisoner's Dilemmas](#), [*public goods dilemmas](#), and [*resource dilemmas](#), and they have been used to model problems of inflation and voluntary wage restraint, conservation of scarce natural resources, environmental pollution, arms races and multilateral disarmament, mob behaviour, and many other social problems involving cooperation and trust. The [*Prisoner's Dilemma game](#) is a social dilemma restricted to two interacting decision makers. See also [COMMONS DILEMMA](#). [So called because it is an extension of the Prisoner's Dilemma game and models social problems]

social distance scale *n.* An instrument introduced by the US sociologist Emory S(tephen) Bogardus (1882–1973) in an article in the *Journal of Applied Sociology* in 1925 for measuring attitudes towards social or ethnic groups. Respondents are presented with a number of groups and are asked to indicate which they would willingly admit to various categories of social relationship, varying in level of intimacy. In one of Bogardus's earliest studies, published in his book *Immigration and Race Attitudes* (1928), the groups were Englishmen, Germans, Jews, and Negroes, and the respondents, 1,725 native-born Americans, were asked which they would 'willingly admit'

*****ebook converter DEMO Watermarks*****

to the following: *to close kinship by marriage, to my club as personal chums, to my street as neighbours, to employment in my occupation, and to citizenship in my country.* The percentages for Englishmen were respectively 94, 97, 97, 95, 96; for Germans 54, 67, 79, 83, 87; for Jews 8, 22, 26, 40, 54; and for Negroes 1, 9, 12, 39, 57. A social distance scale is a simple example of a [*Guttman scale](#), although it predates Guttman's formalization of his scale. Also called a *Bogardus social distance scale*.

social exchange theory *n.* A theory of social interaction based on the proposition that people expect rewards and costs from social exchange to be equitable. It was developed by the US sociologist George Caspar Homans (1910–89) and expounded in his books *The Human Group* (1950) and *Social Behavior: Its Elementary Forms* (1961). See [EQUITY THEORY](#).

social facilitation *n.* The term coined in 1920 by the US psychologist Floyd H(enry) Allport (1890–1978) to refer to the phenomena that were later called [*audience effects](#) and [*coaction effects](#). Allport's term is a misnomer, because the effects are not invariably facilitative. See also [DRIVE THEORY OF SOCIAL FACILITATION](#).

social identity theory *n.* A theory of [*social categorization](#) based on the concept of social identity, the part of the self-concept that derives from group membership. According to the theory, social categories, including large groups such as nations and small groups such as clubs, provide their members with a sense of who they are, and social identities not only describe but also prescribe appropriate behaviour, and membership of the social category of 'student', for example, determines not only how members define and evaluate themselves but also how others define and evaluate them. According to the theory, the basis of social [*prejudice](#) is the enhancement of self-esteem by discrimination against out-groups. The theory was originally formulated in 1978 by the British-based Polish psychologist Henri Tajfel (1919–82). See also [JIGSAW CLASSROOM](#), [MINIMAL GROUP SITUATION](#), [ROBBERS CAVE EXPERIMENT](#), [STIGMATIZE](#). **SIT** abbrev.

social impact See [LAW OF SOCIAL IMPACT](#).

social influence *n.* Any process whereby a person's [*attitudes](#) (1),

*****ebook converter DEMO Watermarks*****

**opinions, *beliefs, or behaviour are altered or controlled by some form of social communication. It includes *conformity, *compliance, *group polarization, *minority social influence, *obedience, *persuasion, and the influence of social *norms (1). See also LAW OF SOCIAL IMPACT, REACTANCE.*

social insect *n.* Any of the species of bees, wasps, ants, and termites that live in organized colonies with division of labour. Some species of ants even practise slavery (see DULOSIS). See also EUSOCIAL, POLYETHISM.

social intelligence *n.* Another name for **emotional intelligence*, especially those aspects concerned with the ability to perceive, appraise, and express emotions accurately and the ability to comprehend emotional messages and to make use of emotional information. Its existence as a distinct characteristic would require evidence for high correlations among different measures of social intelligence and low correlations between such measures and conventional measures of **intelligence*, and neither of these requirements has been adequately fulfilled.

social introversion scale *n.* Any scale designed to measure **introversion*, including the social introversion scale of the **MMPI*.

socialization *n.* 1. The process, beginning in infancy, whereby one acquires the attitudes, values, beliefs, habits, behaviour patterns, and accumulated knowledge of one's society, through child-rearing, education, and modification of one's behaviour to conform with the demands of the society or group to which one belongs. See also ANTICIPATORY SOCIALIZATION. 2. The act or process of altering something in accordance with socialist principles, as by transferring an industry to public ownership.

socialize *vb.* 1. To train, educate, or prepare someone for life in a particular society or group. See also SOCIALIZATION (1). 2. To create or alter something according to socialist principles, as by nationalization. See also SOCIALIZATION (2). 3. To act in a sociable or friendly manner.

social learning *n.* The processes by which social influences alter people's thoughts, feelings, and behaviour. The earliest social learning theories, put forward in 1950 by the US psychologists John Dollard (1900–
*****ebook converter DEMO Watermarks*****

80) and Neal Elgar Miller (1909–2002) and in 1954 by the US psychologist Julian B(ernard) Rotter (1916–2014) were simple ***operant** conditioning theories based on ***reinforcement** (1); more recent versions assign a major role to ***cognitive** processes. In 1969 the Canadian-born US psychologist Albert Bandura (born 1925) argued that imitation and ***modelling** sometimes occur without reinforcement, through simple observational learning, as in an experiment by Bandura and two colleagues in 1961 in which children who observed the actions of an aggressive adult towards an inflatable five-foot BoBo doll tended later, after they were subjected to mild ***frustration**, to imitate the hostile behaviour they had observed. *See also* **LOCUS OF CONTROL**, **MIRROR NEURON**.

social learning theory *n.* The conceptual framework within which the processes of ***social learning** are studied. *See also* **SOCIAL COGNITIVE THEORY**. **SLT** *abbrev.*

social loafing *n.* The tendency to exert less effort on a task when working as part of a cooperative group than when working on one's own—one reason why many hands make light work. The French agricultural engineer Maximilien (Max) Ringelmann (1861–1931) first investigated this phenomenon in a series of experiments carried out in 1882–7 but not published until 1913, in one of which students pulled as hard as they could on a rope, alone and in groups of two, three, and eight; the results showed that, on average, groups of three exerted only two and a half times as much force as an individual working alone, and groups of eight exerted less than four times the force of a single person. The term *social loafing* was coined by the US psychologist Bibb Latané (born 1937) and colleagues who performed an experiment, published in the *Journal of Personality and Social Psychology* in 1979, in which participants attempted to make as much noise as possible, by yelling and clapping, while wearing blindfolds and listening to masking noise through headphones. Compared to the amount of noise that they generated alone, participants made only about 82 per cent as much noise when they believed they were working in pairs and 74 per cent as much noise when they believed they were part of a group of six people working together. The phenomenon has been replicated across a variety of tasks, and evidence has shown that it is greatly reduced by making individual contributions identifiable within the group. Subsequent evidence suggests that social

loafing tends to occur when individuals contribute to a group product, whereas **coaction effects* tend to occur when individuals work in groups to produce individual products. Also called the *Ringelmann effect*. See also *DIFFUSION OF RESPONSIBILITY*.

social neuroscience *n.* An integrative field devoted to the study of the **nervous system*, the **endocrine system*, and the **immune system* in **social psychological* phenomena. It focuses on neural, hormonal, and immunological processes as both causes and effects of such phenomena-how the brain influences social processes and how social processes influence the brain. It incorporates **social cognitive neuroscience* but is potentially wider in scope, including as it does non-cognitive processes. Also called *social psychophysiology*. This approach rose to prominence at the beginning of the third millennium, and a special issue of the *Journal of Personality and Social Psychology* (Volume 85, Number 4) was devoted to it in 2003.

social perception *n.* The processes by which people **perceive* one another. See *ATTRIBUTION*, *ATTRIBUTION THEORY*, *FALSE-CONSENSUS EFFECT*, *IMPLICIT PERSONALITY THEORY*, *IMPRESSION FORMATION*, *PERSON PERCEPTION*, *STEREOTYPE*.

social phobia *n.* Another name for **social anxiety disorder*.

social (pragmatic) communication disorder *n.* A **communication disorder* introduced in **DSM-5* characterized by persistent deficits of verbal and **non-verbal communication* in social situations, including lack of appropriate greeting and information-sharing, inability to adapt communication style to social context, difficulty following conversational rules such as turn-taking, rephrasing when not understood, inappropriate use of **gesture (1)*, and difficulty understanding metaphors, idioms, jokes, and other communications that require understanding of more than what is explicitly stated. To meet the DSM diagnostic criteria, these deficits must cause problems in social, academic, or occupational functioning, with onset during early development and must not be attributable to a **neurological impairment*, **autism spectrum disorder*, **attention-deficit/hyperactivity disorder*, **social anxiety disorder*, or **intellectual developmental disorder*. [From Greek *pragma* a deed + *-ikos* of, relating to,

*****ebook converter DEMO Watermarks*****

resembling, or alluding to **pragmatics*, the social and behavioural aspects of practical language usage]

social psychology *n.* The branch of psychology devoted to social behaviour in all its forms, including **altruism*, **attitudes*, social **compliance*, **conformity*, **obedience* to authority, **person perception*, **attribution* processes, **group dynamics*, **group polarization*, and **non-verbal communication*. See also LIBERATION PSYCHOLOGY, SOCIAL CONSTRUCTIONIST PSYCHOLOGY, SOCIAL NEUROSCIENCE.

social psychophysiology *n.* Another name for **social neuroscience*.

social quotient *n.* An index of social maturity, based on the ratio definition of the intelligence quotient or **IQ*, the social quotient being defined as **social age* divided by **chronological age*, the ratio then being multiplied by 100. Hence $SQ = (SA/CA) \times 100$. See also VINELAND SOCIAL MATURITY SCALE. **SQ** *abbrev.*

social skill *n.* Any **skill* necessary for competent social interaction, including both **language* (1) and **non-verbal communication*. See also CYRANOID, SOCIAL SKILLS TRAINING.

social skills training *n.* Any of a number of techniques, often involving practice, feedback, modelling, and **assertiveness training*, for teaching the complex patterns of behaviour involved in forms of social interaction such as holding conversations, dating, and being interviewed. Also called *communication skills training*. **SST** *abbrev.*

sociobiology *n.* The study of the biological bases of social behaviour. The term was popularized by the US biologist Edward O(sborne) Wilson (born 1929) in the title of his book, *Sociobiology: The New Synthesis* (1975). See also EVOLUTIONARY PSYCHOLOGY. **sociobiological** *adj.* Pertaining to sociobiology. **sociobiologist** *n.* One who practises sociobiology.

sociodrama *n.* A technique of **group therapy* introduced by the Romanian-born US psychiatrist Jacob L(evy) Moreno (1892–1974) as an

adjunct to **psychodrama*. It differs from psychodrama in the greater importance it places on audience participation and its focus on problems likely to be common to all group members rather than just one. Group members act out the relevant conflicts in an effort to find their own solutions to the problems, while the director keeps the audience constantly involved. See also *DRAMA THERAPY*.

socio-economic class *n.* Another name for **class (1)*.

sociogram *n.* A chart showing the network of interrelationships in a social group. It is usually constructed by inviting the group members to indicate their choices (or rejections) of one another, in response to a question such as the following, used in a classic study of an air force squadron: *Which member of the squadron would you most like to have flying alongside you during combat?* On the resulting chart, each group member is represented by a circle, with an arrow pointing from each circle to another, indicating which individuals chose which others, and it typically contains one or more *stars* (chosen by many others), one or more *isolates* (chosen by few), and often one or more *cliques* of mutually chosen individuals. The process of mapping social networks in this way, called **sociometry*, was introduced by the Romanian-born US psychiatrist Jacob L(ey) Moreno (1892–1974), whose books *Who Shall Survive?* (1934) and *Sociometry, Experimental Method and the Science of Society* (1951) made his ideas available to a wide audience. See also *CLIQUE*, *ISOLATE (1)*. [From Latin *socius* a companion + Greek *gramme* a line]

sociolinguistics *n.* The study of interrelationship between language and its social context, especially the social and cultural factors affecting language.

sociology *n.* The study of human societies and the structures and processes within them. Classical sociology has been influenced by the writings of three social theorists in particular: the German political philosopher Karl Marx (1818–1883), who argued that economic modes and relations of production are the fundamental bases of the structures and ideologies within all societies, and who drew particular attention to the importance of class conflict in the functioning and change of societies; the French sociologist Émile Durkheim (1858–1917), who challenged the

*****ebook converter DEMO Watermarks*****

assumption that social processes can be understood in terms of the actions of individuals and argued that even **suicide*, apparently the ultimately individualistic act, cannot be fully explained at the purely individual level; and the German economist and sociologist Max Weber (1864–1920), who focused attention on the social implications of rationality, interpreting economics and law as forms of rational human action and religion as a model of non-rational action, and who classified types of authority and bureaucracy according to this distinction. **Social psychology* is studied in both sociology and psychology. [From French *sociologie* coined in 1837 by the French philosopher and mathematician Auguste Comte (1798–1857) in lectures that were incorporated in his six-volume *Cours de Philosophie Positive* (Positive Philosophy), from Latin *socius* a companion + *logos* word, discourse, or reason]

sociology of knowledge *n.* The study of the social origins of belief systems and (according to its proponents) **knowledge*. The German political philosophers Karl Marx (1818–83) and Friedrich Engels (1820–95) argued in *Die Deutsche Ideologie* (1846, The German Ideology) and elsewhere that people's ideologies, including their social and political beliefs and opinions, are rooted in their class interests, and more generally in the social and economic circumstances in which they live: 'It is men, who, in developing their material intercourse, change, along with this their real existence, their thinking and the products of their thinking. Life is not determined by consciousness, but consciousness by life' (*Marx-Engels Gesamtausgabe* 1/5). Under the influence of this doctrine, and of **phenomenology*, the Hungarian-born German sociologist Karl Mannheim (1893–1947) gave impetus to the growth of the sociology of knowledge with his *Ideologie und Utopie* (1929, translated in 1936 as *Ideology and Utopia*), although the term had been introduced five years earlier by the co-founder of the movement, the German philosopher and social theorist Max Scheler (1874–1928), in *Versuche zu einer Soziologie des Wissens* (1924, Attempts at a Sociology of Knowledge). A strong interpretation claims that all knowledge and beliefs are the products of socio-political forces, but this version is self-defeating, because if it is true, then it too is merely a product of socio-political forces and has no claim to truth and no persuasive force. Mannheim sought to escape this paradox by exempting free-floating intellectuals, whom he claimed were only loosely anchored in social traditions, relatively detached from the class system, and

capable of avoiding the pitfalls of total ideologies and of forging a ‘dynamic synthesis’ of the ideologies of other groups. *See also* [EPISTEMOLOGY](#), [SOCIOLOGY](#).

sociometry *n.* The quantitative study of the interrelations between the members of a social group, especially through the use of a [*sociogram](#). It was introduced by the Romanian-born US psychiatrist Jacob L(ey) Moreno (1892–1974) and became popular after the publication of his books *Who Shall Survive?* (1934) and *Sociometry, Experimental Method and the Science of Society* (1951). **sociometric** *adj.* [From Latin *socius* a companion + *metron* a measure]

sociopathy *n.* Another name for [*antisocial personality disorder](#). **sociopath** *n.* A person with sociopathy. *Compare* [PSYCHOPATHY](#). **sociopathic** *adj.* [From Latin *socius* a companion + *pathos* suffering]

sociosexuality *n.* The degree to which a person is willing to engage in sex without emotional ties. The term was introduced by the US sexologists Alfred Charles Kinsey (1894–1956), Wardell B(axter) Pomeroy (1913–2001), and Clyde E(ugene) Martin (born 1918) in their book, *Sexual Behavior in the Human Male* in 1948. In an article in the *Journal of Personality and Social Psychology* in 1991, the US psychologists Jeffrey A(lan) Simpson (born 1959) and Steven W. Gangestad (born 1957) presented an [*inventory](#) designed to measure individual differences in *sociosexual orientation*, as they called it. People with a restricted orientation typically insist on commitment and closeness in a relationship before engaging in sex with a romantic partner, whereas those with an unrestricted orientation are typically comfortable engaging in sex without commitment or closeness. People with an unrestricted sociosexual orientation typically report that they enjoy sex without commitment, have had several different sexual partners in the past year, and have engaged in sex with partners once and only once on several different occasions. *See also* [SENSATION SEEKING](#). **sociosexual** *adj.* [From Latin *socius* a companion + *sexualis* relating to sex, from *sexus* sex + *-alis* of or relating to]

sodium *n.* A silvery-white, alkaline, metallic element that occurs abundantly in the form of sodium chloride (as in sea water and common table

*****ebook converter DEMO Watermarks*****

salt) and is required to maintain the electrolyte balance in living cells, also playing an important part in the transmission of nerve impulses and in muscle contractions. *See also* [SODIUM CHANNEL](#), [SODIUM PUMP](#). **Na** *abbrev.* [From Latin *soda* sodium carbonate + *-ium* indicating a metallic element]

sodium channel *n.* A [*cation](#) channel, such as one of the pores in the [*rods](#) and [*cones](#) of the retina that is kept open by the substance [*cyclic GMP](#) and consequently has an unusually low [*resting potential](#) of approximately -50 millivolts in the dark, but when molecules of visual pigment are stimulated by light they activate the enzyme [*transducin](#), which in turn inactivates cGMP so that the pores close and the cell becomes [*hyperpolarized](#). *See also* [DRAVET SYNDROME](#), [ION CHANNEL](#), [SAXITOXIN](#).

sodium current *n.* The flow of sodium through the sodium channels of a cell membrane.

sodium glutamate *n.* Another name for [*monosodium glutamate](#).

sodium inactivation *n.* The momentary interruption of the activity of the [*sodium](#) pump during an [*action potential](#).

Sodium Pentothal *n.* A proprietary name for the barbiturate drug [*thiopental](#) (thiopentone). *See also* [TRUTH DRUG](#). [Trademark]

sodium-potassium pump *n.* Another name for the [*sodium pump](#).

sodium pump *n.* A mechanism for expelling positively charged sodium [*ions](#) from inside a neuron, where large negatively charged particles (anions) are trapped by the membrane, across the semipermeable cell membrane to the extracellular fluid, to maintain the interior concentration of positively charged ions far below that of the exterior. When an [*action potential](#) occurs, sodium ions are transferred to the inside of the cell, and after an action potential the process of pumping them out is necessary to maintain the [*resting potential](#) of the neuron. The mechanism simultaneously drives positively charged potassium ions from the extracellular fluid, where their concentration is low, to the intracellular fluid, where their concentration is high, but this occurs at a

lower rate than the outward transfer of sodium ions. Because the pumping process is a form of ***active transport** against the electrochemical gradient resulting from ***osmotic pressure**, it requires energy, which is supplied by the hydrolysis of ***ATP** by certain enzymes that are themselves sometimes called pumps. Also called the *sodium-potassium pump* or $\text{Na}^+ - \text{K}^+$ pump.

soft drug *n.* An imprecise term for a drug such as cannabis or LSD that is not addictive. *See also* **GATEWAY DRUG**. *Compare* **HARD DRUG**.

softening of the brain *n.* A non-technical name for ***encephalomalacia**.

soft sign *n.* A slight abnormality of speech, gait, posture, or behaviour observed during a ***neurological** examination and judged to be indicative of a mild neurological impairment. Also called an *equivocal sign*. *Compare* **HARD SIGN**.

solar retinopathy *n.* Damage to the ***retina** caused by looking at the sun. *See also* **SCOTOMA**.

solecism *n.* 1. A grammatical error or non-standard sentence construction. 2. Any error, mistake, impropriety, breach of etiquette, or departure from good manners. [From Greek *soloikos* speaking incorrectly, from *Soloi* an Athenian colony where a corrupt form of the Attic dialect of Greek was spoken + *oikizein* to colonize]

soluble RNA *n.* Another name for ***transfer RNA**.

solvent *n.* Any substance that is capable of dissolving another.

solvent abuse *n.* Self-intoxication by the deliberate inhalation of volatile ***solvents** such as toluene that are found in many common household products. Preferred usage *solvent misuse*. *See also* **GLUE-SNIFFING**, **INHALANT**, **INHALANT-RELATED DISORDERS**.

soma *n.* 1. The central part of a neuron or other cell containing the ***nucleus**

(1) and other structures that keep the cell alive, as distinct from a cell **process* (2). Also called a *cell body*. 2. The body of an organism as distinct from its mind, or (in physiology and genetics) as distinct from its **germ cells*. **somata** *pl.* **somatic** *adj.* [From Greek *soma* a body]

somaesthesia *n.* A generic term for bodily sensations, including the **cutaneous senses*, **proprioception*, and **kinaesthesia*. US *somesthesia*. Also called *somaesthesia* or *somesthesia*. [From Greek *soma* a body + *aisthesis* sensation, from *aisthanesthai* to feel]

somaesthetic association area *n.* Another name for the somatosensory association area (see *SOMATOSENSORY CORTEX*). US *somesthetic association area*. [From Greek *soma* a body + *aisthesis* sensation, from *aisthanesthai* to feel]

somaesthetic cortex *n.* Another name for the primary **somatosensory cortex*. US *somesthetic cortex*. [From Greek *soma* a body + *aisthesis* sensation, from *aisthanesthai* to feel + Latin *cortex* bark or outer layer]

somatic *adj.* 1. Of or relating to the body as distinct from the mind. 2. Of or relating to the cell body or **soma* (1). [From Greek *somatikos* of or relating to the body, from *soma* a body + *-itikos* resembling or marked by]

somatic cell *n.* A body cell as opposed to a **germ cell*.

somatic compliance *n.* In **psychoanalysis*, the involvement of the body in the expression of symptoms of **hysteria* and other **neurotic* (1) disorders. Sigmund Freud (1856–1939) introduced the concept in his celebrated case study of ‘Dora’ entitled ‘Fragment of an Analysis of a Case of Hysteria’ (1901/5): ‘Every hysterical symptom involves the participation of *both* sides. It cannot occur without the presence of a certain degree of *somatic compliance* offered by some normal or pathological process in or connected with one of the bodily organs’ (*Standard Edition*, VII, pp. 7–122, at p. 40, italics in original). [From Greek *soma* a body + *-ikos* of, relating to, or resembling]

somatic delusion *n.* A ***delusion** regarding the functioning or appearance of one's body, such as the unfounded belief that one's skin, mouth, vagina, or anus emits a foul smell, that one is infested with insects or parasites, that certain body parts are deformed or unsightly, that one is pregnant when one is not, or that an internal organ is not functioning properly. [From Greek *somatikos* of or relating to the body, from *soma* a body + *-itikos* resembling or marked by]

somatic delusional disorder *n.* A type of ***delusional disorder** in which the central delusion is a ***somatic** delusion.

somatic hallucination *n.* A ***hallucination** of a physical state or event within the body, such as an electrical impulse running down one's arms or an object inside one's chest.

somatic marker hypothesis *n.* The idea that people are influenced by somatic markers—physiological reactions such as ***skin conductance responses**—in ***decision-making** situations, even before consciously evaluating alternatives or forming judgements of the relevant ***expected utilities**. According to this hypothesis, decisions are arrived at through the interplay of two processes, the first deliberative and rational, tending to favour alternatives yielding optimal rewards, and the second largely subconscious, affect-driven, and influenced by physiological reactions that tend to override deliberative decisions involving ***deferred gratification**. The hypothesis was put forward by the US-based Portuguese neurologist and neuroscientist Antonio R. Damasio (born 1944) and two colleagues in a book chapter in 1991 and developed further in Damasio's book *Darwin's Error: Emotion, Reason and the Human Brain* (1994). According to Damasio, somatic markers are controlled by the ***ventromedial cortex**. See also **IOWA GAMBLING TASK**. **SMH** abbrev.

somatic nervous system *n.* The division of the ***nervous** system devoted to ***sensation** from external sense organs and control of ***skeletal muscles**. Compare **AUTONOMIC NERVOUS SYSTEM**. **SNS** abbrev.

somatic receptor *n.* A ***sensory** receptor mediating a ***cutaneous sense**,

**kinaesthesia*, or **proprioception*. Also called a *somatoreceptor*. [From Greek *soma*, *somat-* a body + English *receptor*]

somatic sensory cortex *n.* Another name for the **somatosensory cortex*.

somatic symptom disorder *n.* A term introduced in **DSM-5* to replace **somatization disorder*, **hypochondriasis*, and other related terms used in DSM-IV. It is a disorder characterized by one or more **somatic* symptoms that are sufficiently distressing to interfere with everyday life, accompanied by excessive focus on and anxiety associated with the symptoms, persistent worry about health, and excessive devotion of time and energy to the symptoms. The symptoms may or may not be associated with another medical condition. *Compare* BODY DYSMORPHIC DISORDER, GENERALIZED ANXIETY DISORDER, ILLNESS ANXIETY DISORDER, OBSESSIVE—COMPULSIVE DISORDER, PANIC DISORDER.

somatization disorder *n.* A term used in **DSM-IV* for what was later called **somatic symptom disorder*. [From Greek *soma* body + *-izein* cause to become or to resemble]

somatoform disorders *n.* In **DSM-IV*, a category of **mental disorders* characterized by **somatic* symptoms suggestive of a **general medical condition*, but without independent evidence of any diagnosable general medical condition, and not produced intentionally, but causing clinically significant distress or impairment in social, occupational, or other areas of functioning. In DSM-5 this term was replaced by **somatic symptom disorder*. *See* BODY DYSMORPHIC DISORDER, CONVERSION DISORDER, HYPOCHONDRIASIS, PAIN DISORDER, PSEUDOCYCLIS, SOMATIZATION DISORDER, UNDIFFERENTIATED SOMATOFORM DISORDER. *Compare* COMPENSATION NEUROSIS, FACTITIOUS DISORDERS, MALINGERING. [From Greek *soma* body + Latin *forma* form]

somatosensory association area *See* SOMATOSENSORY CORTEX.

somatosensory cortex *n.* Areas of the **cerebral* cortex, namely the primary somatosensory cortex, the secondary somatosensory area, and the
*****ebook converter DEMO Watermarks*****

somatosensory association area, devoted to processing information from the **somatic* receptors. The primary somatosensory cortex, also called the *somaesthetic cortex*, occupying the **postcentral gyrus* immediately behind the central sulcus of the temporal lobe in both cerebral hemispheres, is an area in which parts of the body are mapped contralaterally, with disproportionately large representations of hands, lips, and tongue. The small secondary somatosensory area in the parietal lobes responds specifically to **painful* stimuli relayed by the peripheral nervous system. The somatosensory association area, also called the *somaesthetic association area* or the *supplementary sensory area*, lies just behind the primary somatosensory cortex and provides a basis for **stereognosis*. Also called the *somatic sensory cortex*. See also CUTANEOUS SENSE, SENSORIMOTOR CORTEX, SOMATOSENSORY HOMUNCULUS. [From Greek *soma*, *somat-* a body + Latin *sensorius* of the senses, from *sensus* felt, from *sentire* to sense]

somatosensory homunculus *n.* A standard depiction of the primary **somatosensory cortex* of each cerebral hemisphere as a human figure lying supine along the **postcentral gyrus* immediately behind the central sulcus with its toes deep in the longitudinal fissure towards the midline of the brain (see *illustration*). Each part of the figure represents the area of the somatosensory cortex receiving sensations from the corresponding (contralateral) part of the body, and it has disproportionately large hands, lips, and tongue, which gives it a grotesque appearance. The best known version was developed by the US-born Canadian neurosurgeons Wilder Graves Penfield (1891–1976) and the US neurologist Theodore B(rown) Rasmussen (1910–2002) and published in their book *The Cerebral Cortex of Man* in 1950. Also called a *sensory homunculus*. See also HOMUNCULUS. [From Latin *homunculus* a little man, diminutive of *homo* a man]

Somatosensory homunculus. A version adapted from Penfield and Rasmussen's *The Cerebral Cortex of Man* (1950).

somatostatin *n.* A peptide hormone that inhibits the release of ***growth hormone** by the anterior pituitary and ***insulin** by the pancreas. *Compare* GROWTH HORMONE RELEASING HORMONE.

somatotrophin *n.* Another name for ***growth hormone**. Also spelt *somatotropin*. [From Greek *soma*, *somat-* a body + *trophe* nourishment + *-in(e)* indicating an organic compound]

somatotrophin-releasing hormone *n.* Another name for ***growth hormone releasing hormone**. Also spelt *somatotropin-releasing hormone*. **STRH** *abbrev.*

somatotrophin release inhibiting factor *n.* Another name for ***somatostatin**. Also spelt *somatotropin release inhibiting factor*. **SRIF** *abbrev.*

somatotype *n.* Any of the types of human physique or body build distinguished within a classificatory scheme, sometimes associating specific physical types with corresponding psychological types. See **CONSTITUTIONAL PSYCHOLOGY**. See also **ASTHENIC BODY TYPE**, **ATHLETIC BODY TYPE**, **DYSPLASTIC BODY TYPE**, **PYKNIC BODY TYPE**. **somatotypology** *n.* The study of somatotypes. [From Greek *soma* a body + *typos* a mark]

Somers' D *n.* In descriptive statistics, an asymmetric index of association, closely related to the gamma statistic, between an ***independent variable** and a ***dependent variable** measured on ***ordinal scales** with ties allowed. If two pairs of scores are examined, they must either be concordant, in the sense that the one ranked higher than the other on the independent variable is also ranked higher than the other on the dependent variable, or discordant. Somers' *D* is defined as the difference between the number of concordant pairs and the number of discordant pairs divided by the total number of pairs not tied on the independent variable, and it ranges from -1 to +1. See also **KENDALL'S TAU**. [Named after the US sociologist and statistician Robert Hough Somers (1929–2004) who developed it in 1962]

somesthesis See **SOMAESTHESIS**.

somesthetic See **SOMAESTHETIC**.

somnambulism *n.* Another name for ***sleepwalking**. **somnambulist** *n.* One who engages in somnambulism or sleepwalking. [From Latin *somnus* sleep + *ambulare* to walk]

sonar *n.* Any device or system for detecting or locating objects by

***echolocation**, especially such devices on submarines and the systems of ***biosonar** used by some organisms. [From *so(und)na(vigation and)r(anging)*]

sone *n.* A unit of loudness equivalent to 40 ***phons**. [From Latin *sonus* a sound]

sonic shadow *n.* An area of reduced sound intensity around the ear that is further from a sound source, as a result of reflection and absorption of sound waves by the head, leading to a binaural difference in loudness that is used as a ***cue (2)** for localizing sounds above about 1,000 hertz (about two octaves above Middle C), which have wavelengths shorter than the diameter of the head, but not for longer waves that bend round the head and do not produce sonic shadows. It is less accurate than localization based on ***transient disparity** and ***phase** delay, except for very high-pitched sounds with frequencies above 8,000 hertz, when the ***pinna** becomes effective as a focusing device. Animals with very small heads, such as rodents, cannot use transient disparity or phase delay, because the time differences are too tiny to be detected accurately, but their ears are sensitive to very high-pitched sounds whose wavelengths are shorter than the diameter of their heads, which enables them to use sonic shadows to locate sounds. Also called a *binaural intensity difference*, an *interaural intensity difference*, or a *sound shadow*. See also **BINAURAL RATIO**, **BIOSONAR**, **CONE OF CONFUSION**, **SOUND LOCALIZATION**.

sorites *n.* A string of ***syllogisms** in which the conclusion of each forms a premise of the next, arranged with the intermediate conclusions omitted and only the final conclusion stated explicitly. For example: *All true believers shall be saved; Anyone who is saved must be free from sin; Anyone who is free from sin is innocent in the eyes of God; All those who are innocent in the eyes of God go to heaven when they die; Therefore, all true believers go to heaven when they die.* See also **SORITES PARADOX**. **soritical** or **soritic** *adj.* [From Greek *soreites* heaped, from *soros* a heap]

sorites paradox *n.* A sophistical argument in the form of a ***sorites**, the most familiar example being the following. One grain of sand is clearly not a heap of sand, and the addition of one grain to something that is not a heap can never transform it into a heap; therefore there can never be a heap of sand, and it would be futile to try to make one. A similar argument can be used to

*****ebook converter DEMO Watermarks*****

prove that no man is bald or that no one is old. It is considered by some to be a **paradox* but is more correctly classified as a fallacy.

Sotos syndrome *n.* Another name for **cerebral* gigantism, often spelt incorrectly as *Soto's syndrome*. [Named after the US paediatrician Juan Fernandez Sotos (born 1927) who, with four colleagues, first described it in 1964]

soul talk *n.* A non-technical name for **Black English Vernacular*.

sound localization *n.* The perception of the position of a sound source in space. Sounds below about 1,000 hertz (about two octaves above Middle C) are located in the horizontal plane by momentary *binaural time differences* called **transient disparity* and **phase* delay, and high-pitched sounds are located through *binaural intensity differences* called **sonic shadows*. Humans have a **minimum audible angle* in the horizontal plane of about 2 degrees, but like other terrestrial animals are not good at locating sound in the vertical dimension, whereas the barn owl, which hunts fieldmice and other prey in total darkness, can locate sound sources to within about one degree in both the horizontal and vertical dimensions (azimuth and elevation), more accurately than any other species that has been tested, its left ear pointing downwards and its right ear upwards to aid localization in the vertical dimension. Also called *auditory localization* or *auditory space perception*. See also AUDIOGRAVIC ILLUSION, AUDITORY RECEPTIVE FIELD, BIOSONAR, CONE OF CONFUSION, PSEUDOPHONE, SUPERIOR OLIVARY NUCLEUS, TRAPEZOID BODY.

sound pressure level *n.* The absolute intensity of a sound in decibels relative to a reference level of 10^{-16} W/cm² (watts per square centimetre), slightly below the average human **absolute threshold* for a sound of 1,000 hertz (about two octaves above Middle C). Thus a sound of 60 dB SPL is 60 dB higher than the reference level and has an intensity of 10^{-10} W/cm², and a doubling or halving of absolute sound intensity always corresponds to a change of 3 dB. See also DECIBEL. **SPL** abbrev.

sound shadow *n.* Another name for a **sonic shadow*.

sound spectrogram *n.* A diagram produced by a ***sound spectrograph** showing the intensities of the frequency components of a sound as a function of time, with time represented on the horizontal axis, frequency on the vertical axis, and intensity by the darkness of the line. Often called a *speech spectrogram* when representing speech sounds. [From Latin *spectrum* a spectacle, from *spectare* to watch, from *specere* to look at + Greek *gramme* a line]

sound spectrograph *n.* An electronic device incorporating a large number of sound ***filters** (2), each responsive to a narrow band of frequencies, used for producing ***sound spectrograms**. Also called a *speech spectrograph* when used to analyse speech sounds. See also **VOICEPRINT**.

sound spectrum *n.* The distribution of ***pure tones** in a sound wave, usually represented as a plot of power or ***amplitude** as a function of frequency. See also **SOUND SPECTROGRAM**.

sour *n.* One of the primary tastes in ***Henning's tetrahedron**, the characteristic taste of vinegar or lemon juice.

source amnesia *n.* A form of ***amnesia** in which information is remembered, but the person who remembers it is unable to recall where, from whom, or how the information was obtained.

source memory *n.* Memory for where, from whom, or how certain knowledge or information was acquired. For example, a person who knows that all insects have six legs, and also remembers learning this fact from *Gardeners' Question Time* on the radio while driving to a family gathering on Christmas day in 1995, has excellent source memory for this particular item of knowledge. ***Reality monitoring** is a special form of source memory that involves distinguishing between genuine external sources and one's own imagination as sources of information.

source of instinct See **INSTINCTUAL SOURCE**.

space-time illusion *n.* An ***illusion** in which perception of space

interferes with perception of time or vice versa. See [KAPPA EFFECT](#), [TAU EFFECT](#).

Spanish fly *n.* Another name for [*cantharides](#).

span of apprehension *n.* The number of items that a person can apprehend or grasp at one time, which in turn determines the number of items that can be stored in [*short-term memory](#). Also called an *attention span* or a *span of attention*. See also [CHUNKING](#), [ICONIC STORE](#), [MAGICAL NUMBER SEVEN](#), [SUBITIZE](#). **SOA** *abbrev.*

spasm *n.* An involuntary muscular contraction, such as a [*tic](#), a [*convulsion](#), or a hiccup. See also [AGENESIS OF THE CORPUS CALLOSUM](#). **spasmodic** *adj.* Of, relating to, or occurring in spasms. [From Greek *spasmos* a cramp]

spasmodic torticollis *n.* A [*psychogenic](#) condition characterized by sustained or episodic [*spasms](#) of the neck muscles, causing the head to be twisted out of alignment. Also called *torticollis*, *wryneck*. [From Greek *spasmos* a cramp + Latin *tortus* twisted + *collum* neck]

spasmophemia *n.* A form of [*aphasia](#) in which speech is impaired by [*spasms](#) of the muscles in the [*vocal tract](#), causing stammering or laboured speech. [From Greek *spasmos* a cramp + *phanai* to speak + *-ia* indicating a condition or quality]

spastic *n.* 1. A derogatory term for a person afflicted by [*spasms](#), especially one with [*cerebral](#) palsy. *adj.* 2. Afflicted by or resembling [*spasms](#). [From Greek *spastikos* of or relating to spasms, from *spasmos* a cramp + *-ikos* of, relating to, or resembling]

spastic paralysis *n.* Permanent contraction of a muscle or group of muscles caused by damage to the [*motor cortex](#).

spastic speech *n.* Another name for [*spasmophemia](#).

spatial ability *n.* The capacity to perform tasks requiring the mental

manipulation of spatial relationships, such as **mental rotation*, **mirror drawing*, map-reading, or finding one's way around an unfamiliar environment. *See also* AGNOSIA, COGNITIVE MAP, CORSI BLOCKS, MOZART EFFECT, PRIMARY MENTAL ABILITIES.

spatial frequency *n.* The inverse of the wavelength in a visual image that has been transformed into a **sinusoidal* grating of varying **luminance*, a high spatial frequency capturing fine detail and a low spatial frequency coarse detail in the image, the luminance variation across any image being decomposable into sinusoidal components by **Fourier analysis*. *See also* CONTRAST SENSITIVITY FUNCTION, HYBRID IMAGE, PRIMAL SKETCH, SINUSOIDAL GRATING. *Compare* FREQUENCY (1).

spatial neglect *n.* A **neurological* disorder characterized by a partial or complete lack of awareness of sensory information in (usually) one half of the **visual field*. It is possible for a person to be totally blind in half the visual field without being aware of this fact, though it is easily demonstrated by the **line bisection test*. Lesions in either of the **cerebral* hemispheres in the **visual cortex* or secondary somatosensory area (see SOMATOSENSORY CORTEX) are usually responsible for spatial neglect on the opposite side. Also called *unilateral neglect*, or *unilateral spatial neglect*. *See* HOMONYMOUS HEMIANOPIA.

spatial summation *n.* The simultaneous action of two or more **afferent* neurons that combine additively to produce a **graded potential* in a **postsynaptic* neuron and that may cause it to transmit a nerve impulse or **action potential* that could not be generated by impulses from a single neuron. *See also* GRADED POTENTIAL. *Compare* TEMPORAL SUMMATION.

speaking in tongues *n.* A non-technical name for **glossolalia*.

Spearman rank correlation coefficient *n.* In statistics, a correlation coefficient computed on scores that consist of or have been converted to **ranks*. It is mathematically equivalent to the **product-moment correlation coefficient* after converting the raw scores to ranks. Also called *rho*. Symbol: ρ . *See also* CORRELATION. [Named after the English statistician and psychologist Charles Spearman (1863–1945) who devised it]

*****ebook converter DEMO Watermarks*****

Spearman's rho *n.* Another name for the **Spearman rank correlation coefficient*. [Named after the English statistician and psychologist Charles Spearman (1863–1945) who devised it and *rho* (ρ), the seventeenth letter of the Greek alphabet, which is used to symbolize it]

Special K *n.* A common street name for the drug **ketamine*.

speciation *n.* The process of evolutionary divergence whereby new **species* are formed. *See also* ISOLATING MECHANISM.

species *n.* A **taxonomic* group containing individuals capable of interbreeding and producing fertile offspring. A species is a subdivision of a **genus*, and it may contain one or more **subspecies*, **varieties*, or **races* (2). By convention, following the system put forward by the Swedish botanist Carolus Linnaeus (1707–78) in his book *Systema Naturae* (1737), a species is always given a double name, comprising the generic name with an upper-case initial letter followed by the specific name with a lower-case initial letter, like an entry in a telephone directory comprising a surname followed by a first name, hence *Cannabis sativa*, the common hemp plant, or *Homo sapiens*, the human species. *See also* GENUS. **species** *pl.* **specific** *adj.* [From Latin *species* appearance or kind, from *specere* to look]

speciesism *n.* The belief in the intrinsic superiority of the human **species* over all others, often accompanied by an assumption that human beings are therefore justified in exploiting non-human animals for their own advantage. *Compare* ABLEISM, AGEISM, ETHNOCENTRISM, FATTISM, HETEROSEXISM, RACISM, SEXISM. **speciesist** *n.* 1. One who advocates or practises speciesism. *adj.* 2. Of or relating to speciesism. [Coined from *species* on the model of *racism*]

species-specific *adj.* Of or relating to a characteristic, trait, or pattern of behaviour that is peculiar to a species. **species specificity** *n.* The quality of being species-specific.

specific anosmia *n.* A selective inability to smell a particular odorant. *See also* ANOSMIA, CACOSMIA, DYSOSMIA, HYPEROSMIA, HYPOSMIA, PAROSMIA.

specific developmental disorder *n.* Any disorder in which some distinctive and circumscribed ability or function fails to develop properly from an early age, the deficit not being attributable to any other disorder.

specific developmental disorder of language *n.* A term sometimes used (in **ICD-10* and elsewhere) to refer to a **specific learning disorder*, the deficit not being attributable to neurological or sensory impairment, **intellectual disability*, or environmental deprivation. See LANGUAGE DISORDER, READING DISORDER, SPECIFIC DISORDER OF ARITHMETIC SKILLS, SPECIFIC SPELLING DISORDER.

specific developmental dyslexia *n.* Another name for **reading disorder*.

specific disorder of arithmetic skills *n.* A **specific learning disorder* characterized by a significant impairment in arithmetic skills (addition, subtraction, multiplication, and division) that is not explicable by **intellectual disability* or inadequate schooling. See also ACALCULIA, DYSCALCULIA.

specific hunger *n.* A craving for a particular food or nutrient, especially one in which the body is deficient, the most obvious and well-established example being specific hunger for salt.

specific language disability *n.* Any **specific learning disorder* associated with language. See LANGUAGE DISORDER.

specific learning disability *n.* Another name for a **specific learning disorder*. SLD *abbrev.*

specific learning disorder *n.* A **neurodevelopmental disorder*, introduced in **DSM-5*, characterized by learning and academic difficulties such as inaccurate or slow reading, difficulty in understanding what is read, or difficulty with spelling, grammar, or numerical or mathematical ideas. To meet the DSM-5 diagnostic criteria, the problems must have persisted for at least six months despite remedial interventions, and the academic skills must

be substantially below age norms and must interfere significantly with academic or occupational performance or everyday life, the learning difficulties must have begun during school-age years, and the condition must not be due to vision or hearing problems, to [*intellectual disability](#) or any other mental or neurological disorder, or to language problems or inadequate schooling. According to DSM-5, the [*prevalence](#) of this disorder is between 5 and 15 per cent among school-age children across languages and cultures. *Compare* [ATTENTION-DEFICIT/HYPERACTIVITY DISORDER](#). **SLD** *abbrev.*

specific nerve energies *n.* The doctrine formulated in 1826 by the German physiologist Johannes Peter Müller (1801–58), elaborated by him in 1838, and later firmly established by research, that the qualitative differences between visual, auditory, tactile, olfactory, and gustatory sensations are determined by the particular [*sensory](#) receptors that are stimulated.

specific phobia *n.* An [*anxiety disorder](#) in [*DSM-5](#) characterized by a [*phobia](#) in which the [*phobic stimulus](#) is a specific type of object (such as spiders), event (such as thunder), activity (such as flying), or situation (such as enclosed spaces), exposure to the phobic stimulus almost invariably triggering an anxiety response or [*panic attack](#) and being either avoided or tolerated only with intense anxiety or dread, the avoidance behaviour or anxious anticipation of it being out of proportion to the actual danger and interfering significantly with everyday life, occupational or academic performance, or social relationships. Some classifications (including DSM-5 and [*ICD-10](#)) exclude [*agoraphobia](#). According to DSM-5, the 12-month [*prevalence](#) of this disorder is between 7 and 9 per cent in the US and Europe but significantly lower (between 2 and 4 per cent) in Asian, African, and Latin American countries. A comprehensive table of phobias and phobic stimuli is provided in Appendix I at the back of this dictionary. *Compare* [AGORAPHOBIA](#), [OBSESSIVE—COMPULSIVE DISORDER](#), [PANIC DISORDER](#), [SEPARATION ANXIETY DISORDER](#), [SOCIAL ANXIETY DISORDER](#).

specific spelling disorder *n.* A [*specific learning disorder](#) characterized by a significant impairment in the development of spelling skills without any history of [*reading disorder](#), the [*deficit](#) not being attributable to [*neurological](#) or [*sensory](#) impairment, [*intellectual disability](#), or environmental deprivation.

*****ebook converter DEMO Watermarks*****

spectral colour *n.* Any colour found in the **visible spectrum*, thus excluding colours such as purple (a mixture of red and blue). US *spectral color*. Also called a *spectral hue*. Compare *NON-SPECTRAL COLOUR*.

spectrogram *n.* A graphic representation of a **spectrum*. A graphic representation of the frequency components in a speech sound as a function of time is called a **speech spectrogram*. [From Latin *spectrum* a spectacle, from *spectare* to watch, from *specere* to look at + Greek *gramme* a line]

spectrum *n.* Any distribution of values across a range, especially the range of colours produced by passing white light through a **prism* or a **diffraction grating*, the **visible spectrum* extending from a wavelength of about 390 nanometres at the short end to about 740 nm at the long end. Perceived colour depends on the balance of wavelengths across the whole visual field, and most people who are asked what colours they can see in a spectrum name the **psychological primaries* red, yellow, green, and blue, but the following breakdown and labelling has become conventional: red, 740–620 nm; orange, 620–585 nm; yellow, 585–575 nm; green, 575–500 nm; blue, 500–445 nm; indigo, 445–425 nm; violet, 425–390nm. This sevenfold breakdown can be traced to the English physicist and mathematician Sir Isaac Newton (1642–1727), who first studied the spectrum scientifically in 1666 and who attributed magical properties to the number seven, which he pointed out was also the number of notes in a (**diatonic*) musical scale. See also *CATEGORICAL PERCEPTION*, *INFRA-RED*, *METATHETIC STIMULUS DIMENSION*, *SOUND SPECTRUM*, *SPECTRAL COLOUR*, *ULTRAVIOLET*. **spectral** *adj.* [From Latin *spectrum* a spectacle, from *spectare* to watch, from *specere* to look at]

SPECT scan *abbrev.* Single photon emission computed tomography, a technique of **brain* imaging similar to a **PET scan*, also indicating **regional cerebral blood flow*, but using longer-lived radioactive isotopes and producing less clearly defined images than a PET scan, though at much lower cost because it does not require the use of an on-site cyclotron. Also written *SPET scan*, probably to resemble *PET scan*. Compare *RADIOISOTOPE SCAN*.

speech act *n.* A verbal utterance defined in terms of its content, the intention of the speaker, and the effect on the listener. A speech act necessarily involves a **locutionary act* and may or may not involve an
*****ebook converter DEMO Watermarks*****

***illocutionary act** and a ***perlocutionary act**. The term was introduced in 1961 by the English philosopher John Langsham Austin (1911–60).

speech apraxia *n.* A form of speech ***impairment** resulting not from any language deficit but from difficulty in making the required voluntary movements of the tongue, lips, and lower jaw. *See also* **APRAXIA**.

speech sound disorder *n.* In ***DSM-5**, a ***communication disorder** characterized by persistent difficulty expressing speech sounds, affecting intelligibility of speech, and consequent impairment of social, academic, or occupational functioning. Onset is during development, and to meet the diagnostic criteria, these difficulties must not be due to ***cerebral palsy**, ***deafness**, or any other medical or ***neurological** condition. In the general population, the speech of most children is intelligible by age 4 years, and that of 50 per cent is intelligible by age 2 years. *Compare* **DYSARTHRIA**, **SELECTIVE MUTISM**. **SSD** *abbrev.*

speech spectrogram *n.* A graph of the spectrum of speech sounds produced by a ***sound spectrograph**, called a *speech spectrograph* when used for this purpose, showing sound ***frequency** on the vertical axis and time on the horizontal axis (see **illustration**). It was claimed in the 1960s that voiceprints are as distinctive as fingerprints, and people were convicted in courts of law on the evidence of voiceprint identification. Experiments subsequently established that the technique is less reliable than had originally been thought, and much less reliable than fingerprints or genetic fingerprints. *See also* **SOUND SPECTROGRAM**. [From Latin *spectrum* a spectacle, from *spectare* to watch, from *specere* to look at + Greek *gramme* a line].

Speech spectrogram. This shows a spectrogram of a person uttering the word 'formant'.

speech stretcher *n.* A device that produces slowed but otherwise undistorted recordings of sounds, especially human speech.

speech synthesizer *n.* A device that generates sound waves of varying frequency and intensity. It can be used to simulate the production of human speech, making possible experiments on the perception of speech sounds, and enabling people who are paralysed to communicate verbally.

speed *n.* A common street name for **amphetamine*, **methamphetamine*, and other closely related drugs. [So called because of their stimulant effects]

speed-accuracy trade-off *n.* The tendency for increased speed of performance to lead to more errors.

speedball *n.* A street name for a drug consisting of **cocaine* hydrochloride mixed with **heroin*.

speed test *n.* Any test in which the rapidity of responses, rather than their accuracy, is measured. *Compare* *ACCURACY TEST*, *POWER TEST*.

spell *n.* A **culture-bound syndrome* widespread in sub-Saharan Africa and among African American and Latino communities in the southern United States and elsewhere, characterized by brief episodes of personality change during which the person experiencing the spell believes that some form of communication is taking place with dead relatives or their spirits. A person with this pattern of experiences is endowed locally with dignity and respect, and usually considers it a privilege resulting from being appointed by dead ancestors as a diviner; hence this disorder is distinguished sharply from **ufufunyane*, which is feared and despised and is associated with evil spirits. Also (in southern Africa) called *thwasa*. [From Old English *spell* speech, from *spellian* to speak or announce]

spelling disorder See *SPECIFIC SPELLING DISORDER*.

spelling dyslexia *n.* A form of **dyslexia*, also called *letter-by-letter reading*, usually not accompanied by **dysgraphia*, in which reading proceeds literally letter by letter and is therefore slow and manifests grave impairment. It is caused by a lesion in the left **fusiform gyrus*. See also *SIMULTANAGNOSIA*.

spermatozoon *n.* A male **gamete* or reproductive cell, with a small, flattened head, a long neck, and a very long tail in the form of a whiplike **filament* that provides motility, large numbers of which are contained in the semen that is **ejaculated* during **coitus* although only one at most can penetrate and fertilize the much larger female ovum. **spermatozoa** *pl.* See also *ZYGOTE*. [From Greek *sperma*, *spermatos* seed, from *speirein* to sow]

SPET scan *abbrev.* Another name for a **SPECT scan*. [Presumably to emphasize its relation to a PET scan]

spherical aberration See *ABERRATION (3)*.

sphincter pupillae *n.* The muscle that expands the **iris* and thereby constricts the **pupil* of the eye. Compare *DILATOR PUPILLAE*. [From Greek *sphinkter* a tightener, from *sphingein* to bind tight + Latin *pupillae* of the pupil, from *pupilla* a pupil, diminutive of *pupa* a girl or a doll, alluding to the tiny reflection in the eye]

spicy odour *n.* One of the six primary odours in **Henning's prism*, resembling the odour of cinnamon or nutmeg. US *spicy odor*.

spinal accessory nerve *n.* Another name for either of the pair of **accessory nerves* that supply muscles in the side and front of the neck, the shoulder, and the upper back.

spinal canal *n.* The channel down the middle of the spinal column or backbone containing the **spinal cord*.

spinal cord *n.* The thick band of nerve tissue that runs through the spinal canal and to which 31 pairs of **spinal nerves* are attached. The spinal cord and the brain together constitute the **central nervous system*. *See also* ANTERIOR HORN, BELL–MAGENDIE LAW, CENTRAL CANAL, CORTICOSPINAL TRACT, FUNICULUS, POSTERIOR HORN, PYRAMIDAL DECUSATION, SPINAL CANAL, SPINAL NERVE, SPINAL REFLEX, SUBSTANTIA GELATINOSA.

spinal nerve *n.* Any of the 31 pairs of nerves connected to the **spinal cord*, serving the striped muscles, the skin, and the autonomic nervous system, numbered according to the level at which they emerge: 8 cervical pairs, 12 thoracic, 5 lumbar, 5 sacral, and 1 coccygeal pair. *Compare* CRANIAL NERVE.

spinal reflex *n.* Any **reflex* arc that passes through the spinal cord but avoids the brain. *See also* STRETCH REFLEX.

spinal root *n.* The point of attachment of a **spinal nerve* to the **spinal cord*. *See* DORSAL ROOT, VENTRAL ROOT.

spindle *See* NUCLEAR SPINDLE, SLEEP SPINDLE, SPINDLE CELL.

spindle cell *n.* A type of neuron found in the sixth and deepest (fusiform) layer of the cerebral cortex, with two short **processes* (2) that divide into multiple long fibres. Also called a *fusiform cell*. [So called because it tapers at each end like a spindle]

spinning dancer illusion *n.* A ***movement illusion** based on an ***ambiguous figure**, first published and copyrighted in 2003 by the Japanese Flash designer Nobuyuki Kayahara (born 1972), in which a silhouette of a nude female dancer appears to be pirouetting either to her right or to her left, the absence of depth cues leaving her direction of rotation ambiguous. About two out of three viewers initially perceive her rotating to her right, but viewing the image for some time, or looking away and viewing it in ***peripheral vision**, usually causes her apparent direction of rotation to flip. Although it is widely promoted as a test of left-brain versus right-brain ***laterality** or ***cerebral dominance**, experimental research published in the journal *Perception* in 2010 by the German biologist Nikolaus F(riedrich) Troje (born 1960) and the psychologist Matthew McAdam, his undergraduate student, suggested instead that the direction of rotation depends on whether the viewpoint is assumed to be from slightly above or from slightly below, the human visual system usually being biased towards a viewpoint from above, probably because looking down is more common in everyday life than looking up. Also called the *silhouette illusion*.

spinocerebellar tract *n.* A bundle of nerve fibres connecting afferent nerve fibres in the spinal cord to the cerebellum.

spinocerebellum *n.* The functional area of the ***cerebellum** adjacent to both sides of the midline ***vermis**, including most of the anterior lobe, receiving inputs from the spinal cord and controlling posture and gait. Lesions in this area lead to ***gait ataxia** and impairment of posture. *See also* CEREBELLAR SYNDROME. *Compare* NEOCEREBELLUM, VESTIBULOCEREBELLUM.

spinoreticulothalamic system *n.* A system of nerve fibres connecting the spinal cord, reticular formation, and thalamus, thought to be involved in the processing of bodily sensations such as ***pain**.

spinothalamic tract *n.* A bundle of nerve fibres connecting each ***posterior** horn of the spinal cord to the opposite side of the ***thalamus**, carrying information about ***pain** and temperature and some information about touch. It is one of two major routes by which afferent spinal nerve fibres carrying sensations of ***somaesthesia** are transmitted to the ***thalamus**. *Compare* DORSAL COLUMN.

*****ebook converter DEMO Watermarks*****

spiny I *n.* A type of neuron with spiny projections on its **dendrites*, found abundantly in the **striatum*, projecting to the **globus pallidus* and **substantia nigra*.

spiral aftereffect *n.* The visual aftereffect that is induced by exposure to the **Plateau* spiral.

spiral ganglion cell *n.* Any of a large number of **bipolar* neurons that have their cell bodies just outside the **cochlea* of each ear and that transmit auditory information from the cochlea to the central nervous system via the **vestibulocochlear nerve*. [So called because they occupy the spiral-shaped cochlear canal]

spiral test *n.* In psychometrics, any test of aptitude, ability, or intelligence in which a number of items are presented in sequence, and then the sequence is repeated with more difficult instances of each item type, and so on, with each cycle containing more difficult items than the last.

spiroperidol *n.* A **neuroleptic* (1) drug belonging to the class of **butyrophenones* that blocks **dopamine* neuroreceptors and is used in the treatment of schizophrenia. *See also* DOPAMINE ANTAGONIST.

spite *n.* 1. An **emotion* of malicious ill will characterized by an urge to cause harm to another person, especially when this necessitates some harm to oneself as well. 2. In sociobiology, behaviour of an organism towards another that reduces the **Darwinian fitness* of both. **spiteful** *adj.* Filled with or motivated by spite (1, 2). [A variant of *despite*]

splenium *n.* The rounded tip at the back of the **corpus callosum*, primarily concerned with integrating visual information from the left and right visual fields. [From Greek *splenion* pad or plaster]

splicing, gene *See* GENE SPLICING.

spliff *n.* A common street name for a **cannabis* cigarette. [Rastafarian]

slang]

split brain *n.* Another name for **commissurotomy* or **split-brain preparation*.

split-brain preparation *n.* A surgical operation in which the two **cerebral* hemispheres of a person's brain are separated by cutting the **corpus callosum*, usually to relieve the symptoms of epilepsy, or in which an animal is treated in this way for research purposes. Also called a *commissurotomy* or *commissurectomy*. See also *DISCONNECTION SYNDROME*.

split-half reliability *n.* A measure of the **reliability* of a test based on the correlation between scores on two arbitrarily formed halves of the test, often the odd-numbered and even-numbered test items. More sophisticated versions of this technique are the **Kuder–Richardson coefficient* and **Cronbach's alpha*.

split personality *n.* Another name for **dissociative identity disorder*.

split-plot design *n.* An **experimental design* involving both **between-subjects* and **within-subjects* effects, using a mixed **analysis of variance*. For example, participants randomly assigned to treatment conditions in which they are *either* sleep-deprived or not sleep-deprived (between-subjects factor) may be tested for short-term memory *both* with and without noise (within-subjects factor). The fully developed idea was introduced by the English statistician Frank Yates (1902–94) in a paper entitled 'Complex Experiments' presented to the Royal Statistical Society in 1935 and published in the same year in a *Supplement to the Journal of the Royal Statistical Society* (Volume 2, pp. 181–247). [So called because the design was first used in agricultural research at Rothamsted Experimental Station in Hertfordshire, England, with different treatments being applied to different plots of ground, each subdivided into parts that were exposed to two or more sub-treatments]

split-span See *FILTER THEORY*.

splitting of the ego *n.* In **psychoanalysis*, the coexistence within the

***ego** of two attitudes towards external reality, functioning side by side without influencing each other, one taking reality into account and the other disavowing reality. According to Sigmund Freud (1856–1939), it is peculiar to the disorder of ***fetishism** and certain of the ***psychoses**. He presented his theory in various publications, including an article on ‘Splitting of the Ego in the Process of Defence’ (*Standard Edition*, XXIII, pp. 275–8). In ***object-relations theory** it is seen as a more normal mode of psychological functioning.

splitting of the object *n.* In ***Kleinian** analysis, the most primitive of all ***defence mechanisms**, in which ***instinctual objects** that evoke ***ambivalence** and therefore ***anxiety** are dealt with by compartmentalizing positive and negative emotions, leading to images of self and others that are not integrated. Splitting plays a central role in the theory of ***defensive techniques** proposed by the Scottish psychoanalyst W. Ronald D. Fairbairn (1889–1964). *See also* **GOOD BREAST**, **GOOD OBJECT**.

spontaneous remission *n.* Recovery from a disorder occurring without treatment. The rate of spontaneous remission ranges from about 30 per cent to about 60 per cent for the various classes of mental disorders.

sports psychology *n.* Application to the performance of competitors in all types of sports of research into ***skills** and into psychological factors associated with athletic performance. Also called *sport psychology*.

spouse abuse *n.* Any form of physical or mental exploitation or cruelty towards a husband or wife, causing significant harm to its victim. *See also* **BATTERED WIFE SYNDROME**, **SEXUAL ABUSE**.

spreading activation *n.* An increase in activity in part of a network caused by increased activity in adjacent units or areas. The term is applied to ***neural** network models and also to biological networks such as the ***central nervous system**. *Compare* **SPREADING DEPRESSION**.

spreading depression *n.* An inhibition of the activity of part of the ***nervous** system induced by the application of a solution of potassium chloride (or another salt), which causes the inhibition to spread slowly from
*****ebook converter DEMO Watermarks*****

the point of application into neighbouring **neurons*. Also called *cortical spreading depression*. See also [ACTION POTENTIAL](#), [SODIUM PUMP](#). Compare [SPREADING ACTIVATION](#).

SPSS *n.* No longer an abbreviation (formerly, Statistical Package for the Social Sciences), the most popular set of statistical computer programs among psychologists, distributed by IBM since 2009. Compare [BMDP](#), [SAS](#), [SYSTAT](#).

squeeze technique *n.* A procedure for preventing **premature (early) ejaculation*, in which the partner squeezes the neck of the penis tightly until the urge to ejaculate subsides.

SQUID *abbrev.* Superconducting quantum interference device, an instrument for detecting changes in minute magnetic fields generated by the brain.

squiggle game *n.* In **psychoanalysis*, a procedure introduced by the English psychoanalyst Donald Woods Winnicott (1896–1971) for therapeutic consultations with children: the therapist begins by drawing a random scribble on a sheet of paper, and the child responds by making it into a meaningful drawing on the basis of what it seems to suggest; and then it is the child's turn to make a random scribble for the therapist to complete, and so on, the drawings serving as points of departure for therapeutic interchanges. Winnicott's researches with the game were published posthumously in his book *Therapeutic Consultations in Child Psychiatry* (1971).

squint *n.* Another name for **strabismus*. Also, the act of half-closing the eyes in bright light, but this usage is avoided in technical discourse.

stability *n.* The state or quality of being stable, steady, or dependable. In psychometrics, an aspect of **reliability*, according to which a test or measuring instrument yields approximately the same scores when administered to the same respondents on separate occasions. See also [TEST–RETEST RELIABILITY](#).

stabilized retinal image *n.* A visual image that is prevented from moving on the retina by means of specially constructed contact lenses, so that the eye movements that occur continually during visual **fixation* (1), owing to various forms of **physiological nystagmus*, do not cause the image to move across the retina, the result being that vision fades away after about one second and is replaced by undifferentiated **Eigengrau*, although brief glimpses of the image or parts of it may reappear periodically, especially if the stabilization is not complete. This phenomenon, which was discovered simultaneously and independently by researchers in the US and England in 1952, is also called a *fixed image*, a *stabilized image*, or a *stopped image*. See also [FILLING-IN ILLUSION](#).

stabilizing selection *n.* A form of **natural selection* that operates against the extremes of the range of variation of a characteristic, thereby tending to stabilize the population close to the mean. See also [FREQUENCY-DEPENDENT SELECTION](#). Compare [APOSTATIC SELECTION](#), [DISRUPTIVE SELECTION](#).

stage fright *n.* A form of **anxiety* preceding or accompanying participation in any activity involving public self-presentation before an audience. Also called *performance anxiety*. See also [AUDIENCE EFFECT](#), [DRIVE THEORY OF SOCIAL FACILITATION](#).

stage, libidinal See [LIBIDINAL STAGE](#).

stages of problem solving See [PROBLEM-SOLVING STAGES](#).

staircase illusion *n.* An **impossible figure* based on a staircase in the form of a continuous loop that apparently rises endlessly (see [illustration](#)), first devised in 1958 by the English psychologist/geneticist Lionel S. Penrose (1898–1972) and his mathematical physicist son Roger Penrose (born 1931), later incorporated into *Ascending and Descending*, one of the best known etchings of the Dutch graphic artist Maurits C(ornelis) Escher (1898–1970). Also called the *Penrose staircase*. Often confused with the **Schröder staircase*. See also [AUDITORY STAIRCASE ILLUSION](#).

Staircase illusion. An impossible figure in which a flight of stairs appears to rise endlessly.

staircase method *n.* A **psychophysical** method introduced in 1962 by the US cognitive scientist Tom Norman Cornsweet (born 1929) in which, for **absolute thresholds**, a **variable** stimulus is presented repeatedly and is adjusted upwards whenever it is not perceived and downwards whenever it is perceived, and for **difference thresholds** a variable stimulus is adjusted to increase its absolute difference from a **standard stimulus** whenever the difference is not discriminated or is adjusted to decrease its absolute difference from the standard stimulus whenever the difference is discriminated. Also called the *up-and-down method*. Compare **METHOD OF AVERAGE ERROR**, **METHOD OF CONSTANT STIMULI**, **METHOD OF LIMITS**.

stalking *n.* Pursuing or following prey stealthily and surreptitiously. During the late 1980s, the word's meaning was extended to denote the obsessional pursuit of media and sports celebrities by fans, and it was then extended further to include persistent attempts to communicate with, follow, harass, or maintain surveillance over any unwilling recipient of such attention. During the 1990s, a specific crime of stalking was enacted in every state in the US and in many other countries, legal definitions of stalking usually (though not in England and Wales) requiring proof that the victim experienced reasonable fear of harm. Surveys in the US suggest that approximately 8 per cent of women and 2 per cent of men have been targeted

by stalkers at some time in their lives. *See also* [EROTOMANIA \(1\)](#), [SEXUAL HARASSMENT](#). **stalk** *vb.* **stalker** *n.* A person who engages in stalking. [From Old English *bestealcian* to walk stealthily]

stammering *n.* Another name for **stuttering*. *See* [CHILDHOOD-ONSET FLUENCY DISORDER](#).

standard deviation *n.* In descriptive statistics, a measure of the degree of dispersion, variability, or scatter in a set of scores, expressed in the same units as the scores themselves, defined as the square root of the **variance*. The term was coined in 1893 by the English statistician Karl Pearson (1857–1936). Symbol: *SD* or σ . *Compare* [INTERQUARTILE RANGE](#), [PROBABLE ERROR, RANGE](#), [SEMI-INTERQUARTILE RANGE](#).

standard error *n.* In statistics, a measure of degree of uncertainty about the value of a **parameter* of a population estimated from a sample **statistic*, defined as the **standard deviation* of values of the statistic observed in a large number of random samples from the population. If the parameter being referred to is the **arithmetic mean*, then its standard error is called the *standard error of the mean*, and similarly for any other parameter. **SE** *abbrev.*

standardize *vb.* **1.** In statistics, to convert a score or value to a **standard score*. **2.** In **psychometrics*, to establish population **norms (2)* for a test by applying it to standardization samples. **standardized** *adj.*

standardized regression coefficient *n.* Another name for a **beta coefficient*. Also called a *standardized regression weight*.

standardized test *n.* In psychometrics, a test for which population **norms (2)* have been established.

standard score *n.* In statistics, any score expressed in units of **standard deviations* of the distribution of scores in the population, with the mean set at zero. Also called a *sigma score* or a *z score*. *See also* [STANINE SCORE](#), [STEN SCORE](#), [T SCORE](#).

standard stimulus *n.* In *psychophysics*, a *stimulus* (1) to which an observer attempts to match a *variable* stimulus, or an anchoring stimulus that is assigned a number by the experimenter and that an observer uses as the basis in *magnitude estimation* by assigning numbers to a variable stimulus in relation to it. **S** or **St** *abbrev.*

Stanford–Binet intelligence scale *n.* The first *standardized* (2) English-language *intelligence* test and the prototype of most subsequent intelligence tests, based on a translation of the *Binet–Simon scale*, introduced in the United States in 1916 by the psychologist Lewis Madison Terman (1877–1956) and revised several times since then, one of the first to attempt to eliminate cultural and gender bias from its test items. *See also* **PORTEUS MAZE TEST**. **S–B scale** *abbrev.* [Named after Stanford University, California, where Terman was working when the test was introduced, and the French psychologist Alfred Binet (1857–1911)]

Stanford marshmallow test *See* **MARSHMALLOW TEST**.

Stanford prison experiment *n.* An experiment, conducted in 1971 by the US social psychologist Philip G(eorge) Zimbardo (born 1933) and several colleagues, in which 24 physically and psychologically healthy male undergraduate volunteers were randomly assigned to play the roles of prisoners and guards in a mock prison for \$15 per day. The prisoners wore loose-fitting smocks with ID numbers printed on them, nylon caps, and ankle chains, and the guards wore khaki uniforms and reflecting sunglasses and carried whistles and sticks. The guards were instructed to keep the prisoners incarcerated but were given no specific instructions about how to treat them. The main finding was that both groups entered into their roles excessively realistically, although they knew they were merely participating in an experiment. The prisoners became passive, helpless, and withdrawn, and the guards became aggressive and cruel, inventing ever more creative ways of abusing and humiliating the prisoners. One-third of guards manifested genuinely sadistic tendencies, and two prisoners were so emotionally traumatized that they had to be removed. The experiment was planned to run for two weeks but was abandoned after only six days after concerns were raised about its ethical justification. The findings were first published in the *International Journal of Criminology and Penology* in 1973. *See also*

*****ebook converter DEMO Watermarks*****

OBEDIENCE. SPE *abbrev.* [So called because it was conducted at Stanford University in California, in the basement of the psychology department]

stanine score *n.* In psychometrics, a test score converted to an equivalent ***standard score** in a ***normal distribution** with values 1, 2,..., 9, a ***mean** of 5, and a ***standard deviation** of 1.96. *See also* **DERIVED SCORE**. *Compare* **IQ**, **STEN SCORE**, **T SCORE**, **Z SCORE**. [A blend of *Sta(ndard) nine score*]

stanozolol *n.* An ***anabolic steroid** popular with athletes and bodybuilders and frequently used as a ***performance enhancer**. Formula: $C_{21}H_{32}N_2O$. [From the chemical name of its main metabolite *3'-hydroxystanozolol*]

stapedius *n.* A small muscle in the middle ear that pulls the ***stapes** backwards and acts in conjunction with the ***tensor tympani** in the ***acoustic reflex** to protect the ear from damage when exposed to loud sounds.

stapes *n.* The innermost of the three small bones in the ***middle ear**, transmitting sound vibrations from the ***incus** to the inner ear. Referred to non-technically as the *stirrup*. *Compare* **INCUS**, **MALLEUS**. **stapedes** *pl.* [From Latin *stapes* a stirrup, from *stare* to stand + *pes* a foot, alluding to its resemblance to a stirrup]

star illusion *n.* A form of ***irradiation** illusion in which a central dark star is surrounded by dark diamonds, the spaces between the star and each of the diamonds being equal to the diameter of the star and the longest diameter of a diamond but appearing much larger (see **illustration**). The illusion is enhanced by an effect related to the ***Müller-Lyer illusion** arising from the arrowhead shapes formed by the star and the diamonds.

Star illusion. The white space between the points of the star and of each of the diamonds is equal to the diameter of the star and the longest diameter of a diamond.

start codon *n.* The [*codon](#) or triplet of bases AUG (adenine, uracil, guanine) in a segment of [*RNA](#), or its equivalent in [*DNA](#), signalling the beginning of a protein-coding sequence and specifying the amino acid methionine. Also called an *initiation codon* or an *initiator codon*. See also [TATA BOX](#). Compare [STOP CODON](#).

startle reflex *n.* A reflex pattern of responses to a sudden unexpected stimulus such as a loud noise, including physiological signs of [*arousal](#), flexion of the trunk and limbs, [*piloerection](#), and closing of the eyes. Also called the *startle response* or *startle reaction*. Compare [MORO REFLEX](#).

state anxiety *n.* A temporary form of [*anxiety](#) related to a particular

situation or condition that a person is currently in, a typical example being **test anxiety*. See also [STATE-TRAIT ANXIETY INVENTORY](#). Compare [TRAIT ANXIETY](#).

state-dependent memory *n.* The tendency for information learnt in a particular mental or physical state to be most easily remembered in a similar state. The phenomenon was first investigated systematically in 1964 by the US psychologist Donald (Albert) Overton (born 1935), who focused on *drug-dependent memory* in rats, and this was later demonstrated in humans: material learnt in a drunken state is best remembered in a later drunken state, and so on. Clinical evidence has been cited of heavy drinkers who hide alcohol or money when drunk and are unable to find it when sober but remember where it is as soon as they become drunk again. It has since been established that many classes of drugs produce the effect, that the effect is dose-dependent, that it affects recall but not recognition, and that non-pharmacological states can also elicit the effect demonstrated: in a frequently cited British experiment on *context-dependent memory*, lists of words that were learned by divers while they were underwater were best recalled when they were again underwater, and conversely words learned on land were best recalled on land. Emotional states can also produce the effect—*mood-dependent memory*—and this helps to explain why pleasant experiences are more likely to be remembered by a person who is happy, and unpleasant experiences by someone who is unhappy and is likely to become even more unhappy as a result. Also called *state-dependent learning*. See also [COGNITIVE INTERVIEW](#), [ENCODING SPECIFICITY](#), [REDINTEGRATION](#).

State-Trait Anxiety Inventory *n.* A questionnaire comprising two separate self-rating scales, one measuring **state anxiety* and the other **trait anxiety*, each scale containing 20 items. The inventory was first published by the US psychologist Charles D(onald) Spielberger (1927–2013) and several colleagues in 1970. **STAI** *abbrev.*

static assessment environment *n.* A typical context for test administration in which the tester does not respond interactively to a respondent's incorrect answers but merely proceeds to the following question. Compare [DYNAMIC TESTING](#).

static labyrinth *n.* The **maculae* in the **utricle* and **sacculle*, functioning to control balance by increasing muscle **tonus* to counteract the effect of gravity on the side to which the head is tilted. *See also* VESTIBULAR SYSTEM.

static sense *n.* A form of **proprioception* and **kinaesthesia* providing information about orientation, balance, and acceleration, mediated by the **vestibular system*.

statistic *n.* Any numerical value representing a property of a **sample* of scores. Examples of statistics in this sense are the **arithmetic mean*, the **variance*, and the minimum (lowest score). [From Latin *statisticus* concerning affairs of state, from *status* a state + *-icus* of, relating to, or resembling]

Statistical Analysis System *See* SAS.

statistical inference *n.* Estimating the **parameters* of a population, or forming a judgement about whether an observed relationship or difference can be attributed to chance, usually from the observed properties of a **random sample*. *See also* INFERENCE STATISTICS.

Statistical Package for the Social Sciences *See* SPSS.

statistical power *n.* In inferential statistics, the probability that a **significance* test will reject the **null hypothesis* when it is in fact false. Significance tests vary in power, but all tests increase in power with increasing sample sizes. The power of a test depends on the particular **alternative hypothesis* against which it is tested. *See also* TYPE II ERROR.

statistical prediction *n.* Another name for **actuarial prediction*.

Statistical Product and Service Solutions *See* SPSS.

statistical significance *n.* In statistics, a property of the results of an empirical investigation suggesting that they are not due to chance alone. The

5 per cent level of significance has become conventional in psychology; this means that results are normally considered to be statistically significant if statistical tests show that the probability of obtaining, by chance alone, results at least as extreme as those obtained is less than 5 per cent, usually written $p < .05$. If the probability is not sufficiently small, then the correct interpretation is that there is no evidence of an effect, not that there is evidence of no effect. *See also* [ALTERNATIVE HYPOTHESIS](#), [INFERENTIAL STATISTICS](#), [NULL HYPOTHESIS](#), [P VALUE](#), [SIGNIFICANCE TEST](#). **statistically significant** *adj.* [From Latin *significare* to signify]

statistical test *n.* A procedure for deciding whether or not to reject the [*null hypothesis](#) and conclude that an observed difference or relationship is not due to chance. *See also* [SIGNIFICANCE TEST](#).

statistics *n.* The science of describing and interpreting numerical data in accordance with the theory of [*probability](#), and the application of analytical techniques such as [*significance](#) tests, determination of [*confidence intervals](#), and [*parameter](#) estimation to such data. The two major branches of statistics are [*descriptive statistics](#) and [*inferential statistics](#). [From Latin *statisticus* concerning affairs of state, from *status* a state + *-icus* of, relating to, or resembling]

statocyst *n.* An organ of equilibrium containing [*otoliths](#), found in crustaceans and other invertebrates; also a gravity-sensitive plant cell containing starch grains enabling the plant to maintain its orientation or direction of growth. [From Greek *statos* set or placed + *kystis* a bladder]

statolith *n.* Another name for an [*otolith](#). [From Greek *statos* set or placed + *lithos* a stone]

status epilepticus *n.* A dangerous condition characterized by [*convulsions](#) continuing without interruption, caused by sudden withdrawal from anticonvulsant medication, a lack of glucose in the body, a brain tumour, head injury, fever, or poisoning. [From Latin *status* condition + *epilepticus* epileptic]

status quo bias *n.* Another name for the [*endowment effect](#).

*****ebook converter DEMO Watermarks*****

stealing, pathological See KLEPTOMANIA.

Steele–Richardson–Olszewski syndrome *n.* Another name (especially in the UK) for **progressive supranuclear palsy*. **SRO syndrome** *abbrev.* [Named after the Canadian neurologists John C. Steele (born 1934) and John Clifford Richardson (1909–86) and the Polish-born Canadian neurologist Jerzy Olszewski (1913–64) who first described it in 1964]

steepest descent *n.* Another name for **gradient descent*.

Stelazine *n.* A proprietary name for the **neuroleptic* (1) drug **trifluoperazine*. [Trademark]

stellate cell *n.* Any of a class of small **interneurons* in the **cerebellum*, with multiple processes that synapse on the dendrites of **Purkinje cells*, the action of which they inhibit, also found in the cerebral cortex, where spiny stellates are excitatory and non-spiny stellates are inhibitory. They are especially abundant in the somatosensory cortex, the primary visual cortex (Area V1), and the primary auditory cortex. *Compare* BASKET CELL, GOLGI CELL, PYRAMIDAL CELL. [From Latin *stellatus* starry, from *stella* a star]

stem-and-leaf display *n.* In descriptive statistics, a method of tabulating scores that consist of two or more digits. The initial digits (the stems) determine the rows in which the scores are placed and the remaining digits (the leaves) are listed in order within their respective rows, so that the display resembles a **histogram* lying on its side with the scores in each class interval listed in order, in place of the bars of the histogram (see *illustration*). A stem-and-leaf display provides an informative picture of the distribution of a variable. Also called a *stem-and-leaf diagram*.

Raw data		Stem-and-leaf display
177	171	10 7
118	174	11 1228
122	121	12 12355
178	194	13 3
112	125	14
107	123	15
183	182	16 8
111	112	17 1478
125	133	18 233
183	168	19 4

Stem-and-leaf display. The hidden bimodal distribution of the data, with no scores falling between 134 and 167, emerges when the raw data on the left, displayed for convenience in two columns, are rearranged without loss of information on the right.

stem cell *n.* A master cell that resides in bone marrow and that replicates repeatedly and differentiates to create many different kinds of blood cells and cells of the immune system, and that, unlike other body cells, divides to produce not only new cells of its own type (new stem cells) but also other types of cells, including monocytes, erythrocytes, B lymphocytes, T lymphocytes, and macrophages.

stem completion task *n.* Another name for a **word-stem completion task*.

Stendhal syndrome *n.* A transient **psychosomatic disorder*, supposedly brought about by exposure to a large amount of art or natural beauty in a short space of time, characterized by racing pulse, dizziness, fainting, and sometimes **thought disorder* and **hallucinations*. The term was

introduced in 1979 by the Italian psychiatrist and psychoanalyst Graziella Magherini and popularized in her book *La sindrome di Stendhal* (The Stendhal Syndrome) in 1989. It is named after the French novelist Stendhal, the pen name of Marie-Henri Beyle (1783–1842) who experienced the syndrome on visiting Florence and described his symptoms in his book *Naples and Florence: A Journey from Milan to Reggio* (1817): ‘I was in a sort of ecstasy from the idea of being in Florence, close to the great men whose tombs I had seen. Absorbed in the contemplation of sublime beauty... I reached the point where one encounters celestial sensations. Everything spoke so vividly to my soul.... Life was drained from me. I walked with the fear of falling.’ Compare [JERUSALEM SYNDROME](#).

Stenger test *n.* A test designed to distinguish genuine unilateral *deafness from *malingering. Two tones of the same frequency but different intensity are presented simultaneously, one to each ear. In a person with normal hearing, only the more intense tone is heard, and this is called the *Stenger phenomenon*. A person who is unilaterally deaf in the ear receiving the more intense tone cannot hear that sound but can hear the softer tone in the good ear. In contrast, a person feigning unilateral deafness in the ear receiving the more intense tone cannot hear the softer tone in the other ear and reports hearing nothing. This is called a *positive Stenger response*, and it is very strong evidence of malingering. [Named after the German otologist Paul Stenger (1865–1940) who first described it in an article in the journal *Archiv für Ohrenheilkunde* in 1901 and, in more detail, in the journal *Deutsche Medizinische Wochenschrift* in 1907]

stenography *n.* Shorthand writing, especially with the use of a *Stenotype, specially designed for this purpose. Compare [BRACHYGRAPHY](#), [TACHYGRAPHY](#). **stenographer** *n.* A person skilled in the use of stenography. [From Greek *stenos* narrow + *graphein* to write]

Stenotype *n.* A small silent keyboard machine with 22 keys for recording shorthand, invented in 1906 by a US court reporter Ward Stone Ireland (1883–1956) and still used for making court records. The fingers of the left hand type consonants appearing before vowels, and these are printed on the left of the paper, the fingers of the right hand consonants after vowels, and these appear on the right, and the thumbs of both hands type all the vowels,

*****ebook converter DEMO Watermarks*****

which are printed in the middle. An experienced stenographer can operate comfortably at a normal conversational speed of about 150 words per minute. See also [STENOGRAPHY](#). [Trademark, from Greek *stenos* narrow + *typos* type]

sten score *n.* In psychometrics, a test score converted to an equivalent [*standard score](#) in a [*normal distribution](#) with values 1, 2,..., 10, a [*mean](#) of 5.5, and a [*standard deviation](#) of approximately 2. See also [DERIVED SCORE](#). Compare [IQ](#), [STANINE SCORE](#), [T SCORE](#), [Z SCORE](#). [A blend of *sta(ndard)ten score*]

Stent–Singer rule See [HEBBIAN RULE](#).

stereoacuity *n.* Another name for [*stereoscopic acuity](#).

stereoblindness *n.* An inability to perceive depth on the basis of [*binocular](#) disparity, owing to a reduction in the number of functioning [*disparity-selective cells](#) in the [*visual cortex](#), usually as a result of [*strabismus](#) during infancy. The condition is believed to be quite common (perhaps 4 or 5 per cent of the population) but is generally unrecognized because other depth cues compensate, though it is immediately apparent under examination with [*stereograms](#) or [*anaglyphs](#). See also [DEPTH PERCEPTION](#).

stereochemical theory *n.* An explanation for odour in terms of a small number of odorant molecules with distinctive three-dimensional structures that are assumed to bind to [*olfactory receptors](#), owing to ultramicroscopic slots in their cell membranes specialized to respond to those specific molecular structures. The seven primary odours according to this theory are camphoraceous (like moth balls), musky (like musk), floral or fragrant (like rose or lavender petals), minty (like menthol or peppermint), ethereal (like ether or cleaning fluid), pungent (like vinegar or roasted coffee), and putrid (like faeces or rotten eggs). Also called the *lock-and-key theory*.

stereocilium *n.* Any of the approximately 100 threadlike structures, not true cilia in spite of their name, projecting from each [*hair cell](#) in the [*saccular](#) macula within the [*membranous labyrinth](#) of the [*inner ear](#) and in other epithelia in which hair cells are located. In the inner ear they are

*****ebook converter DEMO Watermarks*****

embedded in a gelatinous matrix containing crystals of calcium carbonate that exert gravitation drag on them. Compare [KINOCILIUM](#). **stereocilia** *pl.* [From Greek *stereos* solid + Latin *cilium* an eyelash]

stereognosis *n.* The identification and recognition of solid or three-dimensional objects by touch alone. Compare [ASTEREOGNOSIS](#). [From Greek *stereos* solid + *gnosis* knowledge]

stereogram *n.* A double picture made up of slightly different images that when viewed through a [*stereoscope](#) or special spectacles produces a three-dimensional visual image. See also [ANAGLYPH](#), [RANDOM-DOT STEREOGRAM](#), [STEREOPSIS](#).

stereopsis *n.* Depth perception based on [*binocular](#) disparity, resulting from the slightly different viewpoints of the side-by-side eyes of humans, monkeys, and some other species, discovered in 1838 by the English physicist and inventor Sir Charles Wheatstone (1802–75). It is served by the [*magnocellular system](#), which is colour-blind (see [ISOLUMINANT](#)). The [*visual cortex](#) contains [*disparity-selective cells](#) that respond only to particular binocular disparities and are thus tuned to respond to stimuli at particular distances. Also called *stereoscopic vision*. See also [ANAGLYPH](#), [BINOCULAR PARALLAX](#), [HOROPTER](#), [PANUM'S FUSION AREA](#), [PANUM'S LIMITING CASE](#), [RANDOM-DOT STEREOGRAM](#), [REDUCTION SCREEN](#), [STEREOBLINDNESS](#), [STEREOSCOPE](#), [STEREOSCOPIC ACUITY](#). [From Greek *stereos* solid + *opsis* sight, from *ops* and eye]

stereoscope *n.* An optical device for displaying a [*stereogram](#) so that its two slightly different images of the same object or scene are presented one to each eye, enabling three-dimensional perception to be experienced through [*stereopsis](#). [From Greek *stereos* solid + *skopein* to view]

stereoscopic acuity *n.* Keenness or sharpness of [*stereopsis](#), measured by the subtended angle corresponding to the minimum [*binocular](#) disparity sufficient to produce a sensation of depth. Under good viewing conditions, stereoscopic acuities corresponding to [*visual angles](#) in the region of 2 seconds of arc, equivalent to 1/1,800 of a degree, have been found. Also called *stereoacuity*. See also [ACUITY](#).

*****ebook converter DEMO Watermarks*****

stereoscopic illusion *n.* Any ***visual illusion** in which three-dimensional depth is misperceived, or any visual illusion that arises from a phenomenon peculiar to binocular vision. See **ANAGLYPH**, **CHESHIRE CAT EFFECT**, **FLOATING-FINGER ILLUSION**, **HOLE-IN-THE-HAND ILLUSION**, **LISSAJOUS FIGURE**, **PULFRICH EFFECT**, **RANDOM-DOT KINEMATOGRAM**, **RANDOM-DOT STEREOGRAM**.

stereoscopic vision *n.* Another name for ***stereopsis**.

stereotactic *adj.* Of or relating to precise three-dimensional localization, especially of brain structures. Also written *stereotaxic*. [From Greek *stereos* solid + *taktos* arranged (for battle), from *tassein* to arrange + *-ikos* of, relating to, or resembling]

stereotactic instruments *n.* Devices designed to facilitate precise three-dimensional localization of tissues for brain surgery and research.

stereotype *n.* A relatively fixed and oversimplified generalization about a group or class of people, usually focusing on negative, unfavourable characteristics, although some authorities recognize the possibility of positive stereotypes as well. The word originally denoted a solid metallic printing plate containing a masthead or other stock image that was difficult to change once cast, and the psychological meaning was introduced by the US journalist Walter Lippmann (1899–1974) in his book *Public Opinion* (1922), where he also articulated the ***cognitive miser** theory of stereotyping. Early empirical studies stressed the remarkable consensus in the stereotypes of various ethnic groups in the US; research into the ***frustration–aggression hypothesis** from the 1940s onwards found evidence for the motivated nature of some stereotypes; and research using the ***F scale** after its publication in 1950 found stereotypic thinking to be characteristic of people with ***authoritarian** personalities and fascist belief systems. In 1954, a book entitled *The Nature of Prejudice* by the US psychologist Gordon W(illard) Allport (1897–1967) popularized the interpretation of stereotypes as nothing more than cognitive categories that simplify ***information** processing and are quite resistant to disconfirming information. There is evidence that some people are capable of maintaining strong stereotypes of typical group members without these stereotypes necessarily influencing how they perceive and evaluate particular members of those groups. See also **CONFIRMATION BIAS**,
*****ebook converter DEMO Watermarks*****

DUAL-PROCESS MODEL, SOCIAL CATEGORIZATION, STEREOTYPE THREAT. **stereotypic** *adj.* **stereotyping** *n.* The act or process of forming a stereotype. [From *stereotype* a fixed, stock plate used for printing a masthead or other standardized text, from Greek *stereos* solid + *typos* type, from *typtein* to strike]

stereotyped movements *n.* Repetitive, non-functional, self-injurious bodily movements such as hand waving, body rocking, head banging, self-biting, or hitting parts of the body, sometimes using an object. *See also* STEREOTYPIC MOVEMENT DISORDER.

stereotype threat *n.* Impairment of performance resulting from perceived likelihood of being judged according to a negative **stereotype*, or fear of acting in a manner likely to confirm the negative stereotype. According to the US psychologists Claude Mason Steele (born 1946) and Joshua M(ichael) Aronson (born 1961), who introduced the term in the *Journal of Personality and Social Psychology* in 1995, stereotype threat tends to occur when members of minority groups find themselves in situations in which negative group stereotypes are salient, typical examples being when African Americans are asked to indicate their ethnic group status before taking a difficult intelligence test, or when women are asked to indicate their sex before responding to a test of mathematical or mechanical ability. The impairment is believed to be caused by physiological **arousal* or **anxiety*.

stereotypic movement disorder *n.* A **neurodevelopmental disorder* in **DSM-5* characterized by apparently purposeless **stereotyped movements*, such as body rocking, head-banging, self-biting or slapping, or hand-waving, interfering with social or academic life and sometimes causing injury requiring medical treatment, with onset in early development, the behaviour not being explained by **drugs* or by another neurodevelopmental or **mental disorder*, such as **obsessive–compulsive disorder* or **trichotillomania*. According to **DSM-5*, the prevalence of this disorder is about 3–4 per cent, but among people with **intellectual disability* in residential homes, between 10 and 15 per cent may have stereotypic movement disorder with self-injury. *Compare* AUTISM SPECTRUM DISORDER, TIC DISORDERS.

Sternberg task *n.* A [*recognition](#) task in which a short sequence of symbols (such as digits) is presented and then removed; a single symbol is then presented, and the respondent has to decide whether or not it was part of the original sequence. Experiments reveal that the mean [*reaction time](#) increases linearly with the number of items in the sequence, and the slope of the function suggests a scanning process of serial comparison in which respondents compare the target symbol with each member of the original sequence at an average rate of 25–30 symbols per second. [Named after the US psychologist Saul Sternberg (born 1949) who published the first experiment using this procedure in the journal *Science* in 1966]

steroid *n.* Any of a group of fat-soluble organic substances with a characteristic chemical structure of 17 carbon atoms bound in four closely linked rings, including the [*sterols](#), [*vitamin D](#), and many [*hormones](#). [From *sterol* + Greek *-oeides* denoting resemblance of form, from *eidos* shape]

steroid hormone *n.* Any [*hormone](#) such as a glucocorticoid, aldosterone, or a sex hormone (androgen or oestrogen) that is synthesized from cholesterol and is a [*steroid](#). The hormones of the adrenal cortex, testes, and ovaries are steroid hormones, whereas those of all other endocrine glands and of the hypothalamus are [*peptide](#) hormones. Synthetic analogues include [*dexamethasone](#), [*nandrolone](#), [*prednisone](#), [*prednisolone](#), [*tetrahydrogestrinone](#), and a synthetic form of [*cortisone](#). See ALDOSTERONE, CORTICOSTERONE, CORTISOL, OESTRADIOL, PROGESTERONE, TESTOSTERONE. See also CORTICOSTEROID DHEA. Compare ANABOLIC STEROID.

steroid receptor *n.* A specific region in a cell specialized for [*steroid](#) hormone binding.

steroid-regulated gene *n.* A gene whose expression is modified by one or more [*steroid](#) hormones.

sterol *n.* Any [*steroid](#) alcohol such as [*cholesterol](#). [Contraction of *cholesterol*, *ergosterol*, and cognate words]

Stevens's law *n.* Another name for the [*power law](#) in psychophysics.

Also called *Stevens's power law*. [Named after the US psychologist S(tanley) S(mith) Stevens (1906–73) who formulated it in 1953 and discussed it in an influential article in the journal *Psychological Review* in 1957]

stigma *n.* A mark of disgrace associated with a person, a personal quality, or a personal circumstance; a mark on the skin indicating a disease; in Christian tradition, the marks left on Christ's body by the crucifixion and transferred by divine intervention to St Francis of Assisi and others. In ancient Greece, bodily signs were sometimes cut or burnt into the bodies of people to advertise their status as slaves, criminals, or traitors and to indicate that they were blemished, ritually polluted, and to be avoided, especially in public places. The term was introduced into the social sciences by the Canadian-born US sociologist Erving Goffman (1922–82) in a book entitled *Stigma: Notes on the Management of Spoiled Identity* (1963). *See also* **STIGMATIZE**. **stigmata** or **stigmas** *pl.* [From Greek *stigma*, *stigmatos* a mark left by a sharp point]

stigmatize *vb.* To devalue or discredit a person or category of people with a deviant attribute or ***stigma**, whose social identity deviates from society's normative expectations, or to exclude a person or group with a particular attribute from certain forms of social interaction. The Canadian-born US sociologist Erving Goffman (1922–82), in his influential book *Stigma: Notes on the Management of Spoiled Identity* (1963), distinguished between blemishes of character (such as mental illness, homosexuality, or criminal behaviour); abominations of the body (physical deformities of various kinds); and the tribal stigma of race, nation, or religion. In virtually all societies, people with disfiguring diseases tend to be ostracized, together with free riders who take social benefits without paying the costs (*see* **PUBLIC GOODS DILEMMA**), and in many societies racial minority groups, obese people, and sexual minority groups also tend to be stigmatized. Psychological research into this phenomenon was stimulated by the book *Social Stigma: The Psychology of Marked Relationships* (1984) by the US psychologist Edward Ellsworth Jones (1926–93) and several co-authors. *See also* **PREJUDICE**, **SELF-PRESENTATION**, **SOCIAL CATEGORIZATION**, **SOCIAL IDENTITY THEORY**. **stigmatization** *n.* The act or process of stigmatizing a person or group of people.

stilboestrol *n.* Diethylstilboestrol, a synthetic form of oestrogen, used as

*****ebook converter DEMO Watermarks*****

a 'morning after' or post-coital contraceptive, especially in cases of rape or incest. US *stilbestrol*. [From Greek *stilb(os)* glittering + English (o)*estr(o)gen* + *-ol* denoting a compound containing a hydroxyl group, from (*alcoh*)*ol*]

Stiles–Crawford effect *n.* The differential effectiveness of light entering through the centre rather than through the edge of the pupil, bright light that is effective for **cones* and that is mediated by the **photopic* system being less effective when entering through the edge than the centre, but dim light effective for **rods* and mediated by the **scotopic* system not showing this differential effect. It is explained by the fact that cones have inner segments serving to channel light travelling directly down their axes, whereas rods are adapted to exploit every scrap of light that falls on them and do not have any channelling mechanism. [Named after the English physiologists Walter Stanley Stiles (1901–85) and Brian Hewson Crawford (1906–91) who discovered the effect in the late 1920s and published it in the *Proceedings of the Royal Society of London, Series B*, in 1933]

Stilling test *n.* A test for **colour-blindness* and **colour* deficiency in the form of a **pseudo-isochromatic* chart composed of dots of equal brightness but different hues arranged to form large numerals visible to viewers with normal vision. This test, the first to use a pseudo-isochromatic chart, was modified and adapted by the Japanese ophthalmologist Shinobu Ishihara (1879–1963) to form his famous **Ishihara test*. Also called the *Stilling Colour Chart* or *Stilling's Colour Table*. Compare *HOLMGREN TEST*. [Named after the German ophthalmologist Jakob Stilling (1842–1915) who developed it]

stimulant drug *n.* Any drug that increases or tends to increase the activity of a system or organ of the body, especially one that increases or speeds up the activity of the **central nervous system* by boosting **catecholamine* transmission, producing an exaggeration of the characteristic features of alert wakefulness, and that in high dosages can cause hallucinations, convulsions, and death. Also called a *psychoanaleptic drug*, a *psychomotor stimulant*, or a *psychostimulant*. A common street name for stimulant drugs in general is *uppers*. See *AMPHETAMINE*, *CAFFEINE*, *COCAINE*, *DEXTROAMPHETAMINE*, *DIGITALIS*, *ECSTASY* (2), *EPHEDRINE*, *KAINIC ACID*, *KHAT*, *MEPHEDRONE*, *MESCALINE*, *METHAMPHETAMINE*, *METHYLPHENIDATE* (Ritalin),

*****ebook converter DEMO Watermarks*****

MODAFINIL, NICOTINE, PENTYLENE TETRAZOL, PHENMETRAZINE, PICROTOXIN, STRYCHNINE, THEOBROMINE, THEOPHYLLINE, XANTHINE, YABA, YOHIMBINE. *See also* PERFORMANCE ENHANCER, SUBSTANCE ABUSE, SUBSTANCE-RELATED AND ADDICTIVE DISORDERS, SYMPATHOMIMETIC, TACHYPHRENIA. *Compare* DEPRESSANT DRUG.

stimulant-related disorders *n.* *Substance-related and addictive disorders in *DSM-5 associated specifically with the use of *stimulant drugs. DSM-5 distinguishes between stimulant use disorder, intoxication, and withdrawal. *See also* SUBSTANCE-INDUCED DISORDERS, SUBSTANCE-RELATED AND ADDICTIVE DISORDERS, SUBSTANCE USE DISORDERS.

stimulus *n.* 1. Any event, agent, or influence, internal or external, that excites or is capable of exciting a *sensory receptor and of causing a *response in an organism. 2. An object or event in the external environment that causes a *response in an organism, also called a *distal stimulus*. 3. A pattern of physical energy that stimulates or excites a *sensory receptor, also called a *proximal stimulus*. 4. Any class of events, agents, or influences that elicit the same type of *response in an organism. 5. Any occurrence that excites or inhibits the firing of a neuron. 6. Anything that rouses an organism or goads it into action. 7. In the *behaviourism of the US psychologist B(urrhus) F(rederic) Skinner (1904–90) and his followers, any event, whether physical or mental, that evokes a *response. *See also* ADEQUATE STIMULUS, CONDITIONED STIMULUS, REACTION TIME, SIGN STIMULUS, SUPERNORMAL STIMULUS, UNCONDITIONED STIMULUS. **stimuli** *pl.* **S** *abbrev.* [From Latin *stimulus* a cattle goad or spur]

stimulus generalization *n.* The tendency for a learned *response to a particular *stimulus (1) to be elicited by other stimuli that resemble it. In *operant conditioning, it is the tendency to respond, after conditioning, to stimuli that were present during *reinforcement (1). *See also* ACOUSTIC GENERALIZATION, GENERALIZATION GRADIENT, SEMANTIC GENERALIZATION.

stimulus intensity dynamism *n.* In *Hullian learning theory, the strength of a *stimulus (1), playing a part with other *intervening variables in determining the *generalized reaction potential. **V** *abbrev.*

stimulus onset asynchrony *n.* The time interval between the
*****ebook converter DEMO Watermarks*****

beginning of one stimulus and the beginning of another. *Compare* INTERSTIMULUS INTERVAL. **SOA** *abbrev.*

stimulus set *n.* 1. In experiments on **reaction time*, a predisposition to concentrate on the **stimulus (1)* rather than the **response*. In **reaction time* experiments it generally leads to slower reactions but fewer errors than a **response set (1)*. 2. A bias disposing an organism to respond in a particular way to a stimulus or class of **stimuli (1)*. 3. A group of **stimuli (1)* used in a particular empirical investigation.

stirrup *n.* A non-technical name for the **stapes* of the middle ear. [So called because of its resemblance to a stirrup]

St John's wort *n.* A shrub of the genus *Hypericum*, especially *H. perforatum*, popular in Europe as an **antidepressant* with relatively few side-effects compared with the more common types, its action combining mild serotonin reuptake inhibition and monoamine oxidase inhibition. *See also* ORPHAN DRUG. *Compare* MONOAMINE OXIDASE INHIBITOR (MAOI), SELECTIVE SEROTONIN REUPTAKE INHIBITOR (SSRI), TETRACYCLIC ANTIDEPRESSANT, TRICYCLIC ANTIDEPRESSANT. [So called because it used to be collected on St John's Eve (23 June) to ward off evil spirits and as a medicinal herb]

stochastic *adj.* Randomly determined, of or relating to a process or variable that has a probability distribution subject to statistical regularities but that cannot be predicted precisely. *Compare* DETERMINISTIC. [From Greek *stochastikos* capable of guessing, from *stochazesthai* to conjecture or aim at, from *stochos* a target]

Stockholm syndrome *n.* A psychological condition in which hostages or victims of kidnappings sometimes develop positive feelings towards their captors, on whom they depend for their survival, especially after being released. [Named after a siege in the Swedish capital Stockholm in 1973 in which people were taken hostage by bank robbers and later refused to cooperate with police]

stocking anaesthesia *n.* A condition analogous to **glove anaesthesia* occurring in the foot and lower leg. US *stocking anesthesia*.

*****ebook converter DEMO Watermarks*****

stomach *n.* The section of the **alimentary* canal between the **oesophagus* and the **small intestine*, consisting of a strong, muscular sac where food is partially digested. [From Greek *stomachos* the throat, later the stomach, from *stoma* the mouth]

stoned *adj.* In drug-culture slang, under the influence of drugs. [From a sense of *stone* to numb or desensitize]

stooge *n.* In experimental methodology, another name for a **confederate*.

stop codon *n.* Any member of the RNA **codon* family UAA, UAG, and UGA (involving the bases uracil, adenine, and guanine), or any of their three equivalents in DNA, signalling the end of a protein-coding sequence. Also called a *nonsense codon*, a *termination codon*, or a *terminator codon*. See also NONSENSE MUTATION. Compare START CODON.

stopped image *n.* Another name for a **stabilized retinal image*.

storage *n.* The act or process of storing anything, especially (in psychology) storing **encoded* information in **memory* for subsequent **retrieval*, or (in computer technology) storing information in a computer or on a magnetic disk or tape. **store** *vb.*

storge *n.* Natural fondness, especially parental affection. [From Greek *storge* affection]

storgic love *n.* A primary type of **love* that is friendly/affectionate and is based on caring and nurturing. Compare AGAPIC LOVE, EROTIC LOVE, LUDIC LOVE, MANIC LOVE, PRAGMATIC LOVE.

STP *n.* A common name for 2,5-dimethoxy-4-methylamphetamine, one of the **phenylalkylamines* among the **hallucinogens*. Also called *DOM*. [A trademark for a motor oil additive]

St Petersburg paradox *n.* A **paradox* of decision making first presented to the St Petersburg Academy in 1738 by the Swiss mathematician

*****ebook converter DEMO Watermarks*****

and physicist Daniel Bernoulli (1700–82). A coin is tossed; if it falls heads then the player is paid one rouble and the game ends. If it falls tails then it is tossed again, and this time if it falls heads the player is paid two roubles and the game ends. This process continues, with the payoff doubling each time, until heads comes up and the player wins something, and then it ends. How much should a player be willing to pay for the opportunity to play this game? According to the principles of probability theory, the player wins one rouble with probability $1/2$, two roubles with probability $1/4$, four roubles with probability $1/8$, and so on, therefore the game's ***expected value** is $(1/2)(1) + (1/4)(2) + (1/8)(4) + \dots$, and this sum is infinite because each of its terms is equal to $1/2$. But it would obviously be absurd to pay a large amount for the privilege of playing the game, because there is a high probability of losing everything, including a 50 per cent chance of losing it on the very first toss, and the game is fatally damaging to the principle of maximizing expected value. The discovery of the paradox led directly to Bernoulli's introduction of 'moral worth', which later came to be called ***utility (1)**. Also called the *St Petersburg game*. See also [RISK AVERSION](#). Compare [ALLAIS PARADOX](#), [COMMON RATIO EFFECT](#), [ELLSBERG PARADOX](#), [MODIFIED ELLSBERG PARADOX](#).

strabismus *n.* A condition in which the orientation of the eyes is abnormal, so that they are not parallel. *Paralytic strabismus* is associated with a malfunction of the ocular muscles resulting from a neurological or muscular disorder or dysfunction. *Non-paralytic strabismus* is an inherited defect in the positioning of the eyes relative to each other, resulting in an inability to use both eyes together, causing the person to fixate with one eye or the other, sometimes leading to ***stereoblindness**. A person with *alternating strabismus* fixates objects in the visual field first with one eye and then with the other, the eyes taking turns for approximately a second each as long as the object is fixated. A person with *monocular* or *non-alternating strabismus* fixates continuously with one eye, the other eye often becoming blind as a result of disuse. Also called *squint*. See also [AMBLYOPIA EX ANOPSIA](#), [ANOOPSIA](#), [CYCLOPHORIA](#), [ESOTROPIA](#), [EXOPHORIA](#), [HETEROPHORIA](#), [HYPERPHORIA](#), [HYPOPHORIA](#). **strabismic** *adj.* [From Greek *strabismos* squinting, from *strabizein* to squint, from *strabos* cross-eyed, related to *straphein* to twist]

stranger anxiety *n.* A form of ***anxiety** occurring in response to the appearance of an unfamiliar person, normally developing in infants between

6 and 8 months of age, manifested by avoidance of **eye* contact, hiding, or crying. It was first discussed in 1957 by the Austrian psychoanalyst René Árpád Spitz (1887–1974). Also called *eight-month anxiety*.

strategic dominance *n.* The property of being a **dominant alternative/strategy*.

strategic game *n.* An interactive decision problem of the type analysed within **game* theory. Also called a *game*.

strategic priming See PRIMING (1).

strategy *n.* **1.** The art or science of generalship or military planning, or a specific long-term plan in a military conflict, business, politics, or social affairs, often distinguished from *tactics*, the detailed manoeuvres carried out to achieve immediate or short-term objectives. **2.** In **game* theory, a complete plan of action, specifying in advance what moves a player will make in every possible situation that might arise in the course of a game. If each player has only one move to make, and if the moves are made simultaneously or in ignorance of the moves chosen by the other player(s), then the available strategies are simply the available moves, but in other cases a strategy specifies a complete contingency plan covering all possible replies by the co-player(s). See also DOMINANT ALTERNATIVE/STRATEGY, MIXED STRATEGY, PROGRAMMED STRATEGY. **strategies** *pl.* **strategist** *n.* **strategic** or **strategical** *adj.* One who devises or implements strategies (1, 2). [From Greek *strategia* generalship, from *strategos* a general, from *stratos* an army + *agein* to lead]

stratified random sample *n.* A **probability* sample in which random sampling is applied piecewise to each stratum of the population to ensure that all subgroups are adequately represented. It resembles a **quota sample*, except that the respondents within each category are selected by simple random sampling rather than haphazardly. See also CLUSTER SAMPLE, RANDOM DIGIT DIALLING, SIMPLE RANDOM SAMPLE. Compare ACCIDENTAL SAMPLE, CONVENIENCE SAMPLE, NON-PROBABILITY SAMPLE, OPPORTUNITY SAMPLE, SELF-SELECTED SAMPLE, SNOWBALL SAMPLE.

Strattera *n.* A proprietary name for the drug **atomoxetine*, a selective
*****ebook converter DEMO Watermarks*****

***noradrenalin** reuptake inhibitor used in the treatment of ***attention-deficit/hyperactivity disorder (ADHD)**. [Trademark]

Stratton experiment *n.* A classic experiment involving inverted visual images carried out in 1895 by the US psychologist George Malcolm Stratton (1865–1957) and published in 1897. See **INVERTING SPECTACLES**.

stream of consciousness *n.* The continuous flow of sensations, images, thoughts, ideas, and feelings that occupy one's ***consciousness**. The concept was introduced by the US psychologist William James (1842–1910) in his book *Principles of Psychology* (1890, p. 237). It was first used as a device in fictional literature by the English novelist Dorothy Miller Richardson (1873–1957) in her sequence of novels under the collective title *Pilgrimage* (1915–38), and it was made famous by two writers who are also linked by the remarkable coincidence of identical dates, the English novelist (Adeline) Virginia Woolf (1882–1941) and the Irish novelist James (Augustine Aloysius) Joyce (1882–1941), especially in the last 50 pages of *Ulysses* (1922).

street drug *n.* Any drug that is taken for its ***psychotropic** effects or for recreational purposes, often though not always illegally.

street name *n.* An unofficial name by which a street drug is referred to by its users and dealers. See **ADAM**, **ACID (2)**, **ANGEL DUST**, **BARBS**, **BENNIES**, **BENZOS**, **CANDY (2)**, **CHARLIE**, **CHINA WHITE**, **COKE**, **CRACK**, **CRANK**, **CRYSTAL METH**, **DOLLS**, **DOPE**, **DOWNERS**, **EINSTEINS**, **GANJA**, **GEAR**, **GOOFERS**, **GRASS**, **H**, **HOG**, **HORSE**, **HUG DRUG**, **ICE**, **JOINT**, **JUNK**, **MEOW MEOW**, **MUSH**, **NEBBIES**, **PEACE PILL**, **PHENNIES**, **PINK LADY**, **POPPERS**, **POT**, **PURPLE HEARTS**, **RED DEVILS**, **REEFER**, **ROCKS**, **ROOFIES**, **SKAG**, **SKUNK**, **SMACK**, **SNOW**, **SPECIAL K**, **SPEED**, **SPEEDBALL**, **SPLIFF**, **TRANQ**, **UPPERS**, **WEED**, **YELLOW BULLETS**.

strephosymbolia *n.* A typical symptom of ***dyslexia** in which letters are transposed, reversed, or confused; more generally a disorder in which objects are perceived in mirror image. [From Greek *strephein* to twist + *symbolon* a symbol]

stress *n.* 1. Psychological and physical strain or tension generated by
*****ebook converter DEMO Watermarks*****

physical, emotional, social, economic, or occupational circumstances, events, or experiences that are difficult to manage or endure. *See also* ACUTE STRESS DISORDER, BASKERVILLE EFFECT, BURNOUT, GENERAL ADAPTATION SYNDROME, IRRITABLE MALE SYNDROME, POST-TRAUMATIC STRESS DISORDER, PROLONGED DURESS STRESS DISORDER, PSYCHONEUROIMMUNOLOGY, PSYCHOSOCIAL STRESSOR, VODOO DEATH. *Compare* EUSTRESS. **2.** In phonetics, the degree of force used in uttering a syllable, stressed syllables being more prominent than unstressed syllables, the prominence being due not only to increased loudness but also sometimes increased length and raised pitch. Also called *accent*. [From C14 English *stresse*, shortened from *distress*, from Latin *strictus* tightened, from *stringere* to draw tight]

stress interview *n.* An interview specifically designed to create *stress (1) in order to assess the interviewee's capacity to withstand stress in other situations.

stressor *See* PSYCHOSOCIAL STRESSOR.

stretch receptor *n.* A receptor such as (in mammals) a *muscle spindle that responds to the stretching of a muscle.

stretch reflex *n.* A reflex contraction of a muscle in response to sudden stretching, controlled by a reflex arc involving just one sensory nerve fibre from a *muscle spindle and one motor neuron. Numerous stretch reflexes help to maintain posture against gravitational and other forces, and *deep tendon reflexes are special examples of stretch reflexes. Also called a *myostatic reflex*. *See also* MONOSYNAPTIC REFLEX, REFLEX.

striate cortex *n.* Another name for the *primary visual cortex (Area V1), showing in cross-section alternating bands of *white matter and *grey matter unrelated to the striped *ocular-dominance columns and *orientation columns that are made visible only by special staining procedures. Often confused with the corpus striatum and the striatum. [From Latin *striatus* streaked, from *stria* a furrow or a flute of a column]

striated muscle *n.* Another name for a *striped muscle. [From Latin *striatus* streaked, from *stria* a furrow or a flute of a column]

*****ebook converter DEMO Watermarks*****

striatum *n.* A large mass of striped white and grey matter of the ***forebrain** or prosencephalon in front of and around the thalamus in each cerebral hemisphere, the afferent part of the basal ganglia, mainly involved in movement planning and control and habit formation. It includes the ***putamen** (connected mainly to the primary ***somatosensory cortex**, the primary ***motor cortex**, and the supplementary motor area) and the ***caudate nucleus** (connected to widespread cortical ***association areas**). Often confused with the corpus striatum, of which it is a part, or the striate cortex, to which it is unrelated. Also called the *neostriatum*. [From Latin *striatus* streaked, from *stria* a furrow, groove, or a flute of a column]

strictly competitive game *n.* A two-person ***zero-sum game**.

string length *n.* A measure of the complexity of an ***average** evoked potential or an ***event-related potential** corresponding to the length of a piece of string laid over a trace of the waveform, a longer string being required for a trace with many high-amplitude deviations from the baseline than for one with few lower-amplitude deviations in the first 250 or 500 ms following onset of the signal. The concept was introduced in 1980 in an article in the journal *Personality and Individual Differences* by the British psychologist Alan E(iner) Hendrickson (born 1936) and the US-born psychologist Donna E(laine) Hendrickson (born 1937), who found a correlation of .72 between string length and Wechsler ***IQ** in a sample of school children (see **illustration**), but hopes that this might provide a truly ***culture-free** measure of ***intelligence** were dashed by subsequent research, which failed to replicate this result. Compare **n140**, **p200**.

String length. Typical evoked potentials from a person with a high IQ (top) and a person with a low IQ (bottom).

string variable *n.* In statistics and measurement theory, any **variable* whose values contain letters or other characters instead of or in addition to numbers. Also called an *alphanumeric variable*. Compare [NUMERIC VARIABLE](#).

striped muscle *n.* Any voluntary muscle, capable of fast contraction, composed of long **myofibrils* that have many nuclei and are transversely striped by alternating bands of **myosin* and **actin*, including all **skeletal muscles*. Also **cardiac muscle*, which is striped but is exceptional in being involuntary. Also called *striated muscle* or *voluntary muscle* (excluding cardiac muscle). Compare [SMOOTH MUSCLE](#).

stroboscope *n.* A device that produces a bright, flashing light, the frequency of which can be synchronized with the frequency, or a multiple of the frequency, of rotation, vibration, or other movement of an object such as a piece of machinery, making it appear stationary and allowing it to be

*****ebook converter DEMO Watermarks*****

inspected in operation. It is also used as a form of illumination in nightclubs and discotheques. Also called a *strobe* or a *strobe light*. See also [ALIASING](#), [WAGON WHEEL ILLUSION](#). **stroboscopic** *adj.* [From Greek *strobos* a whirling + *skopein* to view]

stroboscopic movement *n.* Another name for [*beta movement](#).

stroke *n.* A blockage or (in about 20 per cent of cases) a haemorrhage of blood vessels in the brain, leading to a decreased supply of oxygenated blood to brain tissues normally perfused with blood by those vessels, lasting for more than 24 hours if the patient survives. The consequences depend on the site and extent of the stroke but often include [*paralysis](#) (especially [*hemiplegia](#) on the side of the body opposite the stroke), [*homonymous hemianopia](#), [*amnesia](#), [*aphasia](#), [*agraphia](#), [*convulsions](#), or [*coma](#). Also called *cerebrovascular accident* or *CVA*. See also [ANEURYSM](#), [FAST](#), [INTERNAL CAPSULE](#). Compare [TRANSIENT ISCHAEMIC ATTACK \(TIA\)](#).

strong AI *n.* An interpretation of [*artificial intelligence](#) according to which all thinking is computation, from which it follows that conscious thought can be explained in terms of computational principles, and that feelings of conscious awareness are evoked merely by certain computations carried out by the brain or (in principle at least) by a computer. A debatable implication of this view is that a computer that can pass the [*Turing test](#) must be acknowledged to be conscious. Also called *hard AI*. See also [CHINESE ROOM](#), [GÖDEL'S THEOREM](#). Compare [WEAK AI](#).

Strong–Campbell Interest Inventory *n.* The revised version of the [*Strong Interest Inventory](#), first published in 1974, widely used in career counselling. It was revised several times, incorporating the [*Holland codes](#) and the associated [*Self-Directed Search test](#). Named after the US psychologists David P. Campbell (born 1934) who revised it and Edward Kellogg Strong Jr (1884–1963) who devised the original versions in 1927 and 1938. See also [STRONG INTEREST INVENTORY](#). **SCII** *abbrev.*

Strong Interest Inventory *n.* The revised version of the [*Strong Vocational Interest Blank](#), an [*occupational interest inventory](#), unified for men and women, comprising 317 items, each with the [*response](#) categories

*****ebook converter DEMO Watermarks*****

Like/Indifferent/Dislike or *Yes/?/No*. Since its 1974 revision it has been called the **Strong–Campbell Interest Inventory (SCII)*. **SII** abbrev. [Named after the US psychologist Edward Kellogg Strong Jr (1884–1963)]

Strong Vocational Interest Blank *n.* One of the first widely used **occupational interest inventories*, constructed by the US psychologist Edward Kellogg Strong Jr (1884–1963) and published commercially in a version for men in 1927 and a version for women in 1938. The revised version was called the **Strong Interest Inventory*. **SVIB** abbrev.

Stroop effect *n.* Delay and disruption in naming the colours of words printed in non-matching coloured ink, as when the word *red* is printed in blue ink, the word *blue* in green ink, and so on. To perform the task it is necessary to ignore the meanings of the printed words and to respond only to the colours in which they are printed, but with experienced adult readers **automatic processing* tends to occur, causing interference in the processing of information and a significant (approximately 75 per cent) increase in the time required to name the colours, compared with the time taken to name the colours of meaningless strings of letters, and the effect cannot be suppressed voluntarily. The delay and disruption occur when naming the colours, but not when reading the words. This phenomenon provides a remarkable example of **top-down processing* and knowledge acting as a handicap: a person who could not read the words, through illiteracy or lack of knowledge of the language, for example, would not be slowed down. A commercial test of neuropsychological functioning based on this phenomenon is called the *Stroop Neuropsychological Screening Test (SNST)*. A simple demonstration of it can be constructed with a colour printer, or even with coloured pens. Prepare a page of colour names, such as *red*, *green*, *blue*, and *black*, in random order, each name printed in one of those colours at random, and then prepare another sheet, identical apart from the fact that the colour names are changed to nonsense words by moving each letter forward one place in the alphabet, so that *red* becomes *sfe*, and so on; then ask people to name all the colours in which the words are printed as quickly as possible, and compare the average times for the two sheets. *Compare* **FLANKER COMPATIBILITY EFFECT**, **SIMON EFFECT**. [Named after the US psychologist J(ohn) Ridley Stroop (1897–1973) who first reported the effect in the *Journal of Experimental Psychology* in 1935]

structural equation *n.* An equation representing the strengths of hypothesized relations among a set of **variables* in a formal **model*.

structural equation modelling *n.* The construction of statistical models out of **structural equations*. US *structural equation modeling*. See also ANALYSIS OF COVARIANCE STRUCTURES, PATH DIAGRAM. **SEM** *abbrev.*

structural gene *n.* A **gene* specifying an **amino acid* sequence of a **protein* that is used for building body cells. Compare REGULATOR GENE.

structuralism *n.* **1.** An approach to linguistics, textual analysis, social anthropology, and psychology, inspired by the Swiss linguist Ferdinand de Saussure's (1857–1913) *Course in General Linguistics* (1916) and associated especially with the writings of the French anthropologist Claude Lévi-Strauss (1908–2009) and the Swiss psychologist Jean Piaget (1896–1980), in which systems are analysed according to relations (such as equivalence and contrast) between their elements in order to determine the underlying structures below the surface manifestations of phenomena, and elements cannot be understood apart from their interrelations, because it is the network of interrelations that constitutes the meaningful structure of a system. See also DECONSTRUCTION. **2.** A school of psychology, founded originally on the German psychologist Wilhelm (Max) Wundt's (1832–1920) book *Outlines of Psychology* (1896) and Edward Bradford Titchener's (1867–1927) book *An Outline of Psychology* (1896), devoted to studying mental experience by analysing its elements, notably sensations, but also ideas (images of memory and imagination), and feelings, their properties, and the way they combine with one another, using controlled methods of **introspection*. Structuralism (in this sense) went into decline in Germany with the advent of Nazism in the 1930s and disappeared from US psychology shortly after Titchener's death in 1927. See also ACT PSYCHOLOGY, CONTENT PSYCHOLOGY, INTROSPECTIONISM, WÜRZBURG SCHOOL. **structuralist** *adj. n.* Of or relating to structuralism; a member or follower of the school of structuralism (2), or one who advocates or practises structuralism (1, 2).

structure from motion *n.* The process whereby the three-dimensional shape of an object is perceived by viewing it from different angles as it moves or the vantage point changes. Also called *depth from motion*. See also *****ebook converter DEMO Watermarks*****

KINETIC DEPTH EFFECT. **SFM** *abbrev.*

structure-of-intellect model *n.* Another name for **Guilford's cube*. **SOI** *abbrev.*

strychnine *n.* A highly poisonous **alkaloid* drug derived from the seeds of the *Strychnos nux-vomica* plant, in small doses functioning as a central nervous system **stimulant*, exciting especially spinal reflexes, and sometimes being added to street drugs. It acts by binding to the neuroreceptor sites on **alpha motor neurons* to which **glycine* molecules normally bind, causing **convulsions*. It has been used, probably inappropriately, as an antidote for the respiratory and cardiovascular depression that occurs with barbiturate or anaesthetic poisoning. *Compare* *CURARE*, *PICROTOXIN*, *TETANUS TOXIN*. [From Greek *Strychnos* nightshade]

Student–Newman–Keuls procedure *n.* Another name for the **Newman–Keuls test*. [Named after Student, the pen name of the English statistician William Sealy Gosset (1876–1937) who published a statistic that is used in the test in 1908, the English statistician Dennis Newman (1916–88) who published a preliminary article on the test in the journal *Biometrika* in 1939, and the Dutch horticulturist Matthijs Keuls who developed it further in an article in the journal *Euphytica* in 1952]

Student's t test *n.* The full name for the **t test*. Although it was developed by Student (see *STUDENT–NEWMAN–KEULS PROCEDURE*), it was later developed and modified by the English statistician Karl Pearson (1857–1936).

Study of Values *See* *ALLPORT–VERNON–LINDZEY STUDY OF VALUES*.

stupor *n.* A state of **lethargy* and unresponsiveness with immobility and **mutism*. [From Latin *stupor* numbness, torpor, or senselessness]

stuttering *n.* An informal term for **childhood-onset fluency disorder*. Also called *stammering*. **stutter** *vb.*

stylometrics *n.* Another name for **stylostatics*.

stylostatics *n.* The objective analysis of the relative frequencies of stylistic forms and patterns in the use of language, especially written texts. In practice, stylostatical studies have focused on the frequency and distribution of a small number of stylistic features, such as parts of speech, the **type–token ratio*, the size and diversity of the author's **lexicon* (2), the lengths of words and sentences, the author's preference between alternatives such as *on* versus *upon* and *while* versus *whilst*, rare and idiosyncratic constructions and usages. Stylostatics has been used to settle issues of disputed authorship, and it has important applications in **forensic linguistics*. Also called *stylometrics*. See also APPROXIMATION TO LANGUAGE, HAPAX LEGOMENON.

stylostixis *n.* Another name for **acupuncture*. [From Greek *stylos* a pointed instrument + *stixis* a mark or spot]

subarachnoid *adj.* Below the **arachnoid membrane*, in the space between it and the **pia mater*. See also SUBARACHNOID HAEMORRHAGE. [From Latin *sub* under + *arachne* a spider, alluding to the membrane's delicate weblike structure]

subarachnoid haemorrhage *n.* Bleeding into the space between the **arachnoid membrane* and the **pia mater* and sometimes into the brain itself. The first symptom is a blinding headache that is initially highly localized and then spreads, followed rapidly by dizziness, rigidity of the neck, unequal pupil dilation, nausea, drowsiness, sweating, coma, and in the absence of urgent treatment death within hours or days. US *subarachnoid hemorrhage*. **SaH** *abbrev.*

subception *n.* Another name for **subliminal* perception. [A blend of *sub(liminal)* + (*per*)ception]

subcoerulear nucleus *n.* A cluster of neurons adjacent to the **locus coeruleus* on either side of the **pons*, involved in **REM atonia*. Also spelt *subcerulear nucleus*. See also MAGNOCELLULAR NUCLEUS.

subconscious *adj.* 1. Operating or existing outside of **consciousness*. *n.* 2. In **psychoanalysis*, a term used by Sigmund Freud (1856–1939) in a few very early publications to denote the **unconscious* (2) but quickly abandoned because of its ambiguity. When it is used as a noun, it is usually another name for the **preconscious*, but this is avoided in careful usage.

subcortical *adj.* Located beneath or below the **cerebral* cortex, of or relating to structures or processes in the nervous system below the level of the cerebral cortex. [From Latin *sub* under + *cortex* bark or outer layer + *-icalis* of, relating to, or resembling]

subdural *adj.* Below the **dura mater*, between it and the **arachnoid membrane*. [From Latin *sub* under + *dura mater* hard mother, a literal translation of the Arabic name of the brain's outer membrane]

subdural haematoma *n.* **Subdural* bleeding, creating a blood-filled space between the normally contiguous **dura mater* and **arachnoid membrane*, usually caused by a blow to the head or, especially in old people, by **cerebral arteriosclerosis*, leading to various signs and symptoms including headaches, personality changes, convulsions, coma, and sometimes death. US *subdural hematoma*. [From Greek *haima*, *haimatos* blood + *-oma* indicating an abnormality]

subfornical organ *n.* A small structure below the **fornix* containing neurons that respond to the presence of **angiotensin II* in the blood by exciting neural circuits that tend to initiate drinking. It is one of the **circumventricular organs*. **SFO** *abbrev.*

subiculum *n.* A part of the hippocampal formation (see *HIPPOCAMPUS*) that is situated immediately below **Ammon's horn* (the hippocampus proper) between the dentate gyrus and the entorhinal cortex and that projects to the entorhinal cortex and the fornix. [From Latin *subicio* to lie under]

subitize *vb.* To perceive the number of items in a group without counting them. The maximum number of items that can be subitized under normal circumstances is about six, but **chunking* can sometimes increase the number

substantially. The word was coined by the US psychologist Edna L. Kaufman (1925–2005) and several co-authors in an article in the *American Journal of Psychology* in 1949. See also [ICONIC STORE](#), [MAGICAL NUMBER SEVEN](#), [SPAN OF APPREHENSION](#). **subitization** *n.* [From Latin *subitus* sudden, from *sub* below + *ire* to go + *-izare* to cause to become]

subjective colour *n.* A colour that is perceived in an [*achromatic](#) (1) stimulus. US *subjective color*. See [BENHAM'S TOP](#), [PATTERN-INDUCED FLICKER COLOUR](#).

subjective contour *n.* Another name for an [*illusory contour](#).

subjective equality See [POINT OF SUBJECTIVE EQUALITY](#).

subjective expected utility *n.* The [*expected utility](#) of an event or outcome calculated from subjective probabilities rather than from objective probabilities based on relative frequencies of observable events. **SEU** *abbrev.*

subjective expected utility theory *n.* A theory of decision making according to which a decision maker chooses an alternative or [*strategy](#) (2) that maximizes [*subjective expected utility](#). It was introduced by the US decision theorist Leonard J(immie) Savage (1917–71) in his book *The Foundations of Statistics* (1954), and in the same year it was named and first studied empirically by the US psychologist Ward (Denis) Edwards (1927–2005). See also [ALLAIS PARADOX](#), [BEHAVIOURAL DECISION THEORY](#), [COMMON RATIO EFFECT](#), [ELLSBERG PARADOX](#), [MODIFIED ELLSBERG PARADOX](#), [ST PETERSBURG PARADOX](#). Compare [EXPECTED UTILITY THEORY](#), [PROSPECT THEORY](#), [UTILITY THEORY](#).

subjective probability *n.* Probability defined in terms of degree of belief rather than relative frequency of events (as in the classical interpretation of probability), widely used in [*Bayesian inference](#), in which [*prior probabilities](#) (2) and [*posterior probabilities](#) are often interpreted as degrees of belief, and in [*subjective expected utility theory](#). See also [PROSPECT THEORY](#), [SUBJECTIVE EXPECTED UTILITY](#), [TAXICAB PROBLEM](#), [WELLS EFFECT](#).

subjective utility *n.* The [*utility](#) (1) of an outcome or an event

expressed in terms of an individual's personal judgement or degree of satisfaction rather than by **revealed preference*. See also [SUBJECTIVE EXPECTED UTILITY](#), [SUBJECTIVE EXPECTED UTILITY THEORY](#).

subjective well-being *n.* People's assessment of the overall quality of their lives. Research in **positive psychology* has revealed that, within any given nation, there is only a weak and unreliable correlation between income and subjective well-being, but between nations there is a strong correlation between average income and average subjective well-being, and rising income does not always increase subjective well-being. It is substantially determined by genetic inheritance and is strongly associated with health and longevity. See [EUDAIMONIC WELL-BEING](#), [HEDONIC TREADMILL](#), [HEDONIC WELL-BEING](#). See also [EMERGENESIS](#). **SWB** *abbrev.*

subject (research or experimental) *n.* A person or other organism whose behaviour or mental experience is investigated in a research study. Also called a research or experimental *participant* or *volunteer*. [From Latin *subiectus* thrown under, from *sub* under + *iacere* to throw]

subjunctive conditional *n.* A conditional statement or proposition (of the form *If p, then q*) in which both *p* and *q* are hypothetical. See [CONDITIONAL REASONING](#).

sublimation *n.* In **psychoanalysis*, a **defence mechanism* whereby a repressed or unconscious drive that is denied gratification is diverted into a more acceptable channel or form of expression, as when aggression is diverted into playing or watching violent sports or when **libido* is diverted into artistic or creative activity. Sigmund Freud (1856–1939), in his book *Civilization and its Discontents* (1930, *Standard Edition*, XXI, pp. 64–145), attributed the highest expressions of civilization to the sublimation of the sexual instinct. [From Latin *sublimare* to elevate, from *sublimis* lofty]

subliminal *adj.* Occurring without conscious awareness or below the **absolute threshold*. See also [SUBLIMINAL PERCEPTION](#). Compare [SUPRALIMINAL](#). **subliminally** *adv.* [From Latin *sub* below + *limen* a threshold + *-al(is)* of or relating to]

subliminal perception *n.* *Preconscious processing of stimuli below the intensity or duration of the *absolute threshold and therefore not eliciting conscious perception. It has been shown to occur for all sense modalities, and has been established experimentally by presenting stimuli of sufficiently low intensity or short duration as to be sub-threshold, and by *masking. Alarm was raised about subliminal advertising by the best-selling book *The Hidden Persuaders* (1957) by the US journalist Vance (Oakley) Packard (1914–96) and the essay *Brave New World Revisited* (1959) by the English novelist and essayist Aldous (Leonard) Huxley (1894–1963). Packard referred to a newspaper report in *The Times*: ‘It cited the case of a cinema in New Jersey that it said was flashing ice-cream ads onto the screen during regular showings of film. These flashes of message were split-second, too short for people in the audience to recognize them consciously but still long enough to be absorbed unconsciously. A result, it reported, was a clear and otherwise unaccountable boost in ice-cream sales’ (pp. 42–3). In 1957 the *New Yorker* magazine (21 September, p. 21) and the *Nation* magazine (5 October, p. 206) reported that the *motivational research practitioner James M(cDonald) Vicary (1915–77) had carried out an experiment in a New Jersey cinema in which the messages *Drink Coca-Cola* and *Eat popcorn* (not ice-cream) had been flashed subliminally on alternate evenings and the sales of these products during the intervals had reportedly risen by 18 per cent and 58 per cent respectively. However, Vicary admitted later that he had never actually carried out these experiments (*Advertising Age*, September 17, 1984, pp. 72–3, and October 15, 1984, p. 46); in any event, the reported exposure time of 1/3,000 second was far too short to produce subliminal perception, and attempts to replicate the effect have uniformly failed. Research has shown that subliminal messages have only limited power to influence behaviour, and ‘subliminal auditory tapes’ that are marketed as a means of boosting IQ or helping people to lose weight, give up smoking, or achieve other self-help goals have proved ineffective when studied objectively. Also called *subception*. See also POETZL PHENOMENON.

sublingual gland See SALIVARY GLAND.

submaxillary gland See SALIVARY GLAND.

submissive behaviour *n.* A form of *display (1) in which an animal
*****ebook converter DEMO Watermarks*****

that loses a fight, whether an **escalated fight* or a **conventional fight*, adopts a submissive posture to acknowledge defeat and to deter further attack. Human equivalents include **gestures (1)* of **non-verbal communication* such as holding up one's empty palms to communicate 'I give up'. US *submissive behavior*. See also *EMBLEM*.

Suboxone *n.* A proprietary name for the drug containing **buprenorphine* and **naloxone*. [Trademark]

subspecies *n.* In biology, a **taxonomic* group into which a **species* is divided, containing organisms that are genetically differentiable from other members of the same species by the relative frequencies of their **polymorphic genes*. Also called a *microspecies*, *race*, or *variety*.

substance abuse *n.* A maladaptive use of a **drug*, resulting in impairment of functioning or distress, as manifested by: a failure to perform adequately at home, school, or work; repeated drug use in dangerous circumstances, such as when driving or operating machinery; repeated police arrests; or serious marital or interpersonal problems caused or exacerbated by the drug use. Preferred usage *substance misuse*. See also *ADDICTION*, *DEPENDENCE (2)*, *PSYCHOPHARMACOLOGY*, *SUBSTANCE DEPENDENCE*, *SUBSTANCE-INDUCED DISORDERS*, *SUBSTANCE-RELATED AND ADDICTIVE DISORDERS*, *SUBSTANCE USE DISORDERS*.

substance dependence *n.* One of the major **substance use disorders*, characterized by a maladaptive pattern of substance use leading to clinically significant impairment or distress, manifested by signs and symptoms such as **tolerance (3)*, **withdrawal*, frequently taking larger amounts of the substance over a longer period than intended, persistent desire or effort to cut down on the substance use, excessive time spent on activities related to the substance use and its effects, often leading to the abandonment of social, occupational, or recreational activities, and continued substance use despite knowledge of problems likely to have been caused or exacerbated by it. See also *DEPENDENCE (2)*, *SUBSTANCE-RELATED AND ADDICTIVE DISORDERS*.

substance-induced disorders *n.* A class of **substance-related and addictive disorders* in **DSM-5* including **substance intoxication*, **substance*

*****ebook converter DEMO Watermarks*****

withdrawal, and substance-induced forms of **delirium*, persisting **dementia*, persisting **amnesic disorder*, **psychotic (1) disorders*, **mood disorders*, **anxiety disorders*, **sexual dysfunctions*, and **sleep–wake disorders*. Compare SUBSTANCE USE DISORDERS.

substance-induced persisting amnesic disorder See AMNESTIC DISORDER.

substance intoxication *n.* A condition following administration of a **psychoactive* substance or **drug* resulting in disturbances of **consciousness*, **cognition*, **perception*, **affect*, or **behaviour*. [From Latin *intoxicare* to poison, from *in* in + *toxicum* poison + *-ation* indicating a process or condition]

substance intoxication delirium *n.* A form of **delirium* associated with evidence from the case history, physical examination, or laboratory findings that the disturbance of **consciousness* and change in **cognition* developed during **substance intoxication* or as a consequence of medication.

substance/medication-induced disorder *n.* A term introduced in **DSM-5* to cover **substance/medication-induced psychotic disorder* and also the following disorders, when there is evidence that they are substance/medication-induced: **anxiety disorders*, **bipolar disorders*, **depressive disorders*, **neurocognitive disorders*, **obsessive–compulsive disorder*, **sexual dysfunctions*, and **sleep disorders*. See also **SUBSTANCE INTOXICATION*, **SUBSTANCE WITHDRAWAL*.

substance/medication-induced psychotic disorder *n.* In **DSM-5*, a disorder characterized by **hallucinations* and/or **delusions* that developed during or shortly after **substance intoxication* or **withdrawal* or ingestion of medication capable of producing the symptoms. Compare SUBSTANCE ABUSE, SUBSTANCE DEPENDENCE, SUBSTANCE-INDUCED DISORDERS, SUBSTANCE INTOXICATION, SUBSTANCE INTOXICATION DELIRIUM, SUBSTANCE-RELATED AND ADDICTIVE DISORDERS.

substance P *n.* An 11-member **peptide* that is present in the brain, spinal cord, and peripheral nervous system and that functions as a
*****ebook converter DEMO Watermarks*****

***neurotransmitter**, carrying afferent ***pain** signals, responding to painful stimuli by causing smooth muscles to contract, blood vessels to dilate, and mast cells to release ***histamine**. It is released by ***free nerve endings** after painful stimulation results in transmission of impulses not only in the normal ***orthodromic** direction to the central nervous system but also from points of bifurcation of their axons in the ***antidromic** direction into the neighbouring skin, where the nerve endings respond by releasing substance P. *See also* **AXON REFLEX**, **CAPSAICIN**. [From *substance* + German *P(ulver)* powder, from Latin *pulvis* dust, sand, or ashes, because it was first extracted in 1931 as a powder]

substance-related and addictive disorders *n.* A class of ***mental disorders** resulting from ***drug** use (including alcohol), ***side-effects** of medication, or exposure to toxins, or gambling. The following substances and groups of substances are specifically discussed in ***DSM-5**: ***alcohol**, ***caffeine**, ***cannabis**, ***inhalants**, ***phencyclidine**, other ***hallucinogens**, ***opiates**, ***sedatives**, ***hypnotics**, ***anxiolytics**, ***stimulant drugs**, and tobacco. However, many other substances, including heavy metals, rat poisons containing strychnine, carbon monoxide, and carbon dioxide can also lead to substance-related disorders. *See* **ALCOHOL-RELATED DISORDERS**, **AMPHETAMINE-RELATED DISORDERS**, **CAFFEINE-RELATED DISORDERS**, **CANNABIS-RELATED DISORDERS**, **COCAINE-RELATED DISORDERS**, **GAMBLING DISORDER**, **HALLUCINOGEN-RELATED DISORDERS**, **INHALANT-RELATED DISORDERS**, **NICOTINE-RELATED DISORDERS**, **OPIOID-RELATED DISORDERS**, **PHENCYCLIDINE-RELATED DISORDERS**, **SEDATIVE-, HYPNOTIC-, OR ANXIOLYTIC-RELATED DISORDERS**. *See also* **SUBSTANCE-INDUCED DISORDERS**, **SUBSTANCE USE DISORDERS**.

substance use disorders *n.* A class of ***substance-related and addictive disorders** in ***DSM-5**. *See* **SUBSTANCE ABUSE**, **SUBSTANCE DEPENDENCE**, **SUBSTANCE-RELATED AND ADDICTIVE DISORDERS**. *Compare* **SUBSTANCE-INDUCED DISORDERS**.

substance withdrawal *See* **WITHDRAWAL**.

substance withdrawal delirium *n.* A form of ***delirium** associated with evidence from the case history, physical examination, or laboratory findings that the disturbance of consciousness and change in cognition

*****ebook converter DEMO Watermarks*****

developed during, or shortly after, an episode of **withdrawal*.

substantia alba *n.* The technical name for the **white matter* of the brain and spinal cord. [From Latin *substantia* matter + *alba* white]

substantia gelatinosa *n.* Areas of **grey matter* in the **posterior* horns of the spinal cord, playing a part in **pain* and temperature perception. They are packed with excitatory **interneurons*, the **neurotransmitter* of which is **glutamate*, and inhibitory interneurons, the neurotransmitter of which is either **GABA* for some interneurons or the endogenous opioid **enkephalin* for others. [From Latin *substantia* matter + *gelatina* gelatine, from *gelare* to freeze, alluding to its consistency]

substantia grisea *n.* The technical name for the **grey matter* of the brain and spinal cord. [From Latin *substantia* matter + *grisea* grey]

substantia nigra *n.* One of the **basal ganglia*, implicated in motor control. It is a dark, pigmented area in the midbrain, just below the thalamus, containing neurons that synthesize and release **dopamine* and project primarily to the striatum. Lesions in this area are associated with **Parkinson's disease*. See also *MPP⁺*. [From Latin *substantia* matter + *nigra* black]

substantive *n.* 1. Either a noun or some other word (often a pronoun) standing in place of a noun. *adj.* 2. Of or relating to a word that is a substantive (1). 3. Of or relating to one of the classes of linguistic universals. See *SUBSTANTIVE UNIVERSALS*. [From Latin *substantia* substance, from *sub* under + *stare* to stand + *-ivus* indicating a tendency, inclination, or quality]

substantive universals *n.* One of the classes of **linguistic universals*, consisting of the fundamental building blocks of languages, examples being the apparent existence in all languages of nouns and of vowels.

substitute formation *n.* In **psychoanalysis*, the appearance of a **symptom*, **parapraxis*, or other psychological phenomenon that functions as a proxy or surrogate for an unconscious wish or idea following a process of **substitution*. See also *CHOICE OF NEUROSIS*, *COMPROMISE FORMATION*, *RETURN OF*

substitution *n.* The act or process of putting one thing in place of another. In **psychoanalysis*, a **defence mechanism* whereby an unattainable or unacceptable **instinctual object* or **emotion* is replaced by one that is more accessible or tolerable, resulting in **substitute formation*.

substitution test *n.* Another name for a **coding test*.

subthalamic fasciculus *n.* The small bundle of nerve fibres between the **subthalamic nucleus* and the **globus pallidus*.

subthalamic nucleus *n.* A structure belonging to the **basal ganglia*, situated between each of the cerebral peduncles and one of the mammillary bodies, interconnected primarily with the **globus pallidus*, functioning as a correlation centre for optical and vestibular impulses. See also *BALLISM*, *HEMIBALLISM*, *JACTATION*.

subthreshold *adj.* 1. Insufficient to evoke a **response*. 2. Another word for **subliminal*.

subtraction method *n.* A technique for estimating the duration of a psychological process by measuring the **reaction time* for a task that incorporates the psychological process in question, and the reaction time for a task that does not incorporate it, and then subtracting the second from the first. It was introduced by the Dutch ophthalmologist Franciscus Cornelius Donders (1818–89) in his work on simple reaction time and choice reaction time, published in the *Archives of Anatomy and Physiology* in 1868. Also called the *subtractive method* or *Donders' method*.

subtractive colour mixture *n.* A colour formed from the absorption of light by **subtractive primary* colorants, or the process of forming such a colour. US *subtractive color mixture*. See also *COLOUR MIXING*. Compare *ADDITIVE COLOUR MIXTURE*.

subtractive primary *n.* Any of the colorants blue–green (cyan), deep

purplish red (magenta), or yellow that can be subtracted from white light (usually by mixing pigments) to match any other spectral colour. They are the **complementary colours* of red, green, and blue respectively. Also called a *primary colour*, though that term is ambiguous. *See also* PRIMARY COLOUR (2). *Compare* ADDITIVE PRIMARY, PSYCHOLOGICAL PRIMARY.

Subutex *n.* A proprietary name for the drug **buprenorphine*. [Trademark]

subvocal rehearsal loop *n.* One of the two components of the **phonological loop* of **working memory*, functioning to keep information from decaying by mental repetition, and also translating visual information into phonological code where necessary for **short-term memory*. Also called an *articulatory loop*, an *articulatory rehearsal loop*, or an *articulatory store*.

successive contrast *n.* The phenomenon whereby a sensation such as lightness, colour, or warmth tends to induce the opposite sensation in a stimulus that follows it. Successive warmth contrast can be demonstrated vividly by holding one's left hand in a bowl of cold water and one's right hand in a bowl of hot water for a minute and then transferring both hands to a bowl of lukewarm water, close to **physiological zero*; the lukewarm water feels hot to the left hand and cold to the right hand. This experiment was first alluded to somewhat obscurely in 1690 by the English philosopher John Locke (1632–1704) in his *Essay Concerning Human Understanding* (Book 2, Chapter 8, section 21), as an argument that some physical properties that can be sensed must be secondary rather than **primary qualities*, and in 1846 the experiment was described clearly and studied quantitatively by the German psychophysicist Ernst Heinrich Weber (1795–1878). *See* COLOUR CONTRAST, CONTRAST (2), LIGHTNESS CONTRAST, THERMAL ADAPTATION, WARMTH CONTRAST. *Compare* SIMULTANEOUS CONTRAST.

successive reproduction *n.* A technique for studying memory, popularized by the English psychologist Sir Frederic Charles Bartlett (1886–1969) in his book *Remembering: A Study in Experimental and Social Psychology* (1932, Chapter 5) in which a person reproduces learned material on a sequence of occasions over a period of time. Bartlett called it the *method of repeated reproduction*, and he used the technique to study **reconstructive memory*. The technique had been introduced by the Welsh schoolteacher

*****ebook converter DEMO Watermarks*****

Philip Boswood Ballard (1865–1950) in the *British Journal of Psychology Monograph Supplements* in 1913, although Bartlett did not cite this earlier work. See also [HYPERMNESIA](#), [REMINISCENCE \(2\)](#), [WAR OF THE GHOSTS](#). Compare [SERIAL REPRODUCTION](#).

success neurosis *n.* In [*psychoanalysis](#), a term introduced in 1950 by the Hungarian psychoanalyst Sándor Lorand (1892–1987) to denote the phenomenon whereby a person responds to success with guilt and self-reproach. The condition was first identified by Sigmund Freud (1856–1939) in an article in 1916 on ‘Some Character Types Met With in Psycho-Analytic Work’, where he described people who were ‘wrecked by success’ (*Standard Edition*, XIV, pp. 311–33, at p. 316). Compare [FATE NEUROSIS](#), [FEAR OF SUCCESS](#).

sudorific *adj.* Sweat-producing. [From Latin *sudor* sweat]

suffix effect See [AUDITORY SUFFIX EFFECT](#).

suggestibility *n.* A propensity to be abnormally compliant with suggestions, commands, directions, instructions, or orders from another person, as in [*hypnosis](#). See also [CHEVREUL PENDULUM](#). **suggestible** *adj.* [From Latin *suggerere* to suggest, from *sub* under + *gerere* to bring + *-ibilitas* capacity, from *habilis* able]

suicide *n.* The act of killing oneself deliberately. Approximately 15 per cent of people with [*major depressive disorder](#) or [*bipolar disorder](#) kill themselves each year, suicide being the tenth leading cause of death in the US according to official figures, which are widely believed to underestimate its incidence. The French sociologist Émile Durkheim (1858–1917), in his book *Suicide* (1897), used survey data purporting to show that egoistic suicide, resulting from feelings of self-reproach and sense of failure and more common among single than married people, arises from a lack of social cohesion; that altruistic suicide, carried out for the benefit of others and relatively common in Japan, arises from a sense of failure to society; and that anomic suicide, arising from a sense that life is pointless and rare among Catholics, arises from an absence of social norms that he called [*anomie](#). See also [DEPRESSION](#). Compare [PARASUICIDE](#). **suicidology** *n.* The study of suicide.

*****ebook converter DEMO Watermarks*****

[From Latin *sui* of oneself + *caedere* to kill]

sukra prameha See DHAT.

suk yeong See KORO.

sulcus *n.* Any of the grooves or furrows between the **gyri* or convolutions of the brain, such as the **calcarine sulcus*, **central sulcus*, **lateral sulcus*, **longitudinal fissure*, **parieto-occipital sulcus*, or **superior temporal sulcus*. Also called a *fissure*, especially when referring to one of the longer and deeper grooves. **sulci** *pl.* [From Latin *sulcus* a furrow]

sulcus principalis *n.* Another name for the **longitudinal fissure*.

sum *n.* In mathematics and statistics, a total arrived at by adding a set of numbers or scores together. [From Latin *summa* the top or total, from *summus* highest]

summated ratings *n.* The method used to construct a **Likert scale*.

summation tone *n.* A **combination tone* whose frequency is equal to the sum of the frequencies of the two tones generating it. Compare DIFFERENCE TONE.

sum of squares *n.* In statistics, a shortened expression for the sum of the squared deviations of a set of scores from their **arithmetic mean*, to be distinguished from the sum of the squared scores, the meaning usually being clear from the context. The mean of the sum of the squared deviations, called the *mean square*, is used as an estimate of **variance*.

sunk cost fallacy *n.* Another name for the **Concorde fallacy*, especially among decision theorists.

superaesthesia *n.* Another name for **hyperaesthesia*. US *superesthesia*.

superdominance *n.* Another name for **overdominance*.

*****ebook converter DEMO Watermarks*****

superego *n.* In **psychoanalysis*, one of the three components of the human mental apparatus according to Sigmund Freud (1856–1939), after he replaced the **topography* of the unconscious–preconscious–conscious by the structural model of id–ego–superego after 1920. The superego, which originates from a conflict between the **id* and the **ego* in the course of development, monitors and controls the ego like a judge or a censor. Freud introduced the concept in print for the first time in 1923 in his book *The Ego and the Id* (*Standard Edition*, XIX, pp. 12–66). In his later book *New Introductory Lectures on Psycho-Analysis* (1932/3), he described its three functions as being ‘of self-observation, of conscience and of the ideal’ (1933, *Standard Edition*, XXII, pp. 5–182, at p. 66), and in the following key passage he referred to its long-term effects: ‘Thus a child’s super-ego is in fact constructed on the model not of its parents but of its parents’ super-ego; the contents which fill it are the same and it becomes the vehicle of tradition and of all the time-resisting judgements of value which have propagated themselves in this manner from generation to generation’ (p. 67). In the same work Freud explained its formation in both boys and girls as a consequence of the process of overcoming the **Oedipus complex* (p. 129), and the superego is often described as the heir of the Oedipus complex. Some later theorists have claimed that its development occurs much earlier: the Hungarian psychoanalyst Sandor Ferenczi (1873–1933) argued in 1925 that prohibitions are internalized from the beginning of toilet training; the British-based Austrian psychoanalyst Melanie Klein (1882–1960) first claimed in 1933 that the superego develops during the **oral* stage; and the Austrian psychoanalyst René A(rpad) Spitz (1887–1974) argued in 1958 that it develops gradually during infancy and childhood through **identification* with the aggressor. Also spelt *super-ego*. See also *EGO IDEAL*, *SUPEREGO LACUNA*. [From German *Über-Ich* over-I, from *über* over or above + *ich* I, following the precedent of *ego*]

superego lacuna *n.* In **psychoanalysis*, a class of obviously immoral actions that are not forbidden by the **superego* of a particular person, especially a person with **psychopathy* or **antisocial personality disorder*. [From Latin *lacuna* a hollow or a cavity, from *lacus* a lake]

supergene *n.* A string of **genes* along a **chromosome* whose functions are generally unrelated but that tend to be inherited together because of their

*****ebook converter DEMO Watermarks*****

close proximity.

superior *adj.* Higher in any respect; towards the top of a body, organ, or part, or situated above another homologous structure. *Compare* **INFERIOR**. [From Latin *superior* higher, from *super* above]

superior colliculus *n.* Either of two small hillock-shaped bumps on the ***tectum** (the roof of the midbrain), above and in front of the inferior colliculi, receiving some optic tract nerve fibres that bypass the lateral geniculate nucleus, involved in processing spatial aspects of visual information and eye movements in the direction of visual attention. The four colliculi are collectively called the corpora quadrigemina. **superior colliculi** *pl.* [From Latin *superior* higher, from *super* above + *colliculus* a small hill from *collis* a hill]

superiority complex *n.* A non-technical name for ***grandiose ideas or actions** or a ***grandiose delusion**; more generally, an inflated estimate of one's own merit or importance.

superior longitudinal fasciculus *n.* A bundle of nerve fibres in each cerebral hemisphere linking the ***frontal lobe** to the ***occipital lobe**. *Compare* **INFERIOR LONGITUDINAL FASCICULUS**. [From Latin *superior* higher + *longitudo* length, from *longus* long + *fasciculus* a little bundle, diminutive of *fasculus* a bundle]

superior oblique muscle *n.* The upper of the two ***oblique muscles** attached externally to the eyeball.

superior olivary nucleus *n.* Either of two collections of neuron cell bodies that are situated just above the inferior olivary nuclei in the pons and that receive signals from the ***trapezoid bodies** and project to the ***inferior colliculi**. They contain binaural neurons responding to inputs from both ears, the inputs reaching the superior olivary nuclei after the trapezoid bodies have amplified the left-right differences, and they are implicated in ***sound localization** based on binaural differences in both timing and sound intensity. Also called the *superior olivary complex* or the *superior olive*. *Compare* **INFERIOR OLIVARY NUCLEUS**. **SON** *abbrev.* [So called because it is olive-shaped]

*****ebook converter DEMO Watermarks*****

and above the inferior olivary nuclei]

superior rectus *n.* The upper of the four **rectus muscles* attached externally to the eyeball.

superior temporal gyrus *n.* The top **gyrus* running horizontally on the lateral surface of the **temporal lobe*, a small part of which (**Heschl's gyrus*) is occupied by the primary auditory cortex. Also called the *temporal operculum*.

superior temporal sulcus *n.* The horizontal **sulcus* near the top of each **temporal lobe*, immediately below the superior temporal gyrus, believed to contain neurons that respond to visual images of faces. *See also* MIRROR NEURON. **STS** *abbrev.*

supernormal stimulus *n.* In ethology, an exaggerated **sign* stimulus that evokes a stronger **fixed-action pattern* than the normal sign stimulus. Thus, a yellow pencil with two red spots near its tip evokes even more pecking from a herring gull chick than its parent's bill, which is broader and has only one red spot.

supertaster *n.* A person whose tongue has far more **fungiform papillae* than usual and who therefore experiences **taste* sensations between twice and three times as intensely as normal tasters. About 25 per cent of people are supertasters, and they are more often women than men. They typically experience more intense likes and dislikes for foods and drinks than normal tasters. *See* MAGNITUDE MATCHING, PROPYLTHIOURACIL. [The term was introduced in 1990 by the US psychologist Linda M. Bartoshuk (born 1938) and became widely known after she used it in an article in the journal *Physiology & Behavior* in 1994.]

supertentorial *adj.* Of or relating to symptoms that are presumed to be psychological rather than physical in origin and nature. [From Latin *super* above + English *tentorium* the membrane separating the **cerebrum* from the **cerebellum*, from Latin *tentorium* a tent, from *tendere* to stretch + *-alis* of or relating to]

supervised analysis *n.* Another name for a **control analysis*.

supination *n.* Lying in a supine position (flat on one's back) or, if standing with one's hands at one's sides, turning the palms forwards. *Compare PRONATION.* [From Latin *supinus* lying on the back + *-ation* indicating a process or condition]

supplementary motor area *See MOTOR CORTEX. SMA abbrev.*

supplementary sensory area *n.* Another name for the somatosensory association area. *See SOMATOSENSORY CORTEX.*

suppression *n.* Deliberate banishing from consciousness of selected thoughts, feelings, wishes, or memories, as in **thought stopping*. In **psychoanalysis*, it is a **defence mechanism* in which emotional conflicts or **psychosocial stressors* are dealt with by deliberately eliminating them from **consciousness*. Unlike **repression*, it is a conscious process, and the eliminated material ends up in the **preconscious* rather than the **unconscious* (2). Sigmund Freud (1856–1939) discussed it in his book *The Interpretation of Dreams* (1900, *Standard Edition*, IV–V, at pp. 235–7, 606n).

suppression amblyopia *n.* Another name for **amblyopia* ex anopsia.

suprachiasmatic nucleus *n.* A collection of nerve cell bodies in each side of the **hypothalamus*, above the optic chiasm and immediately adjacent to the supraoptic nucleus, receiving visual information via an accessory optic tract and projecting to the **pineal gland*, involved in the regulation of **biological clocks* and the control of **biological rhythms*. **SCN** *abbrev.* [From Latin *supra* above + Greek *chiasma* a cross, named after the shape of the upper-case letter chi (X), so called because of its location above the optic chiasm]

supraliminal *adj.* Above the threshold of **consciousness* or **sensation*, and hence available in consciousness. *See also SUBLIMINAL PERCEPTION.* *Compare SUBLIMINAL.* **supraliminally** *adv.* [From Latin *supra* above + *limen* a

threshold + *-al(is)* of or relating to]

supranuclear palsy See [PROGRESSIVE SUPRANUCLEAR PALSY](#).

supraoptic nucleus *n.* A [*nucleus](#) (2) in each side of the [*hypothalamus](#), above the optic chiasm and immediately adjacent to the suprachiasmatic nucleus, with nerve fibres projecting to the [*posterior](#) pituitary. Its stimulation causes [*vasopressin](#) to be released by the posterior pituitary. [From Latin *supra* above + Greek *optikos* optic, from *optos* seen, alluding to the optic chiasm]

sure-thing principle *n.* A precept, first enunciated and named by the US decision theorist Leonard J(immie) Savage (1917–71) in his book *The Foundations of Statistics* (1954), according to which, if an alternative *A* is judged to be as good as another *B* in all possible states of the world and better than *B* in at least one, then a [*rational](#) decision maker will prefer *A* to *B*. Savage's illustration refers to a person deciding whether or not to buy a certain property shortly before a presidential election, the outcome of which could radically affect the property market. 'Seeing that he would buy in either event, he decides that he should buy, even though he does not know which event will obtain' (p. 21). This principle is accepted by virtually all decision theorists, although it appears counter-intuitive to some people in puzzles such as [*Newcomb's problem](#), the [*Prisoner's Dilemma game](#), and the [*N-person Prisoner's Dilemma](#). A sure-thing alternative in a decision or a game of strategy is a [*dominant alternative/strategy](#).

surface colour *n.* The appearance of colour when it is perceived as belonging to the surface of an object at a particular distance, with lines and/or edges present in the visual field. US *surface color*. Compare [FILM COLOUR](#).

surface dyslexia *n.* A form of [*dyslexia](#) characterized by an over-reliance on spelling-to-sound correspondences, making words whose spelling is irregular (such as *debt*, *busy*, and *yacht*) difficult or impossible to read. Also called *phonological reading*, *reading by sound*. See also [COGNITIVE NEUROPSYCHOLOGY](#). Compare [DEEP DYSLEXIA](#).

surface structure *n.* A representation of a sentence together with labels
*****ebook converter DEMO Watermarks*****

and brackets to indicate the sentence's syntactic structure. In a famous example given by the US linguist and philosopher (Avram) Noam Chomsky (born 1928), the sentences *John is eager to please* and *John is easy to please* have similar surface structures but completely different ***deep structures**, because the first involves John pleasing someone and the second John being pleased by someone. See also [TRANSFORMATIONAL GRAMMAR](#).

surgency *n.* Another name for ***extraversion**.

surprise examination paradox *n.* Another name for the ***unexpected hanging paradox**.

survey research *n.* Research methods for investigating the distribution of attitudes, opinions, mental disorders, and other characteristics of individuals in specific sections of a population, or in a whole population, often broken down into demographic groups defined by geographical location, ethnic identity, age, sex, social class, marital status, education, and similar criteria. Surveys designed to compare different cultures or subcultures are called ***cross-cultural surveys**. [From Latin *super* over + *videre* to see]

survival of the fittest *n.* An informal description of ***natural selection**, referring to the fact that the fittest organisms in the struggle for existence live longest and therefore transmit more of their genetic characteristics to future generations. [The phrase was coined not by Charles (Robert) Darwin (1809–82) but by the English philosopher Herbert Spencer (1820–1903) in his *Principles of Biology* (1864, part III, Chapter 12), though in the 6th and final edition of *Origin of Species*, Darwin changed the title of Chapter 4 from 'Natural Selection' to 'Natural Selection and the Survival of the Fittest']

survivor guilt *n.* A feeling of guilt for surviving a tragedy in which others died, often associated with a sense of having been partly responsible for what happened. See also [POST-TRAUMATIC STRESS DISORDER](#), [SURVIVOR SYNDROME](#).

survivor syndrome *n.* A term introduced by the US psychiatrist Robert Jay Lifton (born 1926) for a pattern of responses often seen in survivors of terrible ordeals, the most important symptoms being ***anhedonia**, chronic ***anxiety**, ***depression**, ***dyssomnias**, ***nightmares (1)**, and in many cases
*****ebook converter DEMO Watermarks*****

*survivor guilt.

sustained responder *n.* Any of the *photoreceptors in the retina that respond to continuous stimulation by light rather than to changes in light stimulation. *See also* SLOWLY ADAPTING. *Compare* TRANSIENT RESPONDER.

susto *n.* A *culture-bound syndrome found in Peru and other parts of Latin America and among Spanish-speaking communities in the United States and elsewhere, in which, following a frightening experience (sometimes weeks, months, or even years later), the soul is believed to have departed the body, resulting in symptoms such as *psychomotor agitation, *anorexia, *insomnia or *hypersomnia, *nightmares (1), and *depressed mood, together with somatic complaints such as muscle and joint pain, headaches, and diarrhoea. It is also called *espanto* (fright, terror), *tripa ida* (departing gut), *perdida del alma* (departure of the soul), or *fallen fontanel syndrome*. [Spanish *susto* fright or scare]

sweat gland *n.* An *exocrine gland consisting typically of a coiled epithelial tube that secretes perspiration through a pore on to the surface of the *skin, present in humans in nearly all parts of the body.

sweet *n.* One of the primary tastes in *Henning's tetrahedron, the characteristic taste of sugar or *aspartame.

SWOT analysis *n.* A method of auditing an organization, policy, practice, or procedure by listing its strengths (what works well), weaknesses (what works badly), opportunities (feasible improvements), and threats (potential problems and obstacles). Carrying out a SWOT analysis is a simple and easy method of identifying improvements that can usefully be made. [Coined by an unknown source in the US in the late 1960s, from the initial letters of strengths, weaknesses, opportunities, threats]

Sydenham's chorea *n.* A form of *chorea resulting from rheumatic fever, usually in children. Also called *chorea minor*, *rheumatic chorea*, *Saint Vitus' dance*. [Named after the English physician Thomas Sydenham (1624–89) who first identified it]

sylllogism *n.* A structured logical argument consisting of two assumed or given ***propositions** (1), functioning as ***premises**, and a third proposition, functioning as a *conclusion*, deduced from the premises. The premises each share a term in common with the conclusion and also a *middle term* with each other but not with the conclusion. There are 256 structurally distinct syllogisms, of which only 24 are valid. This syllogism is valid: *All men are mortal; No gods are mortal; Therefore no men are gods.* The following syllogism is invalid: *Some men are bald; some men like football; therefore some bald men like football.* Since the Greek philosopher Aristotle (384–322 BC) popularized this form of reasoning in his *Prior Analytics* and *Posterior Analytics*, virtually all syllogisms that have been discussed are ***categorical syllogisms**, but see **MODAL LOGIC**. See also **ATMOSPHERE HYPOTHESIS**, **BELIEF-BIAS EFFECT**, **CONVERSION HYPOTHESIS**, **DEDUCTIVE REASONING**, **LOGIC**, **MOOD** (3), **SORITES**, **VENN DIAGRAM**. **sylllogistic** *adj.* [From Greek *sylllogismos* a syllogism, from *syllogizesthai* to reckon together, from *syn* together + *logizesthai* to reckon or calculate, from *logos* word, discourse, or reason]

Sylvian aqueduct *n.* Another name for the ***cerebral** aqueduct. [Named after the French anatomist Sylvius (1478–1555), also called Jacques Dubois, who discovered it]

Sylvian fissure *n.* Another name for the ***lateral** sulcus. [Named after the Prussian physician Franciscus Sylvius (1614–72), also called Franz de le Boë, who apparently discovered it]

symbiosis *n.* A mutually beneficial relationship between two different species, especially between species living in close proximity to each other. **symbiotic** *adj.* [From Greek *syn* together + *bios* life + *-osis* indicating a process or state]

symbol–digit test *n.* Another name for a ***digit–symbol test**.

symbolic interactionism *n.* A theoretical approach in social psychology and sociology, stemming largely from the writings of the US social psychologist George Herbert Mead (1863–1931), in which people are assumed to respond to elements of their environments according to the

meanings they attach to those elements, such meanings being created and modified through social interaction involving symbolic communication with other people.

symbolic racism *See* MODERN RACISM.

symbolic representation *n.* A form of **knowledge* representation in which arbitrary symbols or structures are used to stand for the things that are represented, and the representations therefore do not resemble the things that they represent. Natural language (apart from onomatopoeic expressions) is the most familiar example of symbolic representation. Also called *propositional representation*. Compare ANALOGUE (2). [From Greek *symbolon* a token + *-ikos* of, relating to, or resembling]

symbolization *n.* In **psychoanalysis*, a **defence mechanism* whereby an unconscious idea is expressed in the form of a different idea, object, image, or concept, sometimes resulting in **symptom* formation.

symbol-substitution test *n.* Another name for a **coding test*.

Symmetrel *n.* A proprietary name for the dopamine agonist drug **amantadine*. [Trademark]

symmetry law *n.* A principle of **Gestalt* psychology according to which perceptions tend to assume forms that are as symmetrical as the sensory input allows. *See also* PRÄGNANZ.

sympathetic apraxia *n.* Another name for **unilateral limb apraxia*. *See also* APRAXIA.

sympathetic ganglionic chain *n.* A string of **ganglia* running down each side of the spinal cord throughout most of its length, containing cell bodies of neurons that belong to the **sympathetic nervous system* and that project axons to muscles and glands, controlling the smooth muscles of the blood vessels, eyelids, hair follicles, sweat, tear, and salivary glands, respiratory organs, irises, and also the heart and other organs. Also called the

chain ganglia or *sympathetic trunk*. [From Greek *syn* with + *pathos* suffering + *ganglion* a cystic tumour]

sympathetic nervous system *n.* One of the two major subdivisions of the **autonomic* nervous system, consisting of nerves originating from the cervical, thoracic, and lumbar regions of the spinal cord, supplying muscles and glands, concerned with general activation and mobilizing the body's fight or flight reaction to stress or perceived danger. It acts in opposition to and more diffusely than the **parasympathetic nervous system*, accelerating pulse rate, dilating the pupils of the eyes and preparing them for **far vision*, causing the sweat glands to secrete and urine to be retained, inhibiting the **smooth muscles* of the **alimentary* canal, diverting blood from the skin and intestines to the voluntary **striped muscles*, and activating the **adrenal gland* to secrete **adrenalin* (epinephrine) and **noradrenalin* (norepinephrine). See also *SYMPATHETIC GANGLIONIC CHAIN*. **SNS** *abbrev.* [From Greek *syn* with + *pathos* suffering]

sympathetic pregnancy *n.* Symptoms of pregnancy experienced by the male partner of a pregnant woman. A majority of men with pregnant partners feel at least some such symptoms. See also *COUVADE*, *PSEUDOCYESIS*.

sympathetic trunk *n.* Another name for a **sympathetic ganglionic chain*.

sympathin *n.* An obsolete name for **adrenalin*, introduced by the US physiologist Walter Bradford Cannon (1871–1945) and the Belgian radiobiologist and inventor Zénon M(arcel) Bacq (1903–83) in an article in the *American Journal of Physiology* in 1931: 'Because the substance is derived from structures under sympathetic control, when they are influenced by sympathetic impulses, we suggest that it be called sympathin' (p. 411).

sympatholytic *adj. n.* (Of, relating to, or having an effect similar to) a drug or other agent that acts against or inhibits the activity of the **sympathetic nervous system*. Compare *PARASYMPATHOLYTIC*, *SYMPATHOMIMETIC*. [From *sympathetic* + Greek *lysis* loosening + *-ikos* of, relating to, or resembling]

sympathomimetic *adj. n.* (Of, relating to, or having an effect similar to) any drug such as **amphetamine*, **cocaine*, **ephedrine*, **phenmetrazine*, **tyramine*, or **yohimbine* that mimics or increases the activity of **adrenalin* (epinephrine), **noradrenalin* (norepinephrine), and **dopamine*, the major neurotransmitters of the **sympathetic nervous system*, thereby acting as a central nervous system **stimulant*, moderate dosages producing increased heart rate and general arousal, decreased fatigue and boredom, enhanced psychomotor performance, loss of appetite, and elevations in mood that are frequently described as euphoric, and higher dosages being associated with a variety of motor symptoms (twitching, restlessness, stereotyped movements), perceptual symptoms (distortion of time, tactile hallucinations or **formication*), mood distortions (fear, paranoia, psychotic symptoms), and occasionally convulsions and death. *Compare* PARASYMPATHOMIMETIC, SYMPATHOLYTIC. [From Greek *syn* with + *pathos* suffering + *mimesis* imitation, from *mimeisthai* to imitate + *-ikos* of, relating to, or resembling]

symptom *n.* A subjective indication of a disorder reported by an afflicted person rather than being observed by an examiner. *See also* PRESENT STATE EXAMINATION (PSE), SCAN, SYMPTOM FORMATION, SYNDROME. *Compare* SIGN (1). [From Greek *symptoma*, from *syn-* together + *piptein* to fall]

symptom formation *n.* In **psychoanalysis*, the appearance of a **neurotic* (1) or other **symptom*, as a symbolic expression or manifestation of a mental conflict through the **return of the repressed*. *See also* CHOICE OF NEUROSIS, COMPROMISE FORMATION, RETURN OF THE REPRESSED, SUBSTITUTE FORMATION, SYMBOLIZATION.

synaesthesia *n.* 1. A sensory experience elicited by a stimulus in a different sensory modality, as when particular sounds evoke sensations of colour. An unusual but memorable example is the remark made in November 2009 by the English supermodel Kate Moss (born 1974): ‘Nothing tastes as good as skinny feels.’ *See also* CHROMAESTHESIA, PHOTISM (1). 2. The experience of a sensation in a different part of the body from the area of stimulation. *See also* REFERRED PAIN. Also called *synaesthesia*. US *synesthesia*, *synesthesia*. [From Greek *syn-* together + *aisthesis* feeling + *-ia* indicating a condition or quality]

synapse *n.* **1.** The junction between two **neurons* or between a neuron and a muscle or gland, where nerve impulses are relayed, usually by a **neurotransmitter*, from the axon of a **presynaptic* neuron to the axon, dendrite, or cell body of a **postsynaptic* neuron, or sometimes from the dendrite of one to the dendrite of another, a typical synapse consisting of a **synaptic cleft* approximately 20 nanometres (millionths of a millimetre) wide into which the neurotransmitter is released from **synaptic vesicles* in the presynaptic neuron, triggering an **action potential* in the postsynaptic neuron if the sum of all the signals reaching the postsynaptic neuron reaches a critical threshold (see *illustration*). Somatodendritic (cell body to dendrite) and somatosomatic (cell body to cell body) synapses have also been identified but are very rare. The effect of the presynaptic neuron on the postsynaptic neuron, muscle, or gland may be either excitatory or inhibitory. See *AXOAXONIC*, *AXODENDRITIC*, *AXOSOMATIC*, *DENDRODENDRITIC*. See also *GAP JUNCTION*, *SYNAPTIC RECEPTOR*. *vb.* **2.** To form or play a part in a synapse (1) as in *Motor neurons synapse directly on to muscles*. **synaptic** *adj.* Of, relating to, or consisting of a synapse (1). [From Greek *synapsis* contact or junction, from *syn* together + *haptein* to fasten]

Synapse. Basic structure.

synaptic bouton *n.* Another name for a **bouton*. Also called an *end foot*, *end bulb*, or *synaptic terminal*.

*****ebook converter DEMO Watermarks*****

synaptic cleft *n.* The narrow gap, typically 0.02 micrometres wide, between a *presynaptic neuron and a *postsynaptic neuron, muscle, or gland at a *synapse (1).

synaptic potential *n.* A change in the voltage difference across the membrane of a *postsynaptic cell, produced by the transmission of a nerve impulse across a *synapse (1). *See also* EXCITATORY POSTSYNAPTIC POTENTIAL, INHIBITORY POSTSYNAPTIC POTENTIAL.

synaptic receptor *n.* A *neuroreceptor in a *postsynaptic neuron specialized to respond to a *neurotransmitter released from a *presynaptic neuron.

synaptic terminal *n.* Another name for a *bouton.

synaptic transmission *n.* The chemical process whereby a *presynaptic neuron passes a nerve impulse across a *synapse (1) to a *postsynaptic neuron, muscle, or gland.

synaptic vesicle *n.* A tiny sac in a synaptic *bouton containing a *neurotransmitter substance. When a nerve impulse arrives, it releases a small amount of the neurotransmitter across the *synapse (1).

synchronicity *n.* A term coined by Carl Gustav Jung (1875–1961) to denote a seemingly significant coincidence in time of two or more events that are related but not causally connected, as when a dream turns out to correspond to an external event or when close relatives or friends have similar thoughts, dreams, or experiences at the same time. Jung introduced the term in 1930, in a lecture on the *I Ching*, an ancient Chinese book of divination, and he published a full account in 1952 in an essay entitled *Synchronizität als ein Prinzip akausaler Zusammenhänge* (Synchronicity: An Acausal Connecting Principle) in Volume 8 of the *Collected Works of C. G. Jung*. *See also* ANALYTICAL PSYCHOLOGY, NOMINATIVE DETERMINISM. [From Greek *synchronos* simultaneous, from *syn* together + *chronos* time + Latin *-itas* indicating a state or condition]

synchronized sleep *n.* Another name for ***NREM sleep**. **S sleep** *abbrev.*

synchronizer *n.* Another name for a ***Zeitgeber**.

syncope *n.* **1.** A brief loss of consciousness resulting from a fall in blood pressure or an interruption in the supply of oxygen to the brain, usually preceded by a sensation of light-headedness and often preventable by lying down or placing one's head between one's knees. It may be caused by emotional stress, stimulation of the ***vagus nerve**, or a sudden change in posture or body temperature. **2.** In linguistics, another word for ***haplology**. [From Greek *synkoptein* to cut short, from *syn-* together + *koptein* to cut off]

syndrome *n.* A pattern of ***signs (1)** and ***symptoms** that tend to co-occur and may indicate a common origin, course, familial pattern, or indicated treatment of a particular disorder. [From Greek *syndrome* from *syn-* together + *dromos* course]

synecdoche *n.* A ***figure of speech** involving the substitution of a word denoting a part of the thing referred to for the whole, or the whole for a part, as in the phrase *all hands on deck*, in which *hands* means sailors. *Compare* **METONYMY**. [From Greek *syn-* together + *ekdoche* interpretation]

synergist *n.* A muscle that acts with another, or a substance that increases the effects of another. *See* **AGONIST (2, 3)**. [From Greek *synergia* cooperation, from *syn-* together + *ergon* work]

synonym *n.* A word that has approximately the same meaning as another word, such as *leap*, which is a synonym of *jump*. In ***semantics**, words are considered to be synonyms if they are close enough in meaning to be interchangeable in some contexts, although they may not be interchangeable in others: for example, in the sentence *This store offers a wide range of goods*, the word *choice* could be substituted for *range* without altering the meaning, and hence these two words are synonyms in that context; but in the sentence *This student displays a wide range of knowledge*, the word *choice* cannot be substituted and is not a synonym of *range*. *Compare* **ANTONYM**.

synonymous *adj.* **synonymy** *n.* The relationship between words that are synonyms. [From Greek *syn* together + *onoma* a name]

synonym test *n.* A type of **intelligence* test item in which the respondent is presented with a word and is asked to supply a word with the same meaning to it, often by choosing from a set of response alternatives. *See also* *SYNONYM*. *Compare* *ANTONYM TEST*.

syntactic aphasia *See* *APHASIA*.

syntactic positive shift *n.* Another name for the **P600* event-related potential. [From Greek *syn* together + *tassein* to arrange in order + *-ikos* of, relating to, or resembling]

syntactics *n.* A term sometimes used, though not in linguistics, as a synonym for **syntax*.

syntax *n.* The branch of **linguistics* devoted to the study of the grammatical arrangement of words and **morphemes* in sentences, and with the rules governing sentence structure in general. **syntactic** *adj.* [From Greek *syn* together + *tassein* to arrange in order]

synthetic language *n.* Another name for an **inflecting language*.

synthetic statement *n.* In **logic*, a declarative statement in which the predicate asserts something that is not contained either explicitly or implicitly in the subject. Such a statement can be tested by observation or experience, and its negation is not self-contradictory. An example is the statement *All bachelors live alone*. The truth or falsity of a synthetic statement or proposition is **a posteriori*. Also called a *synthetic proposition*. *Compare* *ANALYTIC STATEMENT*. [From Greek *synthetikos* expert in putting together, from *syntithenai* to put together, from *syn-* together + *tithenai* to place]

SYSTAT *abbrev.* System for Statistics, a suite of statistical computer programs often used by psychologists, distributed by Systat Software, Inc. *Compare* *BMDP*, *SAS*, *SPSS*.

*****ebook converter DEMO Watermarks*****

systematic desensitization *n.* A technique of **behaviour* therapy, developed in the 1950s by the South African-born US psychiatrist Joseph Wolpe (1915–97) for treating **phobias* in particular, in which each member of a hierarchy of increasingly anxiety-provoking imaginary situations involving the **phobic stimulus* is repeatedly paired with a response that is physiologically incompatible with fear and anxiety, such as deep muscular relaxation, starting with the least frightening item and working up the hierarchy by degrees. An adaptation of the technique involving exposure to the actual phobic stimulus or situation is called *in vivo desensitization*. See also PROGRESSIVE RELAXATION, RECIPROCAL INHIBITION.

systematic review *n.* A review of research using methodical and organized procedures for identifying, selecting, appraising, and synthesizing the primary findings of a large number of research studies. It is especially suited to reviews whose principal aim is to assemble, pool, and summarize research data relevant to a clearly specified question or set of questions. Some systematic reviews include **meta-analysis*. See also COCHRANE REVIEW.

systematized delusion *n.* An organized cluster of **delusions* arising as ramifications of a single basic delusion in order to preserve a coherent or logical belief system.

System for Statistics See SYSTAT.

System 1 thinking *n.* Fast, reactive, emotional thinking, associated with **limbic system* activity. It may be contrasted with *System 2 thinking*: slow, deliberate thinking that uses logic, considers the long-term consequences of actions, and is associated with **prefrontal cortex* activity. This terminology was introduced by the Israeli-American psychologist Daniel Kahneman (born 1934) in an article in the journal *American Economic Review* (2003) and popularized in his book, *Thinking, Fast and Slow* (2011). Taken together these modes of thinking provide an example of a **dual-process model*.

systems analysis *n.* The process of breaking down a complex task into its constituent parts and translating them into a form that enables a computer to carry out the task. **systems analyst** *n.* One who practises systems analysis.

systems theory *n.* An approach to industrial relations, applied also to *family therapy and *group therapy, in which organizations, families, and other groups resemble organisms composed of interdependent parts, each with its own function and pattern of interrelationships with the others.

syzygy *n.* Conjunction or juxtaposition of opposites, as when the sun and the moon lie in a straight line on opposite sides of the Earth. In *analytical psychology, a pair of opposites, especially *anima and *animus (3). Carl Gustav Jung (1875–1961) was struck by the ubiquity of cultural symbols of syzygy, such as the Chinese *yin and yang. **syzygies** *pl.* **syzygial** *adj.* [From Greek *syzygia* union or coupling, from *syn-* with or together + *zygon* a yoke]

Szondi test *n.* A *projective test consisting of 48 photographs of mental patients arranged in six groups, each group containing photographs of eight people representing eight basic psychological needs: a homosexual, a sadist, an epileptic, a hysteric, a catatonic schizophrenic, a paranoid schizophrenic, a depressive, and a manic patient. The respondent is asked to select the two most attractive and the two most repellent photographs from each group. The assumption underlying the test, based on the doctrine of *genotropism, is that the respondent will tend to be attracted to photographs of people with similar genetic predispositions and repelled by those with incompatible genes. The test provides measures (following the order of the photographs listed above) of need for tender, feminine love; need for aggression and masculinity; mode of dealing with aggression; need to exhibit emotions; narcissistic ego-needs; expansive tendencies of the ego; need to acquire and master objects; and need to cling to objects for enjoyment. [Named after the Hungarian geneticist and psychoanalyst Lipot (Leopold) Szondi (1893–1986), who expounded the ideas behind his test in 1944 in a book entitled *Schicksalsanalyse* (Analysis of Destiny) and published the test itself shortly thereafter]

tabes dorsalis *n.* Another name for **locomotor ataxia*. [From Latin *tabes* wasting + *dorsalis* of the back, from *dorsum* the back]

tabletop illusion See *TURNING THE TABLES ILLUSION*.

tabula rasa *n.* A blank slate, a term introduced by the English philosopher John Locke (1632–1704) as a metaphor for the human mind at birth, the belief of Locke and the other British empiricists being that nothing is innate in the mind and that all knowledge comes through the senses. See also *EMPIRICISM*. Compare *INNATE IDEA*. [From Latin *tabula* a tablet + *rasa* smoothed]

tachistoscope *n.* A device for exposing visual stimuli for very brief and carefully measured intervals, used in the study of visual perception, attention, and memory. **tachistoscopic** *adj.* Of or relating to a tachistoscope. [From Greek *tachistos* swiftest, from *tachys* swift + *skopeein* to view]

tachycardia *n.* Abnormally rapid pulse in the normal resting state, often taken to mean over 100 beats per minute. Compare *BRADYCARDIA*. [From Greek *tachys* swift + *kardia* the heart]

tachygraphy *n.* Shorthand writing, especially of the type used in ancient Greece and Rome. Compare *BRACHYGRAPHY*, *STENOGRAPHY*. [From Greek *tachys* quick + *graphein* to write]

tachylalia *n.* Excessively rapid speech. [From Greek *tachys* swift + *lalia* speech]

tachyphasia *n.* Another word for ***tachylalia**. Also called *tachyphresia*. [From Greek *tachys* swift + *phasis* speech, from *phanai* to speak + *-ia* indicating a condition or quality]

tachyphrenia *n.* Racing thoughts or mental processes. It can be induced by extreme emotional states or ***stimulant drugs**. [From Greek *tachys* swift + *phren* mind, originally midriff, the supposed seat of the soul + *-ia* indicating a condition or quality]

tachyphylaxis *n.* A form of drug ***tolerance** (3) that develops very rapidly, exemplified by the typical reaction to repeated dosages of ***ephedrine**, functioning by rapid emptying of ***catecholamine** neurotransmitter substances from ***synaptic vesicles**. **tachyphylactic** *adj.* [From Greek *tachys* swift + *phylax* a guard, following the model of *prophylaxis*]

tact *n.* **1.** Consideration or politeness in dealing with others; diplomacy or skill in handling delicate negotiations. **2.** In the writings of the US psychologist Burrhus F. Skinner (1904–90), a verbal utterance that is elicited by an object or event in the external world. It differs from a ***mand** by being under the control of its antecedents rather than its consequences, but some non-Skinnerians have had difficulty understanding the concept. A typical example is the utterance: *Hello Hymie!* **3.** An almost obsolete term for the sense of touch. [From Latin *tactus* a touching, from *tangere* to touch]

tactile *adj.* **1.** Of, relating to, or involving touch. *n.* **2.** A person whose characteristic style of mental imagery is tactile rather than visual, auditory, or motor. Also (rarely in psychology) called *tactual*. Compare **AUDILE** (2), **MOTILE** (2), **VISUALIZER**. [From Latin *tactilis* tactile, from *tactus* touched, from *tangere* to touch + *-il(is)* indicating capability or relationship]

tactile acuity *n.* The keenness or sharpness of the sense of touch, usually measured by the ***two-point threshold**. Also called *touch acuity*. See also **ACUITY**.

tactile agnosia *n.* Impaired ability to recognize or identify objects by

touch alone. Also called *haptic agnosia*, *tactoagnosia*. Compare [AHYLOGNOSIA](#), [AMORPHOGNOSIA](#). [From Latin *tactilis* of or relating to touch, from *tangere* to touch + Greek *a-* without + *gnosis* knowledge + *-ia* indicating a condition or quality]

tactile aphasia *n.* A modality-specific naming impairment in which objects cannot be correctly named on the basis of touch alone so that a pair of scissors may be misnamed as a clock, or a ring as a balloon. This form of aphasia usually results from neurological damage resulting in disconnection between the tactile and language centres of the brain. See also [APHASIA](#), [DISCONNECTION SYNDROME](#). Compare [AMORPHOGNOSIA](#).

tactile corpuscle *n.* Another name for a [*Meissner's corpuscle](#).

tactile disc *n.* Another name for a [*Merkel cell](#). US *tactile disk*.

tactile egocentre *n.* Any of various points in the body where tactile sensations are perceived or felt to converge. US *tactile egocenter*. See also [EGOCENTRE](#).

tactile hallucination *n.* A [*hallucination](#) of being touched or of something touching the skin, or quite commonly a feeling of electric shock or [*formication](#).

tactile illusion *n.* Any [*illusion](#) of touch. See [ARISTOTLE'S ILLUSION](#), [LIBET'S DELAY](#), [RUBBER HAND PHENOMENON](#), [SENSORY SALTATION](#), [SIZE—WEIGHT ILLUSION](#), [THERMAL GRILL ILLUSION](#). Compare [AUDITORY ILLUSION](#), [VISUAL ILLUSION](#).

tactile receptor *n.* A generic name for [*Meissner's corpuscle](#) or a [*Merkel cell](#). See also [TOUCH RECEPTOR](#).

tactoagnosia *n.* Another name for [*tactile agnosia](#). See [AGNOSIA](#).

tactor *n.* Another name for a [*touch](#) receptor. [From Latin *tactus* a touching, from *tangere* to touch]

tactual *adj.* Another word for **tactile* (1).

Tadoma method *n.* A technique devised in 1910 by the US educator Sophia Kindrick Alcorn (1883–1967) to enable a person who is both blind and deaf to receive and interpret speech by placing a thumb lightly in contact with the speaker's lips and the fingers of the same hand on the speaker's jaw and neck, thereby detecting by touch the pattern of airflow from the speaker's mouth and nose, the articulatory movements, and the vibrations from the vocal tract, permitting a well-practised user of the system to achieve a modest comprehension of slow speech. [Named after two deaf-blind children, Winthrop 'Tad' Chapman (1915–96) and Oma Simpson (1902–27), with whom the technique was first used at the Kentucky School for the Deaf]

taijin kyofusho *n.* A **culture-bound syndrome* found in Japan and included in the official Japanese classification of mental disorders, characterized by an intense and debilitating anxiety that one's body or its parts or functions are embarrassing, displeasing, repugnant, or offensive to others. Also called *shinkei-shitsu*. It is sometimes interpreted in Western cultures as a **body dysmorphic disorder*. [Japanese *taijin* confrontation + *kyofu-sho* phobia, from *kyofu* fear + *sho* nature or kind]

Talbot–Plateau law *n.* Another name for **Talbot's law*.

Talbot–Plateau spiral *n.* Another name for the **Plateau* spiral. Also called the *Talbot–Plateau disc*. [Named after the English photographer, physicist, and psychologist (William Henry) Fox Talbot (1800–77) who studied it, and the Belgian physicist Joseph Antoine Ferdinand Plateau (1801–83) who published a major article on it in 1850]

Talbot's law *n.* The proposition that when two or more colours differing in **hue* or **lightness* are alternated, as on a rotating **Maxwell disc* divided into contrasting sectors, there is a frequency beyond which perceived flicker ceases and an impression of uniform colour is created, and when a colour is mixed with black in this way, its lightness is proportional to the area of the disc that it fills. Also called the *Talbot–Plateau law*. [Named after the English photographer, physicist, and psychologist (William Henry) Fox Talbot]

(1800–77) who published it in 1834, although the Belgian physicist Joseph Antoine Ferdinand Plateau (1801–83) had already formulated the underlying principle and published it in an obscure article in 1829]

Talwin *n.* A proprietary name for the narcotic analgesic **pentazocine*. [Trademark]

tandem gait *n.* Heel-to-toe walking; walking by placing the heel of each foot in turn immediately in front of the toe of the other. It is used as a neurological test of balance and coordination and is useful in identifying subtle or mild **gait ataxia*, and as a crude indication of **alcohol* intoxication. Patients who lose balance during tandem walking are generally considered ataxic. [From Latin *tandem* at length + Old Norse *gata* a path or way]

tandem reinforcement schedule *n.* A **compound reinforcement schedule* in which **reinforcement* (1) is delivered after an organism has completed two or more **simple reinforcement schedules* in succession, no signal being given to indicate to the organism which schedule is operating at any particular time. Also called a *tandem schedule*. See also REINFORCEMENT SCHEDULE. Compare CHAINED REINFORCEMENT SCHEDULE. [From Latin *tandem* at length]

tangentiality *n.* Responding to questions obliquely rather than directly, without giving direct answers. Also called *tangential speech*. Compare CIRCUMSTANTIALITY, GANSER SYNDROME. [So called because responses go off at a tangent to the questions]

tantrum *n.* A sudden outburst or fit of childish rage or temper. Also called a *temper tantrum*.

tanyphonia *n.* Thin, weak, metallic vocal quality resulting from tension in the muscles of the **vocal tract*. [From Greek *tanyzo* to stretch + *phone* a sound + *-ia* indicating a condition or quality]

tapetum *n.* 1. The highly reflective layer that lies behind the retina of cats and other nocturnal animals and that provides the **photoreceptors* with a

second opportunity to respond to rays of light as they return through the retina after being reflected, thereby maximizing the eye's ability to respond to sparse light. It is the tapetum that causes cats' eyes to glow when caught in the beams of a car's headlamps. *Compare* PIGMENT EPITHELIUM. **2.** The sheet of nerve fibres of the *corpus callosum above the lateral ventricles of the brain. [From Latin *tapete* a carpet, from Greek *tapes* a carpet]

tarantism *n.* A nervous disorder characterized by *ataxia and frenzied *choreiform *hyperkinesia that began in southern Italy in the 15th century and spread northwards throughout Europe during the succeeding two centuries before dying out, initially believed to have been caused by a tarantula bite, and remedied by means of lively Neapolitan dances called *tarantellas*. Also called *dancing mania*, *tarantulism*. *See also* SAINT VITUS' DANCE. [From Latin *tarantula*, the large hairy venomous wolf spider, from *Taranto* the name of a port in southern Italy]

tardive dyskinesia *n.* Involuntary *choreiform, *athetoid, or rhythmic, stereotyped or writhing movements of the tongue, jaw, fingers, or hands, resulting as a *side-effect of *neuroleptic (1) medication and damage to the *basal ganglia. **TD** *abbrev.* [From Latin *tardus* late + Greek *dys-* bad or abnormal + *kinesis* movement + *-ia* indicating a condition or quality]

target item *n.* A stimulus that a research participant or subject is searching for or trying to concentrate on, and that in research is often accompanied by *distractors.

task-negative network *n.* Another name for the *default mode network. **TNN** *abbrev.*

task-positive network *n.* An interconnected system of cortical areas involved in attention-demanding activities, including *orienting responses and responses to external sensory input, especially *top-down processing. It includes the inferior *frontal lobe, the frontal eye fields of the *motor cortex, parts of the inferior *parietal lobe areas, and the *dorsolateral prefrontal cortex. *Compare* DEFAULT MODE NETWORK. Also called the *dorsal attention network*. **TPN** *abbrev.*

taste *n.* One of the five classical **senses* (1), stimulated by *sapid* (tastable) substances that are dissolved in water or capable of being dissolved in saliva and that stimulate approximately 9,000 **taste buds* located principally in the **tongue* but also in the soft palate, throat, pharynx, and inside of the cheeks, giving rise to sensations based on the primary tastes, usually assumed according to **Henning's tetrahedron* to be sweet, sour, salty, and bitter (but *see also* *UMAMI*). Also called *geusis* or *gustation*. *See also* *AFTERTASTE*, *AGEUSIA*, *CACOGEUSIA*, *CHEMORECEPTOR*, *FLAVOUR*, *HYPERGEUSIA*, *HYPOGEUSIA*, *MIRACULIN*, *MONOSODIUM GLUTAMATE*, *REDINTEGRATION*, *SUPERTASTER*, *TASTE BLINDNESS*.

taste aversion learning/conditioning *See* *FOOD AVERSION LEARNING*.

taste blindness *n.* An impaired ability to taste certain **sapid* substances such as **PTC* or **propylthiouracil* (*PROP*), or less commonly a complete absence of taste (*ageusia*). *Compare* *CACOGEUSIA*, *DYSGEUSIA*, *HYPERGEUSIA*, *HYPOGEUSIA*, *PARAGEUSIA*, *SUPERTASTER*.

taste bud *n.* Any of approximately 9,000 **sensory* receptors for taste that are abundantly present at the bases of **papillae* in fissures or grooves of the **tongue* and also in the soft palate, throat, pharynx, and insides of the cheeks. *Sapid* (tastable) substances dissolved either in water or saliva enter laterally through pores in the tongue's epithelial cells and make contact within each taste bud with receptor surfaces on the 50–150 **taste* cells that are specialized to bind to molecules with particular structural features, the chemical property of the stimulus being converted into nerve impulses that are transmitted to the central nervous system and are experienced as the distinctive tastes sweet, sour, salty, or bitter. *See also* *HENNING'S TETRAHEDRON*, *PTC*, *SUPERTASTER*, *TASTE*, *TONGUE*.

taste cell *n.* A **neuron* that is located in a **taste* bud and is the actual **sensory* receptor for taste. *See* *GUSTATORY RECEPTOR*. Also called a *gustatory cell* or a *taste receptor*.

taster *See* *PROPYLTHIOURACIL*, *PTC*.

taste receptor *n.* Another name for a [*taste](#) cell, or sometimes for a [*taste](#) bud.

taster(PCT) *n.* A person with a hereditary capacity to taste [*PTC](#).

taster(PROP) *n.* A person with a hereditary capacity to taste [*propylthiouracil](#) (PROP).

taste tetrahedron *n.* Another name for [*Henning's tetrahedron](#).

TAT *abbrev.* Thematic Apperception Test, one of the best known [*projective tests](#), consisting of 31 pictures (originally 20) of emotionally charged social events and situations printed on cards, from which the test administrator selects 20 depending on the age and sex of the respondent, plus a blank card that is presented last. For each picture, the respondent is asked to make up a story that the picture could illustrate, describing the relationship between the people, what has happened to them, what their present thoughts and feelings are, and what the outcome will be. The assumption underlying the test is that respondents tend to project their own circumstances, experiences, and preoccupations into their stories. The test was first introduced by the US artist/psychologist Christiana D(rummond) Morgan (1897–1967) and the US psychologist Henry Alexander Murray (1893–1988) in an article in the journal *Archives of Neurology and Psychiatry* in 1935, where they argued that ‘when someone attempts to interpret a complex social situation he is apt to tell as much about himself as he is about the phenomena on which attention is focused’ (p. 289). An earlier version of the article by Morgan and Murray had been submitted to the *International Journal of Psycho-Analysis* but was rejected in 1934 by the editor, the Welsh psychoanalyst Ernest Jones (1879–1958). A new edition of the test, together with the first manual, were published in 1943 by Harvard University Press, the test being attributed to ‘Henry A. Murray, M.D., and the Staff of the Harvard Psychological Clinic’, although before Chris Morgan was airbrushed out of history the test had been generally known as the *Morgan–Murray Thematic Apperception Test*. The word *thematic* in its name derives from Murray’s concept of a *thema*, an abstract representation of a situation combining a [*press](#) and a [*need](#) (3). See also [APPERCEPTION](#), [BLACKY PICTURES](#), [CHILDREN’S APPERCEPTION TEST](#), [MAKE-A-PICTURE-STORY TEST](#), [PERSONOLOGY](#).

*****ebook converter DEMO Watermarks*****

TATA box *n.* In genetics, the sequence TATAAA of the bases thymine and adenine, approximately 25 base pairs upstream of a **start codon*, involved in binding **RNA* polymerase prior to transcription.

tau effect *n.* A relation between perceived space and time, demonstrated most simply by flashing three equidistant lights *A*, *B*, and *C* successively in the dark, with a shorter time interval between *A* and *B* than between *B* and *C*, creating the **space–time illusion* that *A* and *B* are closer together in space than *B* and *C*. Compare *KAPPA EFFECT*.

tau, Kendall's See *KENDALL'S TAU*.

taxicab problem *n.* The following problem of probability judgement, introduced in a book chapter in 1977 by the Israeli-American psychologists Amos Tversky (1937–96) and Daniel Kahneman (born 1934) to demonstrate the **base-rate fallacy*. A taxicab was involved in a hit-and-run accident at night. Only the Green and Blue cab companies operate in the city, where 85 per cent of the cabs are Green and 15 per cent are Blue. A witness identified the cab as Blue, and when tested under similar conditions was able to identify 80 per cent of both Blue and Green cabs correctly. What is the probability that the cab involved in the accident was Blue? The modal and median judgement was 80 per cent, which coincides with the reliability of the witness but ignores the relative frequency of Blue and Green cabs (the base rate). The correct answer, worked out from **Bayes' theorem*, is .41 or 41 per cent, which is much closer to the base rate.

taxon *n.* Any of the classes or categories belonging to a **taxonomy*. Sometimes contrasted with a dimension or **continuum*, as when a question is posed as to whether or not antisocial personality disorder is a taxon. See also *TYPE FALLACY*. [Back formation from *taxonomy*]

taxonomy *n.* The branch of biology concerned with the classification of organisms; more loosely, any systematic classification. The conventional biological taxonomy includes the following, starting from the highest level: **kingdom* (2), **phylum*, **class* (2), **order* (3), **family* (2), **genus*, **species*, **microspecies*. A microspecies may be a **subspecies*, a **race* (2), or a
*****ebook converter DEMO Watermarks*****

***variety.** See also **TAXON.** **taxonomic** *adj.* [From Greek *taxis* order + *-nomos* arranging]

Taylor aggression paradigm *n.* An established, well validated, and frequently used laboratory technique for measuring ***aggression**. Participants are led to believe that they are engaging in a competitive ***reaction time** task in pairs, trying to press a button before the opponent when a visual cue appears on a screen. Before each trial, the participants set the intensity, on a scale from 1 to 10, of a punishing ***aversive** stimulus (originally, electric shock; later, stimuli such as loud noise) that they will deliver to the opponent if they win, the intensity of the punishments providing a measure of aggression. In a pilot phase, each participant's threshold of unpleasantness is established, to ensure that the punishments are aversive but not painful. In reality, there is no genuine opponent, and the success and failure on each trial is predetermined by the experimenter, so that each participant receives the same punishments and has the same opportunities to deliver punishments. Participants are programmed to win on the first trial, and the intensity of the punishments that they use on that trial provides a measure of unprovoked aggression. After losing and receiving punishments on later trials, the intensity levels that they then set reflect the strength of their aggressive retaliation. The technique was developed by the US psychologist Stuart P. Taylor (born 1939) in the course of his PhD research and published in the *Journal of Personality* in 1967. Also called the *competitive reaction time* (CRT) paradigm. Compare **HOT SAUCE TASK**, **POINT SUBTRACTION AGGRESSION PARADIGM**. **TAP** *abbrev.*

Taylor Manifest Anxiety Scale *n.* Another name for the ***Manifest Anxiety Scale**.

Taylor-Woodhouse illusion *n.* Another name for the ***hollow squares illusion**. [Named after the English optometrists Stephen P(hilip) Taylor (born 1951) and J(oy) Margaret Woodhouse (born 1948) who first published it in 1980]

Tay-Sachs disease *n.* A hereditary disorder transmitted through a ***recessive gene**, relatively common among Ashkenazi Jews, characterized by progressive accumulation of lipids in the brain, leading to ***blindness**,

*****ebook converter DEMO Watermarks*****

convulsions*, **intellectual disability*, and death, usually before 5 years of age. Also called *amaurotic familial idiocy*. **TSD *abbrev.* [Named after the English ophthalmologist Warren Tay (1843–1927) who first identified it in 1881 and the US neurologist Bernard Sachs (1858–1944) who described it further in 1887]

T cell *n.* Another name for a **T lymphocyte*.

teacher unit *n.* In **connectionism* (1) and **parallel distributed processing*, a unit with a predetermined level of activation that determines the levels of activation of other units in order to achieve a target level according to the **delta rule*. See *BACK-PROPAGATION ALGORITHM*. See also *NEURAL NETWORK*.

teacup illusion *n.* A visual illusion closely related to the **horizontal–vertical illusion* that occurs when a person is invited to guess the depth of a teacup, relative to a teaspoon lying horizontally on the table, by grasping the teaspoon's handle at the point that would be opposite the top of the cup if the teaspoon were standing vertically in the cup (see *illustration*). Most people grossly overestimate the depth of the cup relative to the teaspoon.

Teacup illusion. If the teaspoon were standing upright in the teacup, which of the marks on the spoon would be exactly opposite the top of the cup? The answer is 1.

tear gas *n.* Any gas or vapour such as **CN gas*, **CS gas*, or **Mace* that causes the eyes to smart and water, inducing temporary blindness, and is used for personal protection or as an **incapacitant* in warfare or crowd control. Also called a *lacrimator*. Compare *BZ GAS*, *PEPPER SPRAY*.

technique, active See *ACTIVE TECHNIQUE*.

technique, defensive See *DEFENSIVE TECHNIQUE*.

tectal pathway *n.* The nerve fibres from the retinas of the eye that project via the **optic tract* to the **superior colliculi*. Compare *PRETECTAL PATHWAY*. [So called because the superior colliculi are situated in the **tectum*]

tectorial membrane *n.* The membrane in the **inner ear* covering the

***organ of Corti.** Also called *Corti's membrane*. [From Latin *tectorium* a covering, from *tectum* a roof or canopy]

tectum *n.* The structure at the base of the pons that forms the roof of the midbrain, on which are situated four hillock-shaped bumps, the two ***inferior** colliculi involved in hearing and the two ***superior** colliculi (the optic tectum) involved in vision, the four being known collectively as the corpora quadrigemina. In fishes, birds, amphibians, and reptiles it contains the main visual area. *See also* **POSTERIOR CEREBRAL COMMISSURE**. **tectal** *adj.* [From Latin *tectum* a roof or canopy]

tegmentum *n.* The tegmentum mesencephali, the intermediate region of the brainstem below the tectum, containing the motor pathways descending to the spinal cord, the sensory pathways ascending to the thalamus, part of the reticular formation, groups of nerve cell bodies such as the ***substantia nigra**, ***red nucleus**, and ***locus coeruleus**, and in its front part close to the substantia nigra, the ***ventral** tegmental area containing clusters of neurons that secrete dopamine. [From Latin *tegmentum* a covering, from *tegere* to cover or conceal]

Tegretol *n.* A proprietary name for the antimanic drug ***carbamazepine**. [Trademark]

telaesthesia *n.* Perception of objects or events that are beyond the range of the ***sense** organs, a conjectural ***paranormal** phenomenon. US *telesthesia*. *Compare* **CLAIRAUDIENCE**, **CLAIRVOYANCE**, **PRECOGNITION**, **TELEGNOSIS**, **TELEPATHY**. **telaesthetic** or **telesthetic** *adj.* [From Greek *tele* far, from *telos* an end + *aisthesis* feeling + *-ia* indicating a condition or quality]

telalgia *n.* Another name for ***referred pain**. [From Greek *tele* far, from *telos* an end + *algos* pain + *-ia* indicating a condition or quality]

teledildonics *n.* Computer-mediated sexual interaction between entities in ***virtual reality**, using remotely manipulated tactile devices and sex toys. *See also* **MUD**. [From Greek *tele* far + English *dildo* an artificial penis + Greek *-ikos* of, relating to, or resembling]

telegnosis *n.* Knowledge of distant objects or events obtained without use of the sense organs, a conjectural ***paranormal** phenomenon. *Compare* CLAIRAUDIENCE, CLAIRVOYANCE, PRECOGNITION, TELAESTHESIA, TELEPATHY. **telegnostic** *adj.* [From Greek *tele* far, from *telos* an end + *gnosis* knowledge]

telegraphic speech *n.* The typical speech of children from about 2 to 3 years of age, in which most utterances are about three or four words in length and ***function words** are usually omitted. Questions and commands as well as declarative sentences emerge, and typical utterances during this period are: *Daddy kick ball, Where Teddy going?, and Put car here.* *Compare* HOLOPHRASE, PIVOT GRAMMAR.

telekinesis *n.* Movement of a body without the application of physical force, a conjectural ***paranormal** phenomenon. *See also* PSYCHOKINESIS. **telekinetic** *adj.* [From Greek *tele* far, from *telos* an end + *kinesis* movement]

telencephalon *n.* The top part of the forebrain or prosencephalon, comprising the ***cerebral** hemispheres together with the ***olfactory lobes** and ***olfactory bulbs**. Also called *endbrain*. *Compare* DIENCEPHALON. [From Greek *tele* far, from *telos* end + *enkephalos* the brain, from *en* in + *kephale* the head]

teleonomy *n.* The science of ***adaptation (1)**. [From Greek *telos* the end + *-nomos* arranging]

teleopsia *n.* A visual abnormality in which objects appear further away than they are, sometimes arising from the ingestion of a drug such as ***cannabis** or ***LSD**. [From Greek *tele* far, from *telos* an end + *ops* an eye + *-ia* indicating a condition or quality]

telepathy *n.* ***Extra-sensory perception** of another person's mental processes, a conjectural ***paranormal** phenomenon. *See also* PSI, PSI-MISSING. *Compare* CLAIRVOYANCE, PRECOGNITION. **telepathic** *adj.* [From Greek *tele* far, from *telos* an end + *pathos* feeling]

telephone scatologia *n.* A ***paraphilia** characterized by recurrent sexually arousing fantasies, sexual urges, or behaviour involving making

obscene telephone calls to non-consenting recipients. [From Greek *skor*, *skatos* excrement + *logos* a word or discourse + *-ia* indicating a condition or quality]

telephone theory *n.* Another name for the ***frequency** theory of hearing.

telereceptor *n.* A ***sensory** receptor such as a ***visual receptor** or an ***auditory** receptor that can be stimulated by distant stimuli and that mediates a ***far sense**. Also called a *teleceptor*, a *teleoreceptor*, or a *teleoceptor*. Compare **PROXIMORECEPTOR**. [From Greek *tele* far, from *telos* an end + English *receptor*, from Latin *recipere*, *receptum* to receive, from *re-* back + *capere*, *ceptum* to take]

telesthesia See **TELAESTHESIA**.

teletactor *n.* A device for deaf people that converts sound waves into vibrations that can be felt on the skin. The equivalent device for blind people is an ***optacon** or an ***optohapt**. [From Greek *tele* far, from *telos* an end + Latin *tactus* a touching, from *tangere* to touch]

telomerase *n.* A short name for telomere terminal transferase, an ***enzyme** that helps to rebuild ***telomeres** in ***germ line** cells but is normally absent from ***somatic** cells, although it is present in most cancer cells and is largely responsible for their ability to proliferate indefinitely without manifesting cellular or replicative senescence.

telomere *n.* A segment of ***DNA** at the tip of every ***chromosome** that is thought to perform a protective function like the plastic or metal aglet at the end of a shoelace, preventing the chromosome from losing genetic information during replication. It is made up of thousands of repeating or stuttering units consisting of the bases thymine, adenine, and guanine in the sequence TTAGGG, a ***consensus sequence** found in widely divergent species of fish, amphibians, reptiles, birds, and mammals. Every time a cell divides, the telomeres get progressively shorter by about 70 base pairs, until the length eventually falls below a critical level and the cell enters a phase of replicative senescence during which cell division no longer occurs. Telomere

*****ebook converter DEMO Watermarks*****

shortening thus functions as a mitotic clock that regulates the number of divisions a cell can undergo, and it may be chiefly or at least partly responsible for the ageing process. *See also* [TELOMERASE](#). *Compare* [CENTROMERE](#). [From Greek *telos* end + *meros* part]

telophase *n.* The fourth and final phase of [*mitosis](#), when the cell pinches in the middle and a nuclear membrane forms around the chromosomes at each end. [From Greek *telos* end + *phasis* an aspect, from *phainein* to show]

temazepam *n.* A [*sedative–hypnotic](#) drug belonging to the class of [*benzodiazepines](#), used in the treatment of insomnia. Also called *Restoril* (trademark).

temperament *n.* Character or [*personality](#); the characteristic mode of behaviour or reaction of a person or an animal; originally character or personality determined by the particular mixture of the four [*humours](#) (3) in an individual's body. *See also* [COMPLEXION](#) (2). **temperamental** *adj.* Excitable, emotionally volatile, or easily upset. [From Latin *temperamentum* a mixing in proportion, from *temperare* to temper or mingle]

temperament theory *n.* A popular typology of [*personality](#), based on the [*Myers–Briggs Type Indicator](#), focusing on four basic temperaments rather than the standard 16, namely SJ (sensing judges or *guardians*), SP (sensing perceivers or *performers*), NT (intuitive thinkers or *rationalists*), and NF (intuitive feelers or *idealists*).

temperature receptor *n.* A type of [*sensory](#) receptor consisting of [*free nerve endings](#) that respond to stimulation by cold objects or substances in a [*cold spot](#) or to warm or hot objects or substances in a [*warm spot](#). Also called a *thermoreceptor*.

temperature sense *n.* The mainly [*cutaneous sense](#) that responds to warm and cold stimuli. Also called *thermaesthesia* or the *thermal sense* or *thermic sense*. *See also* [COLD SPOT](#), [WARM SPOT](#).

temperature spot *n.* A generic name for a [*cold spot](#) or a [*warm spot](#).

temper tantrum See [TANTRUM](#).

template matching *n.* A hypothetical mechanism of visual recognition according to which forms or patterns are identified by matching them to stored forms or patterns (templates). This principle underlies [*optical character recognition](#) and most systems of [*computer vision](#), but it is not the normal way in which recognition works in the visual system, and it fails to account for [*shape constancy](#). Also called *prototype matching*. See also [SHAPE—SLANT INVARIANCE](#).

tempo *n.* The speed at which a piece or passage of music is played or an utterance or fragment of speech is delivered. [From Italian *tempo* speed, from Latin *tempus* time]

temporal bone *n.* Either of the bones at the sides and base of the skull containing the [*auditory](#) canals. [From Latin *temporalis* of the temple, from *tempus*, *temporis* a temple (on the side of the head)]

temporal lobe *n.* The bottom [*lobe](#) on the side of each cerebral hemisphere, separated on its lateral or outer surface from the frontal lobe and the parietal lobe by the [*lateral](#) sulcus and an imaginary line extending the sulcus horizontally towards the occipital lobe, and from the occipital lobe by an imaginary line from the top of the [*parieto-occipital sulcus](#) to the [*pre-occipital notch](#). It is concerned with hearing, speech perception (especially in the left hemisphere), sexual behaviour, visual perception, musical interpretation (especially in the right hemisphere), memory, and social behaviour. Major lesions in the medial underlying part of this area can result in memory deficits and [*temporal lobe epilepsy](#). See also [GLOBAL AMNESIA](#), [KLÜVER—BUCY SYNDROME](#), [LIMBIC SYSTEM](#), [LOBE](#), [OPERCULUM](#), [SIMULTANAGNOSIA](#), [TOPOGRAPHAGNOSIA](#).

temporal lobe epilepsy *n.* A form of [*epilepsy](#) associated with abnormal electrical discharges radiating from the [*temporal lobe](#), characterized by temporary impairment or loss of consciousness, sometimes accompanied by automatism, and abnormal or even antisocial or violent behaviour, without any apparent convulsions. Such an episode is often

preceded by premonitory **auras* (2), **derealization*, **déjà vu*, **jamais vu*, or **cacosmia*. Also called *psychomotor epilepsy* or *temporal lobe syndrome*. See also INTERICTAL SYNDROME. **TLE** abbrev.

temporal lobe seizure *n.* A **seizure* of the type found in **temporal lobe epilepsy*, without any evidence of a **convulsion*. Also called a *psychomotor seizure*.

temporal operculum See OPERCULUM.

temporal plane *n.* Another name for the **planum temporale*.

temporal retina *n.* The half of the **retina* that is nearest to the temple and from which nerve fibres are projected to the ipsilateral (same-side) cerebral hemisphere after passing through the **optic chiasm*. Compare NASAL RETINA.

temporal summation *n.* The successive impulses of afferent neurons combining additively in a **postsynaptic* neuron to produce a **graded potential* that may cause the neuron to transmit a nerve impulse or **action potential* that could not be produced by a single afferent impulse. See also GRADED POTENTIAL. Compare SPATIAL SUMMATION. [From Latin *temporalis* of or relating to time, from *tempus* time + *-alis* of or relating to]

temporary threshold shift *n.* A temporary change (usually an increase) in a sensory **threshold*, the most familiar forms being the increase in auditory threshold resulting from the **acoustic* reflex in response to loud noise and the increase in visual threshold resulting from the **pupillary light reflex* in response to bright light. **TTS** abbrev.

tendon organ *n.* A shortened name for a **Golgi tendon organ*.

tendon reflex *n.* Another name for a **deep tendon reflex*.

tendon sense *n.* A form of **proprioception* and **kinaesthesia* mediated by receptors in or adjacent to the tendons. See also GOLGI TENDON ORGAN.

tension headache *n.* A pain in the head associated with tension in the muscles of the neck, face, and shoulder, resulting from stress or overwork.

tensor tympani *n.* A muscle in the middle ear that reduces the movement of the **ossicles* when it contracts and that acts in conjunction with the **stapedius* in the **acoustic* reflex to protect the ear from damage when exposed to loud sounds. [From Latin *tensor* a stretcher from *tensus* tight, from *tendere* to stretch + *tympanum* a drum]

ten thousand hour rule *n.* The proposition that expertise in playing a musical instrument or performing any other high-level **skill* requires 10,000 hours of practice, equivalent to three hours a day for slightly under 10 years, or 40 hours a week for slightly under five years. The term was introduced by the English–Canadian journalist and author Malcolm Gladwell (born 1963) on page 40 of his best-selling book, *Outliers: The Story of Success*, published in 2008, citing a study of expert musicians carried out by the Swedish psychologist K. Anders Ericsson (born 1947) and two colleagues that was published in the journal *Psychological Review* in 1993. More precisely, what the research showed was that the attained level of expert music performance of students at an international music academy was positively correlated with the number hours of *goal-directed, deliberate* practice accumulated, and 10,000 hours was merely an approximate *average*. The Nobel-prizewinning US economist and decision theorist Herbert A(lexander) Simon (1916–2001) and the US psychologist William G. Chase (1940–83) had already stated in an article in the journal *American Scientist* in 1973 that there appears to be no chess player who has ever reached grandmaster level with less than about 10,000 hours of practice and that this ‘is comparable to the times that highly literate people have spent in reading by the time they reach adolescence’ (Vol. 61, p. 402). Also written *10,000-hour rule*.

tentorium *n.* 1. The membrane separating the **cerebrum* from the **cerebellum*, consisting of a fold in the **dura mater*. 2. The internal structure of an insect’s head. 3. Any tent or tent-like canopy. *tentoria pl.* **tentorial** *adj.* [From Latin *tentorium* a tent, from *tendere* to stretch]

teonanactyl *n.* Any mushroom of the Agaricaceae family that contains the **hallucinogenic* ingredient **psilocybin*. Also called a *magic mushroom*.

*****ebook converter DEMO Watermarks*****

[From Nahuatl *teotl* a god + *nanacatl* a mushroom]

teratogen *n.* Any substance, organism, or process that causes or increases the probability of a congenital disorder or birth defect in a baby, including a drug such as alcohol (see [FOETAL ALCOHOL SYNDROME](#)), an infection such as German measles, or processes such as exposure to X-rays or other forms of ionizing radiation (see [MUTAGEN](#)). **teratogenic** *adj.* **teratogenesis** *n.* The production of a congenital defect by a teratogen. [From Greek *teras*, *teratos* a monster + *genes* born]

terminal bouton *n.* Another name for a [*bouton](#). Also spelt *terminal button*.

terminal insomnia See [INSOMNIA](#).

terminal threshold *n.* The point along a [*continuum](#) of stimulus intensity beyond which further increases produce no further increases in sensation, although for some types of stimuli pain or damage to the [*sensory](#) receptors may be caused, or an analogous upper point along another stimulus dimension such as sound-wave frequency, the terminal threshold in that case being approximately 20,000 hertz for a person with normal hearing. Also called an *upper threshold*, though this usage causes confusion.

termination codon *n.* Another name for a [*stop codon](#). Also called a *terminator codon*.

Ternus phenomenon *n.* A form of [*apparent movement](#) that is usually demonstrated with a row of four evenly spaced elements (dots or other identical shapes) labelled A, B, C, and D from left to right and presented in a sequence of brief flashes as follows: first A, B, and C all together, then B, C, and D, then A, B, and C again, and so on. If the [*interstimulus interval](#) is long, then no apparent movement is seen; with an intermediate interstimulus interval of about 200 milliseconds (under what Ternus called optimal conditions) *group movement* occurs as a single triplet of elements appears to move forwards and backwards in step without any appearance of two of the elements remaining fixed; and as the interstimulus interval is shortened further *element movement* occurs as A appears to hop forwards and

*****ebook converter DEMO Watermarks*****

backwards over *B* and *C*, which appear to remain stationary. Also called a *Ternus display*. See also [APPARENT MOVEMENT](#), [PHANTOM GRATING](#), [RANDOM-DOT KINEMATOGRAM](#). [Named after the German Gestalt psychologist Josef Ternus (1892–1959) who first described it in 1926]

territoriality *n.* The behaviour of certain animals and birds in marking out or defending their own territory against other members of the same species.

tertiary prevention *n.* Measures taken to alleviate the effects of a disorder, often through [*rehabilitation](#). Compare [PRIMARY PREVENTION](#), [SECONDARY PREVENTION](#).

tertiary projection area *n.* An area of the cerebral cortex that receives projections from a [*secondary projection area](#). Also called an *association area*. Compare [PRIMARY PROJECTION AREA](#).

test age *n.* In psychometrics, a [*derived score](#), expressed in years, representing the average age at which children in the standardization sample achieved the raw score that the respondent achieved.

test anxiety *n.* A form of [*state anxiety](#) aroused by the event or prospect of taking a test or examination. Also called *examination anxiety*. **test-anxious** *adj.*

test battery *n.* In psychometrics, a set of tests standardized on the same population, enabling meaningful comparison or combination of scores on several tests.

test bias *n.* In psychometrics, the property of a psychological test, when administered to a particular group, such as an ethnic minority or one of the sexes, of yielding an average score that is either lower (in the case of negative bias) or higher (positive bias) than the average score for the total population, the disparity being due to a factor or factors other than a true difference in the attribute being measured. The last stipulation is often difficult to prove in practice, but without it an allegation of test bias is vacuous. Without it, one could argue that scales for weighing newborn babies are biased against black

babies, because they yield lower average birth weights for black than white babies. *See also* [ITEM BIAS](#).

testee *n.* In psychometrics, a person being tested or responding to a test.

testing effect *n.* Any effect of taking tests on the respondents, a typical example being [*test sophistication](#).

testis *n.* The technical word for a testicle, the male sex gland or [*gonad](#), which produces [*spermatozoa](#) and secretes [*androgens](#) such as [*androsterone](#) and [*testosterone](#) into the bloodstream. *See also* [MÜLLERIAN INHIBITING SUBSTANCES](#), [WOLFFIAN DUCT](#). *Compare* [OVARY](#). **testes** *pl.* [From Latin *testis* a witness, alluding to the fact that testes bear witness to a person's masculinity]

test item *n.* In psychometrics, an individual question or other element of a psychological test.

Test-Operate-Test-Exit *See* [TOTE](#).

testosterone *n.* A potent male [*steroid](#) [*sex](#) hormone secreted mainly by the testes but also by the female ovaries (where it is required for the production of oestrogen) and adrenal glands, responsible for the development of the male sex organs and tending to stimulate competitiveness and aggression. *See also* [ANDROPAUSE](#), [DIGIT RATIO](#), [DHEA](#), [IRRITABLE MALE SYNDROME](#), [PERFORMANCE ENHANCER](#), [SEX HORMONE](#), [WOLFFIAN DUCT](#). *Compare* [OESTROGEN](#). [From *test(is)* + *ster(oid)* + *-one* indicating a ketone, from Greek *-one* a feminine name suffix]

testosterone replacement therapy *n.* A treatment for disorders associated with reduced [*testosterone](#). *See also* [ANDROPAUSE](#), [IRRITABLE MALE SYNDROME](#). **TRT** *abbrev.*

test-retest reliability *n.* A measure of a test's [*reliability](#), or more specifically its [*stability](#), based on the correlation between scores of a group of respondents on two separate occasions.

test sophistication *n.* Knowledge of how to respond advantageously to psychological tests, acquired as a **testing effect* by a person through extensive experience of taking similar tests. Also called *test wiseness*.

test wiseness *n.* A colloquial name for **test sophistication*. **test-wise** *adj.*

tetanus toxin *n.* A substance that blocks the action of **glycine* on **alpha motor neurons*, causing convulsions. *Compare* *PICROTOXIN*, *STRYCHNINE*.

tetrachromatic theory *n.* Another name for the **opponent-process theory*. [From Greek *tetra-* four + *chroma*, *chromatos* a colour + *-ikos* of, relating to, or resembling]

tetracyclic antidepressant *n.* A class of **antidepressant* drugs, the best known being **mianserin*, that are used to treat depression, their mechanism of action being poorly understood. *Compare* *MONOAMINE OXIDASE INHIBITOR (MAOI)*, *SELECTIVE SEROTONIN REUPTAKE INHIBITOR (SSRI)*, *St JOHN'S WORT*, *TRICYCLIC ANTIDEPRESSANT*. [So called because they have four fused rings in their molecular structures]

tetrahydrocannabinol *n.* An abbreviated name for **delta-9-tetrahydrocannabinol (THC)*.

tetrahydrogestrinone *n.* An **anabolic steroid* used to increase muscle growth, developed secretly by attaching four hydrogen atoms to the steroid drug gestrinone for the specific purpose of making its metabolites undetectable in the urine of a person taking it, and used by athletes as a **performance* enhancer. In 2003 a test was developed for detecting it in urine samples, and several prominent athletes were penalized. **THG** *abbrev.* [From Greek *tetra-* four + *hydor* water + *gestrinone* a drug with a weak progestin and strong anti-progesterone action, used for treating endometriosis]

tetraplegia *n.* Another name for **quadriplegia*. **tetraplegic** *adj.* [From Greek *tetra-* four + *plege* a blow + *-ia* indicating a condition or quality]

tetrodotoxin *n.* A powerful [*neurotoxin](#) that is present in a species of puffer fish and that functions by blocking sodium channels in the neuronal membrane, thereby inactivating the [*sodium](#) pump. Tingling in the lips and tongue usually develops within 10–45 minutes of eating puffer fish, then the sensations spread rapidly to other parts of the body, and this is followed by excessive salivation, weakness, nausea, vomiting, diarrhoea, abdominal pain, paralysis, difficulty swallowing, convulsions, and sometimes death by respiratory paralysis. *See also* [NEUROTOXIN](#), [ZOMBIE \(2\)](#). **TTX** *abbrev.* [From Greek *tetra-* four + *odous*, *odontos* a tooth + *toxikon* arrow-poison, from *toxon* a bow]

texture gradient *n.* A change in the appearance of the grain or microstructure of a surface, an abrupt or sudden change providing a cue for the perception of a [*contour](#), and a gradual change (as when the blades of grass in a meadow appear widely spaced in the foreground and increasingly close together towards the background) being a form of [*perspective](#) that is related to [*aerial perspective](#) and [*linear perspective](#) and is one of the monocular cues of visual [*depth perception](#) (see [illustration](#)). *See also* [VISUAL CLIFF](#).

Texture gradient

T-group *n.* A group of people who meet regularly and investigate patterns of authority and communication among themselves, as a technique of [*group therapy](#) and training developed in the 1940s by the German–US psychologist Kurt Lewin (1890–1947). Also called a *human relations group* or a *sensitivity training group*. *Compare* [ENCOUNTER GROUP](#). [An abbreviation of

(sensitivity) t(raining) group]

thalamencephalon *n.* The part of the ***diencephalon** that includes the ***thalamus** and ***pineal gland**. [From *thalam(us)* + (*di*)*encephalon*]

thalamic syndrome *n.* A raised threshold (diminished sensitivity) for tactile sensations, which are felt as unpleasant if they are felt at all, resulting from a lesion in the ***thalamus**.

thalamus *n.* Either of a pair of large, golfball-sized capsules near the base of the brain in the diencephalon, forming a lateral wall of the third ***ventricle**, containing all the nerve fibres that ascend and descend between the cortex and the spinal cord, part of the ***ascending reticular activating system**, and relay stations such as the ***lateral** geniculate nuclei and ***medial** geniculate nuclei, and receiving all sensory inputs, except from the olfactory receptors, before they are relayed to areas in the cerebral cortex. Its ***ventral** anterior nuclei and ***ventral** lateral nuclei receive inputs from the globus pallidus and cerebellum and project to the prefrontal cortex and motor cortex, its ***ventral** posterior nuclei contain inverted ***topographic maps** of the body and project to the somatosensory cortex, and the ***pulvinar** at its back is implicated in attention. *See also* EPITHALAMUS, INTRALAMINAR NUCLEUS, MASSA INTERMEDIA, NEOTHALAMUS, THALAMIC SYNDROME. **thalami** *pl.* **thalamic** *adj.* [From Greek *thalamos* an inner room or chamber, from *thalos* a vault]

thanatomania *n.* Another name for ***voodoo death**. [From Greek *thanatos* death + *mania* madness]

thanatophobia *n.* A ***specific phobia** focused on fear of death or dying. [From Greek *thanatos* death + *phobos* fear + *-ia* indicating a condition or quality]

Thanatos *n.* In ***psychoanalysis**, the unconscious drive towards dissolution and death, initially turned inwards on oneself and tending to self-destruction; later turned outwards in the form of aggression. Sigmund Freud (1856–1939), influenced by witnessing the ravages of the First World War, introduced the concept hesitantly and tentatively in 1920, in Chapter 6 of his book *Beyond the Pleasure Principle* (*Standard Edition*, XVIII, pp. 7–64), and
*****ebook converter DEMO Watermarks*****

he admitted in a later book *Civilization and its Discontents* (1930) that its existence was open to debate: 'Since the assumption of the existence of the instinct is mainly based on theoretical grounds, we must also admit that it is not entirely proof against theoretical objections' (*Standard Edition*, XXI, pp. 64–145, at pp. 121–2). The concept defies conventional biological assumptions, [*natural selection](#) favouring characteristics promoting survival and reproduction, and many psychoanalysts did indeed dissent, though others, notably the British-based Austrian psychoanalyst Melanie Klein (1882–1960) and her followers, assigned a major role to it, even in early childhood. Also called the *death instinct*. See also [DESTRUCTIVE INSTINCT](#), [DESTRUDO](#), [MORTIDO](#), [NIRVANA PRINCIPLE](#), [OBJECT INSTINCT](#), [PAIN PRINCIPLE](#). Compare [EROS](#). [Named after Thanatos in Greek mythology, the personification of death and brother of Hypnos (the personification of sleep), from Greek *thanatos* death]

Thatcher illusion *n.* Another name for the [*Margaret Thatcher illusion](#).

theism *n.* Belief in a god who created the universe and continues to govern everything that happens, in most theistic belief systems answering prayers and being directly involved with human affairs. Compare [AGNOSTICISM](#), [ATHEISM](#), [DEISM](#), [PANTHEISM](#). **theist** *n.* One who espouses theism. **theistic** or **theistical** *adj.* [From Greek *theos* a god + *-ismos* indicating a state or condition]

Thematic Apperception Test See [TAT](#).

theobromine *n.* A white, crystalline, [*alkaloid](#), [*xanthine](#) derivative, an isomer of theophylline (having the same chemical formula but a different arrangement of atoms within the molecule), that is found in tea, cocoa, and chocolate and that acts as a central nervous system [*stimulant](#), being used in the treatment of headaches, as a diuretic, and as a myocardial stimulant in coronary heart disease. Formula: C₇H₈N₄O₂. Compare [CAFFEINE](#), [THEOPHYLLINE](#). [From Latin *Theobroma* the genus of tropical American cacao trees, literally food of the gods, from *theos* a god + *broma* food + *-ine* indicating an organic compound]

theophylline *n.* A white, crystalline, [*alkaloid](#), [*xanthine](#) derivative and central nervous system [*stimulant](#), an isomer of theobromine (having the same chemical formula but a different arrangement of atoms within the molecule), that is found in tea leaves and is used as a bronchodilator in the treatment of asthma and as a muscle relaxant, with pharmacological properties and medicinal uses similar to those of theobromine. Formula: $C_7H_8N_4O_2$. *Compare* [CAFFEINE](#), [THEOBROMINE](#). [From *theo(bromine)* or Latin *thea* tea + Greek *phyll(on)* a leaf + *-ine* indicating an organic compound]

theoretical research *n.* Another name for [*basic research](#).

theory *n.* **1.** In logic and mathematics, a coherent system of primitive concepts, axioms, and rules of inference from which theorems may be derived. **2.** A [*proposition \(1\)](#) or set of propositions offered as a conjectured explanation for an observed phenomenon, state of affairs, or event. *Compare* [HYPOTHESIS](#), [MODEL](#). **3.** Non-technically, any speculative or conjectural notion or opinion. [From Greek *theoria* view or theory, from *theoreein* to view or observe]

theory of games *See* [GAME THEORY](#).

theory of mind *n.* People's intuitive understanding of their own and other people's minds or mental states, including beliefs and thoughts. It develops by degrees from a very early age in humans: by the age of 3 years children normally have a well-developed theory of mind but cannot yet understand, for example, that people's beliefs can be false: 3-year-olds who open a candy or chocolate box and are surprised to find pencils inside it consistently say that, before the box was opened, other people would have believed that there were pencils inside it and that they believed this also. Research has suggested that a theory of mind is fully developed only in human beings, but that people with [*autism spectrum disorder](#) are severely impaired in their ability to understand mental states and to appreciate how mental states govern behaviour. Without a theory of mind, social behaviour is disrupted and the [*cooperative principle](#) breaks down. The concept was introduced by the US psychologists and primatologists David Premack (born 1925) and Guy Woodruff in an article in the journal *The Behavioral and*

Brain Sciences in 1978, where they defined it as follows: ‘In saying that an individual has a theory of mind, we mean that the individual imputes mental states to himself and others’ (p. 515). The specific inability to appreciate other people’s mental states is called [*mind-blindness](#). See also [EMPATHY](#), [MIRROR NEURON](#). **ToM** abbrev.

theory of planned behaviour *n.* An extended version of the [*theory](#) of reasoned action, incorporating a construct of perceived behavioural control and thus enabling predictions to be made of actions that are under incomplete volitional control. In the theory, perceived behavioural control is a function of one’s beliefs about how likely it is that one has the resources and opportunities required to perform the behaviour. The theory was formulated by the Polish-born US psychologist Icek Ajzen (born 1942) and expounded in his book *Attitudes, Personality, and Behavior* (1988) and in an article in the journal *Organizational Behavior and Human Decision Processes* (1991). US *theory of planned behavior*. **TPB** abbrev.

theory of reasoned action *n.* A general theory of the relationship between attitudes and behaviour, according to which behaviour is determined by behavioural intentions, and behavioural intentions in turn are determined by [*attitudes](#) (1) to behaviour and subjective [*norms](#) (1). An attitude to behaviour is one’s evaluation of the goodness or badness of performing the action in question, and a subjective norm is the perceived social pressure arising from one’s perception of the extent to which significant others would like one to perform the action. Algebraically, $B(f)BI = w_1A_B + w_2SN$, where B denotes behaviour, f indicates a function, BI behavioural intention, A_B attitude towards the behaviour, and SN subjective norm; w_1 and w_2 are empirically determined weights representing the relative importance of the attitudinal and normative components. Attitude towards the behaviour (A_B) is determined by one’s beliefs about the consequences of the behaviour multiplied by the evaluation of each consequence and then summed (see [EXPECTANCY–VALUE THEORY](#)). Subjective norm (SN) is a function of one’s perception of the preferences of significant others as to whether one should engage in the behaviour. The weights w_1 and w_2 reflect the relative influence on behavioural intention of attitude towards the behaviour and subjective norm. The theory was formulated by the US psychologist Martin Fishbein (1936–

2009) and the Polish-born US psychologist Icek Ajzen (born 1942) and published in their books *Belief, Attitude, Intention and Behavior: An Introduction to Theory and Research* (1975) and *Understanding Attitudes and Predicting Social Behavior* (1980). The theory is well supported by research findings, but a limitation of it is that it applies only to behaviour that is predominantly volitional or voluntary, and this limitation was addressed in the later **theory* of planned behaviour.

therapeutic *adj.* Of or relating to the treatment of disorders. *See also* *PSYCHOTHERAPY*. **therapeutics** *n.* The aspect of medicine concerned with the treatment and cure of disorders. **therapist** *n.* An old-fashioned name for a therapist. [From Greek *therapeuein* to heal or take care of, from *theraps* an attendant + *-itikos* resembling or marked by]

therapeutic alliance *n.* In **psychoanalysis*, the implicit cooperative compact between an analyst and a patient whereby the analyst undertakes to offer **interpretations* (2) and the patient undertakes to obey the **fundamental rule of psychoanalysis* and to try to understand the analyst's interpretations.

therapeutic community *n.* A treatment facility in which the total environment, including the physical milieu, the other clients or patients, and the staff, is part of the treatment. *See also* *MILIEU THERAPY*. **TC** *abbrev.*

therapeutic index *n.* Any of several indices relating the clinical effectiveness of a drug to its safety factor, the most common being the **therapeutic* ratio of the **median* lethal dosage to the **median* effective dosage (LD-50/ED-50). Other therapeutic indices include the ratio of the **minimum toxic dosage* to the **minimum effective dosage*, and the difference between the minimum effective dosage and the minimum toxic dosage.

therapeutic ratio *n.* An index relating the clinical effectiveness of a drug to its safety factor, introduced by the German bacteriologist and immunologist Paul Ehrlich (1854–1915), given by dividing the **median* lethal dosage (LD-50) by its **median* effective dosage (ED-50), whence therapeutic ratio = LD-50/ED-50, a drug often being considered safe only if its therapeutic ratio is at least 10. *See also* *THERAPEUTIC INDEX*.

*****ebook converter DEMO Watermarks*****

therapist *n.* A person who practises a *therapy.

therapy *n.* Any form of treatment for a disorder by a method other than surgery; such treatments in general. See also GENE THERAPY, PSYCHOTHERAPY. [From Greek *therapeuein* to heal or take care of, from *theraps* an attendant]

thermaesthesia *n.* Another name for the *temperature sense. US *thermesthesia*. [From Greek *therme* heat + *aisthesis* feeling + *-ia* indicating a condition or quality]

thermal adaptation *n.* A form of *adaptation (2) whereby prolonged exposure to a stimulus that is warmer than *physiological zero tends to cause it to feel less warm, and prolonged exposure to a stimulus that is colder than physiological zero tends to cause it to feel less cold. It can be demonstrated by an experiment described under *successive contrast.

thermalgesia *n.* A condition in which *warm spots are hypersensitive and warm stimuli elicit pain responses. Also written *thermoalgesia*. Compare THERMOANALGESIA. [From Greek *therme* heat + *algesis* sense of pain, from *algos* pain + *-ia* indicating a condition or quality]

thermalgia *n.* Another name for *causalgia.

thermal grill illusion *n.* A *tactile illusion produced by a device, called a *heat grill*, consisting of closely packed alternating warm (40° C) and cool (20° C) bars. When applied to the skin it stimulates both *cold spots and *warm spots and creates a painful sensation of intense heat called *paradoxical heat*. A version of the illusion can be demonstrated by placing your second and fourth fingers (counting your thumb as your first finger) of one hand in a container of warm water and your third finger in a separate container of cold water. This generates a paradoxical sensation of painful heat in the middle finger. The illusion is not fully understood but appears to involve anomalous activation of polymodal C fibre *pain receptors that respond to both heat and cold. The illusion was first reported by the Swedish physiologist Torsten Thunberg (1872–1953) in the journal *Uppsala Läkfören Förhandlingar* in 1896. See also PAIN. TGI abbrev.

thermal sense *n.* Another name for the ***temperature sense**. Also called the *thermic sense*.

thermoanaesthesia *n.* Insensitivity to warmth and coldness owing to a failure of the ***temperature sense**. US *thermoanesthesia*. Also called *thermanaesthesia* or *thermanesthesia*. [From Greek *therme* heat + *an-* without + *aisthesis* feeling + *-ia* indicating a condition or quality]

thermoanalgesia *n.* A condition in which hot stimuli fail to elicit pain responses. Also called *thermanalgesia*. Compare **THERMALGESIA**. [From Greek *therme* heat + *an-* without + *algesis* sense of pain, from *algos* pain + *-ia* indicating a condition or quality]

thermodynamics *n.* The study of the laws governing the interrelationships between heat, mechanical work, and other forms of energy and their effects on the behaviour of systems. The *first law of thermodynamics* (the law of the conservation of energy), states that when a system changes from one state to another, energy is converted to a different form but the total amount of energy remains unchanged or is conserved, making a perpetualmotion machine impossible; the *second law of thermodynamics* states that in any closed system (one that exchanges energy but not matter with the exterior) ***entropy** can only increase or in an idealized case remain unchanged; the *third law of thermodynamics* (the Nernst heat theorem) states that as a homogeneous system approaches a temperature of absolute zero its entropy tends to zero; and the *zeroth law of thermodynamics* states that if two bodies are each in thermal equilibrium with a third body, then they are in thermal equilibrium with each other. [From Greek *therme* heat + *dynamikos* powerful, from *dynamis* strength + *-ikos* of, relating to, or resembling]

thermoform *n.* A raised or embossed representation of a map, diagram, or picture for tactile inspection by blind people. [So called because it is made by shaping heated vinyl sheets]

thermoreceptor *n.* Another name for a ***temperature receptor**.

thermoregulation *n.* A form of **homeostasis* whereby **homoiothermic* animals such as humans maintain a constant internal body temperature. [From Greek *therme* heat + Latin *regulare* to control + *-ation* indicating a process or condition]

theta wave *n.* A low-frequency (5–8 hertz) **EEG* wave in the **hippocampus* associated with relaxed wakefulness and REM sleep. Also called a *theta rhythm*. [From *theta* (θ) the eighth letter of the Greek alphabet]

thiamine See *VITAMIN B₁*.

thigmohyperaesthesia *n.* Abnormal sensitivity to pressure stimuli, often manifested as discomfort caused by pressure from clothing, watchstraps, rings, eyeglasses, or bedcovers. US *thigmohyperesthesia*. **thigmohyperaesthetic**, **thigmohyperaesthetic**, or (US) **thigmohyperesthetic** *adj.* [From Greek *thigma*, *thigmatos* touch + *hyper* over + *aisthesis* sensation, from *aisthanesthai* to feel + *-ia* indicating a condition or quality]

thigmotaxis *n.* Movement towards or away from a solid object in response to tactile stimulation. Compare *THIGMOTROPISM*. **thigmotactic** *adj.* **thigmotactically** *adv.* [From Greek *thigma*, *thigmatos* touch + *taxis* arrangement, from *tassein* to arrange]

thigmotropism *n.* An orienting movement, turning towards or away, in response to a tactile stimulus, a typical example in human behaviour being the **rooting reflex*. Compare *THIGMOTAXIS*. **thigmotropic** *adj.* [From Greek *thigma*, *thigmatos* touch + *tropos* a turning + *-ismos* indicating a state or condition]

thing-presentation *n.* In **psychoanalysis*, the type of non-linguistic and largely visual representation of memories that is characteristic of the **unconscious* (2), whereas in the **preconscious* and in **consciousness* thing-presentations do not occur alone but are accompanied by or associated with **word-presentations*. In a typical passage in an article on ‘The Unconscious’ (1915), Sigmund Freud (1856–1939) referred to this phenomenon: ‘The

conscious presentation comprises the presentation of the thing plus the presentation of the word belonging to it, while the unconscious presentation is the presentation of the thing alone' (*Standard Edition*, XIV, pp. 166–215, at p. 201).

thinking *n.* The act or process of having ideas or thoughts, including *reasoning, *problem solving, *decision making, the formation of *mental models, and the contemplation of *knowledge, *beliefs, and *opinions. See also ABSOLUTE THINKING, CENTIPEDE EFFECT, COGNITIVE DERAILMENT, CONVERGENCE–DIVERGENCE, DELUSION, DEREISM, DIRECTED THINKING, FANTASY THINKING, HUMPHREY'S LAW, HYPER-REFLECTION, IMAGELESS THOUGHT, LATERAL THINKING, LOGIC, MAGICAL THINKING, NOESIS, OBSESSION, PREDICATE THINKING, PROBLEM SOLVING, RATIONAL, THOUGHT DISORDER, THOUGHT STOPPING.

thinking type *n.* One of the subsidiary personality types in *analytical psychology. See FUNCTION TYPE.

thinspiration *n.* Inspiration to lose weight. See PRO-ANA. [A blend of *thin* and (*in*)*spiration*]

thiopental *n.* Thiopental sodium, an ultra-short-acting *barbiturate drug used as an intravenous general anaesthetic and sometimes as a *truth drug. Also called *Pentothal* (trademark), *Sodium Pentothal*, or *thiopentone*.

thiopentone See THIOPENTAL.

thioridazine *n.* Thioridazine hydrochloride, a *neuroleptic (1) drug belonging to the class of *phenothiazines, prescribed in the treatment of *schizophrenia and other *psychotic (1) disorders, dysthymic disorder, childhood behavioural disorders, geriatric mental disorders, depressive disorders, and alcohol withdrawal. Also called *Mellaril* (trademark).

thiothixene *n.* A *neuroleptic (1) drug belonging to the group of *thioxanthenes, used (sometimes in its hydrochloride form) in the treatment of *schizophrenia and other *psychotic (1) disorders. Also called *Navane* (trademark).

thioxanthene *n.* Any of a group of [*neuroleptic \(1\)](#) drugs such as [*thiothixene](#) that have similar pharmacological effects to the [*phenothiazines](#). [From *thio-* indicating a chemical compound containing sulphur, from Greek *theion* sulphur + English *xanthene* a yellow crystalline compound used as a fungicide and as a dye, from Greek *xanthos* yellow + *-ene* indicating an unsaturated compound containing double bonds, from *-ene* a feminine name suffix]

third ear *n.* In [*psychoanalysis](#), a term sometimes used to denote the analyst's faculty of [*interpretation \(2\)](#), which is supposed to enable the analyst to hear things in the patient's words that would not be apparent to an untrained listener with an ordinary pair of ears. The term was introduced by the Austrian-born psychoanalyst Theodore Reik (1888–1969) in the title of his book *Listening with the Third Ear* (1949).

third eyelid *n.* A non-technical name for a [*nictitating membrane](#).

third ventricle *See* [VENTRICLE](#).

thirst *n.* The physiological and psychological state or condition caused by dehydration or lack of drink, characterized by an urge to drink and a feeling of dryness in the mouth and throat. *See also* [ANGIOTENSIN II](#), [BARORECEPTOR](#), [HYPOVOLAEMIC THIRST](#), [INTRACELLULAR THIRST](#), [POLYDIPSIA](#), [SUBFORNICAL ORGAN](#).

Thorazine *n.* A proprietary name for the neuroleptic drug [*chlorpromazine](#). [Trademark]

thought broadcasting delusion *n.* A [*delusion](#) that one's thoughts are being disseminated in a way that enables others to know them.

thought disorder *n.* Any pathological disturbance of thought processes, including [*delusions](#), [*flight of ideas](#), [*loosening of associations](#), or [*perseveration \(2\)](#), characteristic of certain mental disorders, notably [*schizophrenia](#), and considered by some authorities, including the Swiss psychiatrist Eugen Bleuler (1857–1939), who coined the term *schizophrenia*, to be the defining feature of that disorder. Because of the difficulty of

defining it objectively, ***DSM-5** refers to ‘disorganized thinking (speech)’.
See also [COGNITIVE SLIPPAGE](#), [OVERINCLUSIVENESS](#), [PROVERBS TEST](#).

thought experiment *n.* Another name for a **Gedankenexperiment*.

thought insertion delusion *n.* A **delusion* that certain of one’s thoughts that are not one’s own have been inserted into one’s mind by an external agent.

thought stopping *n.* A technique of **cognitive* behaviour modification in which patients or clients are trained to stop thinking about something as soon as it comes to mind, sometimes by self-administering a painful reminder, such as by snapping a rubber band worn round the wrist. It has been used to treat **obsessions*, **phobias*, **paraphilias*, and **hallucinations*.
See also [SUPPRESSION](#).

Thouless ratio *n.* A modified version of the **Brunswik ratio* of **perceptual constancy*, influenced by Fechner’s law, given by $(\log R - \log S)/(\log A - \log S)$, where *R* is the physical magnitude or intensity of the stimulus chosen as a match, *S* is the physical magnitude or intensity for a stimulus match with zero constancy, and *A* is the physical magnitude or intensity that would be chosen under 100 per cent constancy. The ratio is equal to zero when there is no perceptual constancy and 1 when there is perfect constancy. [Named after the English psychologist Robert Henry Thouless (1894–1984) who proposed it in 1931]

three-colour theory *n.* Another name for the **trichromatic theory*.

3-D model description *n.* In the **computational theory* of vision pioneered in the late 1970s by the English psychologist David Courtenay Marr (1945–80), the third and final **representation* (2), consisting of an abstract, object-centred three-dimensional representation enabling object recognition to occur, in contrast to the primitive **primal sketch* and the viewer-centred **2½-D sketch*.

360-degree feedback *n.* A method of appraising the performance of

employees by incorporating confidential evaluations by colleagues or peers and subordinates as well as supervisors or line managers, in contrast to traditional top-down appraisal by supervisors or line managers only. Typically, 360-degree feedback is given in the form of responses to questionnaire items covering behavioural criteria such as problem-solving ability, adaptability, communication skills, team-working, supervisory skills, and administrative skills, each item requiring a rating-scale response, plus a few narrative responses to qualitative questions. In some cases, employees also rate themselves, and *gap analysis* shows the discrepancy between how they perceive themselves and how others perceive them. Employees tend to prefer 360-degree feedback to traditional top-down appraisal, because it provides them with an idea of how their performance is judged from a variety of perspectives. The term was introduced in 1985 by the US marketing expert Mark R. Edwards (born 1948), Chief Executive Officer of TEAMS International, and from the mid-1990s the approach spread rapidly among leading companies. Also called *multi-rater feedback*, *multi-source feedback*, *360-degree assessment*, *360-degree review*, or *upward feedback*, although the latter term is misleading. [So called because an angle of 360 degrees is a complete circle, and the approach incorporates feedback from all directions rather than from only one]

3-hydroxytyramine See [DOPAMINE](#).

three Ps *n.* Pedantry, parsimony, and petulance. See [ANAL CHARACTER](#).

three-seven effect *n.* A phenomenon, based on [*population](#) stereotypes, that is often used by stage conjurors pretending to project their thoughts telepathically to their audiences. The performer says: 'I'm going to think of a two-digit number between one and fifty. I'll make both digits odd but not the same, so fifteen would be OK, but eleven wouldn't because the two odd digits are the same ... [pause]. Now how many of you got thirty-seven?' It usually turns out that more than one-third of the audience have thought of the number 37, partly because 3 and 7 are population stereotypes and partly because, surprisingly, the performer's instructions leave only seven possible two-digit numbers, apart from 15, which is effectively eliminated by being used as an example. It is often used in phoney demonstrations of telepathy.

*****ebook converter DEMO Watermarks*****

threshold *n.* The lowest intensity at which a *stimulus (1) evokes a *response or at which two stimuli can be discriminated from each other. Intensity is interpreted broadly to include variable stimulus *attributes such as the length of a line or the pitch of a tone. Also called a *limen*. See ABSOLUTE THRESHOLD, DIFFERENCE THRESHOLD. See also SIGNAL DETECTION THEORY, SUBLIMINAL PERCEPTION, TERMINAL THRESHOLD.

Thurstone scale *n.* A type of *attitude scale constructed by the *method of equal-appearing intervals, in which a large pool of candidate statements about an attitude object, ranging from strongly negative (*Abortion is never justified*) through neutral (*There are arguments both for and against abortion*) to strongly positive (*Abortion is every woman's right*), are sorted by a group of judges into eleven categories, assumed to appear equally spaced on the attitude *continuum, according to how favourable the statements are towards the attitude object, and items that yield the highest level of agreement among the judges as to their scale position, and that collectively represent an adequate range of contents and scale positions, are then selected for the final scale. Respondents to the scale endorse just those items with which they agree, and an individual respondent's score is calculated as the mean (or occasionally median) of the items endorsed, such scores being assumed to lie on an *interval scale of measurement. Also called an *equal-appearing interval scale*. Compare GUTTMAN SCALE, LIKERT SCALE, SEMANTIC DIFFERENTIAL, UNFOLDING TECHNIQUE, UNOBTRUSIVE MEASURE. [Named after the US psychologist Louis Leon Thurstone (1887–1955) who introduced it in an article in the journal *Psychological Bulletin* in 1929]

thwasa *n.* The Xhosa word for a *spell. [From Xhosa *ukuthwasa* to appear or become visible]

thymine *n.* One of the constituent *bases (1) of *DNA, having an affinity for *adenine. **T** *abbrev.* [From Greek *thymos* the thymus gland + *-ine* indicating an organic compound]

thymoleptic *adj. n.* (Of or relating to) an *antidepressant drug. [From Greek *thymos* temper or emotion + *lepsis* a taking hold or seizure + *-ikos* of, relating to, or resembling]

thymus *n.* A double-lobed ***endocrine gland** situated just below the ***thyroid gland** at the base of the neck, formerly believed to be vestigial in adults but now known to have a crucial role in the lymphatic system and to be the source of ***T lymphocytes**. [From Greek *thymos* the sweetbread or thymus gland]

thyroid gland *n.* An ***endocrine gland**, consisting in humans of two lobes near the base of the neck, that secretes the hormone ***thyroxine**, accelerating growth and metabolism and controlling body temperature. A deficiency of thyroxine leads to ***hypothyroidism** and can result in ***intellectual disability**, whereas an excess produces ***hyperthyroidism** and can lead to swelling of the eyeballs and exophthalmic goitre. The thyroid gland also secretes ***calcitonin**, which regulates ***calcium levels** (*compare* **PARATHYROID GLAND**). *See also* **THYROID-STIMULATING HORMONE**, **THYROTROPHIN-RELEASING HORMONE**. [From Greek *thyreoeides* a door-shaped shield, from *thyra* a door + *eidos* form, alluding to its appearance]

thyroid-stimulating hormone *n.* A hormone secreted by the anterior pituitary in response to ***thyrotrophin-releasing hormone** secreted by the hypothalamus. It stimulates the ***thyroid gland** to secrete ***thyroxine**. Also called *thyrotrophic hormone* or *thyrotropic hormone*(*TH*). **TSH** *abbrev.*

thyrotrophin-releasing hormone *n.* A ***releasing hormone** synthesized and secreted by the hypothalamus, causing the secretion of ***thyroid-stimulating hormone** by the anterior pituitary. Also spelt *thyrotropin-releasing hormone*. **TRH** *abbrev.*

thyroxine *n.* A hormone secreted by the ***thyroid gland**, derived from the non-essential amino acid tyrosine, accelerating metabolism and growth and controlling body temperature. Its chemical name is tetraiodothyronine. Also spelt *thyroxin*.

tic *n.* A spasmodic, recurrent, non-rhythmic, stereotyped movement or vocalization, experienced as irresistible but capable of being temporarily suppressed, often made worse by stress and improved by distraction. Simple motor tics include eye blinking, neck twisting, shoulder shrugging, and facial

grimacing, and simple vocal tics include throat clearing, grunting, snorting, and barking. Complex tics include facial and bodily gestures, repeating words or phrases, **coprolalia*, **echolalia*, and **palilalia*. See also [TIC DISORDERS](#), [TIC DOULOUREUX](#). [French: origin obscure]

tic disorders *n.* An umbrella term in **DSM-5* for a group of **neurodevelopmental disorders* characterized by **tics*. See [PERSISTENT \(CHRONIC\) MOTOR OR VOCAL TIC DISORDER](#), [PROVISIONAL TIC DISORDER](#), [TOURETTE'S DISORDER](#).

tic douloureux *n.* A disorder of the **trigeminal nerve*, usually in a person over 60 years old, causing spasmodic stabbing pain in the forehead, nose, and scalp, the region between the nose, mouth and temple, or the lower face, depending on which of the three branches of the nerve is affected. [From French *tic* a tic + *douloureux* painful, from *douleur* pain or suffering]

tickle *vb.* **1.** To touch, stroke, or poke a part of another person's body lightly, especially in certain sensitive areas such as the chest, stomach, genital area, or under the arms, in a manner that tends to produce **goose pimples*, involuntary muscle spasms, and sensations that are partly pleasurable and partly aversive; hence, figuratively, to excite pleasurable (*She was tickled pink when she heard she was pregnant*). Self-tickling is difficult or impossible to achieve. *n.* **2.** The sensation produced by tickling.

tilt aftereffect *n.* A perceived inclination or slant in the parallel bars of a **grating* as a result of gazing for half a minute or more at a different grating in which the parallel bars are slightly slanted in the opposite direction (see [illustration](#)). See also [CONTINGENT AFTEREFFECT](#), [FIGURAL AFTEREFFECT](#).

Tilt aftereffect. Run your eyes back and forth in the central channel of the left-hand figure for half a minute, then transfer your gaze to the central channel of the right-hand figure; the bars will appear to slope in the opposite direction to those on the left.

tilting-room test *n.* A test devised in the late 1940s by the US psychologist Herman A. Witkin (1916–79) to separate the gravitational cues from the **vestibular system* from the visual cues that are used to judge one's orientation relative to the upright and to measure the cognitive style that came to be called **field* dependence–independence. It consists of a small room that an experimenter can tilt to the left or right, containing a chair that the respondent can tilt to the left or right, the respondent's objective being to try to maintain an upright orientation. Field-independent people are able to bring the chair close to the vertical irrespective of how much the room is tilted, whereas field-dependent people tend to align themselves with the room, even when the room is tilted by as much as 35 degrees. Also called the *body adjustment test* (*BAT*). Compare *ROD-AND-FRAME TEST*.

timbre *n.* The tone-colour or quality of a musical sound, the property that distinguishes the sound of a continuous tone played on two different musical instruments or sung by two different voices at the same pitch and intensity. In German it is called *Klangfarbe*, literally sound colour. In phonetics, it is the characteristic tonal quality distinguishing one **vowel* from another. [From French *timbre* the sound of a bell, from Latin *tympanum* a drum]

time delay in consciousness *n.* Another name for **Libet's delay*.

time sampling diary *n.* A research technique designed to access

*****ebook converter DEMO Watermarks*****

representative samples of people's subjective experiences, especially emotions and motivations, as they go about their daily activities. Participants record their subjective experiences at randomly selected times, typically several times a day for about 30 consecutive days. *Randomization ensures unbiased sampling, and various methods are used to achieve it, including sending bleeper or phone messages to participants at randomly selected times. The technique was first reported by the Austrian psychologist Hermann Brandstätter (born 1930) in a paper delivered to the 30th Congress of the German Psychological Association in 1976 and published in the official proceedings, *Bericht über den 30. Kongreß der DGfPs in Regensburg 1976* (Vol. 2, edited by Werner H. Tack, pp. 60–2), although the English psychologist and psychoanalyst John C(arl) Flugel (1884–1955) had published an article in the *British Journal of Psychology* in 1925 describing a study, without random sampling, in which participants retrospectively recorded, approximately every hour over a period of 30 consecutive days, their emotions during the past hour. Also called *time sampling*. See also [EXPERIENCE SAMPLING](#). **TSD** abbrev.

time-saving bias *n.* A tendency to underestimate the journey time saved by travelling faster when increasing from a low speed and to overestimate the time saved when increasing from a relatively high speed. For example, most people judge that more time will be saved in driving a fixed distance by increasing speed from 70 to 110 km/h (an increase of 40 km/h) than from 30 to 40 km/h (an increase in only 10 km/h), whereas the reverse is actually the case. The correct formula for calculating the time saved $t = D(1/V_1 - 1/V_2)$, where t is the time gained, D is the distance travelled, and V_1 and V_2 are the slower and faster speeds, respectively, but people's judgements tend to be close to the incorrect formula $t = D(V_1 - V_2)/V_2$. The illusion was first reported by the Swedish psychologist Ola Svenson (born 1939) in the *Journal of Experimental Psychology* in 1970.

time series *n.* In statistics, any series of values of a variable taken at successive times or in a fixed order. For example, a person's pulse rate, measured every five minutes over a period of 24 hours, could be regarded as a time series. See also [INTERRUPTED TIME-SERIES DESIGN](#), [NOISE \(2\)](#), [SIGNAL](#), [SIGNAL-TO-NOISE RATIO](#), [TIME-SERIES ANALYSIS](#), [WHITE NOISE](#).

time-series analysis *n.* A set of statistical procedures for analysing *time series. See [ARIMA](#), [AUTOCORRELATION](#), [AUTOREGRESSION](#), [CORRELOGRAM](#), [FOURIER ANALYSIS](#), [MOVING AVERAGE](#). See also [ALIASING](#), [INTERRUPTED TIME-SERIES DESIGN](#), [WHITE NOISE](#).

tinnitus *n.* Ringing, hissing, or rumbling noises in one or both ears, either of psychogenic origin or resulting from such physical causes as middle ear infection, the side-effects of certain drugs, including aspirin, or exposure to very loud noise. [From Latin *tinnire* to ring]

tip-of-the-tongue phenomenon *n.* The recall of certain *attributes of an item of information being sought in memory without being able to recall the information itself. For example, a person trying to recall the capital of Nicaragua may recall that it begins with the letter M, and may know that it has three syllables, but may nevertheless not be able to recall its full name: *Managua*. If asked to guess, such a person might suggest names such as *Minorca*, *Montana*, or *Monica*. Apart from the initial letter or sound and number of syllables, which according to research are most often recalled when the phenomenon occurs, the principal stressed syllable and the final letter or sound are also sometimes recalled—see [SERIAL POSITION EFFECT](#). The phenomenon was first investigated and named by the US psychologists Roger (William) Brown (1925–97) and David McNeill (born 1933) in an article in the *Journal of Verbal Learning and Verbal Behavior* in 1966. See also [UGLY SISTER EFFECT](#). **TOT** abbrev.

Titchener circles *n.* Another name for the *[Ebbinghaus illusion](#). Also called the *Titchener illusion*. [Named after the English psychologist Edward Bradford Titchener (1867–1927) who published it in 1898]

tit for tat strategy *n.* A *[programmed strategy](#) for playing repeated *[Prisoner's Dilemma games](#), also occasionally applied to other games, in which the program cooperates on the first trial and then, on each subsequent trial, chooses the strategy chosen by the co-player on the previous trial. It is often interpreted as a method of implementing *[reciprocal altruism](#). The idea was introduced by the Russian-born US psychologist Anatol Rapoport (1911–2007) in his book *Two-Person Game Theory* (1966, p. 133), and the name was first applied by him to a computer program for playing repeated
*****ebook converter DEMO Watermarks*****

Prisoner's Dilemma games as reported in an article by the US political scientist Robert Axelrod (born 1943) in the *Journal of Conflict Resolution* in 1980. **TFT** *abbrev.*

T lymphocyte *n.* A type of **lymphocyte* synthesized in the **thymus* gland that plays a crucial role in the **immune system*. Two major subtypes are killer T cells that destroy cells infected by viruses and helper T cells that induce other cells, namely **B lymphocytes*, to produce **antibodies*. Also called a *T cell*. *See also* *STEM CELL*. [From *t(hymus)lymphocyte*]

T-maze *n.* A simple **maze* incorporating only one choice point with only two alternatives. It is shaped like the letter *T*, an animal entering the maze at the bottom and being rewarded for reaching the goal box at one end of the crossbar.

tobacco-related disorders *n.* **Substance-related and addictive disorders* introduced in **DSM-5* associated specifically with the use of tobacco, diagnosed only when tobacco use is problematic and causes significant impairment or distress. DSM-5 distinguishes between tobacco use disorder and tobacco withdrawal. *See also* *SUBSTANCE-INDUCED DISORDERS*, *SUBSTANCE-RELATED AND ADDICTIVE DISORDERS*, *SUBSTANCE USE DISORDERS*.

tocopherol *See* *VITAMIN E*.

Tofranil *n.* A proprietary name for the tricyclic antidepressant drug **amitriptyline*. [Trademark]

token *n.* **1.** An indication, sign, or symbol representing something else. **2.** A voucher or object that can be used as payment for goods or services. **3.** In linguistics, an instance or occurrence of a word or other linguistic unit in speech or writing, in contradistinction to the word or symbol (called a *type*) of which it is an instance. *See also* *DISTRACTOR*, *TYPE—TOKEN RATIO*.

token distractor *See* *DISTRACTOR*.

token economy *n.* A technique of **behaviour* therapy sometimes used

in hospitals and other institutions, in which inmates are given tokens (for example, poker chips) as ***reinforcement (1)** for the performance of certain target behaviour patterns (such as dressing or speaking normally or interacting with other patients on the ward), the tokens later being convertible into privileges such as special foods, cigarettes, or access to television.

Tolansky's curvature illusion See **CURVATURE ILLUSION**.

tolerance *n.* **1.** The quality of being able or willing to accept the behaviour of others. **2.** The capacity to withstand extreme conditions or circumstances. **3.** In relation to drugs such as ***narcotic** analgesics, ***dopamine** antagonists, and ***barbiturates**, a tendency to require ever-increasing dosages of the drug to achieve a desired effect, or a markedly diminished effectiveness with continuation of the same dosages, caused by various mechanisms that reduce the number of drug molecules reaching neuroreceptor sites on target cells or that involve compensatory responses to the drug effects such as ***enzyme** induction or ***neuromodulation**. See also **HABITUATION (3)**, **SUBSTANCE DEPENDENCE**, **TACHYPHYLAXIS**. Compare **SENSITIZATION** (reverse tolerance). [From Latin *tolerare* to sustain or lift up]

tolerance of ambiguity See **INTOLERANCE OF AMBIGUITY**.

tomoxetine See **ATOMOXETINE**.

tonal density *n.* A quality of sound associated with the perceived tightness or compactness of a tone, greater density usually occurring with higher frequency tones.

tone *n.* **1.** Any sound wave that is capable of being perceived as having a definite ***pitch**. See also **COMPLEX TONE**, **PURE TONE**. Compare **NOISE (1)**. **2.** A musical interval or difference in pitch equivalent to two ***semitones** or one-sixth of an ***octave**. Also called a *whole tone*. [From Greek *tonos* a tone]

tone deafness *n.* A non-technical name for ***asonia**.

tongue *n.* The movable muscular structure situated on the floor of the

mouth that functions as the principal organ of **taste* and that plays an important part in the articulation of speech sounds, its epithelial covering being richly covered with **papillae*, at the bases of which **taste* buds are situated. Since the beginning of the 20th century, it has often been stated in textbooks that maximal sensitivity for sweet tastes is located at the front of the tongue, sour tastes at the sides, salty tastes at the front and front sides, and bitter tastes in the soft palate above the back of the tongue, but in reality all taste qualities can be elicited from all regions of the tongue containing taste buds. *See also* CIRCUMVALLATE PAPILLA, FILOFORM PAPILLA, FOLIATE PAPILLA, FUNGIFORM PAPILLA. [From Old English *tunge*, cognate with Old High German *zunga*, Latin *lingua*]

tonic-clonic *adj.* Of or pertaining to a convulsion or spasm characteristic of **major epilepsy*, beginning with a **tonic convulsion* lasting up to a minute, then a **clonic convulsion* for approximately a minute, often with clenched teeth, chewing movements, and loss of bladder or bowel control, then usually a period of relaxed unconsciousness followed by amnesia for the episode. Also called *grand mal*, *tonoclonic*. *Compare* ABSENCE.

tonic convulsion *n.* A prolonged and generalized contraction of the skeletal muscles. Also called *tonic immobility* or *tonic spasm*. *Compare* CLONIC CONVULSION, TONIC-CLONIC. [From Greek *tonos* tension, from *teinein* to stretch]

tonoclonic *adj.* A synonym for **tonic-clonic*.

tonotopic map *n.* A **topographic map* of the **basilar* membrane in the **auditory* cortex on **Heschl's gyrus*. Also called a *cochleotopic map*. [From Greek *tonos* a tone + *topos* a place + *-ikos* of, relating to, or resembling]

tonus *n.* The normal tension or elasticity of a resting muscle. Also called *muscle tone*. *See also* CATALEPSY, CATAPLEXY (1), CATATONIA, DECEREBRATE RIGIDITY, DYSTONIA, HYPERTONIA, HYPOTONIA, REM ATONIA. *Compare* ATONIA. [From Greek *tonos* tension or tone]

topagnosia *n.* A form of agnosia involving an impaired ability to identify which part of one's body has been touched. Also called *topagnosis*. *See* *****ebook converter DEMO Watermarks*****

AGNOSIA. See also **AUTOTOPAGNOSIA**. [From Greek *topos* a place + *gnosis* knowing + *-ia* indicating a condition or quality]

top-down processing *n.* ***Information** processing that proceeds from information already stored in memory, especially general assumptions or presuppositions about the material being processed, as when a person forms a hypothesis on the basis of existing ***schemata** and prior experience about what an object might be and then uses sensory evidence to corroborate or disconfirm the hypothesis. In reading indistinct handwriting, for example, if the words *whisky and...* occur and the last word is illegible, a reader may use top-down processing and guess the last word to be *water*, checking the script for evidence to confirm or refute this guess, and if it is refuted, to guess that the word is *soda* and performing another check, and so on. A standard illustration of top-down processing is the phenomenon of reversal in an ***ambiguous figure**, which irresistibly oscillates between different interpretations. *Top-down theories* of perception are theories according to which perceptions are formed in this way. The term was introduced by the US psychologists Donald A(rthur) Norman (born 1935) and David E(verett) Rumelhart (1942–2011) in their book *Exploration in Cognition* (1975). Also called *conceptually driven processing*. See also **ANALYSIS BY SYNTHESIS**, **AUTOMATIC PROCESSING**, **CONSTRUCTIVE MEMORY**, **CONSTRUCTIVISM**, **RECONSTRUCTIVE MEMORY**, **STROOP EFFECT**, **TASK-POSITIVE NETWORK**. Compare **BOTTOM-UP PROCESSING**, **FEATURE DETECTION THEORY**.

top hat illusion *n.* A visual illusion, closely related to the ***horizontal–vertical illusion**, in which a drawing of a top hat, the height of which is equal to the width of its brim, appears much taller than it appears wide (see **illustration**).

Top hat illusion. Its height is equal to the width of its brim.

topographagnosia *n.* A form of agnosia involving an inability to find one's way around, read maps, draw plans, and perform similar functions, often associated with damage to the right hemisphere **parietal lobe*. *See also* *AGNOSIA*. Compare visuospatial agnosia (*see* *AGNOSIA*).

topographic map *n.* Any of the point-to-point representations of sensory fields, including especially the visual, auditory, and tactile fields, within particular areas of the brain, preserving the topological relationship between neighbouring points but often distorting relative distances. Also called a *topographical map* or a *topographic(al) (spatial)representation*. *See* *AUDITORY CORTEX*, *CEREBELLUM*, *LATERAL GENICULATE NUCLEUS*, *PRIMARY VISUAL CORTEX*, *RETINOTOPIC MAP*, *SOMATOSENSORY CORTEX*, *THALAMUS*, *TONOTOPIC MAP*, *VENTRAL POSTERIOR NUCLEUS*. *See also* *SOMATOSENSORY HOMUNCULUS*. [From Greek *topos* a place + *graphein* to write + *-ikos* of, relating to, or resembling]

topography *n.* A detailed description of the major features of a region. In **psychoanalysis*, a description of the layout of the mental apparatus, especially the first topography of Sigmund Freud (1856–1939) in terms of the **unconscious* (2), **preconscious*, and **consciousness*, or his second structural model (from 1920 onwards) in terms of the **id*, **ego*, and

*****ebook converter DEMO Watermarks*****

***superego.** See also METAPSYCHOLOGY. **topographic** or **topographical** *adj.*
[From Greek *topos* a place + *graphein* to write]

topological psychology *n.* A largely discredited psychological geometry introduced in 1936 by the German–US psychologist Kurt Lewin (1890–1947) to represent his ***field** theory, in particular the ***life space**, conceived as a ***hodological space**, and a person’s locomotion within it. [So called in reference to *topology*, the branch of geometry concerned with the properties of a figure that remain unchanged when the figure is stretched, compressed, or bent]

torticollis *n.* A shortened name for ***spasmodic torticollis**.

total quality management *n.* An approach to management based on the principle that every member of staff should be involved in decision making and committed to achieving and maintaining high standards in all areas of the organization’s activities. Additional assumptions are that success depends on giving the customers what they want at a price that they can afford, and that when one part of an organization supplies services to another it should treat the recipient as a customer. **TQM** *abbrev.*

TOTE *abbrev.* Test-Operate-Test-Exit, a ***feedback** loop proposed as the basic unit of behaviour by the US psychologist George A(rmitage) Miller (1920–2012) and co-authors in their book *Plans for the Structure of Behavior* (1960). This hypothetical mechanism responds to a ***stimulus (1)** by testing it for incongruity, operates to remove the incongruity if any is found, tests again, and so on indefinitely until the incongruity is eliminated, then exits. The authors explained in a key passage that the TOTE is intended as a conceptual alternative to the ***reflex** arc: ‘Obviously, the reflex arc is not the unit we should use as the element of behavior: the unit should be the feedback loop itself. If we think of the Test-Operate-Test-Exit unit—for convenience, we shall call it a TOTE unit—as we do of the reflex arc, in purely anatomical terms, it may describe reflexes, but little else. That is to say, the reflex should be recognized as only one of many possible actualizations of the TOTE pattern’ (p. 27). It is not only energy that flows through the feedback loop, but also information and control, and it can be actualized at the cognitive level, as in the following example, especially apt

*****ebook converter DEMO Watermarks*****

for illustrating feedback: a person who is cooking tests a sauce for taste, notes an incongruity between the sensory input and the desired or expected taste, operates by adding various ingredients, tests again and repeats the cycle until no incongruity is found, then finally exits from the feedback loop.

totem *n.* A physical object having ritual significance, or a symbolic representation of such an object, especially a type of animal, plant, or natural structure representing a clan in certain cultures such as those of North American Indians. In **psychoanalysis*, Sigmund Freud (1856–1939), in his book *Totem and Taboo* (1912–13, *Standard Edition*, XIII, pp. 1–162) interpreted it as a representation of the **primal father*. See also *PARTICIPATION MYSTIQUE*. **totem pole** *n.* A pole on which totems are hung. [From Ojibwa *nintotem* mark of my family]

touch *n.* Originally one of the five classical **senses* (1), now a generic term for several senses that respond to stimuli directly in contact with the **skin*. **Dynamic* touch is the ability to sense certain physical properties of an object by moving it around; **haptic* touch is active exploration of objects or surfaces using the sense of touch, usually using the hands; and the **cutaneous senses* are those responsible for the four sensations that may be felt when an object or surface touches the skin and that the Austrian physiologist Max von Frey (1852–1932) identified in 1904 as warmth, cold, pain, and pressure, although pressure is now known to include sensations of texture and vibration (*pallaesthesia*). See also *AESTHESIOMETER*, *COLD SPOT*, *HAPHALGESIA*, *LIBET'S DELAY*, *PARAESTHESIA*, *PRESSURE-SENSITIVE SPOT*, *SENSORY SALTATION*, *TACTILE ACUITY*, *TOUCH RECEPTOR*, *TWO-POINT THRESHOLD*, *WARM SPOT*.

touch acuity *n.* Another name for **tactile* acuity.

touch receptor *n.* A type of **sensory* receptor, located in the **epidermis* or the **dermis* of the **skin*, specialized for sensations of **touch*. See *FREE NERVE ENDING*, *GOLGI TENDON ORGAN*, *MECHANORECEPTOR*, *MEISSNER'S CORPUSCLE*, *MERKEL CELL*, *PACINIAN CORPUSCLE*, *PAIN RECEPTOR*, *RUFFINI CORPUSCLE*, *TEMPERATURE RECEPTOR*. Also called a *tactor*.

tough-mindedness *n.* Practicality, lack of sentimentality, and determination, or obduracy and intractability. In the later writings (from 1975

*****ebook converter DEMO Watermarks*****

onwards) of the German-born British psychologist Hans J(ürgen) Eysenck (1916–97) it is another name for **psychoticism*.

Tourette's disorder *n.* In **DSM-5*, a **tic disorder* of genetic origin (located on chromosome 18) characterized by recurrent multiple motor tics and at least one vocal tic, causing significant distress or impairment in social or occupational functioning, the onset being before age 18 years, and the tics not being attributable to a stimulant drug or other substance or a **general medical condition*. Contrary to common misconception, **coprolalia* or **copropraxia* are present in only a minority of people with the disorder. Also called *Gilles de la Tourette's syndrome (GTS)* or *Tourette's syndrome (TS)*. [Named after the French physician Georges Gilles de la Tourette (1857–1904), who published case studies of eight patients with the disorder in 1885]

Tower of Hanoi *n.* A logical puzzle, frequently studied in cognitive psychology and used as a test of **problem solving* ability, consisting of three pegs, on one of which are placed a number of discs of varying diameter, the largest at the bottom and the smallest at the top (see *illustration*). The problem is to move the tower of disks over to one of the other pegs in the smallest number of moves, moving one disc at a time and using the third peg as a temporary way station as required, and never placing a larger disc on top of a smaller one. The puzzle is of ancient (possibly Indian) origin but was rediscovered by the French mathematician Edouard Lucas (1842–91) and marketed as a toy in 1883. Lucas proved that, for any number n of discs, the minimum number of moves is given by the formula $2^n - 1$. Hence 3 discs can be transferred in 7 moves, 4 discs in 15 moves, 5 discs in 31 moves, and so on. See also *GENERAL PROBLEM SOLVER*. [So called because of its supposed resemblance to a certain type of Vietnamese building, Lucas's toy having been described as a simplified version of the Tower of Brahma, which was said to contain 64 gold discs, and which would therefore require a minimum of $2^{64} - 1$ (more than 18 billion billion) moves to solve]

Tower of Hanoi

toxic *adj.* Of, relating to, or caused by a **toxin*. See also TOXIC DOSAGE.
toxicity *n.* The state or quality of being toxic; or the potency of a **toxin*.
[From Greek *toxikon pharmakon* arrow-poison, from *toxon* a bow]

toxic dosage *n.* The minimum dosage of a drug required to produce signs or symptoms of toxicity in an organism. **TD** *abbrev.* **toxic dosage 50** *n.* Another name for the **median* toxic dosage. See also THERAPEUTIC INDEX, THERAPEUTIC RATIO. Compare EFFECTIVE DOSAGE, LETHAL DOSAGE. **TD-50** or **TD₅₀** *abbrev.*

toxicosis *n.* 1. Any disorder or condition brought about by poisoning. 2. Another name for **food aversion learning*. [From Greek *toxikon pharmakon* arrow-poison, from *toxon* a bow + *-osis* indicating a process or state]

toxin *n.* Any organic poison that stimulates an **immune response* or the production of neutralizing **antibodies*. More generally, any poison, but this meaning is avoided in careful usage. [From Greek *toxikon pharmakon* arrow-poison, from *toxon* a bow]

trace conditioning *n.* A form of **conditioning* (1) involving the repeated brief presentation of a **conditioned stimulus*, followed by a period of time during which no stimulus is presented, and then the presentation of an **unconditioned stimulus*, leading eventually to the development of a **conditioned response* based on the memory of a previous stimulus. Compare DELAY CONDITIONING. [So called because it depends on a memory trace of the conditioned stimulus]

trace, memory See MEMORY TRACE.

trachea *n.* The membranous tube, reinforced with cartilaginous rings, between the lungs and the *larynx, referred to non-technically as the *windpipe. [From Greek *tracheia arteria* rough artery]

tragedy of the commons See COMMONS DILEMMA.

trainable mentally retarded *adj.* An obsolescent educational category equivalent to moderate *intellectual disability. **TMR** abbrev.

training analysis *n.* A course of *psychoanalysis undergone by a student wishing to become an analyst. It was made obligatory at the Congress of the International Psycho- Analytical Association in 1922, although Sigmund Freud (1856–1939), the founder of psychoanalysis, believed that, for practical reasons, it could only be short and incomplete, and that its main objective should be to ensure that the student is suitable for further training ('Analysis Terminable and Interminable', 1937, *Standard Edition*, XXIII, pp. 216–53). Compare CONTROL ANALYSIS.

trait *n.* A characteristic or quality distinguishing a person or (less commonly) a thing, especially a more or less consistent pattern of behaviour that a person possessing the characteristic would be likely to display in relevant circumstances, typical examples being *shyness*, *honesty*, *tidiness*, and *stupidity*. The US psychologists Gordon W(illard) Allport (1897–1967) and Henry S(ebastian) Odbert (1909–95) carried out an exhaustive dictionary search (published in the journal *Psychological Monographs* in 1936) in which they found 17,953 trait names, and after eliminating synonyms that denoted essentially the same traits they were left with 4,505 distinct English trait names denoting psychological differences between people. See also 16PF, BIG FIVE, LANGUAGE PERSONALITY SPHERE, METATRAIT, TRAIT CENTRALITY. [From Old French *trait* a drawing or a stroke of the pen in a picture, from Latin *trahere*, *tractum* to draw]

trait anxiety *n.* A person's general or characteristic level of *anxiety. See also STATE-TRAIT ANXIETY INVENTORY. Compare STATE ANXIETY.

trait centrality *n.* A tendency of certain personality **traits* to have an overwhelming effect in **impression formation*, even influencing the interpretation of other traits associated with the person being judged (an **atmosphere effect*). The phenomenon was discovered in 1946 by the Polish-born US psychologist Solomon E(lliott) Asch (1907–96), who presented one group of judges with a description of a target person who was described as *intelligent, skilful, industrious, warm, determined, practical, and cautious* and another group of judges with a description that was identical apart from the replacement of *warm* with *cold*. The *warm/cold* trait turned out to be central in the sense of profoundly affecting the overall impression of the target person. When the list of traits contained *warm*, 91 per cent of judges guessed that the target person was also *generous*, compared with only 8 per cent when the list contained *cold*. When the stimulus list included *warm*, the target person tended to be perceived as also being *happy, humorous, sociable, and popular*, but when the stimulus list included *cold*, most judges thought the stimulus person would not have those traits but would be *persistent, serious, and restrained*. Other traits, such as *reliable*, were not significantly affected by the *warm/cold* trait. Other trait pairs, such as *polite/blunt*, do not produce the same centrality effect. Central traits are believed to have the property of centrality by virtue of being highly correlated with other traits in the judges' **implicit personality theories*. The phenomenon illustrates the property of a **Gestalt* in which the whole is more than the mere sum of its parts. *See also* HALO EFFECT.

trait negativity bias *n.* A tendency for unfavourable information about a person to have more impact on impressions of that person than favourable information, so that, for example, even a single unfavourable comment in an otherwise supportive reference or testimonial may create a generally bad impression and undermine the candidate's chances. The effect presumably arises from the fact that information about people tends to be mostly positive or neutral, as a result of which negative information tends to have more **salience* (1) and to contain more **information* (2) in the sense of **information* theory. *See also* POLLYANNA EFFECT.

trait validity *n.* In psychometrics, a form of **validity* determined by the extent to which a test correlates more highly with different methods of measuring the same **construct* than it does with similar methods of

*****ebook converter DEMO Watermarks*****

measuring different constructs. The concept was proposed by the US psychologist Donald T(homas) Campbell (1916–96) in an article in the journal *American Psychologist* in 1960, where it was distinguished from validity established through a [*nomological network](#). See also [MULTITRAIT–MULTIMETHOD MATRIX](#).

trance *n.* An altered state of [*consciousness](#), shown by a narrowing of awareness of events in the immediate surroundings, a suspension of the sense of personal identity, and diminution in the range of motor activity and speech. It is characteristic of certain forms of intoxication, some mental disorders, and (controversially) [*hypnosis](#). See also [DISSOCIATIVE TRANCE DISORDER](#), [POSSESSION TRANCE](#). [French *trance*, from Latin *transire* to go across or to die]

trance disorder, dissociative See [DISSOCIATIVE TRANCE DISORDER](#).

trance logic *n.* A peculiar willingness of some people who are [*hypnotized](#) to accept logical contradictions that people who are not hypnotized do not normally tolerate. A classic example, reported by the Austrian-born US psychologist Martin Theodore Orne (1927–2000) in an article in the *Journal of Abnormal and Social Psychology* in 1959, where trance logic was first reported and named, is the *double hallucination*. Orne gave a group of hypnotically susceptible subjects the suggestion that, when they opened their eyes while still hypnotized, they would see a research assistant called Joe, whom they had met, sitting in a chair opposite them. All hypnotic subjects duly hallucinated Joe in the empty chair. They were then told to turn around and look behind them, where the real Joe was standing, and were asked what they saw. Almost invariably, the hypnotic subjects indicated by their answers that they could perceive two images of the same person. Members of a [*control group](#) of subjects who were pretending to be hypnotized either refused to see anyone behind them, or claimed that they could not recognize the person behind them, or said that the hallucination in front of them had vanished; unlike the hypnotized subjects, they were trying to interpret what they had seen according to conventional logic. [So called because of its supposed relation to a hypnotic trance]

tranq *n.* A common street name for the depressant drug [*phencyclidine](#).

*****ebook converter DEMO Watermarks*****

[From *tranquillizer*]

tranquillizer *n.* Any drug that has a calming effect without causing any significant dulling of consciousness, usually because its sites of action are in subcortical structures, in contrast to a sedative or hypnotic drug that also has a calming effect but tends to produce significant hypnotic (sleep-inducing) or narcotic effects as well. The term was first introduced in 1953 to describe the psychotropic effects of reserpine but later came to refer to **anxiolytic* and **sedative* drugs. The *major tranquillizers* are the **neuroleptic (1)* drugs, and the *minor tranquillizers* are the **anxiolytic* drugs. US *tranquilizer*. [From Latin *tranquillus* quiet, calm, or still]

trans See *CIS–TRANS COMPLEMENTATION TEST*.

transactional analysis *n.* A theory of **personality* and a form of **psychotherapy*, originated by the Canadian-born psychoanalyst Eric Berne (1910–70), aimed primarily at improving interpersonal relations by adjusting the balance between the child, adult, and parent ego states that are assumed to coexist within the same personality. **TA** *abbrev.*

transactionalism *n.* An empiricist approach to perception adopted in the 1940s and 1950s by the US painter and psychologist Adelbert Ames, Jr (1880–1955) and his followers, according to which all stimuli are ambiguous, and perceptions are constructed largely from past experiences (transactions) with relevant stimuli, such phenomena as the **Ames room* and the **trapezoidal window* being cited as evidence for this interpretation, which can be traced to the *Essay Towards a New Theory of Vision* (1709) by the Irish philosopher Bishop George Berkeley (1685–1753).

transcendental meditation *n.* A spiritual exercise and form of **psychotherapy* based on Hindu traditions, involving daily periods of relaxation and quiet meditation on a special word, called a mantra, given by an instructor or therapist. See also *MINDFULNESS*. **TM** *abbrev.*

transcortical aphasia *n.* A generic term for transcortical motor aphasia, transcortical sensory aphasia, and mixed transcortical aphasia, all of which arise from lesions interfering with the transmission of nerve impulses

*****ebook converter DEMO Watermarks*****

across the cerebral cortex between the language and motor centres, leading to impairment of spontaneous speech with intact ability to repeat spoken language. See [APHASIA](#). Also called *ideomotor aphasia*.

transcortical magnetic stimulation *n.* A painless and non-invasive technique for studying brain function by applying a pulsed magnetic field across the skull, first used as an aid to neurological examination, by stimulating regions of the [*motor cortex](#) and observing body movements to confirm that the corresponding neural pathways were intact. Depending on the precise positioning of the magnetic field and the pulse frequency, the stimulation elicits [*evoked potentials](#) and can affect visual perception, memory, reaction time, speech, and mood. In the late 1980s it began to be used as a method of functional brain mapping and as a research tool, and it was also investigated as a possible treatment method for certain forms of mental disorder. Also called *transcranial magnetic stimulation*. Compare [ELECTROCONVULSIVE THERAPY](#). TMS *abbrev.* [From Latin *trans* across + *cortex* bark or outer layer + *-icus* of, relating to, or resembling + *-alis* of or relating to]

transcranial magnetic stimulation See [TRANSCORTICAL MAGNETIC STIMULATION](#).

transcriptase *n.* Another name for [*RNA](#) polymerase.

transcription *n.* **1.** The act or process of copying or rewriting a text. **2.** In genetics, the process whereby a molecule of [*RNA](#) is synthesized from a [*DNA](#) template. **transcribe** *vb.* [From Latin *trans* across + *scribere*, *scriptum* to write + *-ion* indicating an action, process, or state]

transducer *n.* A device or instrument that converts one form of energy into another. All [*sensory](#) receptors are transducers inasmuch as they transform kinetic energy, light, sound, heat, and energy from chemical reactions into nerve impulses or [*action potentials](#). [From Latin *transducere* to lead across, from *trans* across + *ducere* to lead]

transducin *n.* An enzyme that is activated by molecules of visual pigment in the retina when they are stimulated by light and that in turn stops the action
*****ebook converter DEMO Watermarks*****

of **cyclic GMP* in keeping open **sodium* channels into the rods and cones. [Alluding to the role of the visual receptors as **transducers* of light into nerve impulses]

transduction *n.* 1. The conversion of energy from one form into another by a **transducer*. See also *SENSORY TRANSDUCTION*. 2. In genetics, the transfer of **DNA* from one bacterial cell to another by a bacteriophage (a virus that infects a bacterium).

transductive reasoning *n.* The term used by the Swiss psychologist Jean Piaget (1896–1980) to denote the type of thinking characteristic of children during the **pre-operational stage* of development. It is so called because it focuses on concrete instances and does not follow the principles of either **induction* (1) or **deductive reasoning*. Also called *transductive logic*, but this is avoided in careful usage, because it is clearly not a form of **logic*.

transfer-appropriate processing *n.* Another name for **encoding specificity*.

transference *n.* In **psychoanalysis*, a form of **displacement* involving the redirection of emotions and attitudes from their original **instinctual object* on to a substitute, especially as occurs in the dependent, child-like, and often both sexually and aggressively charged relationship that a person undergoing therapy usually forms with the analyst, generally having features carried over (transferred) from earlier relationships, especially with parents. The **interpretation* (2) or **working through* of the transference is an important aspect of psychoanalytic therapy in which aspects of past relationships are explored. Sigmund Freud (1856–1939) introduced and discussed this idea in 1914 in an article on ‘Remembering, Repeating and Working-Through’ (*Standard Edition*, XII, pp. 147–56). See also *ACTING OUT* (1), *COUNTER-TRANSFERENCE*, *NEGATIVE TRANSFERENCE*, *POSITIVE TRANSFERENCE*, *RAPPORT*, *REPETITION COMPULSION*, *TRANSFERENCE NEUROSIS* (1, 2).

transference neurosis *n.* 1. In **psychoanalysis*, a category of **psychoneuroses* comprising **anxiety* hysteria, **conversion* hysteria, and **obsessional neurosis*. It is distinguished from **narcissistic neurosis* because **libido* is not withdrawn into the **ego* but is displaced or transferred on to

*****ebook converter DEMO Watermarks*****

external **instinctual objects*. Sigmund Freud (1856–1939) expounded his taxonomy of neuroses to include transference neurosis in 1916–17 in his book *Introductory Lectures on Psycho-Analysis* (*Standard Edition*, XV–XVI, at pp. 387–91). 2. More specifically, the artificial psychoneurosis that develops during psychoanalytic therapy, the **interpretation* (2) of which is one of the techniques of psychoanalysis. In his article on ‘Remembering, Repeating and Working-Through’ (1914) Freud claimed that ‘we regularly succeed in giving all the symptoms of the illness a new transference meaning and in replacing his [the patient’s] ordinary neurosis by a “transference-neurosis” of which he can be cured by the therapeutic work’ (*Standard Edition*, XII, pp. 147–56, at p. 154). See also *TRANSFERENCE*.

transfer of training *n.* The facilitation or impairment of performance of a task resulting from prior training on a different but related task. Transfer tends to be positive when the two tasks involve different stimuli and similar responses, and it tends to be negative when the two tasks involve similar stimuli and different responses. When the two tasks involve different stimuli and different responses, there tends to be little or no transfer. See *BILATERAL TRANSFER*, *NEGATIVE TRANSFER*, *POSITIVE TRANSFER*.

transfer RNA *n.* A soluble form of **RNA* that transports a specific **amino acid* to a **ribosome* during protein synthesis. Also called *soluble RNA*. See also *FRAMESHIFT SUPPRESSION*. Compare *MESSANGER RNA*. *tRNA* abbrev.

transformation *n.* Any alteration in form, character, or substance. In statistics and measurement theory, a change of all the **raw scores* in a data set by means of a mathematical function. Raw scores may be transformed to simplify computation, as when a constant is added to eliminate negative scores, to express the scores in dimensionless units of standard deviations, as when scores are transformed to **standard scores*, to change the shape of the distribution of scores to meet the assumptions of a statistical test, as when **product–moment correlation coefficients* are transformed to **z scores* by means of the **Fisher’s r to z transformation*, or for a variety of other reasons. Some transformations, such as the transformation of raw scores measured on an **interval scale* to **ranks*, are irreversible and involve loss of information, whereas others are reversible and involve no loss of information.

transformational grammar *n.* A representation of a language in terms of the rules through which structures or elements can be derived from others, and in particular the **deep structures* of sentences can be converted into their **surface structures*. See also *BINDING PROBLEM*, *CHOMSKYAN*, *COMPETENCE (2)*, *FORMAL UNIVERSALS*, *GOVERNMENT AND BINDING*, *PERFORMANCE (2)*, *WUG TEST*. Compare *GENERATIVE GRAMMAR*.

transgendered *adj.* Having a preference for or engaging in **transvestism* or **transsexualism*. **transgenderism** *n.* The practice of transgendered behaviour. **transgenderist** *n.* A transgendered person.

transgenic *adj.* Of or relating to an **organism* containing a **gene* or genes transferred artificially from another organism. [From Latin *trans* across + English *gene* + Latin *-icus* of, relating to, or resembling]

transient disparity *n.* Any instantaneous difference between the arrival times of a sound wave at the two ears, including interaural differences in the onset time of the sound, the termination time, and the time of any sudden change in pitch or intensity, but excluding ongoing or continuous **phase* delay. It is used in conjunction with phase delay as a **cue (2)* for localizing sounds below about 1,000 hertz (about two octaves above Middle C) having wavelengths greater than the diameter of the head, so that the sound waves bend round the head rather than being reflected from or absorbed by it, thus preventing a **sonic shadow* from forming on the side furthest from the sound source. Sound waves reach the nearer ear fractionally before the further one, and in an open area with no reflecting surfaces, or a simulation of these conditions using earphones, low-pitched sounds can be localized easily within 10 degrees in the horizontal plane (using other cues in addition, the **minimum audible angle* is nearer 2 degrees). Because sound travels through air at about 343 metres per second (1,240 kilometres per hour or 770 miles per hour), a simple calculation shows that people can detect time differences between the movements of their two eardrums of less than one ten-thousandth of a second. It is one of the *binaural time differences* or *interaural time differences* used in sound localization. See also *BINAURAL SHIFT*, *BIOSONAR*, *CONE OF CONFUSION*, *SOUND LOCALIZATION*. [From Latin *transiens* going over, from *transire* to go over, from *trans* across + *ire* to go]

transient global amnesia *n.* A sudden loss of memory, including both **anterograde amnesia* and **retrograde amnesia*, with full recovery within 24 hours, often resulting from **ischaemia* in the **hippocampus* or **fornix*. Compare GLOBAL AMNESIA. **TGA** abbrev.

transient ischaemic attack *n.* An episode similar to a **stroke* but with full recovery within 24 hours, caused by a partial blockage of blood vessels in the brain leading to a decreased supply of oxygenated blood to brain tissues normally perfused with blood by those vessels, the symptoms typically including disturbance of vision in one eye, dizziness, weakness, numbness, **dysphasia*, or unconsciousness. It is a warning sign of a stroke, which is 13 times more likely within a year of such an episode. US *transient ischemic attack*. **TIA** abbrev.

transient polymorphism *n.* A form of **genetic polymorphism* occurring in the process of **natural selection*, when an **allele* has a selective advantage over another and is proceeding towards fixation at a relative frequency of $p = 1$ but has not yet reached that point. For the time being both alleles are present in the **gene* pool, and some individuals **heterozygous* for the **trait* are present in the population. See also HARDY–WEINBERG LAW. Compare BALANCED POLYMORPHISM. [From Latin *transiens* going over, from *trans* across + *ire* to go + Greek *polys* many + *morphe* a form or shape]

transient responder *n.* Any of a large number of **photoreceptors* in the retina that show little or no response to a static stimulus but respond strongly to a change in the stimulus, such as a movement. See also RAPIDLY ADAPTING. Compare SUSTAINED RESPONDER.

transient tic disorder *n.* Another name for **provisional tic disorder*.

transient tritanopia *n.* A temporary increase in the threshold for blue stimuli after a yellow adapting field is removed, relative to the threshold in the presence of the yellow adapting field. See also ADAPTATION (2), CHROMATIC ADAPTATION (1), TRITANOPIA.

transitional object *n.* In **psychoanalysis*, a term introduced in 1953 by

the English psychoanalyst Donald Woods Winnicott (1896–1971) to denote a familiar object, such as the hem of a blanket, from which an infant between 4 and 12 months old derives comfort, especially while falling asleep, its significance sometimes re-emerging in later life, especially in a period of depression. Winnicott considered it to lie ‘between the thumb and the teddy bear’ inasmuch as it is almost inseparable from the infant, like a thumb, yet in reality is an external object, like a teddy bear. Subsequent writers have generally interpreted the term to refer to an object that a child treats as something halfway between itself and another person, thus including a teddy bear as a typical example.

transitive preferences *n.* Preferences having the property that if one alternative is preferred to a second, and the second is preferred to a third, then the first is preferred to the third. It is often assumed to be an axiom of **rational* judgement. In a transitive preference order, if *x* is preferred to *y*, and *y* is preferred to *z*, then *x* is preferred to *z*. Preferences that are not transitive are said to be *intransitive*. See also *ARROW’S IMPOSSIBILITY THEOREM*, *CONDORCET’S PARADOX*, *LEXICOGRAPHIC SEMIORDER*, *MONEY PUMP*. Compare *CYCLIC PREFERENCES*, *INTRANSITIVE PREFERENCES*. [From Latin *transitivus* going over, from *transiens* going over, *transire* to pass over, from *trans* across + *ire* to go + *-ivus* indicating a tendency, inclination, or quality]

transliminality *n.* A psychological **trait* involving hypersensitivity to psychological material (including **ideation*, **imagery*, **affect*, and **perception*) originating in the **unconscious* (2) and/or the external world, associated with ready transmission of information across the threshold from the unconscious into **consciousness*, and linked with increased likelihood of belief in **paranormal* phenomena, **creativity*, mystical experience, **manic episodes*, **hyperaesthesia*, and positive attitudes to **dream analysis*. The word *transliminal* was coined by the English chemists Francis Lawry Usher (1885–1969) and Frank Playfair Burt (1880–1938) in an article in the *Annals of Psychical Science* in 1909, referring to the process whereby information crosses the threshold either into or out of consciousness. The Australian psychologist Michael (Anthony) Thalbourne (born 1955) introduced the noun *transliminality* and published the earliest version of this concept in the journal *Exceptional Human Experience* in 1991. **transliminal** *adj.* [From Latin *trans* across + *limen* a threshold + *-al(is)* of or relating to]

transmission deafness *n.* Another name for **conductive deafness*.

transmittance *See* REFLECTANCE.

transmitter *n.* Anything that sends or conveys objects, substances, genes, information, and so on; more specifically, a commonly used abbreviation of **neurotransmitter*. [From Latin *trans* across + *mittere* to send]

transplantation of brain tissue *See* FOETAL BRAIN TRANSPLANTATION.

transposon *n.* In genetics, a fragment of **DNA* that is capable of migrating from one **gene* locus to another on the same or a different chromosome, causing a change in the genetic constitution of the organism. *See also* JUMPING GENE. [From Latin *transponere* to remove, from *trans* across or beyond + *ponere* to place, on the model of *codon*]

transsexual *n.* 1. A person with a powerful desire to adopt the physical attributes and to play the role of a member of the opposite sex. *See also* TRANSSEXUALISM. 2. A person who has undergone medical and surgical treatment to alter the body's external sexual characteristics to those of the opposite sex.

transsexualism *n.* Severe **gender* dysphoria, accompanied by a persistent desire to live and be accepted as a member of the opposite sex. *See also* DIANA COMPLEX. *Compare* FETISHISTIC TRANSVESTISM, TRANSVESTISM.

transverse plane *n.* A plane at right angles to the long axis of any organ or organism, in the human body often the same as the **horizontal plane* (see illustration at **coronal plane*). *Compare* CORONAL PLANE, SAGITTAL PLANE. [From Latin *transversus* across]

transverse section *n.* A cutting through the **transverse plane*, in the human body generally equivalent to a **horizontal section*. *Compare* CORONAL SECTION, SAGITTAL SECTION.

transvestic disorder *n.* A **paraphilic disorder* in **DSM-5*

characterized by intense, recurrent sexual arousal from cross-dressing, or associated fantasies or urges over a period of at least six months. To meet the diagnostic criteria, the fantasies, urges, or behaviour must have caused clinically significant distress or impairment in social, occupational, or other areas of life. *See also* [TRANSVESTISM](#).

transvestic fetishism *See* [FETISHISTIC TRANSVESTISM](#).

transvestism *n.* Dressing in the clothes of a member of the opposite sex. Also called *cross-dressing*, *eonism*. *See also* [EONISM](#), [FETISHISTIC TRANSVESTISM](#), [GENDER DYSPHORIA](#), [TRANSVESTIC DISORDER](#). **transvest** *vb.* **transvestite** *n.* A person who is given to transvestism. [From Latin *trans* across + *vestire* to dress]

tranylcypromine *n.* The most stimulating, dopaminergic, and relatively fast-acting of the **monoamine oxidase inhibitor* ([MAOI](#)) drugs, chemically related to **amphetamine* and used in its sulphate form to treat severe depression and panic disorder. Formula C₉H₁₁N. [From its chemical name *tran(s)* + *(phen)yl* + *cy(clo)* + *pro(pyla)mine*]

trapezoidal window *n.* A visual illusion invented by the US painter and psychologist Adelbert Ames, Jr (1880–1955) that consists of a distorted window in the shape of a trapezium (US trapezoid) and that, when viewed frontally from a distance, looks like a rectangular window turned at an angle, and when rotated slowly about its vertical axis and viewed monocularly from about 3 metres (10 feet) or binocularly from more than 6 metres (20 feet) is perceived as a rectangular window oscillating back and forth in a peculiar and unnatural way. Also called the *Ames window*. *See also* [KINEPHANTOM](#), [TRANSACTIONALISM](#). *Compare* [AMES ROOM](#). [From *trapezoid*, in US a quadrilateral having two parallel sides of unequal length, from Greek *trapezoeides* trapezium-shaped, from *trapeza* a table + *-oeides* denoting resemblance of form, from *eidos* shape or form]

trapezoid body *n.* Either of the two diamond-shaped nuclei near the bottom of the **pons* that receive nerve impulses from the auditory receptors and project to the **superior* olivary nucleus. Each trapezoidal body contains

***interneurons** that inhibit impulses from the ear on the same side and excite those from the opposite side, amplifying the left-right differences in the signals transmitted to the binaural neurons of the superior olivary nucleus and thereby facilitating ***sound localization**. [From Greek *trapezion* a small table, diminutive of *trapeza* a table, from *tetra-* four + *peza* a foot]

trauma *n.* A physical injury or wound, or a powerful psychological shock that has damaging effects. **traumatic** *adj.* **traumata** or **traumas** *pl.* **traumatize** *vb.* [From Greek *trauma* a wound]

trauma- and stressor-related disorders *n.* An umbrella term introduced in ***DSM-5** for a group of ***mental disorders** in which experienced ***trauma** or ***stress (1)** are among the diagnostic criteria. See **ACUTE STRESS DISORDER**, **ADJUSTMENT DISORDERS**, **DISINHIBITED SOCIAL ENGAGEMENT DISORDER**, **POST-TRAUMATIC STRESS DISORDER**, **REACTIVE ATTACHMENT DISORDER**.

trauma, birth See **BIRTH TRAUMA**.

traumatic brain injury *n.* Injury to the ***brain** resulting from external force in a road traffic accident, physical assault, fall, or other misadventure. Signs and symptoms include headache, vomiting, nausea, loss of motor coordination, ***aphasia**, ***dysarthria**, ***alexithymia**, dizziness, blurred vision, ***convulsions**, slurred speech, pupil dilation, short-term loss of ***consciousness**, ***coma**, and death. ***Prognosis** depends on the severity and site of the lesion, and length of delay in receiving treatment. ***Subarachnoid haemorrhage** approximately doubles the chances of death. **TBI** *abbrev.* [From Greek *trauma* a wound + *-ikos* of, relating to, or resembling]

traumatic neurosis *n.* Any ***neurosis** precipitated by a ***trauma**. The term was introduced in 1889 by the German neurologist Hermann Oppenheim (1858–1919). See **POST-TRAUMATIC STRESS DISORDER**.

traumatic psychosis *n.* A ***psychosis (1)** resulting from a head injury causing brain damage.

traumatic shock *n.* The partial or total collapse of voluntary and

involuntary bodily functions resulting from circulatory failure or a sudden drop in blood pressure brought about by physical **trauma*, especially blood loss or injury to the spinal cord, **anaphylaxis*, or intense psychological trauma or stress. *Compare* [SHOCK \(1\)](#).

travel agent *n.* An intermediary who arranges trips for travellers; hence, figuratively, an informal name for a street drug dealer. *See also* [TRIP](#).

travelling salesman problem *n.* The problem of finding the shortest path that passes through a given set of points once and only once, as when a travelling salesman needs to visit a number of specified cities exactly once, using the shortest possible route. The problem is notoriously difficult to solve, because the number of possible tours rises rapidly with the number of cities. For 10 cities, there are 3,628,800 different tours from which to choose, because there are ten cities available for the first visit, and for each of these there are nine possibilities left for the second, hence there are $10 \times 9 = 90$ different ways in which the tour can begin with the first two cities, and for each of these there are eight possibilities left for the third visit, and so on, the total number of tours through the ten cities therefore being $10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 3,628,800$ tours. For 20 cities, the number of possible tours is 2,432,902,008,176,640,000, and for 30 cities it exceeds 265 thousand billion billion billion. Even the world's fastest supercomputer would take many billions of years to solve the travelling salesman problem for a tour of the 52 county towns of England and Wales or the 50 state capitals of the United States, but no efficient method of solving the problem has been found, and mathematicians have come very close to proving that it is impossible in principle to find an efficient solution to a problem of this type. *US traveling salesman problem. See also* [BOUNDED RATIONALITY](#), [BRUTE FORCE ALGORITHM](#). **TSP** *abbrev.*

travelling wave *n.* Any wave in which energy is transferred progressively in the direction of the wave propagation (in contrast to a standing wave); in particular a wave that is propagated from the **oval window* along the **basilar* membrane when the eardrum vibrates in response to a sound stimulus, the amplitudes of high-frequency components of the wave being greatest near the oval window and of low-frequency components furthest from the oval window. *US traveling wave. See also* [PLACE THEORY](#).

*****ebook converter DEMO Watermarks*****

treadmill *n.* A device for driving machinery or providing exercise consisting of a continuous moving belt on which a person can walk or jog while staying in the same place. *See also* [HEDONIC TREADMILL](#) [From Old High German *tretan* to tread + Latin *mola* a mill or millstone, from *molere* to grind]

treatment condition *n.* In experimental design, a level of an [*independent variable](#) or combination of levels of two or more independent variables. For example, in an experiment examining the effects of four different drugs on dreaming, research participants or subjects would receive a different drug in each treatment condition. Often shortened to *condition*.

tremor *n.* Any rhythmic vibration or shaking of the body or any of its parts. Two major classes are distinguished: [*resting tremor](#), also called passive tremor, manifested when the affected body part is at rest, as in [*parkinsonism](#), and [*intention tremor](#), also called movement tremor, manifested only when the body part is moved deliberately, as in tremor arising from [*alcohol](#) dependence, [*cerebellar syndrome](#), or [*senile dementia](#). [*Postural tremor](#) does not fall neatly into either category. *See also* [CEREBELLAR SYNDROME](#), [DELIRIUM TREMENS](#), [EXTRAPYRAMIDAL SYNDROME](#), [HIV DEMENTIA](#), [KURU](#), [MULTIPLE SCLEROSIS](#), [NERVIOS](#), [OCULAR TREMOR](#), [PUNCH-DRUNK](#), [YIPS](#). [From Latin *tremere* to tremble]

triad, anal *See* [ANAL TRIAD](#), [THREE PS](#).

triangular theory *See* [LOVE](#).

triarchic theory of intelligence *n.* A theory of [*intelligence](#), put forward in 1985 by the US psychologist Robert J(effrey) Sternberg (born 1949), according to which its three fundamental aspects are analytic, creative, and practical intelligence, only the first of which is measured adequately by conventional IQ tests. Analytic problems require the problem solver to analyse, evaluate, compare, contrast, judge, and so on; creative problems to create, invent, discover, imagine, and so on; and practical problems to apply, put into practice, use, implement, and so on. Unlike analytic problems, creative and practical problems tend to depend on problem recognition and

formulation by the problem solver, to be poorly defined, to require information seeking, to have more than one acceptable solution, and to require everyday experience, motivation, and personal involvement. [From Greek *triarchia* a triple rule, from *treis* three + *archein* to rule + *-ikos* of, relating to, or resembling]

triazolam *n.* A **benzodiazepine* drug used mainly as a **hypnotic (2)* in the short-term treatment of insomnia and as an **anxiolytic* and **sedative*. Also called *Halcion* (trademark).

tribade *n.* A lesbian. **tribadic** *adj.* **tribadism** *n.* lesbianism. [From Latin *tribas* a lesbian, from Greek *tribein* to rub]

tribar *n.* Another name for the **Penrose triangle*.

tricarboxylic acid cycle *n.* Another name for the **Krebs cycle*. [Named after tricarboxylic acid, an acid having three carboxyl groups in each molecule, that plays a crucial role in the Krebs cycle]

triceps reflex *n.* A **deep tendon reflex* occurring in response to a tap on the back of the elbow. [Named after the triceps brachii muscle that controls it, from Latin *triceps* three-headed + *brachium* an arm]

trichotillomania *n.* A **mental disorder* in **DSM-5* characterized by repeated pulling out of one's hair (most often from the scalp, eyebrows, or eyelashes), resulting in visible hair loss, with an increasing sense of tension before pulling the hair, followed by pleasure, gratification, or relief after completing the act. Compare EXCORIATION DISORDER, OBSESSIVE–COMPULSIVE DISORDER. [From Greek *trichos* of hair, from *thrix* hair + *tillein* to pull + *mania* madness]

trichromacy *n.* The phenomenon discovered in 1704 by the English physicist and mathematician Sir Isaac Newton (1642–1727) whereby any spectral colour can be formed by the combination of red, green, and blue light, or in fact by any three wavelengths provided that they are well separated on the visible spectrum. See also PRIMARY COLOUR (1), TRICHROMATIC

THEORY, TRISTIMULUS VALUES. [From Greek *treis* three + *chroma* colour]

trichromatic theory *n.* A theory of colour vision specifically intended to take account of **trichromacy*, according to which at each point on the retina of the eye there are three light-sensitive structures responsive to red, green, and blue light. The theory was formulated in 1802 by the English physician, physicist, and Egyptologist Thomas Young (1773–1829) and championed in 1852 by the influential German physiologist, physicist, and mathematician Hermann Ludwig Ferdinand von Helmholtz (1821–94), and in 1959 physiological research confirmed that the retina contains three types of **cones*, each maximally responsive to a different wavelength, though with overlapping response curves. Also called the *three-colour theory* or the *Young–Helmholtz theory*. Compare *OPPONENT-PROCESS THEORY*.

tricyclic antidepressant *n.* Any member of a class of **antidepressant* drugs that block the reuptake mechanism of **noradrenalin* (norepinephrine) and in some cases also of **serotonin*, allowing these neurotransmitter substances to accumulate at **synapses (1)* in the central nervous system. See *AMITRIPTYLINE*, *CLOMIPRAMINE*, *IMIPRAMINE*. Compare *MONOAMINE OXIDASE INHIBITOR (MAOI)*, *SELECTIVE SEROTONIN REUPTAKE INHIBITOR (SSRI)*, *St JOHN'S WORT*, *TETRACYCLIC ANTIDEPRESSANT*. **TCA** *abbrev.* [So called because they have three rings in their molecular structures]

trifluoperazine *n.* Trifluoperazine hydrochloride, a **neuroleptic (1)* drug belonging to the group of **phenothiazines*, used in the treatment of **schizophrenia* and other **psychotic (1)* disorders and anxiety disorders, also used as an anti-emetic. Also called *Stelazine* (trademark).

trigeminal chemoreception *n.* Another name for the **common chemical sense*.

trigeminal lemniscus *n.* Either of the two bundles of nerve fibres within the **lemniscus* running parallel to the **medial lemniscus* and conveying information from one of the **trigeminal nerves* to the **thalamus*. Compare *LATERAL LEMNISCUS*, *MEDIAL LEMNISCUS*.

trigeminal nerve *n.* Either of the fifth pair of **cranial nerves* whose
*****ebook converter DEMO Watermarks*****

three sensory branches supply (a) the skin of the forehead, nose, and scalp, (b) the region between the nose, mouth and temple, including the **mucous membranes* of the mouth and nose, and (c) the lower face and teeth. It also has a motor root supplying the muscles involved in chewing. *See also* COMMON CHEMICAL SENSE, CORNEAL REFLEX, MAGNETIC SENSE, TIC DOULOUREUX. [From Latin *trigeminus* a triplet, from *tres* three + *geminus* a twin]

trigeminal neuralgia *n.* Another name for **tic douloureux*.

trigram *n.* A string of three letters, which may be a word (*cat*) or a **nonsense syllable* (*kep*). *See also* CVC. [From Greek *treis* + *gramma* a letter or character]

trigraph *n.* A three-letter combination representing a single speech sound, such as *sch* in the German word *Schule*. *Compare* TRIGRAM, TRIPHTHONG.

trihexyphenidyl *n.* Trihexyphenidyl hydrochloride, an **anticholinergic* drug that is used in the treatment of Parkinson's disease. *See also* ANTIPARKINSONIAN.

Trilafon *n.* A proprietary name for the neuroleptic drug **perphenazine*. [Trademark]

trimmed mean *n.* In statistics, the **arithmetic mean* calculated after eliminating a specified proportion or percentage of the largest and smallest scores, a common type being the **5 per cent trim*. It is used occasionally when the set of scores contains values that are much smaller or much larger than the rest, because in such cases it yields a more useful indication of **central tendency* than the untrimmed mean. It was introduced in 1962 by the US statistician John Wilder Tukey (1915–2000).

trip *n.* An excursion involving an outward and return journey; hence, figuratively, an experience induced by a **hallucinogenic* drug. *See also* TRAVEL AGENT.

tripa ida *n.* Another name for **susto*. [From Spanish *tripa* intestine]

(believed in the past to be the seat of the soul) + *ida* departure]

triphthong *n.* A complex **vowel* sound comprising a **glide* from one vowel sound to a second and then a third within a single syllable, with movement of the tongue between the three sounds. In **Received Pronunciation* there are five triphthongs, all of which consist of a **diphthong* followed by a **schwa*; they are the vowels in the words *layer*, *buyer*, *soya*, *flour*, and *mower*. Compare *MONOPHTHONG*, *DIPHTHONG*, *TRIGRAPH*. [From Greek *treis* three + *phthongos* sound]

triplegia *n.* Paralysis of three of the four limbs of the body, usually as a result of multiple lesions in the **motor cortex* or **peripheral nervous system*. Compare *DIPLEGIA*, *HEMIPLEGIA*, *MONOPLÉGIA*, *OPHTHALMOPLÉGIA*, *PARAPLEGIA*, *QUADRIPLEGIA*. **triplegic** *adj.* [From Greek *treis* three + *plege* a blow + *-ia* indicating a condition or quality]

triplet code *n.* A sequence of three **bases* (1) in a **DNA* or an **RNA* molecule, interpreted either as a single **amino acid* during **protein* synthesis or, if it is a **stop codon*, as a signal to terminate translation. See also *CODON*, *CODON FAMILY*, *GENETIC CODE*.

Triptafen *n.* A proprietary name for the tricyclic antidepressant drug **amitriptyline*. Often confused with **tryptophan*. [Trademark]

trisomy *n.* The condition of a human or other **diploid* organism of having three rather than two **chromosomes* of a particular type. **Autosomal* trisomies are often associated with **intellectual disability*, whereas trisomies of the sex chromosomes have variable psychological effects. See *KLINEFELTER'S SYNDROME*, *XXX SYNDROME*, *XXY SYNDROME*. **trisomy 21** *n.* Trisomy of chromosome 21, which underlies **Down's syndrome*. **trisomic** *adj.* [From Greek *treis* three + *soma* a body]

tristimulus values *n.* Three numbers, usually symbolized by *x*, *y*, and *z*, that together define a colour in terms of the proportions of three **additive primaries* that match the given colour when mixed. See also *CIE COLOUR SYSTEM*, *CHROMATICITY*, *COLOUR EQUATION*, *GRASSMANN'S LAWS (PERCEPTION)*, *PRIMARY COLOUR (1)*, *TRICHROMACY*.

*****ebook converter DEMO Watermarks*****

tritanomaly *n.* A form of partial **colour-blindness* caused by a deficiency in the **visual pigment* that absorbs short-wave light, characterized by a decreased sensitivity to blue light and matches that deviate from the normal **Rayleigh equation*. Compare DEUTERANOMALY, PROTANOMALY, TRITANOPIA. [From Greek *tritos* third, alluding to the third of the three **primary colours* (1) red, green, and blue + *anomalos* uneven or inconsistent, from *an-* without + *homalos* even, from *homos* the same]

tritanopia *n.* A rare form of **anomalous dichromacy* in which the **visual pigment* associated with short-wave (blue) light is non-functional, causing a decreased sensitivity to blue light and a tendency to confuse blue with green. See also TRANSIENT TRITANOPIA. Compare DEUTERANOPIA, PROTANOPIA, TRITANOMALY. [From Greek *tritos* third, alluding to the third of the three **primary colours* (1) red, green, and blue + *anopia* blindness, from *an-* without + *ops* an eye + *-ia* indicating a condition or quality]

tritone *n.* A musical interval or difference in pitch of three whole tones (an augmented fourth), as between C and F# or between D and G#, the two sounds thus being separated in pitch by exactly half an **octave*.

tritone paradox *n.* A phenomenon in the perception of musical tones that are clearly defined in terms of pitch class (the twelve notes of the octave that are normally labelled C, C#, D, ... , B) but are ambiguous as regards the octaves to which they belong, each tone being composed of equal **sinusoidal* waves from octaves spanning the auditory range. If one such ambiguous tone is followed by a second, separated from the first by a tritone, then the sequence is clearly perceived as either rising or falling by half an octave, although the stimulus tones lack the cues required to determine pitch. It is a surprising phenomenon rather than a true **paradox*. It was first reported by the British-born psychologist Diana Deutsch (born 1938) in an article in the journal *Music Perception* in 1986. See also AUDITORY ILLUSION, AUDITORY STAIRCASE ILLUSION. Compare MELODIC PARADOX, SEMITONE PARADOX.

trochlear nerve *n.* Either of the fourth pair of **cranial nerves* supplying the superior **oblique muscles* of the eyes. Paralysis of this nerve causes **diplopia* when looking down, as when descending stairs. [From Greek *trochalia* a pulley, referring to the fact that the superior oblique muscle
*****ebook converter DEMO Watermarks*****]

passes through an eyelet and works like a pulley]

troilism *n.* Sexual activity involving three people. [A blend of French *trois* three + English *dualism*]

Troland *n.* A unit of the intensity of light falling on the retina, calculated as the product of ***luminance** and pupil area. It is defined as the retinal illuminance produced by viewing a surface illuminated by 1 lumen per square metre through an artificial pupil with an area of 1 square millimetre centred on the natural pupil. [Named after the US psychologist Leonard Thompson Troland (1889–1932) who introduced it before it was adopted by the Optical Society of America in 1944]

trolley problem *n.* A hypothetical moral dilemma used by philosophers to investigate ethical judgements and intuitions. The original trolley problem was proposed by the English philosopher Philippa Ruth Foot (1920–2010) in an article in the journal *Oxford Review* in 1967. In the slightly modified version that became standard, a trolley is running out of control down a railway track. In its path are five people who will be killed if it continues on its course. By operating a lever, you can divert the trolley on to a different track, where a solitary man on that track will be killed. Is it morally permissible to operate the lever? Most people say yes—about 90 per cent in a very large online survey conducted in 2007 by the US evolutionary biologist Marc D. Hauser (born 1959). In contrast, the US philosopher Judith Jarvis Thompson (born 1929) suggested the following *footbridge problem* in an article in the *Yale Law Journal* in 1985. A trolley is running out of control down a railway track. In its path are five people who will be killed if it continues on its course. You are on a footbridge over the tracks next to a large man. The only way to save the five people is to push the man off the bridge, into the path of the trolley, where only he will be killed. Is it morally permissible to push the man off the footbridge? Most people say no—about 90 per cent in Hauser’s survey. Why most people consider it morally acceptable to sacrifice one life to save five in the trolley problem but not the footbridge problem has been the focus of a great deal of research and discussion in both philosophy and psychology. Compare **KNOBE EFFECT**.

trompe l’oeil *n.* A visual illusion in a painting or other work of art

*****ebook converter DEMO Watermarks*****

creating an impression of reality, such as a painting that appears to be an open window or a T-shirt that gives the impression of a naked torso. [French: a deception of the eye]

trophic hormone *n.* Any of a number of **hormones*, such as **adrenocorticotrophic hormone*, that is secreted by the **anterior* pituitary and that controls the secretion of hormones by other **endocrine glands*. [From Greek *tropos* a turn, from *trepein* to turn]

Troxler effect *n.* The fading of an image in peripheral vision when a central stimulus is fixated with a steady gaze while attention is shifted to the peripheral stimulus. Movement of the peripheral stimulus normally prevents it from fading. Also called *Troxler fading*. [Named after the Swiss-German philosopher and physician Ignaz Paul Vitalis Troxler (1780–1866) who first reported it in 1804]

true self *n.* In the **neo-Freudian* theory of the German-born US psychoanalyst Karen Horney (1885–1952), an underlying personality of unrealized potentials that is fundamentally good.

trust versus mistrust See *BASIC TRUST VERSUS BASIC MISTRUST*.

truth drug *n.* Any sedative or analgesic drug such as **scopolamine* or one of the short-acting **barbiturates*, especially **thiopental* (thiopentone or Sodium Pentothal), that is administered to a person who is to be interrogated in the belief that it might encourage free and truthful answers to questions. Also called a *truth serum*. See also *HYPERMNESIA*.

truth functor *n.* A **sentence functor* with a **truth table*. [From Latin *functio* a function, from *fungi* to perform]

truth table *n.* In **logic*, an arrangement of rows and columns indicating the truth or falsity of a **proposition (1)* for every combination of truth values (true or false) of its component propositions (see *illustration*). It is a device for performing **logical analysis*. See also *SENTENCE FUNCTOR*, *TRUTH FUNCTOR*.

ϕ	ψ	$\phi \vee \psi$
T	T	T
T	F	T
F	T	T
F	F	F

Truth table. The sentence functor of the disjunction ' ϕ or ψ '. The bottom row shows that if ϕ is false and ψ is false, then ' ϕ or ψ ' is false. For every other combination of truth values of the component propositions ϕ and ψ , the sentence functor is true.

tryptamine *n.* A crystalline **amine* formed by decomposition of **tryptophan*, functioning as a **biogenic amine* belonging to the group of **indoleamines*. *See also* DMT, MELATONIN, SEROTONIN. [From *trypt(o)phan* + *amine*]

tryptophan *n.* An essential **amino acid* obtained from dietary milk, cheese, poultry, pineapple, and banana. It is metabolized into **5-hydroxytryptophan*, which is able to cross the **blood–brain barrier*, and then by brain neurons into **serotonin*. Sometimes confused with **Triptafen*. **Trp** *abbrev.* [From Greek *trypsis* a rubbing + *phainein* to appear, alluding to trypsin, an enzyme first produced by rubbing the pancreas with glycerine]

tryptophan hydroxylase *n.* An enzyme involved in the synthesis of **serotonin*, having a parallel action to tyrosine hydroxylase in the synthesis of catecholamines. **TPH** *abbrev.*

T score *n.* In psychometrics, a test score converted to an equivalent **standard score* in a **normal distribution* with a **mean* of 50 and a **standard deviation* of 10. *See also* DERIVED SCORE. *Compare* IQ, STANINE SCORE, STEN SCORE, Z SCORE. [Probably an abbreviation of *true score*]

t test *n.* In inferential statistics, a test most often used to establish the
 *****ebook converter DEMO Watermarks*****

significance of the difference between the means of two samples of scores. It is calculated by dividing the difference between the means by the ***standard error** of this difference. Its full name is ***Student's *t* test**, because 'Student' was the pen name of the English statistician William Sealy Gosset (1876–1937) who developed the theory behind it in 1908 while working for the Guinness brewery in Dublin. The test itself was developed later by the English statistician Karl Pearson (1857–1936). Often written *t-test*, but the hyphen may be considered otiose, because analogous tests such as the χ^2 test and the *U* test are usually written without hyphens. *See also* **INDEPENDENT SAMPLES T TEST**, **ONE-SAMPLE T TEST**, **RELATED SCORES T TEST**. [Probably an abbreviation of *true test*]

tufted cell *n.* A type of vertically oriented neuron in the ***olfactory bulb** that receives inputs from olfactory neurons.

Tukey-HSD test *n.* In statistics, a method of ***multiple comparisons** in which a set of group means are ranked from smallest to largest, and then a statistic that is used to test for a significant difference between a pair of means is computed on the basis of the number of steps between the two means in the rank order. Its full name is the *Tukey honestly significant difference (HSD) test*. Compare **BONFERRONI CORRECTION**, **DUNCAN'S MULTIPLE RANGE TEST**, **LEAST-SIGNIFICANT DIFFERENCE TEST**, **NEWMAN-KEULS TEST**, **SCHEFFÉ TEST**. [Named after the US statistician John Wilder Tukey (1915–2000) who developed versions of it in 1951 and 1952]

tumescence *n.* The process of becoming swollen or enlarged, especially with reference to the ***penis** during the excitement phase of the ***sexual response cycle**. Compare **DETUMESCENCE**. [From Latin *tumescere* to begin to swell, from *tumere* to swell]

tuning curve *n.* The response threshold of a single fibre of an auditory nerve, plotted as a function of the frequencies of the sounds to which it responds, the point at which the threshold is lowest, and therefore the responsiveness greatest, being the ***characteristic frequency** of the fibre. Also called the *frequency tuning curve* or *frequency threshold curve* (**FTC**).

tunnel vision *n.* A form of visual impairment in which the ***visual field** is
*****ebook converter DEMO Watermarks*****

decreased, creating the effect of looking down a narrow tube or tunnel, often resulting from advanced chronic [*glaucoma](#). The American Foundation for the Blind defines a visual field subtending a [*visual angle](#) of 20 degrees or less as a criterion of [*blindness](#).

Turing machine *n.* A hypothetical computing machine consisting of a movable head that reads, writes, or erases discrete symbols drawn from a finite set (often just 1 and 0), dealing with the symbols one at a time in separate frames marked on a tape of limitless length, and that always assumes one of a finite number of states, the activity of the machine being determined jointly by its current state and the symbol being read in the current frame, these two input variables in turn determining what symbol the machine writes in the current frame, what state it assumes next, and whether it moves one frame to the left, one frame to the right, or halts. A Turing machine usually consists of a table of instructions specifying what the machine does in every possible contingency, the input data being abbreviated by a pair of symbols such as (S_1 , 0) or represented by appropriately labelled rows and columns of a matrix, and an instruction being represented by a triplet of symbols such as ($1, S_3, R$), this particular input pair and instruction triplet indicating that if the machine is in state S_1 and the symbol in the current frame is 0, then the machine writes the symbol 1 in the current frame (overwriting the 0), assumes state S_3 , and moves one frame to the right. A *universal Turing machine* incorporates a coded description of a Turing machine in the form of a table of instructions and also a sequence of symbols that it encounters on the tape when it operates. For any possible computation, a Turing machine can, in principle, be constructed, and a universal Turing machine can compute anything computable, given sufficient time. *See also* [ALGORITHM](#), [ARTIFICIAL INTELLIGENCE](#), [CELLULAR AUTOMATON](#). [Named after the English mathematician Alan Mathison Turing (1912–54) who first described it in an influential article in the *Proceedings of the London Mathematical Society* in 1936–7]

Turing test *n.* A hypothetical test or [*Gedankenexperiment](#) to clarify the question as to whether computers can think. A person A and an interrogator in a different room engage in a dialogue by typing messages over an electronic link. At some point A is replaced by intelligent software that

simulates human responses. Turing argued that if the remaining human being is free to ask probing questions (such as *Please write me a sonnet on the subject of the Forth Bridge*) but is unable to determine reliably whether the replies are generated by a human being or a computer, then the computer has passed the test. Turing considered the question *Can machines think?* to be ‘too meaningless to deserve discussion’ and argued that his test, which replaces it, poses a more meaningful problem; but passing the Turing test came to be interpreted by many of his followers as amounting to being able to think. The most sustained attacks on this approach have focused on the [*Chinese room](#) and [*Gödel’s theorem](#). See also [ARTIFICIAL INTELLIGENCE](#), [STRONG AI](#). [Named after the English mathematician Alan Mathison Turing (1912–54) who introduced it in an article in the journal *Mind* in 1950, where he called it the *imitation game*]

Turkish saddle *n.* Another name for the [*sella turcica](#).

Turner’s syndrome *n.* A congenital chromosomal aberration in a female who has only one X chromosome, leading to short stature, absence of functioning ovaries, underdeveloped breasts, uterus, and vagina, often moderate [*intellectual disability](#), and various other signs and symptoms. Zygotes with just one Y chromosome are non-viable. Also called *monosomy X*. Compare [TRISOMY](#). [Named after the US physician Henry Hubert Turner (1892–1970) who first described it in 1938]

turning the tables illusion *n.* An astonishingly powerful though little-known [*perspective illusion](#) in which a pair of identical parallelograms representing the tops of two tables appear radically different (see [illustration](#)). The illusion was first presented by the US psychologist Roger N(ewland) Shepard (born 1929) in his book *Mind Sights: Original Visual Illusions, Ambiguities, and Other Anomalies* (1990, p. 48). Shepard commented that ‘any knowledge or understanding of the illusion we may gain at the intellectual level remains virtually powerless to diminish the magnitude of the illusion’ (p. 128). The illusion arises from our inability to avoid making three-dimensional interpretations of the drawings, according to which the identical parallelograms would represent very different shapes because of perspective foreshortening, and it is based on his less powerful parallelogram illusion, published in an edited book entitled *Perceptual Organization* (1981,

*****ebook converter DEMO Watermarks*****

pp. 297–9). Also called the *tabletop illusion*. Compare [AMES ROOM](#), [CORRIDOR ILLUSION](#), [MÜLLER-LYER ILLUSION](#), [PONZO ILLUSION](#).

Turning the tables illusion. Almost unbelievably, the tabletop on the left is identical in shape and size to the one on the right, as can be confirmed by tracing either of the white parallelograms and placing the tracing over the other.

twilight vision *n.* A non-technical name for [*scotopia](#).

twin study *n.* In behaviour genetics, an examination of the correlation between [*monozygotic](#) twins, and sometimes a comparison with the correlation between [*dizygotic](#) twins, on a measurable [*trait](#) in order to estimate the [*heritability](#) of that trait, the assumption being that the higher the heritability of the trait the greater will be the correlation between monozygotic twins and the more it will differ from the correlation between dizygotic twins, because monozygotic twins share identical genes and should therefore be more alike on a heritable trait than dizygotic twins who share only about half their genes in common. It can be shown mathematically that a rough estimate of heritability is provided by twice the difference between the monozygotic-twin and dizygotic-twin correlations. See also [DF EXTREMES ANALYSIS](#). Compare [ADOPTION STUDY](#), [KINSHIP STUDY](#).

twisted-cord illusion *n.* Any of several visual illusions that are created if a cord made by twisting dark and light strands together, or graphical representations of thin strips of diagonal stripes resembling such a twisted cord, are displayed against a chequered background, the alignment of the cords or strips appearing distorted and disordered (see [illustration](#)). The illusion is caused by the responses of [*orientation-specific](#) neurons in the

*****ebook converter DEMO Watermarks*****

visual cortex. The Scottish physician and psychologist James Fraser (1863–1936) discovered it in 1908, allegedly after observing wool made from strands of different colours lying on tartan fabric, and called it the ‘twisted cord on chequer-work background illusion’. Also called a *Fraser illusion*. See also [FRASER SPIRAL](#).

Twisted-cord illusion. The lines outlining the letters are perfectly vertical or horizontal.

two-alternative forced-choice task *n.* In [*signal](#) detection theory, an experimental procedure designed to eliminate bias resulting from the observer’s criterion level of sensory activation by presenting the observer with pairs of observation time intervals, only one interval in each pair containing the signal, the task being to choose the interval with the signal on each trial. The theory assumes that a particular level of sensory activation occurs in each observation interval and that the observer simply chooses the larger, and it has been shown that 76 per cent correct responses in this task equates to a [*d prime](#) of 1. **2AFC** *abbrev.*

2½-D sketch *n.* In the [*computational theory](#) of vision pioneered in the late 1970s by the English psychologist David Courtenay Marr (1945–80), the second stage in the perceptual process after the [*primal sketch](#), incorporating orientation and depth cues relative to the viewpoint of the observer, but providing a [*representation](#) (2) that is insufficiently abstract for object recognition, because it is viewer-centred rather than being invariant with respect to the observer’s viewpoint. *Compare* [3-D MODEL DESCRIPTION](#), [PRIMAL SKETCH](#). [So called because although it is a three-dimensional representation, it provides insufficient information for visual recognition of three-dimensional objects]

2-deoxyglucose *n.* A substance that stimulates hunger by blocking glucose metabolism in cells. **2-DG** *abbrev.* [From Latin *de-* indicating a deprivation + English *oxygen* + Greek *glykys* sweet]

2-4-6 problem *n.* A problem of concept formation in which people are given the ordered triple of numbers (2, 4, 6) and are invited to try to generate further examples of triples conforming to an unspecified rule that the example obeys, trying to home in on the correct rule on the basis of simple right/wrong feedback after every guess. The actual rule is *any ascending sequence*, but the example invites people to form more specific hypotheses, such as *ascending even numbers* or *numbers ascending by equal intervals*. It was introduced in 1960 by the English psychologist Peter C(athcart) Wason (1924–2003), who found that people tend to try examples consistent with such more specific hypotheses, such as (10, 20, 30) and seldom try examples that would refute them such as (10, 11, 30), thus manifesting **confirmation bias* and failing to find the right answer but often becoming increasingly convinced of the rightness of their incorrect hypotheses. Also called *Wason's 2-4-6 problem*. See also [PROBLEM SOLVING](#).

two-point threshold *n.* A measure of **tactile* acuity defined as the smallest separation at which two points applied simultaneously to the **skin* can be clearly distinguished from a single point. It varies from 1 or 2 millimetres in the finger pads and tongue to more than 60 millimetres on the upper arm, upper thigh, and back. See also [AESTHESIOMETER](#).

two-sample t test *n.* Another name for the **independent samples t test*.

two-step flow *n.* A phenomenon of mass communication, first discovered in a **panel study* of the 1944 US Presidential election and reported in *The People's Choice* (1944) by the Austrian-born US sociologist Paul Felix Lazarsfeld (1901–76) and several colleagues, according to which most rank-and-file members of a population are not directly influenced by messages conveyed through the mass media but are influenced by face-to-face contact with a relatively small number of recipients who do respond to mass media messages and are called *opinion leaders*. This explains why mass media messages often cause significant shifts in public opinion in spite of the fact that most individuals who are investigated show little or no direct
*****ebook converter DEMO Watermarks*****

response to them. The same phenomenon has been shown to occur in the diffusion of fashions and innovations, including the adoption of new drugs by general practitioners.

2-tailed probability *n.* In **inferential statistics*, the probability of obtaining a result as extreme as the one observed, in either direction from the expected value, if the **null hypothesis* is true. If the probability is small (by convention, often less than $p < .05$), then the null hypothesis may be rejected. *Compare 1-TAILED PROBABILITY.* [The name refers to both tails of the relevant **probability* distribution]

2-tailed test *See 1-TAILED TEST.*

two-way avoidance conditioning *n.* A form of **avoidance conditioning* in which, typically, a **conditioned stimulus* such as a light is presented in one end of an alley and is followed by the delivery of foot shock that the animal can avoid or escape by shuttling to the other end of the alley; but after a period of time, the conditioned stimulus is presented at the other end of the alley, so that the animal must return to the original location in order to avoid or escape the shock. The conflict in this situation interferes with learning to such an extent that a rat typically requires dozens or hundreds of responses to learn the task, and many do not learn it at all. Also called *two-way avoidance learning*.

Tycho's illusion *n.* A **cognitive* illusion that caused the cosmology of the Danish astronomer Tycho Brahe (1546–1601) to appear physically impossible to his contemporary, the German astronomer Johannes Kepler (1571–1630), and to astronomers and cosmologists for the next four centuries, until its illusory quality was pointed out in 1998 in a letter to the journal *Nature* by the US political scientist Howard Margolis (1932–2009). In Tycho's cosmology, which partially preserved Copernican heliocentrism but avoided the heresy of displacing the Earth from the centre of the universe, the planets revolve round the sun, but the sun together with its orbiting planets revolves round the Earth. When this is depicted diagrammatically, the orbits of Mars and the sun intersect, creating the impression that these bodies would collide with each other in the Tychonic system, whereas Margolis showed, by constructing a cardboard model, that the system implies no such

*****ebook converter DEMO Watermarks*****

collision.

tympanic membrane *n.* A membrane with a diameter of about 10 millimetres that separates the ***middle ear** from the ***outer ear** and that transmits sound vibrations to the ***inner ear** via the auditory ***ossicles**. Also called the *eardrum*, *membrana tympani*, or *tympanum*.

tympanic reflex *n.* Another name for the ***acoustic** reflex.

Type A *n.* A style of behaviour (*Type A behaviour*) and a personality type (*Type A personality*) characterized by hurried activity, impatience, ambition, and competitiveness, generally associated with the AHA triad of traits (anger, hostility, and aggression), irritable tapping of fingers or feet and clenching of fists or teeth, and a tendency to try to do more than one thing at a time. The term was introduced by the US cardiologists Meyer Friedman (1910–2001) and Ray H(arold) Rosenman (1920–2013) in an article in the *Journal of the American Medical Association* in 1959 and popularized in their book, *Type A Behavior and Your Heart* (1974). Friedman and Rosenman presented the first evidence indicating a significantly increased risk of coronary heart disease associated with Type A behaviour, hence the corresponding personality type is sometimes called the *coronary-prone* personality. See also **PSYCHOCARDIOLOGY**. Compare **TYPE B**, **TYPE C**, **TYPE D**.

Type B *n.* An easy-going style of behaviour (*Type B behaviour*) and personality type (*Type B personality*) lacking the characteristics of ***Type A** and thus associated with a lesser predisposition to coronary heart disease. Compare **TYPE A**, **TYPE C**, **TYPE D**.

Type C *n.* A style of coping with stress or a behaviour pattern (*Type C pattern*) theorized to be associated with relatively poor ***prognosis** in patients with various types of cancer. First described in 1981 in a paper presented at the American Psychological Association's Annual Conference by the US psychologist Lydia Temoshok (born 1960), the Type C pattern reflects a fragile means of coping, characterized by repression and/or decreased recognition of one's own needs and feelings, particularly anger and sadness, with reduced emotional expression and concomitant physiological dysregulation. A relation between this pattern and relatively poor prognosis

*****ebook converter DEMO Watermarks*****

in patients with malignant melanoma (skin cancer) was first reported in an article by Temoshok and colleagues in the *Journal of Psychosomatic Research* in 1985, and another paper authored by Temoshok was published the same year in the journal *Social Science and Medicine* on mechanisms of **psychoneuroimmunology* that might explain the medical effects. Compare TYPE A, TYPE B, TYPE D.

Type D *n.* A personality type associated with a significantly increased risk of death from myocardial infarction (heart attack), independently of biomedical risk factors, and possibly also cancer and immune system malfunction. It was first identified by the Belgian medical psychologist Johan K. L. Denollet (born 1957) and several colleagues in articles published in the journals *Psychosomatic Medicine* in 1995 and *The Lancet* in 1996, although the earlier article used the term *distressed personality type* and the later article the term *Type D personality*. People with this personality type tend simultaneously to experience negative emotion (anxiety, irritability, gloom) and to inhibit or suppress its social expression. Compare TYPE A, TYPE B, TYPE C.

type distractor See DISTRACTOR.

type fallacy *n.* The widespread tendency to classify people or things into categories, even when the ways in which they differ are matters of degree rather than of kind. For example, people tend to think of one another as either being extraverts or introverts, whereas it is well established that **extraversion* is a **continuum* rather than a **taxon*, with most people falling between the extremes. See also CATEGORICAL PERCEPTION.

Type I error *n.* In statistics, the error of rejecting the **null hypothesis* when it is true. The significance level determined from a **statistical test* is the probability of a Type I error. Compare TYPE II ERROR, TYPE III ERROR.

Type II error *n.* In statistics, the error of failing to reject the **null hypothesis* when it is false. The probability of avoiding a Type II error is the **statistical power* of the test, and it depends on the **alternative hypothesis*. Compare TYPE I ERROR, TYPE III ERROR.

Type III error *n.* A term occasionally used to refer to an error arising from a misinterpretation of the nature of the scores being compared in a *significance test, as when a significant difference in an *interrupted time-series design is misinterpreted as relating to a comparison between the mean of the baseline scores and the mean of the post-intervention scores, whereas the true comparison is between *weighted* means of the raw scores, the weights depending on the components of the statistical model (such as autoregressions and/or moving averages; see [ARIMA](#)). Compare [TYPE I ERROR](#), [TYPE II ERROR](#). [Named by the US psychologist Bradley E. Huitema (born 1938) by analogy with Type I and Type II errors]

type-token ratio *n.* In the study of texts, the ratio of the number of different words, called *types*, to the total number of words, called *tokens*. For example, in a particular text, the number of different words may be 1,000 and the total number of words 5,000, because common words such as *the* may occur several times, and in this case the type-token ratio would be 1/5 or 0.2. See [TOKEN \(3\)](#). See also [STYLOSTATISTICS](#). **TTR** abbrev.

tyramine *n.* An *amine with a *sympathomimetic action, synthesized in the body from *tyrosine and replacing *neurotransmitter substances at *adrenergic *neuroreceptors. It is found in ripe cheese, pickled herring, yeast extract, and certain red wines, all of which are forbidden to anyone taking a *monoamine oxidase inhibitor (MAOI) to avoid acute hypertension. See also [CHEESE EFFECT](#). [From *tyr(osine)* + *amine*]

tyrosine *n.* A non-essential *amino acid that is synthesized in the body from *phenylalanine and that acts as a precursor of adrenalin (epinephrine), noradrenalin (norepinephrine), dopamine, thyroxine, L-dopa, and melanin. **Tyr** abbrev. [From Greek *tyros* cheese, from which it was first obtained + *-ine* indicating an organic compound]

tyrosine hydroxylase *n.* An enzyme involved in the synthesis of *catecholamines, having a parallel action to tryptophan hydroxylase in the synthesis of serotonin. See also [ALPHA-METHYLPARATYROSINE](#). Compare [TRYPTOPHAN HYDROXYLASE](#). **TH** abbrev.

ufufunyane *n.* A ***culture-bound syndrome** found mainly among young women in Zulu-speaking and Xhosa-speaking communities of southern Africa, and in Kenya where it is called *saka*, attributed locally to spirit possession, witchcraft, or magical potions administered by rejected lovers or enemies, characterized by shouting, sobbing, ***pseudolalia**, ***paralysis**, ***convulsions**, ***nightmares (1)** with sexual themes, and ***trance** or loss of ***consciousness**. It is feared and despised among local communities and is sharply distinguished from *thwasa* (see **SPELL**). Among Xhosa-speaking people the plural form *amafufunyane* is used to denote the syndrome. [From Zulu *ufufunyane* a character or voice that has entered and taken control of a person, from *ukufuya* to possess (such things as herds of cattle) or to treat a person as a possession]

ugly sister effect *n.* A common feature of the ***tip-of-the-tongue phenomenon**, when a different but related ***blocking memory** pops into consciousness, impeding access to the required memory, and generally being difficult or impossible to dislodge. [The name alludes to the ancient fairy tale in which Prince Charming tries to gain access to the beautiful Cinderella but is blocked by her ugly sisters, who pop up in her place]

Ultimatum game *n.* A two-person ***game (1)** in which a monetary prize is divided by one player making a one-off proposal for a division of the prize and the other player either accepting or rejecting it, neither player receiving anything if the proposal is rejected. Suppose the prize is \$10 or £10. Player I first proposes a division (such as 60 per cent to Player I and 40 per cent to Player II); then Player II either accepts the proposal, in which case the prize is accordingly divided, or rejects it, in which case neither player receives

anything. From a game-theoretic point of view, Player I should offer Player II one penny, and Player II should accept this offer because one penny is better than nothing. Numerous experiments by the US economist Richard H. Thaler (born 1945) and others have shown that human players appear to deviate sharply from **expected utility* theory: Player I usually offers much more than one penny and often offers 50 per cent of the prize, and Player II usually rejects Player I's offer if it is less than about one-quarter of the prize, in which case it is perceived as too unfair or insulting to accept.

ultradian rhythm *n.* Any **biological rhythm* such as a **circannual rhythm* or a **menstrual cycle* with a period longer than a day. *See also* BIOLOGICAL CLOCK, CHRONOBIOLOGY. *Compare* CIRCADIAN RHYTHM, INFRADIAN RHYTHM. [From Latin *ultra* beyond + *dies* a day]

ultrasound *n.* A pressure wave of the same physical character as sound but with a frequency above the **audibility range*, or above about 20,000 hertz, used in scanning devices for *ultrasound imaging* of internal body structures and unborn foetuses, which reflect some of the waves, and also for cleaning jewellery. Some frequencies of ultrasound can be perceived by animals such as bats, which use them for **biosonar*, and dogs. *See also* AUDIOGENIC SEIZURE, GALTON WHISTLE. *Compare* INFRASOUND. **ultrasonic** *adj.* [From Latin *ultra* beyond, from *ulter* distant + English *sound*]

ultraviolet *adj. n.* (Of or relating to) electromagnetic radiation with wavelengths shorter than the shortest radiation in the **visible spectrum* but not as short as X-rays, hence within the range 5 to 390 nanometres, absorbed by glass but transmitted by quartz crystals (from which ultraviolet **lenses* and **prisms* are therefore made), capable of causing genetic **mutations*. *Compare* INFRA-RED. **UV** *abbrev.* [From Latin *ultra* beyond, from *ulter* distant + English *violet*]

Ulysses contract *n.* A form of **informed consent* given in the form of an advance directive by people who have had **psychotic* (1) episodes in the past and wish to precommit themselves to undergo appropriate treatment should they have similar crises in the future. Also called *voluntary involuntary treatment*. [Named after an episode in Homer's *Odyssey* in which Ulysses binds himself to the masthead of a ship to avoid being drawn by the

*****ebook converter DEMO Watermarks*****

Sirens who bewitch men with their songs]

umami *n.* A fundamental taste in Japanese psychophysics, characteristic of the flavour enhancer * **monosodium glutamate** (**MSG**), supposedly not reducible to any combination of the traditional four primary tastes of ***Henning's tetrahedron**, namely sweet, sour, salty, and bitter. It was discovered in 1908 by the Japanese chemist Kikunae Ikeda (1864–1936), who also patented monosodium glutamate in the same year. [From Japanese *umami* delicious taste, from *umai* delicious]

Umweg problem *n.* Another name for a ***detour problem**. [From German *Umweg* a detour, from *um* around + *Weg* a path or road]

Umwelt *n.* An umbrella term for all the environmental influences shaping an individual's behaviour, or the environment as it is experienced by the individual. The word was introduced in 1909 by the Estonian biologist Jacob Johann von Uexküll (1864–1944) in his book *Umwelt und Innenwelt der Tiere* (Environment and Inner World of Animals). In ***phenomenology** and ***existentialism** it is the environment as it is experienced. See also **EXISTENTIAL ANALYSIS**, **EXISTENTIAL THERAPY**. Compare **EIGENWELT**, **MITWELT**. [From German *Umwelt* environment, from *um* around + *Welt* world]

unbalanced bilingual *n.* A person who can speak two languages but not with equal facility. Most bilinguals fall into this category, although rare cases of ***balanced bilinguals** have been confirmed by researchers.

uncertainty *n.* **1.** The state or condition of not being able to know or predict something accurately. **2.** The situation that exists when the outcome that will result from an action is not known with certainty, and even the probabilities associated with the possible outcomes are unknown or cannot be meaningfully estimated. A typical example would arise if a medical researcher were to test a new drug for the first time: various possible outcomes may be known, but there may be no meaningful way of assigning probabilities to them. ***Risk** (2) and uncertainty were first distinguished by the US economist Frank Hyneman Knight (1885–1972) in his book *Risk, Uncertainty, and Profit* (1921), and the distinction is maintained in careful usage, although the terms are often used interchangeably. See also **ELLSBERG**

*****ebook converter DEMO Watermarks*****

PARADOX, INSUFFICIENT REASON, MODIFIED ELLSBERG PARADOX, UNCERTAINTY PRINCIPLE. **uncertain** *adj.* [From Old English *un-* not + Latin *certus* sure or fixed, from *cernere* to discern or decide]

uncertainty principle *n.* The physical law, first propounded in 1927 by the German physicist Werner (Karl) Heisenberg (1901–76), that the position and momentum of a particle cannot both be determined with certainty, because neither can be measured without affecting the other. If the uncertainty of position is Δp , and the uncertainty of momentum is Δq , then $\Delta p \times \Delta q = h/4\pi$, where h is Planck's constant (6.6×10^{-34} Joule seconds). Because h is so small, the uncertainty is apparent only at the subatomic scale, but it has been argued by several brain scientists, and by the mathematical physicist Roger Penrose (born 1931) in *The Emperor's New Mind* (1989) and *Shadows of the Mind* (1994), that such subatomic events may occur in the **cytoskeletons* of **neurons* and may have important implications for psychological processes at the macroscopic level. Also called the *Heisenberg uncertainty principle* or *indeterminacy principle*.

uncinate fasciculus *n.* Either of two small bundles of nerve fibres in the cerebral cortex linking the **frontal lobe* to the anterior **temporal lobe*. [From Latin *uncinatus* hooked, from *uncinus* a hooked structure, from *uncus* a hook + *fasciculus* a little bundle, diminutive of *fasculus* a bundle]

unconditional response *n.* An uncommon but more accurate name for an **unconditioned response*.

unconditional stimulus *n.* An uncommon but more accurate name for an **unconditioned stimulus*.

unconditioned reflex *n.* Another name for an **unconditioned response*, presupposing that it consists of a **reflex* arc. Also called an *unconditional reflex*.

unconditioned response *n.* In **classical conditioning*, a **response* such as salivation that follows an **unconditioned stimulus* such as food naturally without any prior process of **conditioning* (1). *Unconditioned* is a

slight mistranslation of *unconditional*, the term originally used by the Russian physiologist Ivan Petrovich Pavlov (1849–1936), referring to a response that occurs unconditionally, that is, without conditioning. Also called an *unconditioned reflex* or an *unconditional reflex*, presupposing that it consists of a **reflex* arc. Compare *CONDITIONED RESPONSE*. **UR** abbrev.

unconditioned stimulus *n.* In **classical conditioning*, a **stimulus* (1) such as food that naturally elicits an **unconditioned response* such as salivation, without any prior process of **conditioning* (1). It is a slight mistranslation of *unconditional stimulus*, the term originally used by the Russian physiologist Ivan Petrovich Pavlov (1849–1936) to denote a stimulus that elicits a particular response unconditionally, that is, without conditioning. Compare *CONDITIONED STIMULUS*. **US** abbrev.

unconscious *adj.* **1.** Lacking **consciousness* or awareness of mental experiences such as perceptions, thoughts, or emotions; lacking deliberate intention (*an unconscious slip*). Compare *CONSCIOUS* (1, 2). **ucs** abbrev. *n.* **2.** In **psychoanalysis*, a part of the mind containing repressed instincts and their representative wishes, ideas, and images that are not accessible to direct examination, its functions being governed by the mechanisms of the **primary process*, especially **condensation* and **displacement*. The operation of **repression* prevents the contents of the unconscious from entering either **consciousness* or the **preconscious*, and a barrier of **censorship* exists between the unconscious and the preconscious–conscious system. Sigmund Freud (1856–1939) explicated his theory in 1912 in ‘A Note on the Unconscious in Psycho-Analysis’ (*Standard Edition*, XII, pp. 260–6) and in 1915 in an article on ‘The Unconscious’ (*Standard Edition*, XIV, pp. 166–215), but after 1920 he abandoned this **topography* of the mind in favour of a structural model based on the concepts of the **id*, **ego*, and **superego*. See also *COLLECTIVE UNCONSCIOUS*, *ID*, *PERSONAL UNCONSCIOUS*, *THING-PRESENTATION*. **Ucs** abbrev.

uncus *n.* The anterior curved end of the hippocampal formation. [From Latin *uncus* a hook, alluding to its hooklike appearance]

undecidable figure *n.* Another name for an **impossible figure*.

underextension *n.* The interpretation of a word, usually by a child during the course of language development in the second or third year, to mean only part of what it normally means, for example, when a child understands the word *cup* to denote only a particular cup, as if the word were a proper noun. See also [CONCEPT FORMATION](#). Compare [OVEREXTENSION](#), [OVERGENERALIZATION](#), [MISMATCH](#).

undifferentiated schizophrenia *n.* One of the major types of [*schizophrenia](#), defined negatively by the absence of signs and symptoms characteristic of [*catatonic schizophrenia](#), [*disorganized schizophrenia](#), or [*paranoid schizophrenia](#).

undifferentiated somatoform disorder *n.* In [*DSM-IV](#), a [*somatoform disorder](#) characterized by one or more [*somatic](#) symptoms (most commonly chronic tiredness, loss of appetite, gastrointestinal or urinary complaints), lasting at least six months, causing significant distress or impairment in social, occupational, or other important areas of functioning, but below the threshold for a diagnosis of [*somatization disorder](#). The term was replaced in DSM-5 by [*somatic symptom disorder](#). [From Greek *soma* body + Latin *forma* form]

Undine's curse See [ONDINE'S CURSE](#).

undinism *n.* Another name for [*urophilia](#). [From *undine* a water spirit, from Latin *unda* a wave]

undoing *n.* In [*psychoanalysis](#), a [*defence mechanism](#) whereby an emotional conflict associated with an action is dealt with by negating the action or attempting 'magically' to cause it not to have occurred by substituting an approximately opposite action. It differs from an ordinary act of making amends for an action that one regrets, inasmuch as the original action itself, and not merely its consequences, are negated. Sigmund Freud (1856–1939) introduced the concept briefly in his famous case study of the 'Rat Man' entitled 'Notes upon a Case of Obsessional Neurosis' (1909), where he describes [*compulsive](#) actions 'in two successive stages, of which the second neutralises the first' (*Standard Edition*, X, pp. 155–320, at p. 192).

The Rat Man knocked his foot against a stone lying in the road and felt obliged to remove it in case a carriage containing his loved one struck it and caused her to come to grief; but a few minutes later he realized the absurdity of what he had done and felt obliged to put the stone back in its original position in the middle of the road. Freud discussed undoing at greater length in his book *Inhibitions, Symptoms and Anxiety* (1926), where he gave the clearest definition of it: 'An action which carries out a certain injunction is immediately succeeded by another action which stops or undoes the first one even if it does not go quite so far as to carry out its opposite' (*Standard Edition*, XX, pp. 77–175, at p. 113). Freud's daughter Anna Freud (1895–1982) discussed the phenomenon on page 36 of her book *The Ego and the Mechanisms of Defence* (1937).

unexpected hanging paradox *n.* A **paradox* of prediction. Sentencing a man on Friday, a judge says: 'You will be hanged at noon on a day next week, but you will not know which day it is until the morning of the fateful day.' The prisoner reasons as follows. (a) I cannot be hanged next Saturday, because by the end of Friday I would know that I was to be hanged the next day. (b) I cannot be hanged on Friday because, with Saturday ruled out, by the end of Thursday I would know that I was to be hanged on Friday. (c) All the other days of the week can be excluded by the same argument, so I conclude that I cannot be hanged on any day next week, and therefore the judge's sentence cannot be carried out. The paradox was discovered by the Swedish mathematician Lennart Ekbom (1919–2002) and discussed with students in 1943 or 1944 after the Swedish broadcasting system announced that a civil defence drill would be held the following week but that no one would know in advance on which day it would take place. It was first discussed in print in an article in the journal *Mind* in 1948 by the British philosopher D(aniel) John O'Connor (1914–2012). O'Connor initially interpreted the judge's sentence as a classic **self-defeating prophecy*, and for that reason described the problem as 'rather frivolous'; but later commentators pointed out that if the hanging were to take place on Wednesday, for example, then it would indeed be unexpected, given the prisoner's reasoning that appears to have ruled out every day including Wednesday, and this shows that the sentence is not self-defeating. The problem was commented on by several eminent philosophers in subsequent issues, and it has generated by far the greatest attention of all epistemic

paradoxes, without any consensus emerging. However, there are strong reasons to consider it a fallacy (a *falsidical paradox*). In the prisoner's reasoning, (b) contradicts (a), because in (a) he infers from the fact that he is not hanged by Friday that he is certain to be hanged on Saturday, but in (b) he assumes that, if he is not to be hanged by Friday, then Saturday will have been 'ruled out'. Also, even if the prisoner were correct in believing that (a) and (b) imply a contradiction between the judge's statements that the sentence would be carried out the following week and that the prisoner would not know which day it was until the morning of that day, it would not be valid to infer from this that it is the first rather than the second of these statements that is false, and therefore that the hanging could not take place on any day of the following week. Also called the *surprise examination* (or *test*), or the *prediction paradox*. See also [OEDIPUS EFFECT](#).

unfaithful wives problem See [MUDDY CHILDREN PROBLEM](#).

unfinished business *n.* In **Gestalt* therapy, an incomplete Gestalt arising from an experience with which a person has not come to terms; more generally an unresolved problem or issue in an interpersonal relationship.

unfolding technique *n.* A method of **scaling* a set of stimuli without relying on any presupposed scale of measurement. Imagine a set of stimuli that are statements about capital punishment (*Capital punishment is never justified*, *People who commit murder should pay with their own lives*, and so on) arranged along a hypothetical scale, with anti-capital-punishment statements near the left and pro-capital-punishment statements near the right. Suppose an individual has judged the stimuli by the **method of paired comparisons* and produced the rank-ordering of them, from anti-capital-punishment to pro-capital-punishment, and suppose that the judge's ideal point—in this example, the point corresponding to the judge's own attitude towards capital punishment—is marked on the scale with an *X*, yielding a *joint continuum* or *J* scale. An example of a hypothetical *J* scale with the positions of five stimuli (statements about capital punishment) *A*, *B*, *C*, *D*, and *E*, and the individual's ideal point *X*, might be as follows:

---A-----X---C-----B-----D-----E---

From such a *J* scale, the individual's *I* scale could be obtained by imagining
*****ebook converter DEMO Watermarks*****

the *J* scale folded about the point *X*, so that the part of the scale to the left of the *X* is made to overlap the part to the right, yielding the following *I* scale:

X----*C*--*A*-----*B*-----*D*-----*E*---

Reading from the *X* at the left, it is now clear that the individual's preference ordering of the five stimuli (attitude statements) is *CABDE*. If *X* had been closer to *A* than to *C* on the *J* scale, then the individual's preference order would have been *ACBDE*, and if *X* were to the right of the midpoint between *C* and *B*, then the order would be *BCADE*. Any *I* scale may thus be viewed as a folded *J* scale, and from empirical data consisting in effect of observed *I* scales, *J* scales may therefore be recovered by unfolding the observed *I* scales. By unfolding the *I* scales of a number of judges who have ranked the five stimuli (statements), each with a different ideal positions *X* on the hypothetical *J* scale, it is possible to infer not only the order of stimuli on the *J* scale, but also information about relative distances between them, and hence **interval scale* information can be inferred from purely **ordinal scale* input data, provided the judges behave consistently. For example, because the *J* scale depicted above induces the *I* scale *CABDE* and not *CBADE*, we can infer that the distance between *A* and *C* is less than the distance between *C* and *B*, although the data are purely ordinal. The technique was formulated by the US psychologist Clyde Hamilton Coombs (1912–88) and published in the journal *Psychological Review* in 1950, and is also called the *Coombs unfolding technique*. See also [ATTITUDE SCALE](#), [CONJOINT MEASUREMENT THEORY](#), [PORTFOLIO THEORY](#).

unidimensionality *n.* The property of having only one dimension. In psychometrics, the property of a test of measuring only one underlying **attribute* or **construct*. See also [GUTTMAN SCALE](#), [REPRODUCIBILITY](#).

unilateral limb apraxia *n.* Another name for **left-sided apraxia*. See also [APRAXIA](#).

unilateral neglect See [SPATIAL NEGLECT](#). Also called *unilateral spatial neglect*.

uniocular *n.* Another word for **monocular*.

unipedophilia *n.* Another name for ***acrotomophilia**. [From Latin *unus* one + *pes, pedis* a foot + Greek *mania* madness]

unipolar depression *n.* A form of ***depression** that occurs within a ***mood disorder** with symptoms of depression only, without ***manic episodes**. [From Latin *unus* one + *polaris* of or relating to a pole, from *polus* a pole]

unipolar neuron *n.* A ***neuron** that has a single ***neurite**, sometimes considered to be an axon and sometimes part axon and part dendrite. It has a ***dendrite** at one end and an ***end organ** at the other, attached to the cell body by a short process. Also called a *unipolar cell*, *monopolar neuron*, or *monopolar cell*. Compare **BIPOLAR CELL**, **MULTIPOLAR NEURON**.

unique colour *n.* Another name for a ***psychological primary**. US *unique color*. Also called a *unique hue*.

univariate statistics *n.* The branch of statistics devoted to analysing the effects of one or more ***independent variables** on a single ***dependent variable**. The *uni-* in the name refers to the dependent variable. Compare **BIVARIATE STATISTICS**, **MULTIVARIATE STATISTICS**.

universal grammar *n.* The set of formal grammatical features that all ***natural languages**, both actual and possible, must possess in order to have the properties of human languages, as proposed by the US linguist and philosopher (Avram) Noam Chomsky (born 1928) and his followers. See also **FORMAL UNIVERSALS**, **LINGUISTIC UNIVERSALS**. **UG** *abbrev.*

universal quantifier See **QUANTIFIER**.

universals, linguistic See **LINGUISTIC UNIVERSALS**.

universal Turing machine See **Turing machine**.

unobtrusive measure *n.* Any means of obtaining psychological or social science research data other than by interviews, questionnaires, or other direct approaches, that is, without the conscious cooperation of the research

participants or subjects. It is considered useful where responses might be influenced by the respondents' awareness that their behaviour is being observed, the **validity* of measurements in such circumstances demanding **non-reactive measures*. The most common unobtrusive measures are **observational studies*; studies of the physical traces of behaviour, such as the wear of floor tiles in front of museum exhibits as measures of the exhibits' popularity; and investigations based on archival records, including legal records, mass media, sales records, diaries, and other personal data. The term was popularized by the US psychologist Eugene J(ohn) Webb (1933–95) and several co-authors in their book *Unobtrusive Measures: Nonreactive Research in the Social Sciences* (1966), in which the idea itself is traced to the 1870s and attributed to the English explorer and scientist Sir Francis Galton (1822–1911). See also [BOGUS PIPELINE](#), [IMPLICIT ASSOCIATION TEST](#), [LOST-LETTER TECHNIQUE](#), [MODERN RACISM](#).

unrealistic optimism *n.* A judgemental bias that tends to affect people's subjective estimates of the likelihood of future events in their lives, causing them to overestimate the likelihood of positive or desirable events and to underestimate the likelihood of negative or undesirable events. It was first reported in 1925 by the US psychologist F(rederick) H(ansen) Lund (1894–1965) and in 1938 by the US psychologist (Albert) Hadley Cantril (1906–69), and it came to prominence in 1980 when it was studied rigorously and named by the US psychologist Neil D(avid) Weinstein (born 1945) in an article in the *Journal of Personality and Social Psychology*. Weinstein asked students to estimate the relative likelihoods of various events happening to them, compared to the likelihoods of the same events happening to their peers, and his results showed that they rated their chances of experiencing positive events, such as *owning your own home*, *receiving a good job offer before graduation*, and *living past 80*, to be significantly above the average for students of the same sex at the same university, and their chances of experiencing negative events, such as *having a heart attack before age 40*, *being sued by someone*, and *being the victim of a mugging*, to be significantly below average. See also [DEPRESSIVE REALISM](#), [HYPOMANIC EPISODE](#). Compare [LAKE WOBEGON EFFECT](#), [OVERCONFIDENCE EFFECT](#).

unweighted pair-group method using arithmetic averages *n.* Another name for the **average linkage between groups*

*****ebook converter DEMO Watermarks*****

method of cluster analysis. **UPGMA** *abbrev.*

up-and-down method *n.* Another name for the **staircase method*.

uppers *n.* A common street name for central nervous system **stimulant drugs* in general. *Compare* **DOWNERS**.

upper threshold *n.* 1. The higher of the two thresholds determined by the **method of limits*. 2. Another name for a **terminal threshold*, though this usage can cause confusion.

uptalk *n.* An English language speech style in which **intonation* rises in the final syllables of sentences even if they are not questions. It is associated particularly with young people along the west coast of the United States, but it is believed to have spread from New Zealand or Australia in the 1980s, although it has been a standard feature of the speech style of Belfast, Northern Ireland, for centuries. By the beginning of the 21st century, it had become common among young speakers in the United Kingdom, Canada, South Africa, and in other English-speaking language communities. Also called *high rising intonation (HRI)* or *high rising terminal (HRT) speech*. The term was introduced by the science writer James Gorman (born 1949) in an article in the *New York Times* on 15 August 1993.

upward feedback *n.* A misleading name for **360-degree feedback*. It is avoided in careful usage, because 360-degree feedback is sideways and downward as well as upward.

uqamairineq *n.* A **culture-bound syndrome* restricted mainly to Eskimo communities of North America and Greenland, characterized by a sensation of a peculiar sound or smell, followed by sudden **paralysis* accompanied by **anxiety*, **psychomotor agitation*, or **hallucinations*, usually lasting only minutes and attributed to soul loss or spirit possession. It is sometimes interpreted as a type of dissociative disorder. [Inuit]

uracil *n.* One of the constituent **bases (1)* of **RNA*, having an affinity for **adenine*. **U** *abbrev.* [From *ur(ea)* + *ac(etic)* + Latin *-il(is)* indicating

capability or relationship]

Urbach-Wiethe disorder *n.* A skin disorder, probably of genetic origin, believed to cause crystallization of the amygdala and consequent cognitive deficits in some cases. [Named after the US dermatologist Erich Urbach (1893–1946) and the Austrian otologist Camillo Wiethe (1888–1949) who studied its features]

urban legend *n.* An apocryphal story, usually with either a nasty or a humorous twist in its tail, circulated by people who believe it actually to have happened to a ‘friend of a friend’. A typical example is the following, named the *Blind Man* urban legend by folklorists. A woman is taking a shower when she hears the doorbell ring. She calls out ‘Who is it?’ and a voice replies ‘Blind man’. The woman is generous, and keen on helping people with disabilities, so she grabs some loose change and, without bothering to cover herself in front of a blind man, opens the door. The man looks at her with astonishment and says, ‘Good day, madam. Now where do you want me to hang your blinds?’ It is occasionally possible to establish beyond doubt that such a story is apocryphal, but more commonly internal evidence casts sufficient doubt on its veracity for it to be classified as a probable urban legend. The *Blind Man* is typical inasmuch as it appears plausible at first but does not bear closer scrutiny: a bathroom is unlikely to be situated close enough to a front door to enable a woman taking a shower to converse with a man outside; a man who installs blinds does not normally call himself a ‘blind man’; everyone knows that a person describing himself as blind is not necessarily totally blind; a woman would normally cover herself to open the front door even to a caller she thought was totally blind, because other people may be passing in the street; and so on. Also called an *urban myth*. See also RUMOUR.

urethral character *n.* In *psychoanalysis, a personality pattern determined by *fixation (2) of *urethral erotism, characterized by ambition and competitiveness, both being interpreted as reactions against shame. Also called the *urethral personality*.

urethral erotism *n.* In *psychoanalysis, a mode of *libidinal satisfaction through urinating, and focusing of *libido in that region during the *phallic

*****ebook converter DEMO Watermarks*****

stage. Sigmund Freud (1856–1939) linked it to ***masturbation** in his case study of ‘Dora’ entitled ‘Fragment of an Analysis of a Case of Hysteria’ (1901/5, *Standard Edition*, VII, pp. 7–122, at p. 74), and (symbolically) with fire-setting or ***pyromania** in an article on ‘The Acquisition and Control of Fire’ (1932, *Standard Edition*, 22, p. 185). The British-based Austrian psychoanalyst Melanie Klein (1882–1960), on page 186 of her book *The Psycho-Analysis of Children* (1932), stressed the aggressive, corrosive, and essentially sadistic fantasies associated with urination in both children and adults. Also called *urethral eroticism* or *urinary erotism* or *eroticism*. See also **URETHRAL CHARACTER**. Compare **UROPHILIA**. **urethral-erotic** *adj.* [From Greek *ourethra* the urinary canal, from *ourein* to urinate]

urinary erotism *n.* Another name for ***urethral erotism**. Also called *urinary eroticism*.

uroboros *n.* An ancient circular symbol depicting a snake, or sometimes a dragon, swallowing its own tail, representing unity and/or infinity. Carl Gustav Jung (1875–1961) and his followers interpreted it as a metaphor for early development, when ***Eros** and ***Thanatos** are not differentiated and the infant cannot distinguish love from aggression or the feeder from the fed. **uroboric** *adj.* [From Greek *drakon ouroboros* snake devouring its own tail]

urolagnia *n.* Another name for ***urophilia**. [From Greek *ouron* urine + *lagneia* lust]

urophilia *n.* A ***paraphilia** characterized by recurrent sexually arousing fantasies, sexual urges, or behaviour involving urinating or being urinated on. Also called *undinism*, *urolagnia*. Compare **URETHRAL EROTISM**. [From Greek *ouron* urine + *philos* loving, from *phileein* to love + *-ia* indicating a condition or quality]

utility *n.* 1. A measure of the subjective desirability of an outcome or event, corresponding to the individual’s preference for it. The concept was introduced in 1738 by the Swiss mathematician and physicist Daniel Bernoulli (1700–82), who explained the ***St Petersburg paradox** by pointing out that the values of things to a person are not simply equivalent to their monetary values, but the term *utility*, which Bernoulli called *moral worth*,

*****ebook converter DEMO Watermarks*****

became widespread only after the emergence of **expected utility* theory in 1947. It is often used to represent the total gain or loss resulting from a particular course of action or the outcome of a strategic **game* (1). *See also* EXPECTED UTILITY, PAYOFF, PROSPECT THEORY, RISK AVERSION, RISK SEEKING, SUBJECTIVE EXPECTED UTILITY, SUBJECTIVE UTILITY, UTILITY FUNCTION, UTILITY THEORY. **2.** The fact, character, or quality of being useful or serviceable. **3.** The capacity of any commodity to satisfy a human want. **4.** A public service, such as a bus system or an electricity, water, or gas supply. [From Latin *utilitas* usefulness, from *utilis* useful, from *uti* to use]

utility function *n.* A rule specifying the relation between quantities of money or of any commodity and an individual's **utility* (1). *See also* PROSPECT THEORY.

utility theory *n.* A theory of decision making according to which a decision maker chooses an alternative or **strategy* (2) that maximizes the **utility* (1) of the outcome. The modern form of the theory was introduced in 1947 by the Hungarian-born US mathematician John von Neumann (1903–57) and the German-born US economist Oskar Morgenstern (1902–77). *See also* ALLAIS PARADOX, COMMON RATIO EFFECT, ELLSBERG PARADOX, EXPECTED UTILITY THEORY, MODIFIED ELLSBERG PARADOX, PROSPECT THEORY, REVEALED PREFERENCE, ST PETERSBURG PARADOX, SUBJECTIVE EXPECTED UTILITY THEORY.

utricle *n.* The larger of the two sections of the **membranous labyrinth* of the inner ear, functioning as an **otolith* receptor in the **vestibular system*. Also called a *utricle*. *Compare* SACCULE. **utricular** *adj.* [From Latin *utricle* a little bag, diminutive of *uter* a bag]

uvula *n.* The small finger of fleshy tissue that hangs from the soft palate at the back of the throat. [From Latin *uvula* little grape, diminutive of *uva* a grape]

uvular *adj.* In phonetics, of or relating to speech sounds whose **place of articulation* is in the region of the **uvula*, as in the pronunciation of the letter *r* in Parisian French.

vacuum activity *n.* Performance of a **fixed-action pattern* in the absence of its normal **sign* stimulus or **releaser*, believed to result from a build-up of motivational energy breaking through the inhibitory function of the **innate* releasing mechanism. A familiar example to cat owners is the slow rhythmic trampling by a cat with its front paws in its owner's lap, always accompanied by purring and often by dribbling, such behaviour being interpretable as a milk-treading fixed-action pattern normally triggered in a kitten by its mother lying down and exposing her nipples. Also called a *vacuum response* or an *overflow response*.

vagina *n.* The genital canal in females, extending from the vulva to the cervix of the uterus. *See also* *MÜLLERIAN DUCT*, *MÜLLERIAN INHIBITING SUBSTANCE*. **vaginal** *adj.* [From Latin *vagina* a sheath]

vagina dentata *n.* A fantasy of a toothed vagina, a legendary hazard associated with sexual intercourse. The Austrian psychoanalyst Otto Rank (1884–1939) first identified it, in his book *The Trauma of Birth* (1924), as a widespread cause of anxiety among neurotic men, and it was explored further by the Hungarian psychoanalyst Sandor Ferenczi (1873–1933). The counterpart fantasy among women, called *penis dentata* (toothed penis), is less commonly observed. [From Latin *vagina* a sheath + *dentata* toothed, from *dens*, *dentis* a tooth]

vaginismus *n.* A **sexual dysfunction* of women characterized by recurrent or persistent involuntary spasm of the perineal muscles surrounding the vagina when penetration is attempted with a penis, finger, tampon, or other object, interfering with sexual intercourse, causing significant distress

or problems of interpersonal interaction. It is not diagnosed if it is attributable to a ***general medical condition**. *See also* GENITO-PELVIC PAIN/PENETRATION DISORDER. *Compare* DYSPAREUNIA. [From Latin *vagina* a sheath + *-ismus* indicating a state or condition]

vagus nerve *n.* Either of the tenth pair of ***cranial nerves**, the longest cranial nerve and the most important nerve of the ***parasympathetic nervous system**, a sensory part receiving sensations from the ***mucous membranes** of the digestive system and a motor part supplying the heart, lungs, and alimentary canal, controlling swallowing. One of the most striking effects of its stimulation is slowing of the heart. *See also* VAGUSSTOFF. [From Latin *vagus* wandering, alluding to its roundabout course]

Vagusstoff *n.* The name coined in 1921 by the German pharmacologist Otto Loewi (1873–1961) for what is now called ***acetylcholine**, following his pioneering experimental demonstration of the chemical nature of nervous transmission. Electrical stimulation of the ***vagus nerve** of a frog's heart, held in a beaker of saline solution and still beating, stimulated the release of a substance that, when pumped into a separate beaker containing a second frog's heart with its vagus nerve removed, caused the beating of the second heart to slow as if its vagus nerve had been stimulated. [From German *Vagus* vagus + *Stoff* material or substance]

validation *n.* The act or process of making something valid, ratifying it, or checking that it satisfies certain standards or conditions. In psychometrics, the process of establishing the ***validity** of a test. **validate** *vb.* [From Latin *validus* valid, from *valere* to be strong + *-ation* indicating a process or condition]

validity *n.* The soundness or adequacy of something or the extent to which it satisfies certain standards or conditions. A research procedure or an interpretation of results obtained from a research study are considered valid if they can be justified on reasoned grounds. In psychometrics, it is the extent to which a test measures what it purports to measure, or the extent to which specified inferences from the test's scores are justified or meaningful. ***Internal validity**, ***external validity**, and ***ecological validity** (1) form a hierarchy in that order: an empirical investigation may produce results that

*****ebook converter DEMO Watermarks*****

have high internal validity and low external validity and ecological validity, or high internal validity and external validity and low ecological validity, but a higher form of validity is not possible without the lower forms. See CONCURRENT VALIDITY, CONGRUENT VALIDITY, CONSENSUAL VALIDITY, CONSTRUCT VALIDITY, CONTENT VALIDITY, CONVERGENT VALIDITY, CRITERION VALIDITY, CROSS-VALIDATION (1), DISCRIMINANT VALIDITY, FACE VALIDITY (a priori validity), INCREMENTAL VALIDITY, INTRINSIC VALIDITY, PREDICTIVE VALIDITY, TRAIT VALIDITY. See also NOMOLOGICAL NETWORK, REPLICATION (2), VALIDITY COEFFICIENT, VALIDITY GENERALIZATION. Compare RELIABILITY. **valid** *adj.*

validity coefficient *n.* A *correlation coefficient between scores on a test and a criterion of *validity, or a similar value taken as evidence of the test's validity. Compare RELIABILITY COEFFICIENT.

validity generalization *n.* Applying evidence of *validity obtained in a restricted range of circumstances to situations falling outside that range. This procedure is generally justified on the basis of *Bayesian inference, *meta-analysis, or other reasoned grounds. See also EXTERNAL VALIDITY, ECOLOGICAL VALIDITY (1).

Valium *n.* A proprietary name for the benzodiazepine drug *diazepam. [Trademark]

value (of a variable) *n.* In mathematics and statistics, a specific number, amount, or magnitude attained by a *variable, or occasionally a state attained by a non-numerical variable such as sex, the possible values of which are male and female. [From Latin *valere* to be worth]

vanishing point *n.* A point, usually located on the *horizon, towards which receding lines such as railway tracks appear to converge when depicted or viewed in *linear perspective.

vapours *n.* An almost obsolete word for the psychological condition later called *hysteria, formerly thought to arise from gases in the abdomen.

variability *n.* In statistics, the degree to which a set of scores is dispersed

or scattered. Two sets of scores with identical ***means** (averages) may have widely different variabilities. The usual measures of variability are the ***variance** and the ***standard deviation**. *See also* INTERQUARTILE RANGE, PROBABLE ERROR, RANGE, SEMI-INTERQUARTILE RANGE.

variable *n.* Anything that is subject to variation; in psychological research, any ***stimulus (1)**, ***response**, or extraneous factor that is changeable and that may influence the results of the research. *See also* DEPENDENT VARIABLE, EXTRANEOUS VARIABLE, INDEPENDENT VARIABLE, INTERVENING VARIABLE, MEDIATING VARIABLE, VALUE (OF A VARIABLE), VARIATE.

variable error *n.* In ***psychophysics**, any error of judgement or perception that is attributable to chance fluctuation and does not include any systematic bias. *Compare* CONSTANT ERROR.

variable-interval schedule *n.* In ***operant** conditioning, a simple ***reinforcement** schedule in which reward follows the first response that the organism makes after a random time interval, and then the first response that it makes after another random time interval, and so on, the average length of the interval being specified in seconds as an affix to the abbreviation, hence VI20 indicates a variable-interval schedule with an average interval of 20 seconds. Also called a *variable-interval reinforcement schedule*. *See also* SIMPLE REINFORCEMENT SCHEDULE. *Compare* FIXED-INTERVAL SCHEDULE, FIXED-RATIO SCHEDULE, VARIABLE-RATIO SCHEDULE. **VI** *abbrev.*

variable-ratio schedule *n.* In ***operant** conditioning, a simple ***reinforcement** schedule in which reward is delivered after the organism has made a random number of responses, and is then rewarded after a further random number of responses, and so on, the average number of responses before reinforcement being specified as an affix to the abbreviation, hence VR50 indicates a variable-ratio schedule with an average of 50 responses between reinforcements. Also called a *variable-ratio reinforcement schedule*. *See also* SIMPLE REINFORCEMENT SCHEDULE. *Compare* FIXED-INTERVAL SCHEDULE, FIXED-RATIO SCHEDULE, VARIABLE-INTERVAL SCHEDULE. **VR** *abbrev.*

variable stimulus *n.* In ***psychophysics**, a ***stimulus (1)** that is varied by the experimenter and is usually compared in magnitude to a ***standard**

*****ebook converter DEMO Watermarks*****

stimulus. Also called a *comparison stimulus*. **s** or **V** abbrev.

variable-sum game *n.* Another name for a **mixed-motive game*. [So called because the sum of the payoffs to the players varies from one outcome to another]

variance *n.* In descriptive statistics, a measure of the degree of dispersion, variability, or scatter of a set of scores. It is defined as the mean (average) of the squared deviations of the scores from their mean. Also called a *mean square*. See also INTERQUARTILE RANGE, PROBABLE ERROR, RANGE, SEMI-INTERQUARTILE RANGE, STANDARD DEVIATION. [From Latin *variare* to diversify]

variate *n.* In statistics, any **variable* whose values can be predicted only probabilistically, such as a **dependent variable* in a research design. The term is often used loosely to refer to any **variable*. See also BIVARIATE STATISTICS, MULTIVARIATE STATISTICS, UNIVARIATE STATISTICS.

variety *n.* The quality or condition of being diversified, or a collection of unlike things. In biology, a **taxonomic* group into which a **species* is divided, containing organisms that are genetically differentiable from other members of the same species by the relative frequencies of their **polymorphic genes*. Also called a *microspecies*, *race*, or *subspecies*. [From Latin *varietas* variety, from *varius* various]

vascular dementia *n.* A form of **dementia* associated with neurological signs and symptoms (such as exaggerated deep tendon reflexes) or laboratory findings indicating cerebrovascular disease (such as multiple cortical **infarcts*) that are judged to be responsible for the disorder. Also called *arteriosclerotic dementia*, *multi-infarct dementia (MID)*. [From Latin *vasculum* a little vessel, diminutive of *vas* a vessel]

vascular neurocognitive disorder *n.* A **neurocognitive disorder* in **DSM-5* associated with **vascular dementia*.

vascular tunic *n.* The middle layer of the eyeball, including the **ciliary body*.

vasoconstrictor *n.* Any drug, hormone, or nerve that causes blood vessels to narrow or contract. **vasoconstriction** *n.* Narrowing of blood vessels. See also [ERGOT](#), [VASOPRESSIN](#). Compare [VASODILATOR](#). [From Latin *vas* a vessel + *constringere*, *constrictum* to bind together or compress]

vasodilator *n.* Any drug, hormone, or nerve that causes blood vessels to expand. **vasodilation** *n.* Expansion or widening of blood vessels. Compare [VASOCONSTRICTION](#). [From Latin *vas* a vessel + *dilatare* to spread out, from *dis-* apart + *latus* wide]

vasomotor *adj.* Of or relating to a drug, hormone, or nerve that can cause blood vessels to constrict or dilate. See [VASOCONSTRICTOR](#), [VASODILATOR](#). [From Latin *vas* a vessel + *motor* a mover, from *movere* to move]

vasopressin *n.* A hormone produced by the [*hypothalamus](#) and stored in the [*posterior](#) pituitary, also synthesized artificially. It is released from the posterior pituitary in response to a decrease in blood volume detected by [*baroreceptors](#) or [*blood-flow receptors](#), or in response to an increase of sodium or of certain other substances in the blood detected by [*osmoreceptors](#) (2), or as a reaction to pain, stress, or the action of certain drugs such as nicotine, whereupon it stimulates smooth muscle contraction and causes constriction of small blood vessels and release of [*renin](#) by the kidneys, thereby raising blood pressure and inducing water retention in the kidney tubules. It also functions as a [*neurotransmitter](#) in the brain, where it is thought to have a role in memory, and it is sometimes inhaled via a nasal spray as a [*smart drug](#), supposedly improving attention, concentration, and memory. Also called *antidiuretic hormone* or *ADH*. See also [OXYTOCIN](#). [From *Vasopressin* a trademark, from Latin *vas* a vessel + *pressare* to keep pressing, from *premere*, *pressum* to press]

Vater–Pacini corpuscle *n.* Another name for a [*Pacinian corpuscle](#). [Named after the German anatomist Abraham Vater (1684–1751) who discovered it some time prior to 1741, and the Italian anatomist Filippo Pacini (1812–83) who rediscovered it in 1835 and gave a full description of it in 1840]

vault *n.* Another name for the ***fornix**, so called because of its arched appearance; or more generally an arched roof or ceiling, or a room, chamber, or cellar with such a structure. [From Old French *voute* a vault, from Latin *volvere, volutum* to roll]

vection *n.* An illusion of ***passive movement** arising from the perception of motion in the surrounding environment, as when a person sitting in a stationary train sees another train on an adjacent track begin to move and experiences an illusory sensation of being moved in the opposite direction. The phenomenon was first identified and studied quantitatively in 1929 by the German psychologist Karl Duncker (1903–40). Also called *induced motion*. See also **AUDIOGYRAL ILLUSION**. Compare **APPARENT MOVEMENT**. [From Latin *vector* a bearer or carrier, from *vehere, vectum* to convey + *-ion* indicating an action, process, or state]

vegetative state See **PERSISTENT VEGETATIVE STATE**.

velar *adj.* Of or relating to speech sounds articulated with the back of the tongue against the soft palate, as in the final ***phonemes** in the words *wick*, *wig*, and *wing*. See also **PLACE OF ARTICULATION**. [From *velum* the soft palate, from Latin *velum* a veil]

velocity constancy *n.* A form of ***perceptual constancy** according to which if an object is moving with constant velocity its perceived velocity also remains constant despite changes in the velocity of its images on the viewer's retinas, as when a viewer standing by the side of a road watches a car approaching at constant speed, the retinal image moves slowly when the car is far away and much more rapidly as it passes the viewer, and movements of the viewer's eyes add erratic movements to the retinal images, but the viewer nevertheless perceives the car moving at a constant speed.

Venn diagram *n.* A pictorial representation of logical ***propositions (1)** or ***sets (1)** by overlapping circles depicting all possible combinations of set membership within different areas of the diagram. It is useful for clarifying and checking logical arguments (see **illustration**). Any area that contains no members is shaded, an x is placed within any area containing at least one

member, and an x is placed on the border between any two areas at least one of which contains members. For example, the proposition *All A are B* is depicted by two overlapping circles representing *A* and *B*, with the area of *A* that does not overlap *B* being shaded to show that it is empty; the proposition *Some A are C* is depicted by two overlapping circles representing *A* and *C*, with an x in the area where *A* and *C* overlap; and so on. Compare [EULER DIAGRAM](#). [Named after the English logician John Venn (1834–1923) who introduced it in 1880]

Venn diagram. This represents the syllogism: ‘All *A* are *B*; Some *C* are *A*; Therefore, some *C* are *B*’.

ventral *adj.* Of, relating to, or situated towards the same side of the body as the belly, except in the brain, where *ventral* is synonymous with *inferior* or *bottom*, as if humans walked on all fours and the cerebrum were not bent forwards 80° relative to the brainstem to keep it horizontally oriented when standing upright. Compare [DORSAL](#). [From Latin *venter*, *ventris* the belly]

ventral anterior nucleus *n.* A cluster of nerve cell bodies near the

front of the lower part of each **thalamus*, receiving inputs from the globus pallidus and projecting to the prefrontal cortex. *Compare* VENTRAL LATERAL NUCLEUS, VENTRAL POSTERIOR NUCLEUS.

ventral lateral nucleus *n.* A cluster of nerve cell bodies at the side of the lower part of each **thalamus*, receiving inputs from the globus pallidus and the cerebellum and projecting to the motor cortex and the supplementary motor area. *Compare* VENTRAL ANTERIOR NUCLEUS, VENTRAL POSTERIOR NUCLEUS.

ventral posterior nucleus *n.* A cluster of nerve cell bodies behind the ventral lateral nucleus of each **thalamus*, containing an inverted **topographic map* of the body with a disproportionate amount of space devoted to the face and especially the tongue, receiving inputs from the medial lemniscus and the trigeminal lemniscus and projecting to the somatosensory cortex. *Compare* VENTRAL ANTERIOR NUCLEUS, VENTRAL LATERAL NUCLEUS.

ventral root *n.* The short pathways into which a **spinal nerve* divides near its point of attachment to the front of the **spinal cord*, containing efferent or motor fibres emerging from the front of the spinal cord. *See also* BELL–MAGENDIE LAW. *Compare* DORSAL ROOT.

ventral tegmental area *n.* The lower part of the **tegmentum* alongside the substantia nigra, containing nerve cell bodies that release **dopamine*, projecting to various parts of the **limbic system* and the **prefrontal cortex*, implicated in emotional responsiveness and possibly, when overactive, linked to schizophrenia. *See also* MESOCORTICAL SYSTEM. VTA *abbrev.*

ventricle *n.* Any of a number of small cavities in the body, especially the two lower contractile chambers of the heart, which are filled with blood, and the four major cavities in the brain, which are filled with **cerebrospinal* fluid. The two lateral ventricles in the forebrain, the main parts of which lie in the temporal lobes immediately below the corpus callosum and above the thalamus, are separated by the **septum pellucidum* and are connected by the **foramen of Monro* to the third ventricle in the midline of the brainstem, and the third ventricle is connected in turn by the **cerebral* aqueduct to the fourth

*****ebook converter DEMO Watermarks*****

at the level of the pons and cerebellum. Also called a *lumen*. See also [AREA POSTREMA](#), [ENCEPHALOGRAM](#), [EPENDYMA](#), [EPENDYMAL CELL](#), [HYDROCEPHALUS](#), [LUMEN \(2\)](#), [MAGENDIE'S FORAMEN](#), [ORGANUM VASCULOSUM LAMINA TERMINALIS](#), [PNEUMOENCEPHALOGRAM](#). **ventricular** *adj.* [From Latin *ventriculus* a little belly, diminutive of *venter*, *ventris* a belly]

ventriloquism effect *n.* An [*auditory](#) illusion in which sound is misperceived as emanating from a source that can be seen to be moving appropriately when it actually emanates from a different invisible source. The effect is most powerful for speech sounds, and it arises from [*visual dominance](#) over auditory information. It is exploited by stage ventriloquists who practise the art of speaking without moving their lips while manipulating the movements of a puppet or dummy. [From Latin *venter* the belly + *loqui* to speak]

ventromedial cortex *n.* The lowest part of the [*prefrontal cortex](#) on the [*medial](#) or inner surfaces of both brain hemispheres, below the [*corpus callosum](#), corresponding to Brodmann areas 11, 12, 13, 14, and 47 (see illustration accompanying entry on [*Brodmann area](#)), involved in sensations of pleasure and [*reinforcement \(1\)](#), [*social skills](#), and physiological reactions implied by the [*somatic marker hypothesis](#). Also called the *ventromedial prefrontal cortex*. [From Latin *venter*, *ventris* the belly + *medialis* situated in the middle, from *medius* the middle + *cortex* bark or outer layer]

ventromedial hypothalamic syndrome *n.* A constellation of signs and symptoms associated with a lesion in both sides of the [*ventromedial hypothalamus](#), especially [*hyperphagia](#), [*bulimia \(1\)](#), and [*aggression](#) or rage. Also called *hypothalamic hyperphagia*. Compare [LATERAL HYPOTHALAMIC SYNDROME](#).

ventromedial hypothalamus *n.* The lower middle part of each side of the [*hypothalamus](#), responsible for the feeling of satiation after eating, stimulation of which inhibits eating and destruction increases eating, also implicated in the control of anger and aggression. Also called the *satiety centre*. See also [APPESTAT](#). Compare [LATERAL HYPOTHALAMIC FEEDING CENTRE](#). **VMH** *abbrev.* [From Latin *ventris* a belly + *medialis* situated in the middle, from *medius* the middle]

*****ebook converter DEMO Watermarks*****

ventromedial tract *n.* Part of the ***corticospinal tract** controlling trunk movements that does not decussate but stays on the same side of the body midline.

verbal ability *n.* Another name for ***verbal intelligence**.

verbal intelligence *n.* One of the fundamental ***factors (2)** of human intelligence, derived from ***factor** analysis, corresponding roughly to ***crystallized intelligence**. Also called *verbal ability*. See also **BRITISH ABILITY SCALES**, **MILL HILL VOCABULARY SCALE**, **WECHSLER SCALES**.

verbal overshadowing *n.* A phenomenon of memory in which verbally describing a face (or other item) impairs later recognition of it, apparently contradicting the traditional idea that ***elaborative rehearsal** enhances memory performance. The phenomenon was discovered in 1999 by the US psychologists Jonathan W(olf) Schooler (born 1959) and Tonya Y. Engstler-Schooler (born 1967) and first reported in an article in the journal *Cognitive Psychology* in 1990. In their original experiment, these researchers showed subjects a video of a bank robbery; then they asked half of them to describe the robber and the other half (the ***control group**) to perform an irrelevant activity. The subjects who had described the robber verbally were significantly worse than the control subjects at recognizing the previously seen robber from a line-up of similar looking faces, because their verbal memory had overshadowed their visual memory. The finding has both theoretical and practical significance, especially for the accuracy of eyewitness recollection. This phenomenon is not directly related to ***overshadowing**. [So called because the verbal description eclipses the visual memory]

verbal rating scale *n.* Any ***rating scale** in which the ***response** categories are labelled with words, such as *Strongly Disagree*, *Disagree*, *Neutral*, *Agree*, *Strongly Agree*. Compare **GRAPHIC RATING SCALE**, **NUMERICAL RATING SCALE**.

verbal transformation effect *n.* An ***auditory illusion** involving radical changes in what is heard in a clear recording of a word or phrase

repeated many times in a continuous loop. If a single word is repeated 360 times in three minutes, the average young adult listener experiences substantial distortions and hears about 30 changes involving about six different word forms. In a classic experiment in which the word *tress* was used, listeners heard such words as *dress*, *stress*, *Joyce*, *florist*, *purse*, and even phonetically unrelated words such as *lunchtime*. Children under six years experience few if any transformations, and susceptibility to the effect declines slowly in middle age. The phenomenon was discovered by the US psychologist Richard M. Warren (born 1925) and the English psychologist Richard L(angton) Gregory (1923–2010) and published in the *American Journal of Psychology* in 1958, a more detailed account being provided by Warren in the journal *Psychological Bulletin* in 1968. Compare [SEMANTIC SATIATION](#).

vergence *n.* Inward or outward turning of the eyes; a generic term for both [*ocular convergence](#) and [*ocular divergence](#). [From Latin *vergere* to incline]

veridical *adj.* Truthful or accurate, especially in relation to [*perceptions](#), [*dreams](#), or [*premonitions](#) that are confirmed by subsequent observations. **veridicality** *n.* The property or condition of being veridical. [From Latin *veridicus* truthful, from *verus* true + *dicere* to speak]

vermis *n.* The wormlike central strip connecting the two halves of the [*cerebellum](#) along its midline, involved in the coordination of trunk and eye movements and probably in the regulation of motivation. See also [ATTENTION-DEFICIT/HYPERACTIVITY DISORDER](#). [From Latin *vermis* a worm]

vernacular *n.* The indigenous language or [*dialect](#) commonly spoken by members of a community. See also [BLACK ENGLISH VERNACULAR](#). [From Latin *vernaculus* belonging to a household slave, from *verna* a household slave]

vernier acuity *n.* [*Visual acuity](#) expressed in terms of the minimum [*visual angle](#) of displacement that can be detected between two bars or lines that are almost, but not quite, aligned. [From *vernier scale* an auxiliary device for making fine adjustments to a measuring instrument, named after the French mathematician Paul Vernier (1580–1637) who invented it]

Verstehen *n.* A method of interpreting or understanding other people through an intuitive understanding of symbolic relationships derived from adopting the point of view of the people being studied. It was originally put forward by the German philosopher Wilhelm Dilthey (1833–1911) who argued that the ultimate goal of the human or mental sciences (*Geisteswissenschaften*) is understanding, whereas that of the natural sciences (*Naturwissenschaften*) is explanation (*Erklärung*). See also [ACTION](#), [HERMENEUTICS \(1\)](#). [From German *Verstehen* understanding, from *verstehen* to understand]

vertebrate *n.* **1.** An animal with a spinal column or backbone, belonging to the subphylum Vertebrata, characterized by a relatively well-developed brain, including fish, amphibians, reptiles, birds, and mammals in the phylum Chordata. Compare [INVERTEBRATE \(1\)](#). *adj.* **2.** Of or relating to a vertebrate (1). Compare [INVERTEBRATE \(2\)](#). [From Latin *vertebra* a spinal joint, from *vertere* to turn]

vertical décalage See [DÉCALAGE](#).

vertical icicle plot *n.* In statistics, a graphical representation of the formation of clusters during successive steps of a [*cluster analysis](#). The steps of the analysis are represented in the display by the rows, and the individuals or cases by the columns, with individuals or cases in the same cluster being joined by a horizontal line. Compare [HORIZONTAL ICICLE PLOT](#). [Named after its resemblance to a row of icicles hanging from a windowsill]

vertical thinking See [LATERAL THINKING](#).

vertigo *n.* A sensation of dizziness or of the external world or one's body whirling around, usually caused by damage to the [*vestibular system](#). Sometimes used to denote a pathological fear of heights, more correctly called *acrophobia*. [From Latin *vertigo* a whirling around, from *vertere* to turn]

vesicle *n.* Any small sac or cavity, including any of the [*ventricles](#) of the brain, or the [*prosencephalon](#), [*mesencephalon](#), or [*rhombencephalon](#) of the

developing foetus. *See also* [SYNAPTIC VESICLE](#). [From Latin *vesicula* a little bladder or blister, diminutive of *vesica* a bladder or blister]

vestibular nerve *n.* One of the two major branches of the [*vestibulocochlear nerve](#), transmitting information related to balance from the [*vestibular system](#). [From Latin *vestibulum* a forecourt]

vestibular nystagmus *n.* Any form of [*nystagmus](#) controlled by the [*vestibular system](#) and activated by head movements. *See also* [POST-ROTATIONAL NYSTAGMUS](#), [VESTIBULO-OCULAR REFLEX](#).

vestibular sense *n.* The sense of balance and orientation, governed by the [*vestibular system](#). *See also* [AUBERT EFFECT](#), [VESTIBULOCOCHLEAR NERVE](#).

vestibular system *n.* An organ in the [*membranous labyrinth](#) of the [*inner ear](#) mediating sensations of balance, orientation, and movement, containing the [*otolith](#) (or statolith) organs that are responsive to linear acceleration (including gravity) and the [*semicircular canals](#) that are responsive to angular acceleration. When the head is accelerated rapidly in a straight line, a gelatinous membrane covered with heavy [*otoconia](#) crystals of calcium carbonate tends to remain stationary through inertia, bending or displacing [*hair cells](#) that project into the fluid at different angles from the [*maculae](#) of the [*utricle](#) and [*sacculle](#), causing the hair cells to trigger nerve impulses that are sent to the brainstem and cerebellum, leading to reflex movements of muscles of the eyes, neck, limbs, and trunk, and exciting neurons in the central nervous system that mediate the perception of motion and orientation in space. The otolith organs also respond to gravity, which according to the general theory of relativity is equivalent to accelerating an object upwards at 9.8 metres per second squared. The three semicircular canals detect angular acceleration by means of hair cells that project into the gelatinous membrane of the [*cupula](#) where a fluid (endolymph) acts as an inertial mass resisting angular acceleration, displacing the hair cells in the direction opposite to the direction of movement and causing adjoining neurons to send nerve impulses to the brainstem and cerebellum. Also called the *vestibular apparatus*. *See also* [AUBERT EFFECT](#), [KINAESTHESIS](#), [MECHANORECEPTOR](#), [PROPRIOCEPTION](#), [VESTIBULAR NERVE](#), [VESTIBULAR NYSTAGMUS](#), [VESTIBULAR SENSE](#), [VESTIBULO-OCULAR REFLEX](#). [From Latin *vestibulum* a

*****ebook converter DEMO Watermarks*****

forecourt or entrance]

vestibule *n.* An entrance hall, or a cavity positioned at the entrance to another, especially the **vestibular system* of the inner ear. **vestibular** *adj.*

vestibulitis *n.* Inflammation of the **labyrinth* and **cochlea* of the inner ear, causing ataxia, deafness, and vertigo.

vestibulocerebellum *n.* The functional area of the **cerebellum*, comprising the **vermis*, **flocculonodular lobe*, and associated nuclei, having two-way connections with **Deiters' nucleus* in the **medulla oblongata*. Lesions in this area lead to **nystagmus* and **ataxia*, especially involving trunk movements. *See also* CEREBELLAR SYNDROME. *Compare* NEOCEREBELLUM, SPINOCEREBELLUM. [So called because it is a part of the cerebellum connected to Deiters' nucleus, which receives inputs mainly from the vestibular system]

vestibulocochlear nerve *n.* Either of the eighth pair of **cranial nerves*, supplying the organs of hearing and balance in the **inner ear*. It has two principal branches: the vestibular nerve, which transmits information related to balance from the **vestibular system*, and the cochlear nerve, which transmits auditory information from the **organ of Corti* in the cochlea of the inner ear to the **inferior colliculus* and thence to the **auditory cortex*. Also called the *auditory nerve* or the *acoustic nerve*.

vestibulo-ocular reflex *n.* A reflex rotation of the eyes activated by the **vestibular system* in response to a movement of the head, keeping the retinal image stable, also activated by stimulation of the external auditory canal with warm fluid, eliciting rotatory nystagmus towards the stimulated side, or cold fluid eliciting rotation away from the stimulated side. *See also* BÁRÁNY TEST, CALORIC NYSTAGMUS. **VOR** *abbrev.*

Viagra *n.* The proprietary name of the drug sildenafil citrate, introduced in 1998 for the treatment of **impotence (2)* or **erectile disorder*. It acts by selectively inhibiting the enzyme phosphodiesterase type 5 (PDE5) that metabolizes **cyclic GMP* in the **corpora cavernosa* of the penis, increasing the bioavailability of cyclic GMP and thereby increasing the inflow and decreasing the outflow of blood in these erectile tissues, the effects becoming
*****ebook converter DEMO Watermarks*****

apparent within half an hour or an hour of oral administration. [Trademark, a blend of *vi(gour)* + *(Ni)ag(a)ra*, suggesting a combination of power or stamina and unstoppable flow, coined by the drug company Pfizer in spite of the fact that the name *Niagara* has connotations of falls rather than rises]

vibration receptor *n.* A **sensory* receptor that responds to rapid oscillatory movements and that mediates the **vibratory sense*. See *MEISSNER'S CORPUSCLE*, *PACINIAN CORPUSCLE*. See also *MECHANORECEPTOR*.

vibratory sense *n.* The faculty for sensing vibration, mediated by **vibration receptors*, also involved in the tactile sensation of texture when the fingers are moved across a surface. Also called *vibrotactile perception*. See also *PALLAESTHESIA*, *TOUCH*.

Vierordt's law *n.* The proposition that short time intervals tend to be overestimated and long ones underestimated, the *indifference interval* being the intermediate length that is neither overestimated nor underestimated, usually found by experiment to be in the region of 0.7 second. [Named after the German physiologist Karl von Vierordt (1818–84) who formulated it in 1868]

vigilance *n.* The state or condition of being alert and attentive. It is studied in psychology by measuring the speed and accuracy with which a person can respond to stimuli, the stimuli usually being infrequent and difficult to detect against a background of **noise* (2). See also *SIGNAL DETECTION THEORY*. [From Latin *vigilans* keeping awake, from *vigilare* to be watchful, from *vigil* awake]

vignette *n.* A word-picture, a brief verbal outline of a scenario, or a short story about hypothetical characters in a particular situation, to which research participants or interviewees are asked to respond. Vignettes are used in various areas of psychological research including studies related to **attribution* theory, and they are also used to elicit opinions, attitudes, beliefs, or judgements. [From French *vignette* a small vine, from *vigne* a vine, from Latin *vineā* a vine, alluding to the original meaning, a design of vine-leaves and tendrils used on the title-page of a book or manuscript]

Vigotsky blocks See *VGOTSKY BLOCKS*.

*****ebook converter DEMO Watermarks*****

Vineland Social Maturity Scale *n.* A scale designed to measure social competence, defined as a functional composite of human traits that subserve social usefulness and are reflected in self-sufficiency and in service to others, from birth to 30 years of age. It measures eight categories of behaviour: self-help general, self-help eating, self-help dressing, locomotion, occupation, communication, self-direction, and socialization. An interview is conducted with a parent, sibling, or other third party who is familiar with the person being assessed, and scores are assigned according to the behaviours that are reported to be customarily exhibited, the assessment being expressed in terms of **social age* or **social quotient*. It was developed by the US psychologist Edgar (Arnold) Doll (1889–1968), originally published in 1936, and discussed in Doll's booklet *Your Child Grows Up* in 1950. [Named by Doll after the Vineland Training School for the Mentally Retarded, where it was developed]

virtual reality *n.* A computer-generated perceptual simulation of a three-dimensional image or environment with which the viewer can interact, often requiring a headset or goggles providing visual stimuli and gloves or other bodily attachments fitted with sensors. In a typical virtual reality display, turning the head produces an appropriate change in what is seen, and moving a hand activates a corresponding movement of an image of a hand in the display. The term, which became popular in the 1980s, is based on the concept of a *virtual image* in optics, which is an image of the kind seen in a mirror and formed from light rays apparently diverging from an object or surface, in contradistinction to an actual image formed from light rays actually diverging from an object or surface. *See also* *MUD*, *TELEDILDONICS*. **VR** *abbrev.*

virtual self *n.* In **self-psychology*, an image of the **neonate*'s self in the mind of a parent.

virus *n.* A submicroscopic particle of **RNA* or **DNA*, coated with **protein* and capable of self-replication within the cells of an organism, where its effects are often **pathogenic*. [From Latin *virus* venom]

viscera *n. pl.* A generic term for the large internal organs of the abdominal cavity. **viscus** *sing.* **visceral** *adj.* [From Latin *viscera* entrails, plural of *viscus*]
*****ebook converter DEMO Watermarks*****

an internal organ]

visceral afferent fibres *n.* Nerve fibres that arise from neuron cell bodies in ***dorsal** root ganglia and that transmit impulses from the internal organs of the body to the spinal cord. *Compare* **VISCERAL EFFERENT FIBRES**. [From Latin *viscera* entrails, plural of *viscus* an internal organ + *aferre* to carry to, from *ad* to + *ferre* to carry]

visceral efferent fibres *n.* Nerve fibres that belong to the sympathetic and parasympathetic divisions of the ***autonomic** nervous system and that transmit impulses from the spinal cord to smooth muscles and glands. [From Latin *viscera* entrails, plural of *viscus* an internal organ + *eferre* to carry off, from *e* from + *ferre* to carry]

visceroreceptor *n.* A ***sensory** receptor located in the ***viscera**. Also called a *visceroceptor*. *See also* **INTEROCEPTOR**.

visible spectrum *n.* The part of the ***spectrum** of light that stimulates ***photoreceptors** in the eye and produces visual sensations, with wavelengths ranging from about 390 to 740 nanometres corresponding to the ***bandwidth** of the visual system.

vision *n.* **1.** One of the five classical ***senses** (1), stimulated by light and mediated by ***photoreceptors** in the retinas of the eyes. It consists of three largely independent systems that analyse information about shape, colour, and movement, respectively, and that feed sensory signals from photoreceptors along three separate visual pathways to different processing systems in the ***visual cortex**, rather than a single hierarchical system that processes them all together. *See also* **MAGNOCELLULAR SYSTEM**, **PARVOCELLULAR SYSTEM**. **2.** An unusually vivid mental ***image** (3). **3.** A mystical or religious experience or divine revelation involving supernatural or paranormal perception (*the vision of St John of the Cross*). **4.** The experience of perceiving an apparition or ghost (*I had a vision of my late father*). **5.** The faculty of wise judgement or foresight (*We need a leader with vision*). **visual** *adj.* Of or relating to vision (1) or the eyes. [From Latin *visio* sight, from *videre* to see + *-ion* indicating an action, process, or state]

visual accommodation *n.* Another name for **accommodation (1)*.

visual acuity *n.* The keenness or sharpness of **vision (1)*, measured by various devices such as an **acuity grating*, **Landolt circles*, **König bars*, or a **Snellen fraction*. See also ACUITY, DYNAMIC VISUAL ACUITY, MINIMUM SEPARABLE, MINIMUM VISIBLE, STEREOSCOPIC ACUITY, VERNIER ACUITY.

visual adaptation *n.* A generic term for **chromatic adaptation (1)*, **dark adaptation*, **light adaptation*, **prism adaptation*, **transient tritanopia*, or any other form of **adaptation (2)* affecting **vision (1)*. See also FIELD ADAPTATION, VISUAL AFTEREFFECT.

visual aftereffect *n.* Any visual experience that follows and is caused by an earlier visual stimulus, including **afterimages* and an important class of **visual illusions*. See AUBERT EFFECT, CONTINGENT AFTEREFFECT, FIGURAL AFTEREFFECT, MCCOLLOUGH EFFECT, MOTION AFTEREFFECT, SPIRAL AFTEREFFECT, SUCCESSIVE CONTRAST, TILT AFTEREFFECT, WATERFALL ILLUSION.

visual angle *n.* The angle subtended at the nodal point of the eye's crystalline lens by a visual stimulus, determined jointly by the size of the stimulus and its distance from the observer. The visual angle subtended by the moon in the night sky is almost exactly one-half of a degree or 30 minutes of arc, this being the *angular size* of the stimulus. Labelling the visual angle θ (degrees), if the linear size (height, width, or diameter) of the stimulus is h and its distance from the observer is d , where h and d are measured in any units provided they are the same, then according to simple trigonometry $\tan(\theta/2) = (h/2)/d$. Hence for the image of a person 6 feet tall at a distance of 100 feet, $h = 6$, $d = 100$, and $\tan(\theta/2) = 3/100 = 0.03$. Using an inverse tangent button ($\tan^{-1}$) on a pocket calculator or a table of tangents, we can determine that $\theta/2 = 1.72$, therefore the visual angle θ subtended by the object is 3.44 degrees or 3 degrees and 26 minutes of arc. For small visual angles, the approximation $\tan \theta \approx h/d$ may be used, yielding in this example $\tan \theta = 0.06$ and $\theta = 3.43$ degrees, which also rounds to 3 degrees and 26 minutes of arc. The moon's diameter is 2,160 miles and its average distance is 238,900 miles, therefore $\tan \theta \approx 2,160/238,900$, yielding an angular size of $\theta \approx 0.52$. The sun's diameter is approximately 400 times that of the moon and it is 400

times further away, so by a remarkable coincidence, it subtends almost exactly the same angle at the eye. *See also* [AUBERT–FÖRSTER PHENOMENON](#), [EMMERT’S LAW](#), [KÖNIG BARS](#), [MINIMUM SEPARABLE](#), [MINIMUM VISIBLE](#), [SIZE CONSTANCY](#).

visual aphasia *n.* Another name for [*alexia](#). *See also* [APHASIA](#).

visual area *See* [VISUAL CORTEX](#).

visual association cortex *See* [VISUAL CORTEX](#).

visual cliff *n.* An experimental apparatus for studying depth perception in infants, introduced by the US psychologists Eleanor J(ack) Gibson (1910–2002) and Richard D(avid) Walk (1920–1999) and published in the journals *Science* in 1957 and *Scientific American* in 1960, consisting of a narrow wooden board laid across the middle of a sheet of heavy glass, with a chequered material immediately beneath the glass on one side of the board and several feet below it on the other side (see [illustration](#)). Although the glass surface is palpably flat and solid on both sides, the chequered pattern provides a [*texture gradient](#) indicating a deep cliff on one side of the central board, and an infant as young as 6 months who is placed on the board will happily crawl across the glass to its mother on the shallow side but will almost invariably refuse to cross the deep side in spite of strong coaxing and tactile evidence that the glass provides a solid surface. The effect has also been found in several other species, such as kittens that have just learned to walk at about 4 weeks of age and that never cross the visual cliff, and chicks less than a day old that also never cross the cliff, suggesting that depth perception is innate rather than learned by experience.

Visual cliff. The infant will not crawl across the deep end.

visual cortex *n.* The areas of the ***cerebral** cortex devoted to processing visual information from the eyes, including the ***primary visual cortex** and the visual association cortex. The primary visual cortex, occupying the gyri on both sides of the deep ***calcarine sulcus** in the ***occipital** cortex, is known technically as Area V1 (for Visual Area 1), and it is sometimes called the striate cortex, because it contains white bands of myelin within the cortical layers of grey matter that give it a striped appearance. Neurons in Area V1 have the smallest ***receptive fields** in the visual cortex. The visual association cortex, now generally called the prestriate cortex, occupies areas successively further outward from the primary visual cortex. Area V2, immediately adjacent to V1, is characterized by thin stripes responsive to colour information and thick stripes responsive to directional motion and form,

*****ebook converter DEMO Watermarks*****

separated by paler interstripes responsive only to form, and it receives inputs concerning form from layers 2 and 3 of Area V1 and relays them to Area V3; it also receives inputs concerning colour from **blobs* in Area V1 and relays them to Area V4; and it receives inputs concerning movement and stereopsis from layer 4B of Area V1 and relays them to Area V5 (also called *MT* because it is situated towards the back of the **middle temporal gyrus*). Area V3, which surrounds V1 and V2, is specialized for monochromatic pattern perception, and Area V3A, which surrounds V3, is specialized for dynamic or moving form; Area V4, which occupies the **fusiform gyrus*, is specialized for colour vision and form perception; and Area V5 (or MT) is specialized for the perception of visual motion and stereopsis. There are further projections from Areas V3, V4, and V5 to specialized visual areas, such as the **inferior temporal gyrus* specialized for recognizing certain types of patterns, perhaps including hands, a part of the **superior temporal sulcus* containing neurons that respond selectively to faces, and the **pulvinar* at the back of the thalamus concerned with attention. Area V7, adjacent to V3A, has an unknown function, Area V8, adjacent to V4 at the back of the inferior temporal gyrus, processes colour vision, and an area labelled V6 has been identified only in monkeys.

visual disparity *n.* Another name for **binocular* disparity.

visual dominance *n.* The tendency for visual information to determine what is perceived when there is a conflict between the visual information and information from another sensory modality, as in the **ventriloquism effect*.

visual egocentre *n.* The point either midway between the eyes or at the centre of the skull where visual sensations are perceived or felt to converge. US *visual egocenter*. See also *EGOCENTRE*.

visual evoked potential *n.* An **evoked potential* elicited by a visual stimulus. See also *NERVE CONDUCTION VELOCITY*. **VEP** abbrev.

visual field *n.* The entire area of space supplying stimuli to the visual receptors at a given time. In humans, the visual field of each eye subtends a **visual angle* of about 170 degrees in the horizontal plane and there is almost complete overlap between the visual fields of the two eyes. The part of the

*****ebook converter DEMO Watermarks*****

visual field to the left of the point on which gaze is fixated is called the *left visual field* (lvf) and the area to the right the *right visual field* (rvf), each of these areas being a *hemifield*. Also called *field of vision* or a *visual perceptual field*. See also APPURTENANCE, DIVIDED VISUAL FIELD, GANZFELD, HOMONYMOUS HEMIANOPIA, PERIMETRY, TUNNEL VISION. Compare RECEPTIVE FIELD.

visual fixation *n.* The act or process of **fixating* (1) or training one's eyes on an object or point in the visual field so that its image falls on the **foveas* of the eyes.

visual hallucination *n.* A **hallucination* of vision, either of fully formed images of people or objects, or of unformed visual sensations such as flashes of colour or movement.

visual illusion *n.* Any of a diverse and heterogeneous group of **illusions* in the visual domain, also called *optical illusions*, the most significant of which fall into the following inexact and overlapping categories: *ambiguous figures*, which are not strictly illusory but are generally included in discussions of visual illusions: see DUCK-RABBIT, HYBRID IMAGE, MACH ILLUSION, NECKER CUBE, REVERSIBLE GOBLET, SCHRÖDER STAIRCASE, SCRIPTURE'S BLOCKS, SPINNING DANCER ILLUSION, YOUNG GIRL/OLD WOMAN FIGURE; *associative illusions*: see BALDWIN ILLUSION, CHEQUER-SHADOW ILLUSION, CRAIK-O'BRIEN EFFECT, CURVATURE ILLUSION, DELBOEUF ILLUSION, EBBINGHAUS ILLUSION, EHRENSTEIN'S BRIGHTNESS ILLUSION, EHRENSTEIN'S SQUARE ILLUSION, FILLED-SPACE ILLUSION, FILLING-IN ILLUSION, FRASER SPIRAL, GELB EFFECT, HELMHOLTZ ILLUSION, HERING ILLUSION, HERMANN GRID, HOLLOW SQUARES ILLUSION, HORIZONTAL-VERTICAL ILLUSION, IRRADIATION ILLUSION, JASTROW ILLUSION, KARDOS EFFECT, LAND EFFECT, MARGARET THATCHER ILLUSION, MORINAGA MISALIGNMENT ILLUSION, MÜLLER-LYER ILLUSION, MÜNSTERBERG ILLUSION, ORBISON ILLUSION, OUCHI ILLUSION, PATTERN-INDUCED FLICKER COLOUR, PINNA-BRELSTAFF ILLUSION, POGGENDORFF ILLUSION, PONZO ILLUSION, SANDER PARALLELOGRAM, STAR ILLUSION, TEACUP ILLUSION, TOP HAT ILLUSION, TWISTED-CORD ILLUSION, WUNDT ILLUSION, ZANFORLIN ILLUSION, ZÖLLNER ILLUSION; *illusory contours*: see EHRENSTEIN'S BRIGHTNESS ILLUSION, KANIZSA TRIANGLE, RANDOM-DOT STEREOGRAM; *impossible figures*: see FREEMISH CRATE, IMPOSSIBLE TRIDENT, PENROSE TRIANGLE, STAIRCASE ILLUSION; *movement illusions*: see APPARENT MOVEMENT (alpha movement, beta movement, gamma movement, delta movement), AUTOKINETIC EFFECT,

*****ebook converter DEMO Watermarks*****

CHESHIRE CAT EFFECT, FLASH-LAG EFFECT, HOLLOW-FACE ILLUSION, KINETIC DEPTH EFFECT, LISSAJOUS FIGURE, MOTION CAPTURE, OCULOGYRAL ILLUSION, OPTIMAL MOVEMENT, OUCHI ILLUSION, PARTIAL MOVEMENT, PINNA–BRELSTAFF ILLUSION, PHANTOM GRATING, PHI MOVEMENT, RANDOM-DOT KINEMATOGRAM, ROTATING HEAD ILLUSION, SPINNING DANCER ILLUSION, SPIRAL AFTEREFFECT, TERNUS PHENOMENON, VECTION, WAGON WHEEL ILLUSION, WATERFALL ILLUSION, WINDMILL ILLUSION; *perspective illusions*: see AMES ROOM, CORRIDOR ILLUSION, HOLLOW-FACE ILLUSION, HORIZONTAL–VERTICAL ILLUSION, LEANING TOWER ILLUSION, MOON ILLUSION, PONZO ILLUSION, TEACUP ILLUSION, TRAPEZOIDAL WINDOW, TURNING THE TABLES ILLUSION; *space–time illusions*: see KAPPA EFFECT, TAU EFFECT; *STEREOSCOPIC ILLUSIONS*: see ANAGLYPH, CHESHIRE CAT EFFECT, FLOATING-FINGER ILLUSION, HOLE-IN-THE-HAND ILLUSION, HOLLOW-FACE ILLUSION, LISSAJOUS FIGURE, PULFRICH EFFECT, RANDOM-DOT KINEMATOGRAM, RANDOM-DOT STEREOGRAM; *VISUAL AFTEREFFECTS*: see AUBERT EFFECT, CONTINGENT AFTEREFFECT, FIGURAL AFTEREFFECT, MCCOLLOUGH EFFECT, MOTION AFTEREFFECT, SPIRAL AFTEREFFECT, SUCCESSIVE CONTRAST, TILT AFTEREFFECT, WATERFALL ILLUSION. *See also* CARPENTERED WORLD, HONI PHENOMENON, NAIVE REALISM, PEPPER’S GHOST, TROMPE L’OEIL, VIERORDT’S LAW. *Compare* AUDITORY ILLUSION, POSTURAL AFTEREFFECT, TACTILE ILLUSION.

visual image *See* IMAGE (1, 2, 3).

visual impairment *n.* Any defect of vision, especially one falling short of total blindness. *See* BLINDNESS.

visual induction *n.* A form of *induction (3) in the visual modality in which stimulus elements associated with one part of the visual field or of an object or image affect what is perceived in another. *See* ASSOCIATIVE ILLUSION, COLOUR CONTRAST, LIGHTNESS CONTRAST.

visualizer *n.* A person whose characteristic style of mental imagery is visual rather than auditory, tactile, or motor. *Compare* AUDILE (2), MOTILE (2), TACTILE (2).

visual masking *n.* A reduction or elimination of the detectability of a brief (shorter than 100 milliseconds) visual stimulus called the *test stimulus* by the presentation of a second stimulus called the *masking stimulus* either

*****ebook converter DEMO Watermarks*****

before the test stimulus (**forward masking*), at the same time as the test stimulus (**simultaneous masking*), or after the test stimulus (**backward masking*). When the test stimulus and masking stimulus do not overlap spatially, forward masking is called **paracontrast* and backward masking is called **metacontrast*. The term was introduced in 1925 by the French experimental psychologist Henri Piéron (1881–1964). See also [BRIGHTNESS MASKING](#), [CENTRAL MASKING](#), [DICHOPTIC MASKING](#), [INSPECTION TIME](#), [MASKING](#), [PERKY PHENOMENON](#).

Visual–Motor Gestalt Test See [BENDER GESTALT TEST](#). **VMGT** *abbrev.*

visual pigment *n.* Any of four different **pigments* that are contained in **rods* and **cones* in the retinas of the eyes and that absorb light over a broad range of the **visible spectrum* but are maximally sensitive to either short wavelengths (blue light), medium wavelengths (green light), or long wavelengths (red, orange, and yellow light), the rod pigment **rhodopsin* having peak sensitivity to light of approximately 510 nanometres in the green part of the spectrum and the **cone* pigments having peak sensitivity at approximately 430 nm, 530 nm, and 560 nm, usually called blue, green, and red pigments respectively, although light of these wavelengths actually looks violet, blue–green, and yellowish–green. See also [BUNSEN–ROSCOE LAW](#), [CHROMOPHORE](#).

visual purple *n.* Another name for **rhodopsin*.

visual receptor *n.* Any of the **rods* or **cones* in the **retina* of the eyes that function as **sensory receptors* by converting light stimuli into nerve impulses. Also called a *photoreceptor*.

visual search *n.* An experimental task, the objective of which is to find a particular element in a visual display, as when all occurrences of the letter *e* have to be located and crossed out as quickly as possible in a page of text. A simple but striking demonstration of the fallibility of visual search can be carried out by printing the following sentence on a sheet of paper: FINISHED FILES ARE THE RESULT OF YEARS OF SCIENTIFIC STUDY COMBINED WITH THE EXPERIENCE OF LIFE. Many people who are
*****ebook converter DEMO Watermarks*****

asked to count the occurrences of the letter F as quickly as possible find only four of them after completing the search to their own satisfaction, although F occurs seven times in the sentence. *See also* [MULTIFRAME TASK](#), [SINGLE-FRAME TASK](#).

visual suppression *n.* Momentary suspension of visual perception during a [*saccade](#), triggered by [*feedforward](#) of the efferent output of the extra-ocular muscles, eliminating the impression of movement that would otherwise be created by the motion of the eyes, which cause movements of the images across the retinas. If a visual display linked to an automatic eye-movement tracker is altered only during saccades, the viewer does not perceive the changes occurring but may eventually become conscious of the fact that the image is no longer the same as it was. Also called *saccadic suppression*.

visual system *n.* A generic name for the totality of structures of the nervous system involved in vision.

visual violet *n.* Another name for [*iodopsin](#).

visual word-form dyslexia *n.* A generic name for [*attentional dyslexia](#), [*neglect dyslexia](#), and [*spelling dyslexia](#). Also called *peripheral dyslexia*.

visuospatial sketchpad *n.* A subsystem of [*working memory](#) that functions as a [*buffer store](#) for visually coded information.

vitamin *n.* Any of a number of organic substances (thus excluding trace minerals) that are present in foods in small quantities (thus excluding fats, carbohydrates, and proteins) and are necessary for normal [*metabolism](#).

vitamin A *n.* [*Retinol](#), a fat-soluble vitamin necessary for [*scotopic](#) vision, formed by [*hydrolysis](#) of beta-carotene, which is found in carrots and other yellow and green vegetables, butter, eggs, fish oil. **vitamin B complex** *n.* A group of water-soluble vitamins found especially in yeast and liver, necessary for the normal function of the cardiovascular and nervous systems, including thiamine (vitamin B₁), riboflavin (vitamin B₂ or, especially in the US,

vitamin G), pyridoxine (vitamin B₆), and cyanocobalamin (vitamin B₁₂). **vitamin C** *n.* Ascorbic acid, a white, crystalline, water-soluble vitamin found in citrus fruits, tomatoes, green vegetables, and potatoes, necessary for repair of fibrous tissue, as an antioxidant scavenging **free radicals* that can damage cells, and as a cofactor in the synthesis of **adrenalin* (epinephrine) and **noradrenalin* (norepinephrine); the human body cannot store it and a deficiency causes scurvy. **vitamin D** *n.* A group of fat-soluble vitamins found in cod-liver oil and other fish oils, milk, butter, and eggs, also synthesized from cholesterol in the skin when exposed to sunlight, a deficiency causing rickets and osteoporosis. **vitamin E** *n.* Tocopherol, a group of fat-soluble vitamins found in wheatgerm, lettuce, nuts, soybean, and eggs, necessary for normal reproduction and for maintaining **pituitary gland*, **adrenal gland*, and **sex* hormones. **vitamin G** *n.* Another name for vitamin B₂. **vitamin H** *n.* Another name (especially in US) for biotin, one of the B complex vitamins. **vitamin K** *n.* A group of fat-soluble vitamins found in green vegetables, eggs, fish-liver oils, necessary for blood clotting, also called *quinones*. **vitamin P** *n.* A group of water-soluble vitamins found in citrus fruits, blackcurrants, and rosehips, necessary for maintaining the permeability of the blood capillaries, also called *bioflavonoids*. [From Latin *vita* life + English *amine*, from *am(monium)* + Greek *-ine* indicating an amine, first identified and named in 1912 by the Polish-born US biochemist Casimir Funk (1884–1967) in the mistaken belief that they are amines]

vitamin therapy *See* ORTHOMOLECULAR THERAPY.

vitreous humour *n.* The transparent gelatinous substance that fills the eyeball between the crystalline lens and the retina. US *vitreous humor*. [From Latin *vitreus* made of glass, from *vitrum* glass, probably related to *videre* to see]

VNTR *abbrev.* Variable number of tandem repeats. VNTR genetic loci are those containing **repetitive DNA*.

vocal cords *n.* Two pairs of membranes in the **larynx*. The upper pair are called false vocal cords and are not involved in speech production; the lower pair (true vocal cords) are the **vocal folds*. [From Latin *vocalis* of or

relating to voice, from vox voice]

vocal folds *n.* A pair of membranes, resembling lips, stretched across the *larynx from front to back and capable of closing and opening to form a space called the *glottis. During speech production, the airstream from the lungs causes them to vibrate, and this vibration, amplified by resonators of the chest, throat, mouth-cavity, nose-cavity, and sinuses, results in the production of vocal sounds. Also called (*true*) *vocal cords*.

vocal fry *n.* A *vocal register characterized by a low-frequency (20–70 Hz) creaky articulation of a vowel, usually at the end of a speech segment or sentence. A typical example occurs in the 1933 Paramount film *She Done Him Wrong* at the end of the sentence in which the US actress Mae West (1893–1980) says: ‘Why don’t you come up some time and see me?’ According to research published in the *Journal of Voice* in 2012, vocal fry became common mainly among young, female Americans in the first decade of the 21st century, but in the United Kingdom it was already established among upper-class men as a marker of social status, and it is an intrinsic feature of some languages, such as Vietnamese, in which it can change the meaning of a word. Also called *creak* or *glottal fry*. [So called because of its resemblance to the sound of food being fried in fat]

vocal register *n.* The vocal *pitch adopted for speech, three important examples being falsetto (high pitch), modal voice (the normal pitch for speech), and *vocal fry (the lowest pitch). [From Latin *registrum* a register, from *regerere* to transcribe, from *re-* again + *gerere* to bear]

vocal tic disorder *n.* Any *tic disorder in which the predominant symptom is a vocal tic. *See also* TIC.

vocal tract *n.* The part of the air passage from the lungs that lies above the *larynx. The part of the air passage below the larynx is the *trachea.

vocational aptitude test *n.* In psychometrics, any *aptitude test designed to predict how successful the respondent is likely to be in a particular occupation.

voice box *n.* A non-technical name for the *larynx.

voiceprint *n.* Another name for a *speech spectrogram.

void mode *n.* A manner of viewing a coloured surface through a small aperture so that only a small and isolated area of the surface is visible at one time. Under these conditions the *Land effect disappears, and some *non-spectral colours such as brown cannot be perceived at all, the appearance of brown arising only when a yellow surface is darker than its surround. See also RETINEX THEORY. Compare ANORTHOSCOPIC, REDUCTION SCREEN.

volaemic thirst *n.* Another name for *hypovolaemic thirst. US *volemic thirst*.

volley theory *n.* A refinement of the *frequency theory of pitch perception, first proposed in 1939 by the US psychologist Ernest Glen Wever (1902–91), according to which the ear converts acoustic vibrations into nerve impulses for frequencies between about 500 hertz (the maximum firing rate of individual auditory neurons) and 5,000 hertz (above which the *place theory provides an adequate explanation) by causing groups of neurons to fire repeatedly and slightly out of phase with one another, producing a stream of nerve impulses more rapid than the firing rate of any individual neuron, analogously to volleys of arrows from a group of asynchronous archers arriving at their target more frequently than the maximum firing rate of any individual archer. Also called the *platoon-volley theory*. Compare FREQUENCY THEORY, PLACE THEORY.

voltage-gated ion channel *n.* An *ion channel, the permeability of which is regulated by changes in the cell's *membrane potential. Compare CHEMICALLY GATED ION CHANNEL.

volume *n.* 1. The magnitude of the three-dimensional space occupied by a solid or a quantity of fluid (*brain volume*, *blood volume*); hence, figuratively, a quantity or amount of anything (*volume of trade*). 2. The perceived magnitude of space filled by a sound, loud and low-pitched sounds generally appearing to fill more space than soft and high-pitched sounds. 3. Another

name for **loudness*, but this sense is avoided in careful usage. **4.** A bound book, especially one belonging to a series. [From Latin *volumen* a roll or book, from *volvere* to turn or roll up]

volume colour *n.* Another name for **film colour*. US *volume color*. [So called in contrast to surface colour]

volumetric thirst *n.* Another name for **hypovolaemic thirst*. [From Greek *volumen* a roll + *metron* a measure + *haima* blood]

voluntary involuntary treatment *n.* Another name for a **Ulysses contract*.

voluntary muscle *n.* Any muscle controlling voluntary functions and consisting of **striped muscle* tissue, including any **skeletal muscle*. The **cardiac muscle*, though striped, is an exception in not being a voluntary muscle. *See also* *MUSCLE*. *Compare* *INVOLUNTARY MUSCLE*.

volunteer (research or experimental) *n.* Another name for a **subject (research or experimental)* or **participant (research or experimental)*.

vomer nasal organ *n.* A slender horizontal groove ending in a blind pouch in the nasal **mucous membrane* on each side of the septum separating the nostrils in most mammals. In non-human mammals and reptiles it is highly developed and functions as a sensitive olfactory organ that responds to **pheromones*, but in human adults it is rudimentary and possibly vestigial, though there is some evidence that it functions as a receptor for **steroid* molecules and mediates the **Whitten effect*, even in humans. Also called *Jacobson's organ*. **VNO** *abbrev.* [From *vomer* the bone separating the nasal passages in mammals, from Latin *vomer* a ploughshare + *nasalis* of or relating to the nose, from *nasus* the nose]

von Osten's horse *See* *CLEVER HANS*.

von Restorff effect *n.* A tendency, when attempting to recall a list of

words or other items that have been learned, to show superior recall for any item that has a high degree of **salience* (1), a typical example being a word printed in differently coloured ink. The effect is much weaker for **recognition* memory. Also called the *Restorff effect* or the *isolation effect*. See also *NEXT-IN-LINE EFFECT*. Compare *RANSCHBURG INHIBITION*. [Named after the German psychologist Hedwig von Restorff (1906–62) who first reported it in her doctoral dissertation, published in the journal *Psychologische Forschung* in 1933, and in a second article, co-authored with her dissertation supervisor, the German Gestalt psychologist Wolfgang Köhler (1887–1967), in the same journal in 1937]

voodoo death *n.* Death or apparent death resulting from the effects of voodoo, a set of religious beliefs and practices of West African origin, surviving in Haiti and other parts of the Caribbean and in scattered communities in the southern United States. Voodoo formerly involved human sacrifice and cannibalism; it now involves sorcery and curses so frightening that they are believed to be capable of causing the death of their victims, though some of the deaths may be apparent rather than real and may result from poisoning by sorcerers attempting zombification (see *ZOMBIE* (2)). In Haitian voodoo (or vodun), the physical parts of a human being are the *corps cadavre* (mortal flesh), which decays after death, and the *n'âme* (spirit of the flesh), which passes into the soil. The spiritual parts are the *z'étoile* (star of destiny) and the two components of the soul, namely the *gros-bon-ange* (great good angel) and the *ti-bon-ange* (little good angel), both of which survive death and are susceptible to sorcery. The term was brought to prominence by the US physiologist Walter Bradford Cannon (1871–1945) in an article entitled ‘“Voodoo” Death’ in the journal *American Anthropologist* in 1942. Also called *thanatomania*. See also *BASKERVILLE EFFECT*, *NOCEBO EFFECT*, *ZOMBIE* (2). [From Louisiana French *voudou*, from West African Ewe *vodu* a guardian spirit]

voting paradox *n.* Another name for **Condorcet's paradox*.

vowel *n.* A speech sound, almost invariably forming the main part of a syllable, that involves no significant obstruction of the airstream through the **vocal tract*. Various features distinguish the sound of one vowel from another, notably whether the front, central part, or back of the tongue is

*****ebook converter DEMO Watermarks*****

raised, leading to **front vowels*, **central vowels*, and **back vowels* respectively, and how high the tongue is raised towards the roof of the mouth, leading to **close vowels*, **mid vowels*, and **open vowels*. These features are often portrayed on a *vowel quadrilateral* representing the mouth schematically (see *illustration*). Compare *CONSONANT*, *SEMIVOWEL*. [French *voyelle*, from Latin *vox* a voice]

Vowel quadrilateral

voyeurism *n.* A **paraphilia* characterized by recurrent, intense sexual fantasies, urges, or behaviour involving the surreptitious observation of people who are naked, undressing, or engaging in sexual activity. See also *SCOPOPHILIA*, *VOYEURISTIC DISORDER*. **voyeur** *n.* A person given to voyeurism, often referred to non-technically as a **peeping Tom*. Compare *ÉCOUTEUR*. [From French *voyeur* one who observes or sees]

voyeuristic disorder *n.* A **paraphilic disorder* in **DSM-5* characterized by intense, recurrent sexual arousal from watching unsuspecting people when they are naked, undressing, or having sex, or associated fantasies or urges. To meet the diagnostic criteria in *DSM-5*, the individual must be at least 18 years of age and must either have acted out this

behaviour with a non-consenting person over a period of at least six months, or the fantasies or urges must have caused clinically significant distress or impairment in social, occupational, or other areas of life for the same minimum period. *See also* [VOYEURISM](#).

vulva *n.* The orifice of the [*vagina](#), constituting the external genitalia of a human female, including the labia majora, labia minora, and clitoris. [From Latin *vulva* a covering or womb]

VX *abbrev.* The chemical name of methylphosphonothioic acid, a colourless and odourless liquid that was developed in the UK in 1949, that turns into a potent [*nerve](#) gas when exposed to air, and that is stockpiled by the United States and other countries as a potential chemical weapon. It blocks the transmission of nerve impulses in the central nervous system, causing convulsions and respiratory failure, its effect being immediate. Just 10 milligrams on the skin is enough to kill an average adult male. Formula: $C_{11}H_{26}NO_2PS$.

Vygotsky blocks *n.* A test of [*concept formation](#) in which the respondent is presented with 32 blocks differing in shape, colour, width, and height and is asked to sort them into categories according to codes written on their undersides. The respondent is not told the meaning of the codes, but blocks with the same code belong to the same category, one code being used for all tall and wide blocks, a second code for short and wide blocks, a third code for tall and thin blocks, and a fourth code for short and thin blocks, colour and shape being irrelevant. Also spelt *Vigotsky blocks*, and sometimes referred to as the *Vygotsky test* or *Vigotsky test*. [Named after the Russian psychologist Lev Semyonovich Vygotsky (1896–1934) who used them extensively in his research, though he credited their development to his colleague Leonid Solomonovich Sakharov (1900–28)]

Wada test *n.* A procedure for determining which cerebral hemisphere is dominant for speech production by injecting an anaesthetic (sodium amytal) into one of the carotid arteries that supply blood to the brain and noting whether speech is immediately disrupted, indicating that the anaesthetized hemisphere is dominant for speech. [Named after the Japanese-born Canadian physician Juhn Atsushi Wada (born 1924) who introduced it in 1949]

waggle dance *n.* One of two patterns of movement, described by the Austrian zoologist Karl von Frisch (1886–1982) in a series of publications from 1924 onwards, through which a female honey-bee communicates to other members of her hive the direction and distance of a source of nectar or a new nesting site more than a certain distance away—more than about 5–80 metres away, depending on the bee species or subspecies. The bee describes a repeated figure of eight on the (usually) vertical surface of a honeycomb, moving in a straight line while wagging her abdomen swiftly (3–15 hertz) from side to side, looping back to perform another straight wagging run from the same point, then looping back for a further straight wagging run, and so on, alternating the return loops between left anticlockwise) and right (clockwise) (see [illustration](#)). The direction of the wagging run relative to the perpendicular indicates the direction of the target relative to the position of the sun, the liveliness and length of the dance, how rich the food source is; and the tempo of the dance, the distance of the food source—for example, in the giant honey-bee *Apis dorsata*, 40 complete figures of eight per minute indicates 15 metres, 27 per minute indicates 30 metres, and 19 per minute indicates 610 metres. This comes closer to being a [*language \(1\)](#) than any other non-human communication system. *Compare* [ROUND DANCE](#). [Translated

from von Frisch's German *Schwänzeltanz* literally tail-wagging dance, from *schwänzel* to wag one's tail, from *Schwanz* a tail + *Tanz* a dance]

Waggle dance

Wagner–Meissner corpuscle *n.* Another name for ***Meissner's corpuscle**. [Named after the German anatomists Rudolf Wagner (1805–64) and Georg Meissner (1829–1905) who both studied it]

wagon wheel illusion *n.* A visual illusion caused by ***aliasing** in which a rotating wheel or other object, when viewed in a cinema or television picture or under ***stroboscopic** illumination, appears to turn slowly one way, then slowly the other way as its rotation gathers speed. If the picture or stroboscopic frequency is exactly synchronized to a multiple of the rotation frequency, then the rotating object appears stationary. Compare **WINDMILL ILLUSION**.

Wald–Wolfowitz runs test *n.* In statistics, a ***non-parametric** and ***distribution-free test** of the randomness of an ordered sequence of binary or dichotomous observations, in which the number of ***runs** expected on the basis of chance is calculated and compared with the observed number of runs. Also called the *runs test*. [Named after the Romanian-born US statistician Abraham Wald (1902–50) and the Polish-born US statistician Jacob Wolfowitz (1910–81) who developed it in 1940]

*****ebook converter DEMO Watermarks*****

Wallerian degeneration *n.* Disintegration of a nerve fibre following injury or disease distal to the nerve cell body, progressing from the site of the lesion along the axon away from the nerve cell body, leaving the segment between the nerve cell body and the site of the injury intact. It is sometimes induced experimentally to trace projections from particular areas to unknown destination sites. Also called *anterograde degeneration*. [Named after the English physiologist Augustus V(olney) Waller (1816–70)]

Ward's method *n.* In statistics, a widely used technique of **cluster analysis* that begins with isolated individuals or cases and progressively combines them into clusters, and then combines clusters, until every individual is in the same cluster. At each stage in the analysis individuals or clusters that merge are those that result in the smallest increase in the sum of the squared distances of each individual from the mean of its cluster. Ward's method is a form of **agglomerative hierarchical clustering*. [Named after the US educational psychologist Joe Henry Ward, Jr (1926–2011), who developed the technique in 1963]

warm/cold effect *See* TRAIT CENTRALITY.

warm spot *n.* A small area of the **skin* supplied by **free nerve endings* that transmit sensations of warmth when touched by warm stimuli. *See also* PARADOXICAL WARMTH, PARADOXICAL HEAT. *Compare* COLD SPOT.

warmth contrast *n.* The apparent increase in the warmth of a stimulus when it is juxtaposed with or follows shortly after a cooler stimulus, or its apparent decrease in warmth if it is juxtaposed with or follows a warmer stimulus. *See also* CONTRAST (2), SIMULTANEOUS CONTRAST, SUCCESSIVE CONTRAST, THERMAL ADAPTATION.

War of the Ghosts *n.* A haunting native American folk tale that has been widely used to study memory since the English psychologist Sir Frederic Charles Bartlett (1886–1969) introduced it into psychology for his experiments on **serial reproduction* and **successive reproduction* and recorded it in his book *Remembering: A Study in Experimental and Social Psychology* (1932). He chose it because of its capacity to arouse vivid

imagery and because it was taken from a radically different culture and 'seemed likely to afford good material for persistent transformation' (p. 64). This is the story exactly as Bartlett presented it, apart from new paragraphs, which have been suppressed for reasons of space: 'One night two young men from Egulac went down to the river to hunt seals, and while they were there it became foggy and calm. Then they heard war-cries, and they thought: "Maybe this is a war party". They escaped to the shore, and hid behind a log. Now canoes came up, and they heard the noise of paddles, and saw one canoe coming up to them. There were five men in the canoe, and they said: "What do you think? We wish to take you along. We are going up the river to make war on the people". One of the young men said: "I have no arrows". "Arrows are in the canoe", they said. "I will not go along. I might be killed. My relatives do not know where I have gone. But you", he said, turning to the other, "may go with them." So one of the young men went, but the other returned home. And the warriors went on up the river to a town on the other side of Kalama. The people came down to the water, and they began to fight, and many were killed. But presently the young man heard one of the warriors say: "Quick, let us go home: that Indian has been hit". Now he thought: "Oh, they are ghosts". He did not feel sick, but they said he had been shot. So the canoes went back to Egulac, and the young man went ashore to his house, and made a fire. And he told everybody and said: "Behold I accompanied the ghosts, and we went to fight. Many of our fellows were killed, and many of those who attacked us were killed. They said I was hit, and I did not feel sick". He told it all, and then he became quiet. When the sun rose he fell down. Something black came out of his mouth. His face became contorted. The people jumped up and cried. He was dead.' (p. 65)

Wason selection task *n.* A simple but tricky logical puzzle introduced in 1966 by the English psychologist Peter C(atheart) Wason (1924–2003) and widely used to study **problem solving*. Four cards are laid on a table with their uppermost faces showing the following letters and numbers: *E*, *K*, 4, 7. The respondent is told that each card has a number on one side and a letter on the other. The following rule may or may not be true: *If a card has a vowel on one side, then it has an even number on the other side*. Which cards would have to be turned over to determine whether or not the rule is true? The vast majority of respondents choose only the card showing *E*, or the card showing *E* and the card showing 4. The correct answer is *E* and 7. If the card showing

E turned out to have an odd number on the other side, or if the card showing 7 turned out to have a vowel on the other side, that would disprove the rule. But the card showing 4 is irrelevant, because the rule does not state that a card with an even number on one side must have a vowel on the other, and therefore turning over this card could neither prove nor disprove the rule. The failure of most respondents to select the card showing 7, which could disprove the rule, and their tendency to select the irrelevant card showing 4, were interpreted by Wason as evidence of a **confirmation bias*. According to some researchers, errors in this task may also be due partly to a **matching bias*—a tendency to focus attention on evidence that contains the letters and numbers mentioned explicitly in the rule that is being tested. The problem can be framed in realistic rather than abstract terms. In one influential Italian experiment, participants were shown a sealed and an unsealed envelope face down, and an envelope with a 50-lire stamp and an envelope with a 40-lire stamp face up, and were asked which envelopes would have to be turned over to prove or disprove the rule: *If a letter is sealed, then it has a 50-lire stamp on it*. This is the identical problem; but when it was presented in this way, most people solved it easily—a classical **framing effect*. Also called *Wason's four-card selection task* or simply the *four-card problem*.

Wason's 2-4-6 problem See 2-4-6 PROBLEM.

waterfall illusion *n.* A visual illusion of **apparent movement* created by gazing for a period of time at a fixed point in a waterfall and then looking at a stationary object, which appears to move upwards. It is usually produced in the laboratory by means of an endless belt of horizontal stripes or dots at which a viewer is instructed to stare fixedly. If the belt is stopped after about 30 seconds, the vivid illusion is created that it is drifting backwards, but in a strange manner, appearing to move without changing position. The illusion was first discussed in print by the Greek philosopher Aristotle (384–322 BC) in the *Parva Naturalia* in the essay *On Dreams*, although Aristotle did not mention waterfalls: 'When people turn away from looking at objects in motion, for example rivers, and especially those that flow very rapidly, things really at rest are then seen as moving' (Chapter 2, Bekker edition, p. 459b). Also called the *waterfall effect*. See also MOTION AFTEREFFECT. Compare PLATEAU SPIRAL.

water intoxication *n.* A condition of irritability, lethargy, and confusion, sometimes followed by convulsions and coma, caused by drinking an excessive quantity of water, leading to an abnormally low concentration of **sodium* in the blood.

water-jar problem *n.* Any logical problem involving the measurement of a specified volume of liquid using jars of different capacity, first introduced into cognitive psychology in 1942 by the US psychologist Abraham S(amuel) Luchins (1914–2005) to study **Einstellung* effects in **problem solving*. A typical complex water-jar problem requiring an indirect solution is as follows. Given empty jars holding 21 quarts, 127 quarts, and 3 quarts, obtain 100 quarts of water; this is solved by filling the 127-quart jar and then from it filling the 21-quart jar once and the 3-quart jar twice, leaving 100 quarts as required in the 127-quart jar. A simple water-jar problem such as the following can be solved directly. Given empty jars holding 15 quarts, 39 quarts, and 3 quarts, obtain 18 quarts of water; this can be solved directly by filling the 15-quart and 3-quart jars and then emptying their contents into the 39-quart jar. In an experiment with college students, Luchins found that after solving several complex problems, 81 per cent of the students used the same indirect procedure with simple problems that could be solved directly, and only 17 per cent used the direct approach, whereas 100 per cent of students who had not been exposed to the complex problems solved the simple problems directly. Previous success with the indirect technique apparently created an *Einstellung* or **set (2)* that blinded students to the direct approach. See also *AUFGABE*, *GENERAL PROBLEM SOLVER*, *SET (2)*.

water on the brain *n.* A non-technical name for **hydrocephalus*.

wavelength *n.* The distance between successive peaks of a wave, measured in the direction of propagation. Wavelength (λ) is equivalent to the velocity of propagation (v) divided by wave frequency (f): $\lambda = v/f$. The **visible spectrum* of light extends from a wavelength of about 390 nanometres at the violet end to about 740 nm at the red end, and the **audibility range* of sound waves from about 21.44 metres at the low end to 1.72 centimetres at the high end.

W cell *n.* A type of ganglion cell with a slow-conducting axon found in the
*****ebook converter DEMO Watermarks*****

retinas and the lateral geniculate nuclei, not clearly classifiable as an X cell or a Y cell, projecting to cells lying in the **parvocellular system* of the **lateral geniculate nucleus* concerned with colour vision and from there to **blobs* in the upper layers of the **primary visual cortex*.

weak AI *n.* An interpretation of **artificial intelligence* according to which conscious awareness is a property of certain brain processes, and whereas any physical behaviour can, in principle at least, be simulated by a computer using purely computational procedures, computational simulation cannot in itself evoke conscious awareness. *See also* CHINESE ROOM, GÖDEL'S THEOREM. *Compare* STRONG AI.

weal response *See* AXON REFLEX.

weapon focus *n.* A tendency for eyewitnesses to a crime involving a firearm to concentrate their attention on the weapon and as a consequence to show relatively poor subsequent recall of other aspects of the incident, in particular poor ability to identify the offender. The underlying psychological mechanism responsible for this phenomenon is **sharpening*.

Weber–Fechner law *n.* Another name for **Fechner's law*, Fechner himself having called it Weber's law, acknowledging the contribution to its development of the German psychophysicist Ernst Heinrich Weber (1795–1878).

Weber fraction *n.* In **psychophysics*, a ratio, differing from one type of sensory experience to another, representing the smallest increment in the magnitude of a stimulus that can be detected under ideal testing conditions, and that is a constant for each type of sensation according to **Weber's law*. Its value has been determined experimentally as $k = 1/62$ for visual brightness discrimination, $k = 1/333$ for auditory pitch discrimination, $k = 1/11$ for auditory loudness discrimination, $k = 1/53$ for weight discrimination, and so on. *See also* WEBER'S LAW. [Named after the German psychophysicist Ernst Heinrich Weber (1795–1878) who discovered it and published it in Latin in 1834 and in German in 1846]

Weber's law *n.* In **psychophysics*, the proposition that the smallest
*****ebook converter DEMO Watermarks*****

detectable difference in the magnitude of a stimulus (the [*Weber fraction](#)) is proportional to the magnitude of the lesser stimulus. Thus, for example, the smallest difference in weight that can be detected is proportional to the original weight, so that most people can just barely feel the difference in weight between an object of 530 grams and one of 540 grams, or between 1,060 grams and 1,080 grams, the [*Weber fraction](#) being 1/53 for weight discrimination according to experimental tests. The law is usually expressed by the equation $(\Delta I)/I = k$, where ΔI is the [*difference threshold](#) in physical magnitude, I is the magnitude of the lesser stimulus, and k is the Weber fraction, which is a constant for any type of sensation but that varies from one type of sensation to another. The law is accurate over most of the usable ranges for most sensory modalities (across 99.9 per cent of the range of visual brightness intensities that can be tested without damaging people's eyes, across 999,999-millionths of the usable range of auditory loudness intensities, and so on) but it breaks down at the extremes, and for auditory pitch perception the Weber fraction remains constant above 500 hertz but is slightly larger for lower pitches. *Compare* [FULLERTON–CATTELL LAW](#). [Named after the German psychophysicologist Ernst Heinrich Weber (1795–1878) who formulated it in 1834]

Wechsler Adult Intelligence Scale *See* [WECHSLER SCALES](#).

Wechsler Intelligence Scale for Children *See* [WECHSLER SCALES](#).

Wechsler Preschool and Primary Scale of Intelligence *See* [WECHSLER SCALES](#).

Wechsler scales *n.* A suite of [*intelligence tests](#) based on a test originally developed in 1939 as the *Wechsler-Bellevue* ([WB](#)) scale by the Romanian-born US psychologist David Wechsler (1896–1981). The *Wechsler Adult Intelligence Scale* (fourth revision) or WAIS-IV and the *Wechsler Intelligence Scale for Children* or WISC-IV were published in 2008 and are among the most highly regarded intelligence tests, and the *Wechsler Preschool and Primary Scale of Intelligence* or WPPSI and the *Wechsler Abbreviated Scale of Intelligence* or WASI are also well known. Each of these scales has to be administered individually by a trained tester, and each yields an overall IQ score, plus four index scores and scores on component

*****ebook converter DEMO Watermarks*****

subtests. The subtests of the WAIS-IV are grouped into a *Verbal Comprehension Scale*, comprising similarities (explaining what things have in common), vocabulary (explaining the meanings of words), information (general knowledge), and comprehension (explaining the reasons for everyday things); a *Perceptual Reasoning Scale*, comprising block design (arranging painted wooden blocks to copy designs formed by the examiner), matrix reasoning (filling in missing abstract symbols in an array), visual puzzles (working within a specified time limit, viewing a completed jigsaw puzzle and selecting three pieces that, when combined, reconstruct the puzzle), picture completion (working within a specified time limit, pointing out missing elements in several line drawings, such as the numeral 8 missing from a clock face or a leg missing from a crab), and figure weights (working within a specified time limit, viewing a scale with missing weights and selecting the option that keeps the scale balanced); a *Working Memory Scale*, comprising digit span (repeating back a string of numbers that are read out, either in the same order or reverse order), arithmetic (solving numerical problems), and letter-number sequencing (ordering numbers and letters presented in an unordered sequence); and a *Processing Speed Scale*, comprising symbol search (working within a specified time limit, scanning a group of symbols and indicating whether one matches a symbol in another group, completing as many items as possible), coding (working within a specified time limit, copying symbols that are paired with numbers), and cancellation (working within a specified time limit, scanning a structured arrangement of shapes and marking particular shapes). The [*correlations](#) between scores on the subtests are generally moderate or high.

weed *n.* Any useless or unwanted plant. Also, a common street name for [*cannabis](#), especially in the form of [*marijuana](#).

Weigl–Goldstein–Scheerer tests *See* [GOLDSTEIN–SCHEERER TESTS](#).

Weismannism *n.* The doctrine of the continuity of the [*germ plasm](#) and its rigid segregation from the mortal bodies in which it resides, including the notion that the [*germ line](#) can influence the body but not vice versa. *See also* [CENTRAL DOGMA](#). [Named after the German biologist August Friedrich Leopold Weismann (1834–1914) who expounded it in a series of articles in 1889–92]

*****ebook converter DEMO Watermarks*****

well-defined problem *n.* In the study of **problem solving*, any problem in which the initial state or starting position, the allowable operations, and the goal state are clearly specified, and a unique solution can be shown to exist. Typical examples are the **Tower of Hanoi*, **Wason selection task*, and **water-jar problems*. A problem that lacks one or more of these specified properties is an **ill-defined problem*, and most problems that are encountered in everyday life fall into this category. Also called a *well-structured problem*. See also *NINE-DOT PROBLEM*, *PROBLEM-SOLVING STAGES*.

Wells effect *n.* A reluctance to make judgements of legal liability on the basis of naked statistical evidence alone. In the original experiments, evidence from tyre tracks providing an 80 per cent probability that a particular bus company was responsible for running over a dog persuaded fewer than 20 per cent of experienced judges and people without legal training to rule against the bus company, although they were instructed to decide on the balance of probabilities. In contrast, evidence that the particular bus company was responsible for running over the dog, based on an analysis of tyre tracks that was said to be 80 per cent reliable, persuaded almost 70 per cent to rule against the company. Thus, evidence that is 80 per cent reliable is sufficient to persuade most people, but naked statistical evidence of an 80 per cent probability is not, although the mathematical probability is the same in both cases. See also *BASE-RATE FALLACY*, *SUBJECTIVE PROBABILITY*, *TAXICAB PROBLEM*. [Named after the US psychologist Gary L(eroy) Wells (born 1950) who first drew attention to the phenomenon in 1992]

well-structured problem *n.* Another name for a **well-defined problem*.

Weltanschauung *n.* A world view, philosophy, or distinctive outlook of a particular individual or group. [From German *Welt* world + *Anschauung* view or opinion]

wendigo *n.* Another name for **windigo*.

Wernicke–Korsakoff syndrome *n.* A generic name for disorders of the **central nervous system* resulting from a deficiency of thiamine (vitamin

B₁), usually caused by chronic **alcohol dependence*, with the signs and symptoms of **Wernicke's encephalopathy* and/or **Korsakoff's psychosis*.

Wernicke's aphasia *See* APHASIA.

Wernicke's area *n.* A region of the **cerebral cortex* towards the back of the **superior temporal gyrus* (temporal operculum), between Heschl's gyrus and the angular gyrus, usually in the left **cerebral hemisphere*, involved in the comprehension of both spoken and written language. Lesions in this area are associated either with Wernicke's aphasia, also called *auditory aphasia*, *receptive aphasia*, or *sensory aphasia* (*see* APHASIA), or with logagnosia (*see* AGNOSIA). *See also* PLANUM TEMPORALE. *Compare* BROCA'S AREA. [Named after the German neuropsychiatrist Karl Wernicke (1848–1905) who discovered it in 1874]

Wernicke's encephalopathy *n.* A degenerative brain disorder resulting from a deficiency of thiamine (vitamin B₁), usually caused by chronic **alcohol dependence*, characterized by lesions in the hypothalamus and elsewhere, causing **diplopia*, **nystagmus*, **dyskinesia*, and intellectual impairment. [Named after the German neurologist Karl Wernicke (1848–1905) who first described it in 1881]

Wertherism *n.* Morbid sentimentality. *See also* WERTHER SYNDROME.
Wertherian *adj.* [Named after the hero of Goethe's novel *The Sorrows of Young Werther* (1774), the publication of which led to a spate of suicides among young men]

Werther syndrome *n.* A pattern of imitative **cluster suicides* following the well-publicized suicide of a famous person. The phenomenon was first demonstrated statistically by the South African-born US sociologist David P. Phillips (born 1943) in an article in *American Sociological Review* in 1974, and elaborated in articles in *Science* in 1977 and 1978 and in the *New England Journal of Medicine* in 1986 and 1987. For etymology, *see* WERTHERISM.

Wheatstone–Panum limiting case *n.* Another name for **Panum's*

limiting case. [Named after the English physicist and inventor Sir Charles Wheatstone (1802–75) who discovered and reported it in 1838, and the Danish physician and physiologist Peter Ludvig Panum (1820–85) who rediscovered it in 1858]

whistled speech *n.* A form of human communication by whistling used by certain communities in Central and South America, the Canary Islands, and Turkey. When used for this purpose, whistling follows closely the rhythms and intonation contours of speech, allowing the listener to translate the whistled tones into ordinary language.

white blood cell *n.* Another name for a **leucocyte*. Also called a *white blood corpuscle*.

white coat syndrome *n.* High blood pressure or hypertension caused by **anxiety* in a doctor's surgery or other clinical environment, in a patient whose blood pressure is normal in other environments. Also called *white coat hypertension*. [Alluding to the white coat traditionally worn by clinicians]

white matter *n.* The whitish tissue of the brain and spinal cord, composed chiefly of myelinated neurons, the whiteness being due to the **myelin* and not the nerve tissue, which is grey. Also called (technically) the *substantia alba*. Compare GREY MATTER.

whiteness constancy *n.* Another name for **lightness* constancy.

white noise *n.* A sound wave or any other **time series* that is essentially random, all frequencies within a specified range being represented with equal intensity or energy. The sound of a radio or television receiver tuned between stations is white noise. The Russian statistician Evgeny Evgenievich Slutsky (1880–1948) proved in 1927 that a time series with a periodic structure can be transformed into white noise by passing it through a linear filter such as a **moving average*, and white noise can be transformed back into the periodic time series by passing it through the reverse linear filter, and this theorem is a basic principle of time-series modelling. See also NOISE (2). Compare COLOURED NOISE, FROZEN NOISE, PINK NOISE. [So called by analogy with white light, which contains all spectral frequencies in equal proportion]

*****ebook converter DEMO Watermarks*****

whitigo *n.* Another name for **windigo*.

Whitten effect *n.* The synchronization of the **oestrous cycles* of a group of females living together, occurring only when a male or his **pheromone* is present. It has been observed in rats, hamsters, voles, goats, cows, sheep, and humans, and is believed to operate via the **vomeronasal organ*. Also called the *male mouse effect*. Compare *LEE–BOOT EFFECT*. [Named after the Australian reproductive biologist Wes (Wesley Kingston) Whitten (1918–2010) who first reported it in 1959]

whole object *n.* In **Kleinian* analysis, any person or other entity that serves as an **instinctual object* satisfying another person's sexual **instinct* (3), the first instance in human development usually being the mother. It is distinguished from a **part object* that is a portion of a whole object serving the same function, such as the mother's breast. See also *DEPRESSIVE POSITION*, *GOOD OBJECT*, *INSTINCTUAL OBJECT*, *OBJECT RELATIONS*, *SPLITTING OF THE OBJECT*.

whole tone *n.* Another name for a **tone* (2).

whole-word method *n.* A method of teaching reading by encouraging children to recognize the shapes of entire words rather than individual letters and their associated sounds. Also called *look-and-say method*. Compare *PHONICS* (2).

Whorfian hypothesis *n.* Another name for the **Sapir–Whorf hypothesis*.

wicket rhythm *n.* Another name for the **mu wave*. [Named after the appearance of the EEG wave, which resembles a row of croquet wickets or hoops]

Widrow–Hoff rule *n.* Another name for the **delta rule*.

wife/mother-in-law figure *n.* Another name for the **young girl/old woman figure*. Also called the *wife-mistress figure*.

Wilcoxon matched-pairs test *n.* In statistics, a popular *significance test that is used with two related samples to test the *null hypothesis that the distributions of two variables are identical. It makes no assumptions about the shapes of the distribution of the two variables and it is therefore a *distribution-free test. It involves calculating the absolute values of the differences between the two variables for each individual or case and then converting these differences to *ranks, and the test statistic is computed from the sums of ranks for negative and positive differences. The distribution-dependent alternative is the *related scores *t* test. [Named after the Irish-born US chemist and self-taught statistician Frank Wilcoxon (1892–1965) who developed the test in 1945]

Wilcoxon rank-sum test *n.* An alternative name for the *Mann–Whitney *U* test, not to be confused with the *Wilcoxon matched-pairs test.

Wild Boy of Aveyron *n.* A boy, about 10 years old, discovered in 1798 by a group of hunters near Aveyron in France, after living in the forest, roaming about almost naked, apparently without human contact. He was studied in detail by the French physician Jean Marie Gaspard Itard (1774–1838) and is considered a classic example of a *feral child.

wild psychoanalysis *n.* A term introduced in 1910 by Sigmund Freud (1856–1939), in an article entitled “‘Wild’ Psycho-Analysis’ (*Standard Edition*, XI, pp. 221–7), to denote amateur attempts at *psychoanalysis based on ignorance or misunderstandings of its fundamental ideas, such endeavours being characterized by attempts to rush the process of analysis through premature *interpretations (2) conveyed to the patient without proper *working through and without regard for *resistance and *transference. Appropriately, Freud’s article was published in the same year that the International Psycho-Analytic Association was founded.

Williams syndrome *n.* A rare condition (estimated to occur in 1 out of 20,000 births) characterized by delayed physical and mental development, leading to mild *intellectual disability, coupled with strengths in such areas of functioning as language usage, face recognition, social skills, and musical performance. It was discovered in 1993 that the syndrome is caused by the deletion of the gene that directs the manufacture of elastin, a protein

*****ebook converter DEMO Watermarks*****

providing strength and elasticity to blood vessels, from one of the two copies of chromosome 7 present in every body cell. People with this syndrome, who are often called *Williams people* or *Williams children*, have facial features reminiscent of elves or pixies, hoarse voices, ***hyperacusis** or extreme sensitivity to noise, cardiovascular problems, and elevated levels of ***calcium** in the blood. Compare **DOWN'S SYNDROME**. **WS** abbrev. [Named after the New Zealand cardiologist John Cyprian Phipps Williams (born 1922) who first described it in 1961. According to a biography by Michael King of the New Zealand writer Janet Frame, entitled *Wrestling With the Angel: A Life of Janet Frame* (2000), Williams disappeared into obscurity in Europe in the mid 1960s, and his brother and sister were unable to trace him even with the help of Interpol]

will therapy *n.* A type of ***psychotherapy**, introduced by the Austrian ***psychoanalyst** Otto Rank (1884–1939) in his book *Will Therapy and Truth and Reality* (1945), in which the patient is encouraged to exert will power in order to develop autonomy and independence.

will to power *n.* In ***individual psychology**, a term introduced by the Austrian psychiatrist Alfred Adler (1870–1937) to denote the need, especially in men, to outdo and to dominate others.

windigo *n.* A rare ***culture-bound syndrome** found among North American Indian tribes in the subarctic cultural area, characterized by symptoms such as depression, homicidal or suicidal thoughts, and a compulsive desire to eat human flesh, often prompting warnings to family and friends to get as far away as possible, followed by the afflicted person turning into a cannibal, regarded locally as a monster and generally ostracized or put to death. The reality of this syndrome, as opposed to its status as a localized folk myth, is controversial. Also called *wendigo*, *whitigo*. [From Ojibwa *wintiko* a flesh-eating monster]

windmill illusion *n.* A visual illusion first described by the English mathematician Robert Smith (1689–1768) in his book *A Compleat System of Opticks* (1738), in which the blades of a windmill, seen from a distance silhouetted against the sky, appear to reverse their direction of rotation. The direction of rotation sometimes becomes indeterminate, and Smith pointed

*****ebook converter DEMO Watermarks*****

out that the illusion can also be observed in weather-cocks and flags. It should not be confused with the [*wagon wheel illusion](#) but is closely related to the [*kinetic depth effect](#).

windpipe *n.* A non-technical name for the [*trachea](#).

winner's curse *n.* A tendency for the highest bid at an auction to exceed the true market value of the lot or prize. It arises from the fact that the bidders' estimates of the value of the prize are unreliable; some bidders are likely to underestimate the value and others to overestimate it, and it is the bidder who overestimates it the most who is likely to make the highest bid and to win the prize, in which case the winner is, in this sense, a loser. The effect has been confirmed by both experimental and field studies. It can be explored with the following demonstration, based on a classic experiment published in the *Journal of Conflict Resolution* in 1983. Fill a jar with coins and auction it off to the highest bidder among a group of friends. The average bid will probably be less than the value of the coins, because of [*risk aversion](#) among bidders, but the winning bid will probably exceed the value of the coins, dramatically illustrating the winner's curse and providing a small profit for the auctioneer. The phenomenon was first discussed in an article on the purchase of oil-drilling rights in the *Journal of Petroleum Technology* in 1971 and was subsequently analysed in depth by the US economist Richard H. Thaler (born 1945).

Winnicottian *adj.* Of or relating to the theories and practices of the English psychoanalyst Donald Woods Winnicott (1896–1971). See [GOOD-ENOUGH MOTHER](#), [OBJECT-RELATIONS THEORY](#), [SQUIGGLE GAME](#), [TRANSITIONAL OBJECT](#). See also [BASIC TRUST VERSUS BASIC MISTRUST](#).

win-stay, lose-shift strategy *n.* A simple strategy, applicable to any sequential decision task or [*game \(1\)](#), according to which the first decision or move is chosen arbitrarily, and thereafter, whenever a choice leads to reward or a satisfactory outcome the player repeats it on the following occasion, and whenever it leads to punishment or an unsatisfactory outcome the player switches to a different option on the following occasion. If applied to the [*minimal social situation](#), it leads to mutually rewarding choices after only three rounds. It amounts to an implementation of the [*law of effect](#). It was

*****ebook converter DEMO Watermarks*****

first suggested in 1962 by the US psychologist Harold H(arding) Kelley (1921–2003) and several colleagues in the journal *Psychological Monographs*. It has also been called the *Pavlov strategy* because of its simple reflex properties.

Wisconsin Card Sorting test *n.* A widely used test of abstract thinking, planning, and ability to alter mental **set* (2) as circumstances require. The test consists of 128 cards differing in colour, form, and number of design markings, and the respondent tries to match them to four target cards, the test administrator telling the respondent merely whether each sort is right or wrong but not what the rule is, and in the latter stages of the test the sorting rule is changed without warning, requiring the respondent to show flexibility. The test was developed at the University of Wisconsin by the US psychologist David A(lexander) Grant (1916–77) and Esta A. Berg and first published in the *Journal of General Psychology* in 1948. It is regarded as a good indicator of **frontal lobe* damage, and is especially useful for identifying **perseveration* (1, 2). **WCST** *abbrev.*

Wisconsin General Test Apparatus *n.* A device incorporating a presentation tray and a moveable screen for studying learning and perception in rhesus monkeys. Several objects are placed on the tray, just outside the cage, and the monkey selects one of them, then the screen is lowered, the placement of the objects is altered, and then the screen is lifted and the monkey chooses again, and so on. **WGTA** *abbrev.* [So called because it was developed at the University of Wisconsin]

wish fulfilment *n.* Satisfaction of a desire, especially, in **psychoanalysis*, the satisfaction of an **unconscious* (1) desire in a disguised way such as a **fantasy* (2), **dream* (1), **symptom*, or **parapraxis*. *See also* DREAM ANALYSIS.

withdrawal *n.* A constellation of **signs* (1) and **symptoms* manifested by a person with drug **dependence* (2) or **addiction* after ceasing to take the drug or reducing the dosage, varying from one drug to another but often including agitation, anxiety, delirium, insomnia, dysphoria, running nose, muscle pains, sweating, fever, tremor, formication, and nausea. Also called *abstinence syndrome*. *See also* INCENTIVE–SENSITIZATION THEORY, NALORPHINE,

*****ebook converter DEMO Watermarks*****

SUBSTANCE DEPENDENCE, SUBSTANCE WITHDRAWAL DELIRIUM.

withdrawal of cathexis *n.* Another name for **decathexis*.

within-subjects design *n.* Any research design in which the same research participants or subjects are tested under different **treatment conditions*. *See also* LATIN SQUARE, RELATED SCORES *T* TEST, REPEATED-MEASURES ANALYSIS OF VARIANCE. *Compare* BETWEEN-SUBJECTS DESIGN, SPLIT-PLOT DESIGN.

Witzelsucht *n.* A pattern of verbal punning and inappropriate jocularity often observed in people with **frontal lobe* lesions. [From German *witzeln* joking + *Sucht* sickness or mania]

Wolffian duct *n.* Either of the pair of ducts that are present in a human **embryo*, alongside the pair of **Müllerian ducts*, and that develop into the male internal reproductive tract if embryonic **testes* are present and secrete **testosterone* and **Müllerian inhibiting substance*. In a female embryo the default development occurs: the Wolffian ducts atrophy and disappear because of the absence of testosterone, while in the absence of Müllerian inhibiting substance the Müllerian ducts develop into Fallopian tubes, uterus, and the upper part of the vagina. [Named after the German anatomist Kaspar Friedrich Wolff (1735–94)]

Wolf Man *n.* The nickname given in the literature of **psychoanalysis* to a 23-year-old Russian patient analysed in 1910–14 by Sigmund Freud (1856–1939) and discussed in 1918 in a case study entitled ‘From the History of an Infantile Neurosis’ (*Standard Edition*, XVII, pp. 7–122). The nickname refers to a terrifying dream about wolves that the patient had experienced at the age of 3½, which Freud interpreted as a symbolic representation of the **primal scene* of parental intercourse that he had witnessed two years earlier. The case generated a great deal of material that appeared to confirm Freud’s theories and refute those of the Austrian psychiatrist Alfred Adler (1870–1937) and the Swiss psychologist Carl Gustav Jung (1875–1961), who had defected from the psychoanalytic movement in 1911 and 1913 respectively.

woman, phallic *See* PHALLIC WOMAN.

*****ebook converter DEMO Watermarks*****

woolsorter's disease *n.* An obsolescent name for **anthrax*. [So called because woolsorters used to be at risk of contracting it from sheep]

word-association test *n.* A research technique pioneered by the English explorer, amateur scientist, and psychologist Sir Francis Galton (1822–1911) and published in 1879/80 in the journal *Brain*, then reinvented in 1904 as a diagnostic aid or **projective test* by the Swiss psychologist Carl Gustav Jung (1875–1961). In the technique popularized by Jung, a list of (usually 100) stimulus words is read out, the patient or subject responding to each stimulus word as quickly as possible with the first response word that comes to mind, and then the exercise is repeated a second time with the same list of words. The stimulus words are selected to cover a wide range of topics and generally include a number of *critical words* that are likely to have particular psychological significance (Jung's original list included such critical words as *beat*, *dead*, *fear*, *kiss*, *pure*, *ridicule*, and *sick*), and the person's responses, occurring before **defence mechanisms* have time to intervene, are assumed to reveal aspects of unconscious mental processes and especially **complexes* (2), enabling the analyst to focus in on the key areas of unconscious conflict. According to Jung, the major *complex indicators* are unusual reactions such as laughing or blushing, abnormally long reaction times, repetition of the stimulus word, absurd or far-fetched associations, and failure to respond to a stimulus word. Jung published an account of the technique as a **lie detector* test in an article entitled 'The Association Method' in the *American Journal of Psychology* in 1910 and expounded it in detail in his book *Studies in Word-Association* (1919), after he had founded his school of **analytical psychology*. See also EXPERIMENTALLY INDUCED FALSE MEMORY, KENT–ROSANOFF FREE ASSOCIATION TEST, MARBE'S LAW. **WAT** *abbrev.*

word blindness *n.* A non-technical name for **alexia* or **dyslexia*. It was the original term used by the German physician Adolf Kussmaul (1822–1902), who first described dyslexia in 1877.

word-building test *n.* A cognitive task in which a respondent is given a set of letters from which to construct as many words as possible.

word completion task *n.* Another name for a **word-stem completion*
*****ebook converter DEMO Watermarks*****

task.

word constancy *n.* A form of **perceptual constancy* according to which a spoken word tends to sound recognizably the same despite wide variations both between and within speakers in **paralanguage*, including **accent* (1), **loudness*, **pitch*, **prosody*, **rhythm*, **tempo*, and **timbre*.

word deafness *n.* An impaired ability to understand spoken language; another name for Wernicke's aphasia. Also called *word meaning deafness*. See *APHASIA*.

word-form dyslexia See *VISUAL WORD-FORM DYSLEXIA*.

word-length mnemonic *n.* A memory aid based on the numbers of letters in a sequence of words. See *MNEMONIC*.

word-presentation *n.* In **psychoanalysis*, the linguistic and largely auditory representation of memories accompanying non-linguistic **thing-presentations* in the **preconscious* and **consciousness*, in contrast to the purely thing-presentations in the **unconscious* (2). Sigmund Freud (1856–1939) argued that in **schizophrenia*, word-representations are sometimes treated like thing-representations, and in an article entitled 'A Metapsychological Supplement to the Theory of Dreams' (1915/17) he described a similar phenomenon occurring in dreams: 'Where the word-presentations occurring in the day's residues are recent and current residues of *perceptions*, and not the expressions of thoughts, they are themselves treated like thing-presentations' (*Standard Edition*, XIV, pp. 217–36, at p. 228).

word salad *n.* A non-technical name for **incoherence*.

word-stem completion task *n.* A cognitive task in which the respondent is given the first few letters of a word (such as *VIK* ...) and tries to complete the word as quickly as possible. Also called a *word completion task* or a *stem completion task*.

word superiority effect *n.* A **configural superiority effect*, making a letter more easily recognizable when it is seen in the context of a word than on its own. Thus, if several observers are shown brief **tachistoscopic* exposures and are asked to press one button if the word *fact* appears and another button if the word *fast* appears, they will tend to respond quicker and more accurately than if the stimuli are the letter *c* and the letter *s* presented in isolation. This type of **context effect* presents a serious challenge to researchers who believe that letters must be recognized in order to identify words. **WSE** *abbrev.*

working memory *n.* According to a theory put forward by the English psychologists Alan (David) Baddeley (born 1934) and Graham J(ames) Hitch (born 1946) in a book chapter in 1974, a temporary store for recently activated items of information that are currently occupying consciousness and that can be manipulated and moved in and out of **short-term memory*. It consists of a **central executive* and two **buffer stores*, called the **phonological loop* and the **visuospatial sketchpad*, its functions are carried out largely in the **prefrontal cortex* of the brain, and it is tested in a variety of organisms by means of **delayed-response tasks* and tests of **object permanence*. In 2000, Baddeley proposed a third buffer store, called the **episodic buffer*, providing limited-capacity storage for integrated episodes or scenes using multiple codes. *See also* DORSOLATERAL PREFRONTAL CORTEX. **WM** *abbrev.* [The term was first used by the US psychologist George A(rmitage) Miller (1920–2012) and co-authors in a book entitled *Plans for the Structure of Behavior* (1960, p. 65) to denote a unitary memory store for action plans, and the Canadian-born US psychologist John R(obert) Anderson (born 1947) subsequently used it to denote a declaratory memory store (*see* ACT*). The term appeared again in the book *Human Problem Solving* (1972) by the US cognitive scientists Allen Newell (1927–92) and the US political scientist and decision theorist Herbert A(lexander) Simon (1916–2001) shortly before being used by Baddeley and Hitch to denote their multi-component model.]

working through *n.* In **psychoanalysis*, the process by which an **interpretation* (2) is conveyed to a patient, overcoming the **resistance* that it has previously generated and enabling the patient to accept repressed ideas or wishes underlying **symptoms*. Sigmund Freud (1856–1939) described this

*****ebook converter DEMO Watermarks*****

process most fully in his article on 'Remembering, Repeating and Working-Through' (1914, *Standard Edition*, XII, pp. 147–56).

work psychology *n.* An umbrella term for all aspects of **occupational psychology* and **industrial/organizational psychology*.

W process *n.* In **psychoanalysis*, a term used by Sigmund Freud (1856–1939) to denote any function of the **perception–consciousness system*. Also called a ω process or a *Pcpt–Cs process*.

writing disorder *See* *SPECIFIC LEARNING DISORDER*.

written expression, disorder of *n.* A **specific learning disorder* characterized by substantially below-average writing skills for the given age, intelligence, and education, interfering substantially with scholastic or academic achievement or everyday life and not being due merely to a sensory deficit.

wryneck *n.* A non-technical name for **spasmodic torticollis*.

wug test *n.* A test designed to investigate the acquisition of plural-forming and other rules of **grammar*. A child is presented with an imaginary object and is told, 'This is a *wug*'. Then a second instance is presented, and the child is asked what the two are called. The correct answer is *wugs*, pronounced with a voiced /z/ sound, as in *dogs*, because the plural-forming letter follows a voiced consonant /g/. After a voiceless consonant such as /t/, the plural-forming letter should be a voiceless /s/, as in *cats*, and after a sibilant, an additional syllable should have a voiced /z/, as in *verses*. To investigate understanding of other grammatical rules, the test includes questions such as 'What do you call a man who *zibs*?' the correct answer being a *zibber*. Even very young children are able to produce correct plurals, past tenses, and possessives of words that they have never heard before, showing that they have internalized abstract linguistic rules. The test was introduced by the US psychologist Jean Berko (born 1931, later called Jean Berko Gleason) in an article in the journal *Word* in 1958. *See also* *ASSIMILATION (3)*, *IMPLICIT LEARNING*. [A deliberately constructed nonsense word]

*****ebook converter DEMO Watermarks*****

Wundt illusion *n.* A visual illusion in which a pair of straight lines appear to be bowed inwards when superimposed on a pattern of lines converging to points on either side of them (see [illustration](#)). It is closely related to the [*Hering illusion](#). [Named after the German psychologist Wilhelm (Max) Wundt (1832–1920) who first published it in 1896]

Wundt illusion. The two horizontal lines are straight.

Würzburg school *n.* A school of psychological thought that flourished under the leadership of the Latvian-born German psychologist Oswald Külpe (1862–1915) from 1894 until his death in 1915. Külpe worked in Leipzig for eight years with the founder of the structuralist school Wilhelm (Max) Wundt (1832–1920) before moving to Würzburg in 1894, where he founded the school that became an important rival to the [*structuralism \(2\)](#) of Leipzig. Whereas Wundt discouraged experimental research into higher mental processes such as thinking, Külpe and his followers concentrated their research largely on thinking, attention, and aesthetic responses. The Würzburg school is remembered chiefly for claiming to have discovered [*imageless thought](#).

Xanax *n.* A proprietary name for the benzodiazepine drug **alprazolam*.
[Trademark]

xanthine *n.* The white, crystalline compound methylxanthine or any substituted derivative of it, especially the three methylated derivatives **caffeine*, **theobromine*, and **theophylline* that are pharmacologically active as central nervous system **stimulants*, acting through increasing the permeability of neuron cell membranes to **calcium*, the major psychological effects at low doses being a decrease in fatigue and drowsiness, an increase in speed and efficiency, and a decrease in the number of errors (especially in an overlearned task such as typing). Formula: $C_5H_4N_4O_2$. [From Greek *xanthos* yellow, alluding to the lemon-yellow residue that it leaves when evaporated with nitric acid]

xanthopsia *n.* A visual defect in which everything in the visual field appears to have a yellow hue. It can be induced temporarily by prolonged exposure to blue light, and it is sometimes associated with jaundice or poisoning with **digitalis* or foxglove. *See also* CHROMATIC ADAPTATION (1). [From Greek *xanthos* yellow + *ops* an eye + *-ia* indicating a condition or quality]

X cell *n.* A type of ganglion cell belonging to the **parvocellular system*, present in the retina and the lateral geniculate nuclei. Also called a *P cell*.

X chromosome *n.* A type of **sex* chromosome present in pairs in all of the diploid cells of females, and present singly, paired with a **Y chromosome*, in all diploid cells of males. [So called because of its

*****ebook converter DEMO Watermarks*****

resemblance to the letter X]

xenoglossia *n.* A facility claimed by some spirit mediums, clairvoyants, and other psychics to speak in languages that they have never learnt. Xenoglossia should be distinguished carefully from ***glossolalia**. [From Greek *xenos* foreign + *glossa* a tongue + *-ia* indicating a condition or quality]

xenomelia *n.* Another word for ***apotemnophilia**, considered more appropriate by the Scottish neurologist Paul D(uncan) McGeoch (born 1975) and several co-authors who introduced the term in an article in the *Journal of Neurology, Neurosurgery and Psychiatry* in 2011. [From Greek *xenos* foreign + *melos* a limb + *-ia* indicating a condition or quality]

X-linked *adj.* Of or relating to a gene situated on the ***X chromosome** or a ***character** (2) or ***trait** determined by such a gene. Most X-linked disorders and conditions, including ***Duchenne muscular dystrophy**, haemophilia, and various forms of ***colour-blindness**, are determined by ***recessive genes** carried by females on an X chromosome but expressed predominantly in males who have only one X chromosome, preventing ***complementation** from occurring. A female can inherit such a gene, but its effects are normally masked by a normal ***dominant *allele**, unless the female inherits the abnormal allele from both parents. *See also* DALTONISM, HOLOGYNIC, HORNER'S LAW, SEX-LINKED. *Compare* Y-LINKED. **X-linkage** *n.*

XTC *n.* A street name for ***ecstasy** (2). [From the similarity in sound; not an abbreviation]

XXX syndrome *n.* A chromosomal abnormality in which a woman has three ***X chromosomes** instead of the usual two, leading to deficits in auditory and language comprehension, and usually sterility. *Compare* KLINEFELTER'S SYNDROME, XYY SYNDROME.

XXY syndrome *n.* Another name for ***Klinefelter's syndrome**.

XYY syndrome *n.* A chromosomal abnormality in which a man has an extra ***Y chromosome**, often leading to antisocial behaviour and violence.

Compare ANTISOCIAL PERSONALITY DISORDER, KLINEFELTER'S SYNDROME,
TURNER'S SYNDROME, XXX SYNDROME.

yaba *n.* A popular street drug, originating in Thailand and Burma (Myanmar), consisting mainly of **methamphetamine* but with more powerful effects than **ecstasy*. Regular use of yaba has been linked with kidney and lung disorders, **hallucinations*, **paranoia*, **formication*, and **panic attacks*. First manufactured in Germany in 1934, where it was originally called Pervitin and was added as a **stimulant drug* to chocolate bars supplied to members of the German air force (*Luftwaffe*) in World War II, it is usually ingested in pill form but can also be smoked on tin foil, and its **psychotropic* effects occur largely through activation of **noradrenalin* pathways. [Thai: literally crazy medicine]

yagé *n.* The South American plant *Banisteriopsis caapi*, or the **hallucinogenic* drink more commonly called **harmine*, made from its seeds, originally by native Americans. [American Spanish]

yang See *YIN AND YANG*.

Yates' correction for continuity *n.* In statistics, a correction sometimes applied before performing the **chi-square test* on data in a 2×2 contingency table to improve the approximation to the theoretical distribution, which is a continuous distribution in contrast to the discrete scores being analysed. Corrected chi-square values are always smaller than uncorrected values. [Named after the English statistician Frank Yates (1902–94) who published the correction in 1934]

YAVIS *abbrev.* Young, attractive, verbal, intelligent, successful, the syndrome of personal qualities that counsellors, therapists, and people in

*****ebook converter DEMO Watermarks*****

general supposedly find most appealing in their clients or associates. This idea first appeared in 1964 in the book *Psychotherapy: The Purchase of Friendship* by the US psychologist William Schofield (1921–2006). *Compare* [HOUND](#).

yawn *vb.* To open the mouth and [*pharynx wide](#), inhale deeply, stop breathing for a short period, and then exhale slowly, in a distinctive pattern of largely involuntary behaviour that is observed in all classes of [*vertebrates](#), including fish, amphibians, reptiles, birds, and mammals, and is therefore assumed to have evolved to serve an important adaptive function. It used to be believed that it serves to restore the ratio of oxygen to carbon dioxide in the blood, but that interpretation was undermined by evidence that yawning is not triggered by experimental manipulations that lower the level of oxygen in the blood or by oxygen-depleting physical exercise. The adaptive function of yawning may be to increase physiological arousal or to cool the brain. In humans, yawning develops prenatally, is often associated with fatigue or boredom, and is highly sensitive to [*behavioural contagion](#). *n.* The act of yawning. [From Old English *gionian* to yawn, cognate with Old Saxon *ginon* and Old High German *ginen* to yawn]

Y cell *n.* A type of ganglion cell belonging to the [*magnocellular system](#), present in the retinas and the lateral geniculate nuclei. Also called an *M cell*.

Y chromosome *n.* A [*sex](#) chromosome occurring in all of the diploid cells of males, paired with an [*X chromosome](#). [So called because of its resemblance to the upper-case letter Y]

yellow bile *See* [HUMOUR \(3\)](#).

yellow bullets *n.* A street name for the barbiturate drug [*pentobarbital](#) (pentobarbitone).

yellow-sighted *adj.* Experiencing [*xanthopsia](#).

yellow spot *n.* Another name for the [*macula lutea](#).

Yerkes–Dodson law *n.* The proposition that optimal task performance occurs at an intermediate level of ***arousal**, with relatively poorer performance at both lower and higher arousal levels, leading to an inverted U relation between arousal and performance. It is often accompanied by the proposition that the peak occurs at a lower level of arousal for easy than for difficult tasks. **YDL** *abbrev.* [Named after the US psychologists Robert Mearns Yerkes (1876–1956) and John Dillingham Dodson (1879–1955) who published an article in the *Journal of Comparative Neurology and Psychology* in 1908 on the ‘Relation of Strength of Stimulus to Rapidity of Habit-formation’, though they did not enunciate the law explicitly or attempt to test it directly]

Yerkish *n.* An artificial language, using a computer console with keys bearing geometrical symbols for words, developed by the US primatologists Duane Rumbaugh (born 1929) and Sue Savage-Rumbaugh (born 1946) for communicating with chimpanzees. [Named after the Yerkes Regional Research Center in Georgia, US, where the language was developed, which in turn is named after the US psychologist Robert Mearns Yerkes (1876–1956), who founded the parent laboratory in Florida in 1919]

yin and yang *n.* In traditional Chinese philosophy, two complementary principles of the universe, *yin* being a passive female principle that is cold, wet, dark, and earthly, and *yang* being an active male principle that is hot, dry, light, and heavenly. Their balance is believed to maintain the harmony of the universe and of everything in it, including human bodies and minds. *See also* **SYZYGY**. [From Chinese *yin* dark + *yang* bright]

yips *n.* A type of focal ***dystonia** associated with psychological tension or anxiety, common among golfers but, for reasons unknown, seldom afflicting snooker, pool, or billiards players, usually experienced as a ***tremor**, ***spasm**, or weakness in the fingers or hands before making a shot (especially a golfing putt) and described as *having the yips*. [Origin unknown]

Y-linked *adj.* Of or relating to a gene situated on the ***Y chromosome** or a characteristic or ***trait** determined by such a gene, such as hirsutism of the ears and certain other characteristically masculine traits. No significant Y-linked disorders are known. *See also* **HOLANDRIC**, **SEX-LINKED**. *Compare* **X-**
*****ebook converter DEMO Watermarks*****

LINKED. **Y-linkage** *n.*

yohimbine *n.* A crystalline alkaloid, found in the bark of the tropical African yohimbe tree *Corynanthe yohimbe*, that acts as a noradrenalin (norepinephrine) ***agonist** (3) and is taken as a ***sympathomimetic** central nervous system ***stimulant drug** and, in its hydrochloride form, as an ***aphrodisiac**. Formula $C_{21}H_{26}N_2O_3$. [From Bantu *yohimbé* the yohimbe tree + *-ine* indicating an organic compound]

yoked control *n.* In experimental designs in which members of an ***experimental group** and a ***control group** are paired, the control group members receiving the same stimuli, reinforcements, or punishments as the experimental group members but without the possibility of influencing these effects through their own behaviour, the effects being controlled by the experimental group members alone.

yolk phenomenon *n.* A slip of the tongue experimentally induced by phonological ***priming**, first described in 1970 in an article in the journal *Psychological Review* by the US psychologists Gregory A(dams) Kimble (1917–2006) and Lawrence C(harles) Perlmuter (born 1938) using the following word game, which also explains its name: ‘If one reads the following list of questions (Q) to someone, he will get either the answer (A) shown for the last question or else he will almost get that answer. In the latter case, the subject will probably recognize the point of the demonstration and indicate that fact. Q. What do we call a tree that grows from acorns? A. Oak. Q. What do we call a funny story? A. Joke. Q. The sound made by a frog? A. Croak. Q. What is another word for cape? A. Cloak. Q. What do we call the white of an egg? A. Yolk (sic!)’ (vol. 17, p. 373). *See also* **COGNITIVE ILLUSION**. *Compare* **MOSES ILLUSION**.

young girl/old woman figure *n.* A popular ***ambiguous figure** that does not depend on figure–ground reversal and that appears as a portrait of a young girl or an old woman (see **illustration**). It was copied from an anonymous German postcard issued in 1888 and published as a cartoon by the US artist William Ely Hill (1887–1962) in *Puck* magazine in 1915 under the title *My Wife and My Mother-in-law. They are Both in this Picture—Find Them*, then it was adapted and republished in 1930 by the US psychologist
*****ebook converter DEMO Watermarks*****

Edwin Garrigues Boring (1886–1968), to whom it is often wrongly attributed. In 1961 the US psychologist Jack Botwinick (1923–2006) published a version equally as unflattering to old men entitled *Husband and Father-in-law*. Also called the *old woman/young girl figure*, the *wife/mistress figure*, or (misleadingly) the *Boring figure*.

Young girl/old woman figure

Young–Helmholtz theory *n.* Another name for the **trichromatic theory* of colour vision. [Named after the English physician, physicist, and Egyptologist Thomas Young (1773–1829) who proposed it in 1802, and the German physiologist, physicist, and mathematician Hermann Ludwig Ferdinand von Helmholtz (1821–94) who subsequently championed it]

YRMODA *abbrev.* Year, month, day. A function in **SPSS* and other statistical software packages for converting dates to days elapsed, so that arithmetic calculations can be performed on them.

Zanforlin illusion *n.* A visual illusion in which a straight line extending between the most distant points on the circumferences of two circles appears shorter than a line of the same length extending between the nearest points on the circumferences of two similar circles (see [illustration](#)). It is closely related to the [*Baldwin illusion](#) and possibly also the [*Müller-Lyer illusion](#). [Named after the Italian psychologist Mario Zanforlin (born 1934) who first described it in 1967]

Zanforlin illusion. The horizontal straight lines are equal in length.

zar *n.* A [*culture-bound syndrome](#) found in Ethiopia and other areas of North Africa, and among Arab communities in various parts of the Middle East, characterized by episodes of [*dissociation](#) that are locally attributed to spirit possession and are associated with signs and symptoms such as shouting, laughing, self-injury or self-mutilation, singing and weeping, often followed by apathy and withdrawal. The condition is traditionally dealt with through elaborate ceremonies of exorcism involving singing, dancing, and drinking the blood of a sacrificed ram. Also called *sar* in Somalia and elsewhere. [Amharic *zar* an evil spirit]

*****ebook converter DEMO Watermarks*****

Z-disc *n.* A dark line separating two *sarcomeres of muscle tissue, being the membranes to which the *actin filaments of the sarcomere are attached. US *Z-disk*. Also called a *Z-line*.

Zeigarnik effect *n.* The tendency for interrupted tasks, in some circumstances, to be recalled better than completed tasks. For example, a restaurant waiter may remember a complex order while a meal is in progress but forget the details as soon as the meal is over and the bill calculated. [Named after the Russian psychologist Bluma (Wolfovna) Zeigarnik (1901–88), who first reported it in the journal *Psychologische Forschung* in 1927]

Zeitgeber *n.* An environmental cue as to the passage of time, such as the *diurnal cycle of light and dark, that tends to calibrate and synchronize a *biological clock to the external passage of time. Also called a *synchronizer*. See also *ENTRAINMENT*. [From German *Zeitgeber* a timer, from *Zeit* time + *geben* to give]

Zener cards *n.* A deck of 25 cards used in research into *extra-sensory perception. On the face of each card is printed one of five symbols (circle, cross, square, star, or wavy lines); therefore, the chance probability of a hit is 1/5 for an individual card, and the number of hits expected on the basis of chance alone for the complete pack is five. Also called *ESP cards*. [Named after the US psychologist Karl E(dward) Zener (1903–64) who devised them at Duke University in 1930 and objected in vain to their being named after him]

zenith distance *n.* The direction of an object or image in a vertical plane relative to a point directly overhead. Compare *AZIMUTH*. [From Old Spanish *zenit* zenith, from Arabic *samt*, short for *samt-al-ras* overhead, from *samt* direction + *al* the + *ras* head]

zero-crossing *n.* In *computational theories of vision, a location where the *luminance in a smoothed or blurred visual image changes abruptly. Zero-crossing segments that align with one another for different levels of smoothing form the basis of *contours in the *primal sketch. [So called because in mathematical terms it is a region where the second derivative of

the luminance function changes from positive through zero to negative or from negative through zero to positive]

zero-order approximation to language See APPROXIMATION TO LANGUAGE.

zero-sum game *n.* In *game theory, a game in which the sum of the players' payoffs is equal to zero in every outcome of the game. Two-person zero-sum games are *strictly competitive games*, in which the players' interests are directly opposed, one player's gain invariably being equal to the other's loss. See also MINIMAX THEOREM. Compare MIXED-MOTIVE GAME.

Zipf's laws *n.* **1.** A law of linguistics stating that the frequency of a word is inversely proportional to its rank in frequency. More precisely, the rank (r) of a word on a frequency list multiplied by the frequency (f) with which the word is used is a constant (C), hence $rf = C$. For example, in the London–Lund corpus of spoken English, the words *see*, *which*, and *get* are the 45th, 55th, and 65th most frequently used words, and their frequencies are 674, 563, and 469 respectively; thus $45 \times 674 = 30,330$, $55 \times 563 = 30,965$, and $65 \times 469 = 30,485$; in each case $rf = 30,500$ approximately. This relationship has been confirmed in many languages, but it is now known that it tends to break down for words at both extremes of the frequency range. **2.** A law of linguistics stating the existence of an inverse relation between the lengths of words and their frequency, resulting presumably from the fact that frequently used words tend to be shortened, so that *pianoforte* becomes *piano*, *omnibus* becomes *bus*, *television* becomes *telly*, *zoological garden* becomes *zoo*, and so on. [Named after the US philologist George Kingsley Zipf (1902–50) who formulated both laws]

Zöllner illusion *n.* A visual illusion in which parallel straight lines appear to converge and diverge alternately when intersected by a herringbone pattern of oblique stripes (see illustration). [Named after the German astronomer Johann Karl Friedrich Zöllner (1834–82) who first reported it in 1860 after observing it in the pattern of a piece of dressmaking fabric]

Zöllner illusion. The long lines are straight and parallel.

Zoloft *n.* A proprietary name for the antidepressant drug [*sertraline](#).
[Trademark]

zombie *n.* 1. In informal usage, a person who appears to be lifeless, apathetic, and unresponsive to the external environment, or one who behaves like an [*automaton](#). 2. A being believed to belong to the living dead, a corpse resurrected by witchcraft, especially in the voodoo cult of Haiti and in certain

*****ebook converter DEMO Watermarks*****

West African religions from which it is derived. In Haitian voodoo, a person who has been given a *coup poudre* (magic powder) by a voodoo sorcerer, called a *bokor*, appears to die, is buried, and is exhumed a few days later as an apparently soulless zombie to work as the *bokor*'s slave. In 1982 the Irish-Canadian ethnobiologist (Edmund) Wade Davis (born 1953) discovered that *coup poudre* is made from puffer fish and other ingredients containing the powerful neurotoxin * [tetrodotoxin](#) (TTX), and in his book *The Serpent and the Rainbow* (1985) he put forward a theory of zombiism according to which ingestion of a barely sub-lethal dosage of the poison results in a deep coma resembling death, and both the poison and the live burial cause extensive neurological damage, so that the victim who is later exhumed and revived has few intact memories or mental capacities and no power of speech and usually adopts the shuffling gait and blank facial expression characteristic of a zombie. Although this theory has been widely accepted, there is evidence that some zombies, at least, are simply people with severe or profound *[intellectual disability](#). Also spelt *zombi*. See also [VOODOO DEATH](#). **zombify** vb. To turn someone into a zombie (1, 2), or deprive a person of vitality or spirit. [From Kikongo *zumbi* a fetish, from *nzambi* a spirit of a dead person]

zona fasciculata *n.* The middle portion of the *[adrenal cortex](#), where *[glucocorticoids](#) and other hormones are produced. [From Latin *zona* a girdle or belt + *fasciculus* a small bundle, diminutive of *fascis* a bundle]

zona glomerulosa *n.* The outer, knotty portion of the *[adrenal cortex](#), where *[mineralocorticoids](#) are produced. [From Latin *glomerulus* a cluster or knot, diminutive of *glomus* a ball]

zona granulosa *n.* The granular portion of a *[Graafian follicle](#), where the *[ovum](#) is embedded. [From Latin *granulum* a little grain, diminutive of *granum* a grain]

zona incerta *n.* A small ribbon of nerve cell bodies on each side of the *[hypothalamus](#) that control drinking. Stimulation in this area instigates *[polydipsia](#) or excessive drinking, and a lesion can result in *[adipsia](#) or cessation of drinking. [From Latin *zona* a girdle or belt + *incertus* uncertain or obscure, so called because its function was unknown for a long time after its discovery]

*****ebook converter DEMO Watermarks*****

zona reticularis *n.* The innermost netlike portion of the **adrenal cortex*, acting together with the **zona fasciculata* to produce **glucocorticoids* and other hormones. [From Latin *zona* a girdle or belt + *reticulum* a little net, diminutive of *rete* a net]

zone of proximal development *n.* A term introduced in 1931 by the Russian psychologist Lev Semyonovich Vygotsky (1896–1934) to denote the distance between a child's 'actual developmental level as determined by independent problem solving [and the higher level of] potential development as determined through problem solving under adult guidance or in collaboration with more capable peers'. Vygotsky believed that it is most likely to emerge during play. See *DYNAMIC TESTING*. Also called the *zone of potential development*. **ZPD** abbrev.

zonule of Zinn *n.* The ligament from which the **crystalline lens* of the eye is suspended. Also called the *ciliary zonule* or the *zonula ciliaris*. [Named after the German anatomist Johann Gottfried Zinn (1727–59) who discovered it]

zooerasty *n.* Another name for **bestiality (1)*. [From Greek *zoion* and animal + *erastes* a lover]

zoophilia *n.* A **paraphilia* characterized by recurrent sexually arousing fantasies, sexual urges, or behaviour involving erotic attraction of a person to an animal; more specifically, another name for **bestiality (1)*. [From Greek *zoion* an animal + *philos* loving, from *phileein* to love + *-ia* indicating a condition or quality]

zoösemiotics *n.* The study of animal communication systems. [From Greek *zoion* an animal + *semiotics*]

z score *n.* In statistics, any score expressed in units of **standard deviations* of the distribution of scores in the population, with the mean set at zero and standard deviation equal to 1. It was introduced in 1924 by the English statistician and geneticist Ronald Aylmer Fisher (1890–1962). Also called a *standard score* or *sigma score* or sometimes a *deviation score*. See *STANDARD*

SCORE. *See also* [DERIVED SCORE](#). *Compare* [IQ](#), [STANINE SCORE](#), [STEN SCORE](#), [T SCORE](#).

z test *n.* In inferential statistics, a test to determine whether a sample [*mean](#) is significantly different from a population mean, and hence whether the sample is unlikely to have come from the population. The z statistic is calculated by dividing the difference between the two means by the [*standard error](#) of the sample mean. If the value of z exceeds a critical value (plus or minus 1.96, for a [*significance](#) level of 5 per cent), then the [*null hypothesis](#) is rejected.

Zwaardemaker olfactometer *n.* A device for measuring olfaction, consisting of a glass tube through which an odorant is drawn into the nostril, the amount of odour being determined by the length of the tube. [Named after the Dutch physiologist Hendrik Zwaardemaker (1857–1930) who devised it in 1888]

Zwaardemaker smell system *n.* A scheme for classifying smells based on nine fundamental or primary odours: ethereal (like ether or beeswax), aromatic (like spice or camphor), fragrant (like lavender or rose petals), ambrosiac (like amber or musk), alliaceous (like garlic or onion), empyreumatic (like roasted coffee or tobacco smoke), hircine (like strong cheese or rancid food), foul (like bedbugs or coriander flower), and nauseous (like faeces or rotten eggs). *Compare* [CROCKER–HENDERSON SYSTEM](#), [HENNING’S PRISM](#). [Named after the Dutch physiologist Hendrik Zwaardemaker (1857–1930) who published it in 1895]

zygote *n.* A fertilized [*ovum](#) or egg. *See also* [BLASTOCYST](#), [EMBRYO](#), [FOETUS](#), [MORULA](#). [From Greek *zygotos* yoked, from *zygon* a yoke]

Zyprexa *n.* A proprietary name for the atypical antipsychotic drug [*olanzapine](#). [Trademark]

Appendices

Appendix I: Phobias and phobic stimuli

A phobia is a persistent, irrational fear of an object, event, activity, or situation, called the *phobic stimulus*, resulting in a compelling desire to avoid it. A more detailed definition is given under the headword **phobia** in the main body of the dictionary, and the correct term for irrational fears that do not qualify as true phobias is defined under the headword **paraphobia**. This is probably a more comprehensive inventory of phobias and their etymologies than any previously published, but it has no pretensions to completeness. Virtually anything is capable of becoming a phobic stimulus, and names of phobias are often coined as nonce words; hence the number of potential phobias is unlimited, and any attempt to list them exhaustively would be futile. The entries in this appendix are restricted to phobias that have been discussed in serious publications or catalogued in general or specialist reference works. In addition to etymologies, the table includes cross-references and occasional comments on usage. Phobias with separate entries in the main body of the dictionary are flagged.

The names of most phobias are formed by combining a Greek prefix denoting the phobic stimulus with the suffix *-phobia* (from Greek *phobos* fear + *-ia* indicating a condition or quality). But many names of phobias are neoclassical hybrids, combining a Latin prefix with the Greek suffix, a typical example—one is tempted to say a classic example—being *claustrophobia*. Although frowned on by linguistic purists, this type of word formation is well established in contemporary English: compare *sociology*, *television*, *monolingual*. There are also a few phobias that are named by combining an English (or other modern language) prefix with the Greek suffix, for example *computerphobia*.

What follows is a double-entry list. Each phobia can be looked up either under its technical name, where the phobic stimulus is specified and a brief etymology is given, or (excepting *panphobia*) under its distinguishing phobic stimulus or stimuli—spiders, confined spaces, heights, and so on—where the name of the corresponding phobia will be found. After looking up the name of a phobia, the entry under the corresponding phobic stimulus may then be consulted for alternative names, if any, of the same phobia; or after looking

up a phobic stimulus, the entry under the corresponding phobia may be consulted for further information, including its etymology and occasional cross-references to related entries within the list.

ablutophobia Bathing. [From Latin *ablutio* the act of washing, from *abluere* to wash away]

acarophobia Bugs, mites, and other small creatures. *Compare* MICROPHOBIA, PARASITIOPHOBIA. [From Greek *akari* a mite]

accidents Dystychiphobia.

acerbophobia Sour tastes. Also called *acerophobia*. [From Latin *acerbus* sour, from *acer* sharp]

ophis a snake]

opinions, contrary or other Allodoxaphobia.

ornithophobia Birds. [From Greek *ornis*, *ornithos* a bird]

osmophobia Odours or smells. *Compare* BROMIDROSIPHOBIA. [From Greek *osme* a smell]

osphresiophobia Odours or smells. *Compare* BROMIDROSIPHOBIA. [From Greek *osphresis* smell]

ostraconophobia Shellfish. [From Greek *ostrakon* a shell]

otters Lutraphobia.

overnight success Meteorophobia.

overwork Ergophobia or ponophobia.

paedophobia Children or boys. US *pedophobia* or *pediophobia*. *Compare* PARTHENOPHOBIA. [From Greek *pais*, *paidos* a child or a boy]

pain Algophobia or odynophobia.

palindromes Aibohphobia.

pamphobia A variant spelling of *panphobia*.

panophobia A variant spelling of *panphobia*.

panphobia Sudden causeless fear or panic, hence a phobia without a phobic stimulus. Often misdefined and misinterpreted as fear of everything, on a mistaken assumption (a folk etymology) that it derives from the Greek *pan* all. *Compare* PANTOPHOBIA, POLYPHOBIA. [From Greek *Pan* the god of pastures, flocks, and woods, who supposedly inspired fears]

pantophobia Everything. Often confused with *panphobia*, which has a different meaning and etymology. *Compare* POLYPHOBIA. [From Greek *pas*, *pantos* all]

papaphobia The pope or popery. [From Latin *papa* a pope]

paper Papyrophobia.

papyrophobia Paper. [From Greek *papyros* the paper-reed]

paraleipophobia Neglecting work or duty. Also spelt *paralipophobia*. [From Greek *paraleipein* to leave aside, from *para* beside + *leipein* to omit]

parascevedekatriaphobia Friday the 13th. Also spelt *paraskevedekatriaphobia* or *paraskevidekatriaphobia*. Compare TRISKAIDEKAPHOBIA. [From Latin *parasceve* and Greek *paraskeue* Friday or the day of preparation (for the Jewish sabbath), from Greek *para* beside or beyond + *skeuos* a utensil + *dekatreis*, *dekatria* thirteen, from *deka* ten + *treis*, *tria* three]

parasites Parasitiophobia.

parasitiophobia Parasites. Compare ACAROPHOBIA, MICROPHOBIA. [From Greek *parasitos* a parasite, from *para* beside + *sitos* corn]

parthenophobia Virgins or young girls. Compare PAEDOPHOBIA. [From Greek *parthenos* a virgin]

parturiphobia Childbirth or labour. [From Latin *parturire* to be in labour]

paterophobia Fathers (of the early Church). [From Greek *pater* a father]

pathophobia Disease. [From Greek *pathos* suffering]

patriophobia Hereditary disorders. [From Greek *patrios* ancestral or native]

peanut butter Arachibutyrophobia.

peccatophobia Sinning. Also spelt *peccatiphobia*. Compare HAMARTOPHOBIA. [From Latin *peccare* to sin]

pediculophobia Lousiness or infestation of lice. [From Latin *pediculus* a little louse]

pedophobia or pediophobia See [PAEDOPHOBIA](#).

peladophobia Baldness or becoming bald. [From French *pelade* alopecia, from *peler* to deprive of hair, pluck, or peel]

peniaphobia Poverty or destitution. [From Greek, *penia* poverty, from *penes* a destitute or needy person]

penises Ithyphallophobia or phallophobia.

phagophobia Eating. [From Greek *phagein* to eat]

phalacrophobia Baldness. [From Greek *phalakros* bald-headed]

phallophobia Penises. [From Greek *phallos* a penis]

phantoms Phasmaphobia.

pharmacophobia Medicines or medicinal drugs. [From Greek *pharmakon* a drug]

phasmaphobia Ghosts or phantoms. Also spelt *phasmophobia*. [From Greek *phasma* a spectre]

phengophobia Daylight. Compare HELIOPHOBIA, PHOTOPHOBIA, SELAPHOBIA. [From Greek *phengos* light, daylight]

philemaphobia Kissing. [From Greek *philema* a kiss]

philophobia Love. [From Greek *phileein* to love]

philosophobia Philosophy or philosophers. [From English *philosophy*, from Greek *philosophia* philosophy, from *philos* friend, from *phileein* to love + *sophia* wisdom]

philosophy or philosophers Philosophobia.

phobanthropy See ANTHROPOPHOBIA.

phobias Phobophobia.

*****ebook converter DEMO Watermarks*****

phobodipsia Drinking.

phobophobia Fear of phobias. [From Greek *phobos* fear]

phonophobia Sounds or speaking aloud. [From Greek *phone* a sound or voice]

photophobia Light. This word more usually denotes a physiological hypersensitivity to light caused by conjunctivitis, etc. *Compare* HELIOPHOBIA, PHENGOPHOBIA, SELAPHOBIA. [From Greek *phos*, *photos* light]

phrenophobia Thinking or madness. [From Greek *phren* mind, originally midriff, the supposed seat of the mind]

phronemophobia Thinking. [From Greek *phronema* thought, from *phronein* to think]

phthisiophobia Tuberculosis. [From English *phthisis* tuberculosis, from Greek *phthisis* consumption]

phyllophobia Leaves. [From Greek *phyllon* a leaf]

places (certain) Topophobia.

plants Botanophobia.

plutophobia Wealth. [From Greek *ploutos* wealth]

pneumatophobia Spiritual things. [From Greek *pneuma*, *pneumatos* spirit]

pnigophobia Choking or suffocating. Also called *pnigerophobia*. [From Greek *pnigos* choking]

poetry Metrophobia.

pogonophobia Beards or bearded men. [From Greek *pogon* a beard]

poinophobia Punishment. *Compare* RHABDOPHOBIA. [From Greek *poinē* penalty]

pointed objects Aichmophobia or belonephobia.

MPD Multiple personality disorder. See [DISSOCIATIVE IDENTITY DISORDER](#).

MPI See [MAUDSLEY PERSONALITY INVENTORY](#).

MPP⁺ Methylphenylpyridine. See [MPP⁺](#) in the main body of the dictionary.

MPPP 1-Methyl-4-phenyl-4-propionoxy-piperidine. See [MPPP](#) in the main body of the dictionary.

MPTP 1-Methyl-4-phenyl-1,2,3,6-tetrahydropyridine. See [MPTP](#) in the main body of the dictionary.

MR See [MENTAL RETARDATION](#), [MOTIVATIONAL RESEARCH](#).

MRH Müllerian regression hormone. See [MÜLLERIAN INHIBITING SUBSTANCE](#).

MRI Magnetic resonance imaging. See [MRI](#) in the main body of the dictionary.

mRNA See [MESSENGER RNA](#).

MRS Modern Racism Scale. See [MODERN RACISM](#).

MS See [MULTIPLE SCLEROSIS](#).

MSD Male sexual dysfunction. See [DELAYED EJACULATION](#), [ERECTILE DISORDER](#), [MALE HYPOACTIVE SEXUAL DESIRE DISORDER](#), [PREMATURE \(EARLY\) EJACULATION](#).

MSE See [MENTAL STATUS EXAMINATION](#).

MSER See [MENTAL STATUS EXAMINATION REPORT](#).

MSG See [MONOSODIUM GLUTAMATE](#).

MSH See [MELANOCYTE-STIMULATING HORMONE](#).

MSS See [MEDICAL STUDENT SYNDROME](#).

*****ebook converter DEMO Watermarks*****

MT See [MASSAGE THERAPY](#). Also, median or middle temporal. See MT in the main body of the dictionary.

MTD See [MINIMUM TOXIC DOSAGE](#).

mtDNA See [MITOCHONDRIAL DNA](#).

MTF Modulation transfer function. See [CONTRAST SENSITIVITY FUNCTION](#).

MTL See [MEDIAL TEMPORAL LOBE](#).

MTMM See [MULTITRAIT–MULTIMETHOD MATRIX](#).

MTT See [MENTAL TIME TRAVEL](#).

MUD Multi-user dungeon, or multi-user dimension. See MUD in the main body of the dictionary.

MZ See [MONOZYGOTIC](#).

N Often used to represent the total number of scores in a data set or total number of research participants or subjects in an experiment or investigation. *Compare N*. Also Number (intelligence factor): see [PRIMARY MENTAL ABILITIES](#).

n Often used for the number in a subsample. *Compare N*.

N140 Negative deflection, 140 milliseconds. See [n140](#) in the main body of the dictionary.

N₂O See [NITROUS OXIDE](#).

N400 Negative deflection, 400 milliseconds. See [n400](#) in the main body of the dictionary.

NA See [NORADRENALIN](#).

Na See [SODIUM](#).

N Ach See [NEED FOR ACHIEVEMENT](#). Also written *nAch*.

N Aff See [NEED FOR AFFILIATION](#). Also written *nAff*.

*****ebook converter DEMO Watermarks*****

Na⁺-K⁺ Sodium–potassium. *See* [SODIUM PUMP](#).

NANC Non-adrenergic, non-cholinergic. *See* [NANC](#) in the main body of the dictionary.

<http://allpsych.com/>

- AllPsych Online. A virtual psychology classroom for psychology students.

[http://78.158.56.101/archive/psychology/s.php?p=216&db=psychology.ltsn.:](http://78.158.56.101/archive/psychology/s.php?p=216&db=psychology.ltsn.)

- The Higher Education Academy Psychology Network. Useful information about psychology practicals.

<http://www.units.muohio.edu/psybersite/>

- Psybersite. Web tutorials for learning about a wide range of topics in psychology.

Biological and comparative psychology

<http://faculty.washington.edu/chudler/introb.html#tn>

- Neuroscience for Kids. Accessible web site dealing with many aspects of neuroscience.

<http://www.pigeon.psy.tufts.edu/psych26/history.htm>

- Important Scientists in the Early Development of Comparative Cognition. Information on Darwin, Pavlov, Thorndike, etc.

<http://animalbehaviorsociety.org/>

- Animal Behavior Society. 'Founded to encourage and promote the study of animal behavior.'

<http://www.neurosurgery.org/cybermuseum/pre20th/crowbar/crowbar.html>

- American Crowbar Case. Phineas Gage's brain injury and nineteenth century theories of cerebral localization.

<http://www.pbs.org/wgbh/aso/tryit/brain/>

- Probe the Brain. Activities to learn about brain structure and function.

<http://www.hedweb.com/gooddrug.htm>

- Good Drug Guide. Massive guide to drugs and their effects.

<http://psych.hanover.edu/Krantz/neurotut.html>

- Basic Neural Processes. A collection of tutorials on neural functions.

<http://www.rci.rutgers.edu/~lwh/drugs/>

- *Drugs, Brains and Behavior*. Full-text book by C. Robin Timmons and Leonard W. Hamilton (1990).

<http://www.psych.ucsb.edu/research/cep/primer.html>

- *Evolutionary Psychology: A Primer*. Full-text book, by Leda Cosmides and John Tooby (1997).

<http://www.sfn.org/>

- Society for Neuroscience. Advancing the study of the brain and nervous system.

Cognitive psychology, cognitive neuroscience, and cognitive science

<http://cogprints.org/view/subjects/psyc.html>

- Cogprints. Free access to thousands of psychology articles online, subdivided by areas.

<http://www.sjdm.org/>

- Society for Judgment and Decision Making. With useful links to relevant web sites.

<http://www.dualtask.org/>

- Dual Task. Demonstrations and information about human multi-task performance and attention limits.

<http://www.g2conline.org/?gclid=CNajoaHC67QCFQRnOgodom8AZA>

- Genes to Cognition Online. Neuroscience: disorders, cognitive processes, research.

<http://users.ecs.soton.ac.uk/harnad/Papers/Py104/loftus.mem.html>

- Formation of False Memories. Informative discussion by Elizabeth Loftus.

<http://wordnet.princeton.edu/wordnet/>

- WordNet. English nouns, verbs, adjectives, and adverbs grouped into sets of cognitive synonyms.

<http://www.cnbc.cmu.edu/>

- Center for the Neural Basis of Cognition. Investigation of neural mechanisms in human cognitive abilities.

Intelligence

<http://www.intelltheory.com/>

- Human Intelligence. Includes biographies and interactive map of the history of intelligence theory and testing.

<http://www.danielgoleman.info/topics/emotional-intelligence/>

- Daniel Goleman. Blog about emotional intelligence by one of its pioneers.

<http://www.cs.bath.ac.uk/~jjb/web/uni.html>

- Understanding Natural Intelligence. With a list of useful papers and books.

Perception

<http://www.illusionworks.com/>

- Illusions, Perception & Cognitive Science. Al Seckel's collection of visual illusions, with references and links.

<http://www.ritsumeai.ac.jp/~akitaoka/index-e.html>

- Akiyoshi's illusion pages. Spectacular collection of visual illusions.

<http://www.simplypsychology.org/perception-theories.html>

- SimplyPsychology. Theories of perception.

<http://sulcus.berkeley.edu/FLM/MS/Physio.Percept.html>

- Physiology of Perception. Explanations and diagrams to explain the physiology of perception.

Personality

<http://buros.unl.edu/buros/jsp/search.jsp>

- Test Reviews Online. Reviews of psychological tests from the *Mental Measurements Yearbook*.

<http://ipip.ori.org/ipip/>

- International Personality Item Pool. IPIP, providing free personality tests for research in psychology.

<http://pandc.ca/>

- Personality & Consciousness. Links to articles on personality theorists such as Adler, Jung, Lewin, and Maslow.

<http://www.uky.edu/~eushe2/Pajares/self-efficacy.html>

- Information on Self-efficacy. Massive site about self-efficacy, its measurement, and Albert Bandura's theories.

<https://personality-project.org/>

- Personality Project. A collection of web pages devoted to the academic study of personality.

<http://repgrid.com/>

- Personal Construct Psychology. Site devoted to the system developed by George Kelly.

Social psychology

<http://www.socialpsychology.org/>

- Social Psychology Network. With over 14,000 links, plus resources in social psychology teaching and research.

<http://www.prisonexp.org/>

- Stanford Prison Experiment. The official web site, describing the classic experiment.

<http://www.bbc.co.uk/programmes/p0038x9c>

- Altruism. Listen online to the BBC *In Our Time* debate about altruism.

<http://muskingum.edu/~psych/psycweb/history/milgram.htm>

- Stanley Milgram. Biography and overview of his research into obedience and other issues.

http://psychology.wikia.com/wiki/Social_Cognition_Paper_Archive_and_Infoc

- Social Cognition Paper Archive. Articles and links to social psychology researchers.

<https://implicit.harvard.edu/implicit/>

- Project Implicit. Demonstrations and research information about the Implicit Association Test.

<http://www.sesp.org/>

- Society of Experimental Social Psychology. 'A scientific organization dedicated to the advancement of social psychology.'

Positive psychology

<http://www.ppc.sas.upenn.edu/>

- Positive Psychology Center. Promoting research, training, education, and the dissemination of positive psychology.

<http://www.capeu.com>

- Centre for Applied Positive Psychology. Promoting the science and practice of positive psychology.

<http://eu.wiley.com/WileyCDA/Section/id-814228.html>

- TED Studies: Psychology - Understanding Happiness. Videos of short lectures.

Developmental psychology

<http://www.eadp.info/links/>

- European Association of Developmental Psychology. With useful developmental psychology links.

<http://www.bdadyslexia.org.uk/>

- British Dyslexia Association. With links to information about dyslexia.

<http://www.psychology.sunysb.edu/attachment/index.html>

- Resources and commentary on attachment from the New York Attachment Consortium.

Sleep and dreams

<http://www.sleephomepages.org/>

- Sleep Home Pages. A portal to many web sites with information about sleep.

<http://www.sleepnet.com/>

- Sleepnet. Many links to sites about sleep, sleep disorders, and dreams.

<http://psych.ucsc.edu/dreams/>

- Dreamresearch. Information about using content analysis to study dreams.

Mental health

<http://psychcentral.com/>

- PsychCentral. Mental health network, with information and support networks for mental health.

<http://www.aedweb.org/web/index.php>

- Academy for Eating Disorders. Information about all eating disorders.

<http://www.bacp.co.uk/>

- British Association for Counselling and Psychotherapy. With many links.

<http://rebt-cbt.net/>

- REBT–CBT. Rational emotive behaviour therapy and cognitive behaviour therapy, with podcasts and articles.

<http://www.simplypsychology.org/cognitive-therapy.html>

- SimplyPsychology. Straightfoward discussions of types of behaviour therapy.

<http://www.apahelpcenter.org/>

- APA Help Center. American Psychological Association's brochures, tips, and articles on psychological and emotional issues.

<http://www.stress.org/>

- The American Institute of Stress. Clearing house for information on all stress-related subjects.

Research resources

<http://www.surveymonkey.com/Default.aspx>

- SurveyMonkey. An online site for creating surveys.

<http://www.randomizer.org/>

- Research Randomizer. For assigning experimental participants or subjects randomly to treatment conditions.

<http://www.onlinepsychresearch.co.uk/participants/current-studies/>

- Online Psychology Research. Participate in psychology studies currently running on the internet.

<http://psych.hanover.edu/research/exponnet.html>

- Psychological Research on the Net. Categorized list of experiments on the internet to participate in.

<http://pics.psych.stir.ac.uk/>

- Psychological Image Collection at Stirling. Including a database of faces for use in research.

<http://www.data-archive.ac.uk/>

- UK Data Archive. The largest UK collection of social sciences digital data.

<http://survey.net.ac.uk/sqb/>

- Social Survey Question Bank. Examples to assist with the design of new survey questionnaires.

<http://www.apa.org/pubs/databases/psyc critiques/index.aspx>

- PsycCRITIQUES. American Psychological Association database of reviews of psychology books.

<http://www2.chass.ncsu.edu/garson/pa765/statnote.htm>

- Statnotes. Useful information about multivariate statistics.

Ethics

<http://www.apa.org/ethics/>

- APA Ethics Office. Ethical guidelines issued by the American Psychological Association.

<http://www.bps.org.uk/what-we-do/ethics-standards/ethics-standards/>

- Ethics and Code of Conduct. Ethical guidelines issued by the British Psychological Society.

<http://neuroethics.upenn.edu/>

- Neuroethics. Ethical issues emerging from different branches of clinical and basic neuroscience.

Careers

<http://www.bps.org.uk/careers-education-training/careers-education-and-training>

- Careers in Psychology. Advice from the British Psychological Society.
<http://www.apa.org/careers/resources/guides/careers.pdf>

- Careers in Psychology. Booklet from the American Psychological Association.

<http://psych.hanover.edu/gradframe.html>

- Career Decision Aids. List of links to web pages useful for psychology careers advice.

Prominent psychologists

<http://mechanism.ucsd.edu/~bill/research/ANAUT.html>

- Biographies of Major Contributors to Cognitive Science. Expanded from *Companion to Cognitive Science* (Blackwell, 1988).

<http://www.psychwww.com/books/interp/toc.htm>

- Interpretation of Dreams. Full-text online version of Sigmund Freud's book.

<http://www.freud.org.uk/>

- Freud Museum. Site of the Sigmund Freud Museum in London.

<http://www.uky.edu/~eushe2/Pajares/james.html>

- William James. Massive site dedicated to this pioneer of US psychology.

<http://webpace.ship.edu/cgboer/jung.html>

- Carl Jung. Biography and description of Jung's theories.

<http://webpace.ship.edu/cgboer/maslow.html>

- Abraham Maslow. Biography and description of his theory of the hierarchy of needs.

<http://www.maslow.org/main.php>

- Maslow Nidus. Collection of papers, portions of books, and biography of Abraham Maslow.

<http://www.piaget.org/index.html>

- Jean Piaget Society: Information about the Swiss developmental psychologist.

<http://webpace.ship.edu/cgboer/skinner.html>

- B. F. Skinner. A biography of and a description of Skinner's work.

<http://www.nrogers.com/carlr Rogers.html>

- Carl Rogers. Biographical pages about Carl Rogers and the humanistic psychology movement.

Miscellaneous

<http://www.indiana.edu/~kinsey/index.html>

- Kinsey Institute. For Research in Sex, Gender, and Reproduction.

http://www.theassc.org/eprints_archive

- Association for the Scientific Study of Consciousness. With a searchable list of free articles.

<http://www.myscp.org/>

- Society for Consumer Psychology. With additional links.

<http://serendip.brynmawr.edu/Mind/>

- *Mind and Body: René Descartes to William James*. Full-text book by Robert H. Wozniak (1992).

<http://www.behavior.org/>

- The Cambridge Center for Behavioral Studies. With information on behaviour analysis.
